There can be no doubt on this score: the overwhelming majority of the American people were favorably disposed toward the Soviet Union at the end of the war. It is clear too that this sentiment was not the product of conspiratorial left-wing manipulations. A *Fortune* magazine poll conducted by Elmo Roper in 1943 indicated that of various segments of the American population the group designated as "executives" had the greatest confidence in Soviet postwar intentions! Forty-eight per cent of the "executives" were convinced that "after the war . . . Russia . . . will not try to bring about Communist governments in other countries." On the other hand, according to Roper, only thirty-one per cent of the entire population was of the same belief. Roper's poll indicated a greater degree of uncertainty regarding Soviet postwar intentions than the polls taken in 1944, a discrepancy which is not altogether understandable. But, for our purposes the importance of his poll lies in the fact that it suggests that the most responsible citizens in America were the very ones most imbued with the wartime confidence in the Soviet Union.

Roper's breakdown only reinforces our conviction that the pro-Soviet feelings were not primarily the product of Communist manipulations. "Executives" are hardly a class traditionally vulnerable to Communist propaganda; on the contrary, they are most nearly immune to it. But they are the group most attentive to the complex demands of the American national interest, and during the war a degree of "sympathy" with the Soviet Union was apparently in the American national interest.

The first discernible shift in American attitudes toward the Soviet Union came in the first six months of 1945, when the war with Germany was brought to an end, and when the Soviet intention to absorb all of Eastern Europe into her orbit became clear. Pro-Sovietism was

no longer in the American national interest; and to many it was already evident that Russia had replaced Germany as America's chief protagonist for mastery of Europe. Polls taken in September reflected this shift, but also indicated that the mass of American people were far from ready to commit themselves to the costly and difficult struggle with the Soviet Union which was later to consume so much of their energies. Indeed, as late as 1948 the residue of wartime illusions was so great that only the Communist *coup* in Czechoslovakia insured the passage through Congress of the Marshall Plan.

The wartime illusions affected all segments of the population. But the only group which continued to act upon these illusions after the war was that portion of the labor movement and radical intelligentsia which the Communist Party could organize into the Wallace movement. Employing all the slogans and apologies which *Life* and other magazines had popularized during the war, this movement was a direct outgrowth of the wartime atmosphere. Its size should not be underestimated; it was calculated in the spring of 1948 that Wallace would have received close to five million votes. That he did not was only because of the impact of the *coup* in Czechoslovakia, the Berlin Blockade, and the extraordinary campaign Truman subsequently waged.

But in long-range terms the failure of the Wallace movement may be attributed to the failure of his gloomy economic forecasts to stand up before the dynamic expansion of American business activity in the postwar period. In Italy and France, where no such boom had occurred, the Communist parties were able to consolidate the hold on the labor movement they gained during the war. As a result, the illusions born of the wartime alliance still flourish in France and Italy. Only America's amazing industrial machine prevented a similar development here.

VI

Yet, despite the rapidity with which America recovered from her wartime illusions, she paid dearly for them, not as dearly as many of our contemporary politicians would have us believe, but the price was high nevertheless. Could it have been otherwise? It is difficult to say; no glib and simple answers are possible. The design here has been to show how irrelevant is the very suggestion that the failure to respond

more resolutely can be pinned on any particular group of ignorant or neglectful people.

Our extreme reactionaries today declare that there was an alternative to pro-Soviet wartime enthusiasm: We should never have been in the war in the first place, and should have, instead, either allied with Germany and Japan against Russia, or permitted Russia and Germany to have exhausted themselves in a long war of mutual attrition! That this is the most fanciful thinking is obvious: but it provides an insight into their line of reasoning, and their present view that America should either destroy Russia by sudden atomic attack or withdraw from all our foreign commitments and turn America into an isolated fortress like Gibraltar.

In both cases they oppose an alliance with democracies in a war against totalitarianism because they instinctively realize that such an alliance, and such a war, has an essentially democratic foundation and would have democratizing effects both upon America and the world. Such a price is so high they would rather risk losing Europe and Asia to Fascism or Communism than pay it.

The wartime alliance with Soviet Russia had a similar role in the general political layout. The Soviet Union is a reactionary and totalitarian power; but the world does not see her so. On the contrary, her entrance into the Second World War gave hope to millions that a better world would result from the war; and millions fought inspired by this hope. Therefore any power that participated in the Second World War had to compete with the Soviet Union in the struggle for a "better tomorrow," and this meant the slogans of social progress. The same is the case today with regard to American alliances with the semi-socialist powers of England, India, France and Italy.

Certain analysts—George Kennan is foremost among them—have deplored the lack of political realism in the slogans with which America has fought its wars. And certainly the cynical manipulation of emotions which accompanies every war is deplorable. But perhaps it is even more cynical to expect the American people to go to war without great feelings and passions. Should we be so harsh with the American people because they dared to hope that a better world was going to emerge from the terrible holocaust of the last war? These hopes were based upon many illusions; but the hopes themselves should be treasured, for without them our civilization is surely doomed.

Ernst, Morris

February 1, 1955

Dear Brendan:

Morris Ernst, whom you have met several times, is shortly coming to London. He has a project to cause Americans to produce funds for a statue of Sir Winston to be placed in Grosvenor Square. Needless to say, I am enthusiastic about it providing the Prime Minister concurs. There would be no difficulty in raising the money.

As ever yours,

Rt. Hon. Brendan Bracken

Re: Tobacco:

Take a look at the tax situation, its high proportion of consumer purchase cost, its relation to playing cards, liquor, etc., where taxes are levied not for revenue but as an attempt to reform the human animal and more particularly note that if tax on cigarettes were graded by number of packages produced by a company, every town would have a little cigarette machine with a manufacturer turning out packages within the limited number at seven or eight cents in competition with the giant who presumably could stand per package tax rate since he brags about the economies of bigness. A bill along this line was introduced in Congress a couple of years ago.

Dear Ed:

On behalf of Judge William Clark, I today instituted suit against John Foster Dulles and other members of the State Department. I am enclosing herewith copies of the papers which were filed in Washington this morning. Perhaps you will find this matter of interest and importance to the American people and, therefore, worthy of comment.

Sincerely yours,

Morris L. Ernst

EXPLANATORY STATEMENT BY MORRIS L. ERNST, REPRESENTING JUDGE WILLIAM CLARK

The issue in this case boils down simply to this: May the State Department require a citizen to surrender his constitutional right of freedom of speech as condition for the issuance of a passport?

We hold that in so doing, in the case of Judge Clark, the action of the Department is arbitrary, capricious, without any authority in law and unconstitutional in that it deprives a citizen of his freedom of speech and freedom of movement without due process of law.

Man's right to freedom of movement stems from the Magna Charta, which stated that "any freeman may leave the realm and return thereto." It is interesting to note that one of the cases in which the Supreme Court has upheld freedom of movement as a constitutional right was that in which it affirmed the ruling of Judge Clark, then sitting as a United States District Judge, which prevented Mayor Hague of Jersey City from forcibly deporting to New York persons who were attacking Hague's anti-union activities.

Now the State Department apparently holds that freedom of movement stops at the water's edge.

The facts in this case are simple:

Judge Clark, an American citizen with an outstanding record of public service, has been trying since January to obtain a passport for a trip to Europe, the purposes of which are unobjectionable to the Department.

Solely on the ground that he might make remarks in Germany differing from positions of the Department, the Department

refuses to grant Judge Clark a passport, or even to grant him a hearing. Noting Judge Clark's loyalty and devotion to the U.S., Under Secretary Bedell Smith has indicated that Judge Clark would be issued a passport only if he would amend his passport application to make clear that he would not make such remarks while in Germany.

Judge Clark insists on maintaining his constitutional right, in Germany, to voice his opinions if asked to do so. He insists on his right to state, for instance, his belief that the West German courts should acknowledge the rights of American citizens to bail and speedy trial, all guaranteed by our own Constitution. The State Department's attitude in preventing him from speaking out on these matters while in Germany is particularly curious because Judge Clark, as legal consultant to General Clay, assisted in the removal of a great many German judges whose actions the Department now prevents him from criticizing.

The bizarre aspect of this case is that if Judge Clark were accused of subversion, he would be entitled, under State Department regulations, to a hearing before the Board of Passport Appeals. As he happens to be a loyal citizen, he is accorded no hearing. Thus admittedly loyal people become legal waifs - their freedom of movement restricted without hearings. So, also, our great Republic, preaching as it does freedom of speech, press and movement, to the peoples struggling under the weight of dictatorship abroad, appears to deny those same freedoms even to our most honorable citizens.

807 BAR PRESS INC., 54 LAFAYETTE ST., NEW YORK 13 — WA. 5-3482-3.

IN THE

United States District Court

District of Columbia

WILLIAM CLARK, *Plaintiff,* *against* JOHN FOSTER DULLES, Secretary of State, WALTER BEDELL SMITH, Under Secretary of State, SCOTT W. McLEOD, Administrator, Bureau of Security, Consular Affairs and Personnel, Department of State, and RUTH B. SHIPLEY, Director, Passport Office, Department of State, *Defendants.*	**COMPLAINT** Civil Action No.....

The complainant, William Clark, complaining of the defendants, respectfully alleges as follows:

1. This is an action for declaratory judgment under Title 28, United States Code, §2201, for an injunction and for review under the Administrative Procedure Act §10.

2. (a) The plaintiff is a citizen of origin of the United States, entitled to all the rights and privileges of such citizenship. Except for his services in World War II and a year as legal consultant to General Lucius D. Clay, American Governor of the Western Zone of Germany, the plaintiff has served as a member of the judiciary continuously since 1923, having been successively a Judge of the Court of Errors and Appeals of the State of New Jersey, the United States District Court for the District of New Jersey, the United States Circuit Court of Appeals for the Third Circuit, and Chief Justice of the Military Gov-

ernment Courts and of the Allied High Commission Courts for Germany. Plaintiff held the latter post from on or about September 15, 1949 until on or about his enforced return to the United States in December, 1953.

(b) The defendants have conceded the plaintiff's devotion and loyalty to the United States.

3. The defendant, John Foster Dulles, is Secretary of State and as such has been charged by statute (22 U. S. C. 211a) with the duty of granting and issuing passports under rules designated and prescribed by the President. The defendant, Walter Bedell Smith, is Under Secretary of State. The defendant, Scott W. McLeod, is Administrator, Bureau of Security, Consular Affairs and Personnel, Department of State. The defendant, Ruth B. Shipley, is Director, Passport Office, Department of State. The defendants, Smith, McLeod and Shipley have acted on behalf of the Department of State and as agents for the defendant, John Foster Dulles, Secretary of State, in respect to the matters alleged in this complaint.

4. On or about January 21, 1954, the plaintiff made application to the Department of State for a passport on the Department's regular passport application form in order to visit Germany, France, Italy and Great Britain. (A copy of this application is attached hereto as Exhibit "A" and made a part hereof.) In response to a question contained in the application form, plaintiff stated the purposes of his intended visit in substance as follows:

a) Completion of the plaintiff's studies for the degree of Doctor of Jurisprudence for which he matriculated at the University of Munich;

b) The gathering of evidence to be submitted to the Congress if it should see fit to investigate any of the issues between the plaintiff and the Department of State regarding plaintiff's judgeship;

c) Visiting an ailing aunt in Scotland and the plaintiff's son in Paris;

d) Attending to certain personal affairs, which plaintiff was unable to wind up in view of the fact that the usual time accorded to officers of the United States prior to their return to the United States was denied the plaintiff.

5. As part of the aforesaid application, plaintiff included the following statement:

"I would be less than frank if I did not state that I reserve to myself my fundamental right of free speech. I shall, accordingly, if I am asked to do so, make such comments as I see fit upon the recent controversy between me and the State Department. I shall feel free to object again to the State Department's having dismissed me and having me deported from Spain. I shall feel free to explain again my defense of the rights of American citizens in Germany. I shall not refrain from stating my well-known position on the right of bail and speedy trial in general, and particularly for American citizens residing in Germany, and my equally clear position decrying discrimination against members of minority groups, in this instance particularly the Jews of Germany."

6. The aforesaid statement was made necessary because plaintiff had and has reasonable grounds to believe, in view of his differences with and public criticism of State Department attitudes on the matters mentioned in the statement set forth in paragraph 5, that unless in his passport application plaintiff expressly reserved to himself his right as a citizen of the United States to express views contrary to those held by the State Department on such matters, his passport, if granted, would be revoked, as had been his diplomatic passport, if he should, while abroad, express such views.

7. The defendants have refused and continue to refuse to issue the plaintiff a passport not under their purported right to refuse to issue passports to subversives, to those convicted of crimes, in ill health, avoiding taxes or under subpoena, but solely upon the ground that plaintiff might while in Germany comment, if asked, on the controversy between plaintiff and the State Department, object to his dismissal from his judicial position and deportation from Spain by the State Department, explain his defense of the rights of American citizens in Germany, state his position on the right of bail and speedy trial in general, and particularly for American citizens residing in Germany, and state his position decrying discrimination against members of minority groups, particularly the Jews of Germany. The defendants have refused and continue to refuse to issue the plaintiff a passport except on the implicit understanding or condition that the plaintiff, if granted a passport, will refrain from such utterances while in Germany.

8. The plaintiff's application for a passport was proper in all respects and in conformity with law, the facts stated therein are true and, accordingly, the plaintiff is entitled to a passport on the basis of his application without the imposition of the aforesaid condition.

9. The defendants, although requested to do so, have refused to grant the plaintiff a hearing on his passport application.

10. Under Title 8 United States Code, Section 1185, and the regulations issued by the defendant Dulles (22 Code of Federal Regulations, Section 53.1) and the Proclamation of the President of the United States dated January 23, 1953 (18 Federal Register 489), it is unlawful for plaintiff or any other citizen of the United States to leave or enter or attempt to leave or enter the territory of the

United States to or from the continent of Europe without a valid passport issued by the defendants.

11. The defendants have no right under the passport statute (22 U. S. C. Section 211a) or the regulations thereunder, to refuse the plaintiff a passport solely on the ground mentioned in paragraph 7 hereof, or, in granting a passport to the plaintiff, to impose the condition mentioned in said paragraph 7.

12. The defendants have construed the passport statute (22 U. S. C. 211a) granting them power to issue passports as authorizing them to withhold passports in their absolute, unqualified discretion without specific standards limiting such discretion. As so construed and applied by the defendants, the passport statute violates constitutional prohibitions of the First and Fifth Amendments against abridgment of freedom of speech and deprivation of personal liberty and property without due process of law.

13. The action of the defendants and each of them in refusing and continuing to refuse to issue the plaintiff a passport solely upon the ground mentioned in paragraph 7 hereof, and their refusal and continued refusal to issue the plaintiff a passport, except on the implicit understanding or condition mentioned in the said paragraph 7, is arbitrary, capricious, without authority in law, and an abuse of the discretion, if any, vested in the defendants to refuse to issue passports.

14. The aforesaid action of the defendants and each of them

a) has deprived and is depriving the plaintiff of his right of "freedom of speech" and his "right to petition the Government for a redress of his grievances" (in that he may not go abroad to

collect material to support such grievances) as secured to him by the First Amendment and the "due process" clause of the Fifth Amendment of the United States Constitution;

b) has deprived him of his "liberty" (in confining his freedom of movement) and "property" (in his right to educate himself), "without due process of law" as secured to him by the Fifth Amendment of the United States Constitution, and

c) has created an actual controversy between plaintiff and the defendants as to plaintiff's right to the issuance of a passport and the defendants' right to refuse the plaintiff a passport on the ground, or to impose the condition mentioned in paragraph 7 hereof.

WHEREFORE, plaintiff prays this Honorable Court:

1. To render a declaratory judgment, pursuant to the provisions of Title 28 U. S. C. §2201 et seq., declaring and adjudging (a) that the action of the defendants and each of them

(i) in refusing plaintiff a passport solely on the ground that plaintiff might, while in Germany, comment, if asked, on the controversy between plaintiff and the State Department, object to his dismissal from his judicial position and his deportation from Spain by the State Department, explain his defense of the rights of American citizens in Germany, state his position on the right of bail and speedy trial in general, and particularly for American citizens residing in Germany, and state his position decrying discrimination against members of minority groups, particularly the Jews of Germany, and

(ii) in imposing, as a condition to the granting of a passport that plaintiff, if granted a passport, refrain from such utterances while in Germany

is arbitrary, capricious, without authority in law and in contravention of the First Amendment and the "due process" clause of the Fifth Amendment of the United States Constitution, and (b) that defendants may not continue to refuse plaintiff a passport solely on the aforesaid ground nor impose the aforesaid condition.

2. That the defendants and each of them and all persons acting by, for or under any of them be enjoined from continuing to refuse plaintiff a passport on the aforesaid ground and from continuing to impose the aforesaid condition on the ground that such action by defendants is arbitrary, capricious, without authority in law, and unconstitutional within the meaning of the aforesaid Amendments.

3. That in view of the premises, the defendants be directed to issue the plaintiff a passport on the ground that their refusal so to do is arbitrary, capricious, without authority in law and unconstitutional under the First and Fifth Amendments, or, in the alternative, that the defendants be directed to grant plaintiff a hearing in conformity with the Administrative Procedure Act.

4. That the defendants and each of them and all persons acting by, for or under any of them be enjoined from revoking the plaintiff's passport, when issued, solely on the ground that plaintiff has made any utterances of the kind mentioned in paragraph 1 of this prayer.

5. That plaintiff have such other and further relief as may be just and proper.

Respectfully submitted,

PURPOSE OF TRIP

1. To conclude my studies for the Degree of Doctor of Jurisprudence for which I matriculated on or about June 28, 1951, including preparation of my doctoral thesis, the subject of which is "A comparison of the Common Law and German Law of Murder". These studies require the examination of German legal textbooks and other authorities obtainable only in libraries at Munich and Frankfort. To obtain the degree, I must submit the completed thesis to the Chancellor of the University of Munich and offer myself for personal examination thereon.

2. To gather further material in aid of the Congress should it see fit to investigate any of the issues between me and the State Department regarding my judgeship.

3. To visit my Aunt, who is a resident of Scotland and in bad health, and my son, who is connected with Columbia Broadcasting System in Paris.

4. To attend to personal affairs which I was unable to conclude because of the seizure of my previous passport, its validation only for return to the United States, my arbitrary removal from Spain where I was vacationing, and the consequent prevention of my return to Germany from Grand Canary Island, as was my original intention.

I would be less than frank if I did not state that I reserve to myself my fundamental right of free speech. I shall accordingly, if I am asked to do so, make such comments as I see fit upon the recent controversy between me and the State Department. I shall feel free to object again to the State Department's having dismissed me and having me deported from Spain. I shall feel free to explain again my defense of the rights of American citizens in Germany. I shall not refrain from stating my well-known position on the right of bail and speedy trial in general and particularly for American citizens residing in Germany, and my equally clear position decrying discrimination against members of minority groups, in this instance particularly the Jews of Germany.

United States District Court

District of Columbia

WILLIAM CLARK,
Plaintiff,
against

JOHN FOSTER DULLES, Secretary of State, WALTER BEDELL SMITH, Under Secretary of State, SCOTT W. McLEOD, Administrator, Bureau of Security, Consular Affairs and Personnel, Department of State, and RUTH B. SHIPLEY, Director, Passport Office, Department of State,
Defendants.

POINTS AND AUTHORITIES IN SUPPORT OF MOTION FOR PRELIMINARY INJUNCTION

I

STATEMENT OF FACTS

On January 21st, 1954, the plaintiff, an American citizen of origin, made application to the Department of State for a passport to visit Germany, France, Italy and Great Britain. His purposes in going abroad, as stated in his application, were unobjectionable to the Department (see Exhibit A-9*). As part of his application the plaintiff included a statement (set forth at length in the Complaint) which honorably notified the Department that in making application the plaintiff was reserving to himself his "fun-

* The reference is to the Exhibits attached to plaintiff's affidavit in support of this motion.

damental right of free speech'' and accordingly, that he would ''feel free to comment, if asked, on the recent controversy between the Department and [himself]''. These comments, the plaintiff stated, might possibly include his objection to his removal from his judicial position and deportation from Spain by the State Department, his defense of the rights of American citizens in Germany, his position on the right to bail and speedy trial in general, and particularly for American citizens residing in Germany, and his position decrying discrimination against members of minority groups, in this instance particularly the Jews of Germany.

The Department of State refused the plaintiff a passport. In the correspondence which followed between the plaintiff and his counsel, on the one hand, and the defendants on the other, the Department made clear that its refusal was based on the Department's fear that the plaintiff would speak his mind as indicated in his statement. It appears to be the Department's position that it can compel United States citizens going abroad to remain mute on the important issues of our time and that in so doing it is protecting what it considers to be ''the best interests of the United States''. The Department also made clear that no question of the plaintiff's devotion or loyalty to the United States was involved, and, accordingly, that the plaintiff would be granted a passport if he withdrew the statement from his application, and would not, while in Germany, make the utterances mentioned. No question was raised that the plaintiff would engage in any activity other than speech, or use speech for any unconstitutional end. Neither was it contended that the plaintiff would in any way violate German law. The matter thus reached an impasse and the plaintiff was obliged to institute this action to protect his rights.

II

QUESTIONS OF LAW PRESENTED

The principal issue in this case is: May the Department of State require a citizen to surrender his constitutional right of freedom of speech as a condition for the issuance of a passport?

The defendants claim the power to refuse the plaintiff a passport under Title 22 U. S. C. §21a, which provides that "The Secretary of State may grant and issue passports * * * under such rules as the President shall designate and prescribe for and on behalf of the United States * * *". The only regulation directly applicable to this case was issued by the President and provides that "The Secretary of State is authorized in his discretion to refuse to issue a passport * * * [and] to withdraw or cancel a passport already issued * * *" (22 Code of Fed. Regs. §51.75).

It is the plaintiff's contention that the Department of State may not, under existing law and under the Constitution, impose the condition sought to be imposed in this case as a condition of the issuance of a passport. It is submitted that the action of the Department in so doing is arbitrary, capricious, without any authority in law and unconstitutional, in that it deprives the plaintiff of his freedom of speech and freedom of movement without due process of law. It is submitted that if the passport statute (22 U. S. C. §211a) be construed as the defendants construe it, it provides, in the language of Justice Douglas, for that "Absolute discretion * * * (which) * * * marks the beginning of the end of liberty" [*New York* v. *United States,* 342 U. S. 882, 884 (1951)] and is therefore unconstitutional. Should it be determined, contrary to plaintiff's contention, that the plaintiff may, under the passport statute, constitutionally be refused a passport, then Section 1185 of Title 8 U. S. C., is unconstitutional as it deprives plaintiff of his freedom of movement guaranteed by the Fifth Amendment of the United States Constitution.

III

JURISDICTION

This Court has jurisdiction to grant the relief sought.

Where the ground assigned for administrative action is arbitrary, capricious, without authority in law or unconstitutional, this Court has jurisdiction to review that action and grant the relief required, including a mandatory injunction. *Perkins* v. *Elg,* 307 U. S. 325 (1939); *McGrath* v. *Kristensen,* 340 U. S. 162 (1950); *Mastrapsasqua* v. *Shaughnessy,* 180 F. 2d 999 (C. A. 2, 1950); *Siegel* v. *United States,* 87 F. Supp. 555 (1949); *Goldsmith* v. *Board of Tax Appeals,* 270 U. S. 117 (1926). Since the Department of State's action is an abuse of the discretion (if any) committed to it by law, review may also be had under §10 of the *Administrative Procedure Act,* 5 U. S. C. §1009; *Heikkila* v. *Barber,* 345 U. S. 229 (1953); *National Labor Relations Board* v. *Guy S. Atkinson,* 195 F. 2d 141, 149 (C. A. 9, 1952); *Chavez* v. *McGranery,* 108 F. Supp. 255 (D. C. S. D. Cal., 1952). Even were it unnecessary for the Department to assign reasons for its refusal, where it in fact appears that the Department's discretion was exercised on an illegal or unconstitutional ground, this Court has jurisdiction to review. *S. E. C.* v. *Chenery Corp.,* 318 U. S. 80 (1943); *Virginia Stage Lines* v. *United States,* 48 F. Supp. 79, 83 (D. C. W. D. Va., 1942).

IV

The defendants have refused plaintiff a passport on a ground which is arbitrary, capricious, illegal and unconstitutional and they have deprived him of his rights without due process of law.

The refusal of the Department of State to issue the plaintiff a passport was based solely upon the ground that the plaintiff might make remarks in Germany on the subjects mentioned in his application. These subjects include what plaintiff believes can properly be characterized as helpful criticism of the judicial institutions of Western Germany. No other grounds were relied on, and, indeed, the Department indicated that the plaintiff would be issued a passport if he amended his application so as to make it clear that he would not make such remarks while in Germany.

A. As construed and applied by the defendants, the Passport Act (22 U.S.C. 211a) is unconstitutional because it contravenes the First and Fifth Amendments to the United States Constitution.

(1) As construed and applied by the defendants, the Passport Act violates the First Amendment and deprives the plaintiff of his liberty secured by the Fifth Amendment.

The Fifth Amendment of the United States Constitution provides that "No Person * * * shall be * * * deprived of life, liberty, or property, without due process of law * * *" U. S. Const. Amend. V. "Undoubtedly the right of locomotion, the right to remove from one place to another according to inclination, is an attribute

of personal liberty * * * " *Williams* v. *Fears,* 179 U. S. 270, 274 (1900); *Allgeyer* v. *Louisiana,* 165 U. S. 578 (1897); *C. I. O.* v. *Hague,* 25 F. Supp. 127 (D. N. J., 1938); *Bauer* v. *Acheson,* 106 F. Supp. 445 (D.C.D.C., 1952); 1 *Blackstone's Com.* *138. The right of locomotion has been recognized as one of the natural rights of man (see *Reale, Le Probleme des Passeports,* Recueil des Cours, Academie de Droit International, 1934, Vol. 14, pg. 89 *et seq.,* 100-1), and grew and was reiterated as man freed himself from the feudal chains which bound him to the lord and land of his birth. *Diplock, Passports and Protection in International Law,* 32 The Grotius Society 44 (1946); 1 Crosskey, Politics and the Constitution 427 (1953). The right does not stop at the water's edge. Magna Charta, Chapter 42. That great instrument proclaimed: "It shall be lawful, for the time to come, for anyone to go out of our Kingdom and return safely, by land or water, saving his allegiance to us." Freedom of movement is part of the right of expatriation and includes, in our time, the right to leave the country, for "The distinction between restriction to a jail, to a city, to a state, or to a nation is merely one of degree." *Note,* 61 Yale L. J., at p. 190 (1952); *Talbot* v. *Janson,* 3 Dall. 133 (U. S., 1795); *9 Op. Atty. Gen. 356* (1859); *Lapides* v. *Clark,* 176 F. 2d 619 (D. C. App., 1949), cert. den., 338 U. S. 860 (1949); *Walker* v. *Chief Quarantine Officer,* 89 F. Supp. 980 (D. Canal Zone, 1943); *Hague* v. *C. I. O.,* 25 F. Supp. 127 (1938), mod'f and aff'd, 101 F. 2d 774 (C. A. 3, 1938), aff'd as mod'f, 307 U. S. 496; *Universal Declaration of Human Rights,* Art. 13, para. 2 (adopted by the United States). As it is now a crime to attempt to leave the country without a passport (8 U. S. C. 1185; *Proclamation of the President,* No. 3004, U. S. Cong. & Admin. News, 1953, p. 915), the denial of a passport is the denial of this freedom of locomotion. *Han Lee Mao* v. *Brownell,* 207 F. 2d 142 (D. D. App., 1953); *Bauer* v. *Acheson, supra.* Accordingly, if the plaintiff may, under the statute, be denied a passport, 8 U. S. C. 1185 is unconstitutional.

Of course, even this liberty may be restricted when the requirements of "due process" are met (*Nebbia* v. *New York,* 291 U. S. 502 (1933)), but "a deprivation of liberty to which the government is a party is unconstitutional when it is 'arbitrary or without reasonable relation to some purpose within the competency of the state to effect.' *Meyer* v. *State of Nebraska,* 262 U. S. 390, 400." *Pollock* v. *Public Utilities Comm. of the D. of C.,* 191 F. 2d 450, 457 (D. C. App., 1951), rev'd on other grounds, 343 U. S. 451 (1951); *Publix Cleaners* v. *Florida Dry Cleaning and Laundry Bd.,* 32 F. Supp. 31 (1940); *North American Securities Co.* v. *S. E. C.,* 327 U. S. 686, 705 (1946). Even where the legislative purpose is to achieve a permissible end, the power to regulate must be so exercised as to not unduly infringe the protected freedom. *Cantwell* v. *Connecticut,* 310 U. S. 296 (1940). And the rational connection between the remedy provided and the evil to be curbed must be much greater where freedom of speech is involved than is otherwise necessary. *Thomas* v. *Collins,* 323 U. S. 516, 530 (1945).

In this case, the plaintiff has asserted the right possibly to differ with positions taken by the Department of State while the plaintiff is in Germany. This the defendants have denied, although restrictions on freedom of speech are *prima facie* invalid and "ordinarily irrelevant to permissible subjects of governmental action." *American Communications Ass'n* v. *Douds,* 339 U. S. 382, 391 (1950); *Bridges* v. *Wixon,* 326 U. S. 135 (1945). The prevention of criticism of State Department positions in Germany is not a permissible legislative end, as the basic purpose of the First Amendment is to bar governmental authorities from silencing their critics. *Near* v. *Minnesota,* 283 U. S. 697, 716-20 (1931). The fact that the restriction on freedom of speech sought to be imposed in this case is not direct, but involves the government's control of passport facilities, does not make the deprivation any less unconstitutional. *Bauer* v. *Acheson, supra.* As the Supreme Court said:

> "We must recognize that regulation of 'conduct' has all too frequently been employed by public authority as a cloak to hide censorship of unpopular ideas. We have been reminded that 'It is not often in this country that we now meet with direct and candid efforts to stop speaking or publication as such. Modern inroads on these rights come from associating the speaking with some other factor which the state may regulate so as to bring the whole within official control.' " *American Communications Ass'n* v. *Douds, supra,* at p. 399, quoting Mr. Justice Jackson, concurring in *Thomas* v. *Collins, supra.*

Freedom of speech may not be denied absent a showing that there is involved some "clear and present danger" of a substantive evil which is both "extremely serious" and of an "extremely high" degree of imminence. *Bridges* v. *California,* 314 U. S. 252, 261-2 (1941). "Mere talk" does not give rise to such an evil (Black, J., dissenting in *Carlson* v. *Landon,* 342 U. S. 524, 556 [1951]), nor does the protection of speech bear, as the defendants imply, "an inverse ratio to the timeliness and importance of the ideas seeking expression." *Bridges* v. *California, supra,* at p. 269.

In effect these authorities require that a balance of interest be struck between the liberty to be protected and the end to be achieved. The end to be achieved here is what the Department conceives to be the protection of our foreign policy. The plaintiff does not contend that this is an unimportant or illegitimate end. He contends rather that the liberty to be protected is so vital to our national well-being, especially in the way plaintiff seeks to exercise it, that it must be given greater weight in that balance than even so important an end. This is especially true because the liberty seeking protection is the essence of our way of life. The denial of this liberty cannot be, as the defendants contend, in "the best interests

of the United States", for it represents us to the world as denying at home the very right which we represent ourselves as seeking for all peoples everywhere.

The fact that it is in Germany in which the plaintiff seeks to speak (if asked), as distinguished from other foreign countries, is not of significance. Germany's defeat did not put to an end her independent existence under international law. *Clark* v. *Allen,* 331 U. S. 503 (1947). The Department of State has no greater right to control who may go to or speak in Germany than it has to control those rights in any other foreign country, unless such rights were "specifically reserved" in the Occupation Statute. See *Occupation Statute, Documents on the Creation of the German Federal Constitution,* Office of Military Government for Germany (U. S.), p. 116 (1949); *Letter Defining the Powers of the Federal Government in the Police Field, Documents, etc.,* pp. 137 *et seq.* The Department did not reserve to itself that right, but rather, reserved to itself the power to enforce respect for the Basic Law of Germany which includes the right of freedom of speech. *Occupation Statute, §2(f), Documents, etc., supra; Letter of Approval of Basic Law, May 12, 1949, Documents, etc., supra,* at p. 138; *The Bonn Constitution,* Article 5.

Even if the courts should hold that there is no right as such to a passport, the statute as construed and applied by the defendants would be unconstitutional, for the government may not make the use of government facilities dependent upon the surrender of a constitutional right. See, *e.g., West Virginia State Bd. of Ed.* v. *Barnette,* 319 U. S. 624 (1943); *Hannegan* v. *Esquire, Inc.,* 327 U. S. 146 (1946); *Western Union Tel. Co.* v. *Kansas,* 216 U. S. 1, 35-6 (1910). Even privileges or "acts of grace" granted by the government may not be revoked or denied on unconstitutional grounds. *Pike* v. *Walker,* 121 F. 2d 37 (D. C. App., 1941); *Fleenor* v. *Hammond,* 116 F. 2d 982 (C. A. 6, 1947); *Standard Airlines* v. *C. A. B.,* 177 F. 2d

18, 20 (D. C. App., 1949) and the cases cited therein; *Barnett, Passport Administration and the Courts,* 32 Oreg. L. Rev. 193 (1953), at pp. 199-201, esp. nts. 43-45.

The statute, as construed and applied, also falls as a prior restraint of freedom of speech under the rule enunciated in *Near* v. *Minnesota, supra.*

(2) As construed and applied by the defendants, the Passport Act invalidly discriminates against the plaintiff thereby denying him "due process" under the Fifth Amendment.

To deny the plaintiff a passport because he insists on reserving to himself his constitutional rights while others do not (see Exhibit A-20) or because he may exercise those rights, is to discriminate against him unconstitutionally. Just as Congress may not "enact a regulation providing that no Republican, Jew or Negro shall be appointed to federal office" (*United Public Workers* v. *Mitchell,* 330 U. S. 75, 100 [1947]), so it may not deny passports, whether they be rights or privileges, to defenders of civil liberties. *Cf. In re Summers,* 325 U. S. 561, 571 (1945); *Wieman* v. *Updegraff,* 344 U. S. 183, 191-2 (1952); *Yick Wo* v. *Hopkins,* 118 U. S. 356 (1885); *Bolling* v. *Sharpe,* U.S. , 98 L. ed. (Advance p. 591) (1954).

Another of the legal paradoxes of this case arises from the fact that the plaintiff is neither a subversive nor a person whose purpose in going abroad is to violate the laws of the United States. If he were such a person, he would be entitled to a hearing (*22 Code of Fed. Regs. §§51.135-8, 51.143*) before the Board of Passport Appeals of the Department of State. Precisely because the plaintiff is not tainted with subversion, he is not, under the Department's own regulations, entitled to a hearing (see *22 Code of Fed. Regs. 51.175*), and the Department refuses to grant him one. (See Exhibits A-17 and A-20.)

Moreover, although specific standards are provided for the denial of passports to subversives (*22 Code of Fed. Regs. §51.135 and §51.141*) and the criminally inclined (*§51.136*), the plaintiff, because the Department does not claim that he falls into either of these categories, becomes a sort of legal waif, entitled to neither the imposition of standards applicable to his case nor the right to a hearing. Administratively, the result thus obtained is to encourage the Department to refuse passports to persons thought to be subversives, not on the ground that they are in fact subversives, but rather on the ground that they are persons of unquestioned loyalty and therefore may be deprived of passports as the Department sees fit. Neither the "due process" clause of the Fifth Amendment, nor any free and rational society can countenance such a result.

(3) As construed and applied by the defendants, the Passport Act does not require that plaintiff be granted a hearing, thus depriving him of a procedural "due process" under the Fifth Amendment.

Whether a passport is considered a right or a privilege, it may not be constitutionally refused without a hearing, especially since its refusal represents a denial of the right to speak as set forth in plaintiff's statement, and plaintiff's right of freedom of movement. *Qwong Hai Chew* v. *Colding,* 344 U. S. 590 (1953); *Han Lee Mao* v. *Brownell, supra; Wang Yang Sung* v. *McGrath,* 339 U. S. 33 (1950); *Bauer* v. *Acheson, supra,* at p. 452; *Ng Fung Ho* v. *White,* 259 U. S. 276 (1922); *Fleenor* v. *Hammond, supra; Eisler* v. *Clark,* 77 F. Supp. 610 (D.C.D.C., 1948); *In re Carter,* 192 F. 2d 15 (D. C. App., 1951); *Goldsmith* v. *Board of Tax Appeals,* 270 U. S. 117 (1929). Even where a prisoner's pardon is revoked, elemental standards of fairness must be present and the prisoner given some op-

portunity to be heard, and the action based on evidence, not mere "whim or caprice". *Burns* v. *United States,* 287 U. S. 216, 223 (1932).

If this Court should construe the act, contrary to defendants' position, to require a hearing, then the plaintiff will be entitled to a hearing which conforms to the standards provided by the Administrative Procedure Act. *Wang Yang Sung* v. *McGrath, supra,* at pg. 49-50; *United States* v. *Libby, McNeil & Libby,* 107 F. Supp. 697 (D.C. Alaska, 1952); *Marine Engineers Ben. Ass'n* v. *N. L. R. B.,* 202 F. 2d 546 (C. A. 3, 1953); *Pinkett* v. *United States,* 105 F. Supp. 67, 72-3 (D. C. Md., 1952).

In fairness to the defendants, it may be said that the plaintiff contends that the defendants' position is, as shown by the correspondence attached to plaintiff's moving affidavit, that no factual issue is involved and that the sole reason for the refusal of a passport was based on defendants' fear that plaintiff might speak, as indicated in his statement, in Germany. If this is so, then the issue in this case is solely one of law and no hearing is required, although this Court nevertheless has the obligation of review. *Perkins* v. *Elg., supra; S. E. C.* v. *Chenery Corp., supra.*

B. The Passport Act (22 U.S.C. 211a) requires that definite standards be issued governing the refusal to issue passports; neither the President nor the Secretary of State has proclaimed standards which would support the refusal of the defendants to issue the plaintiff a passport in this case; accordingly, the refusal to issue the plaintiff a passport was without authority in law.

The Congress has made no law governing the issuance or refusal of passports, nor prohibiting any citizen from speaking freely in Germany, unless it be Title 22, U. S. C. §211a. As noted above, that statute provides that "the Secretary of State may grant and issue passports * * * under such *rules* as the President shall designate and prescribe for and on behalf of the United States * * *." (Emphasis supplied.) The President has not issued "rules" which relate to this case (see *22 Code of Fed. Regs. 51.1 et seq.*), but has merely delegated his function to the Secretary of State by a regulation which provides that "The Secretary of State is authorized *in his discretion* to refuse to issue a passport, * * * to withdraw or cancel a passport already issued * * *" (emphasis supplied) (*22 Code of Fed. Regs. 51.75; Proclamation of the President,* No. 3004, U. S. Cong. and Adm. News [1953], p. 915). The Secretary of State has also issued regulations (*22 Code of Fed. Regs. 51.135 through 51.143*) but these relate chiefly to procedural matters, subversives, and potential criminals. No regulations have been issued either by the President or the Secretary of State which announce any standards applicable to this case.

By the use of the word "rules" in the statute, Congress intended that definite standards should be promulgated governing the issuance or refusal of passports. *Cf. Lloyd Sabaudo Societa Anonima* v. *Etling,* 287 U. S. 329 (1932); *Joint Anti-Fascist Refugee Committee* v. *McGrath,* 341 U. S. 123 (1951); *Bridges* v. *Wixon,* 326 U. S. 135 (1945).

The word "rule" has been defined as "an established standard, guide or regulation; a principle or regulation set up by authority, prescribing or directing action or forbearance" (*Black's Law Dictionary,* 4th Ed., 1951); "That which is prescribed or laid down as a guide to conduct" (*Ballantine's Law Dictionary,* 2nd Ed., 1948); "A regulation or formula to which conduct must conform" (*Bouvier's Law Dictionary,* 1941). Obviously, the President's regulation granting "discretion" to the Secretary of State is not "an established standard" or a "principle or regulation * * * prescribing or directing action or forbearance", nor is it a "guide to conduct" or a "formula to which conduct must conform." Congress plainly intended and was told that definite standards would be enunciated, as the legislative history of this act and former section 224 of Title 22 U. S. C. (now 8 U. S. C. 1185) shows. See *Report of the Senate Committee on Judiciary on H. R. 4973* (S. R. 444), 77th Cong., 1st Sess.; *Hearings, House Committee on Foreign Affairs on H. R. 11947* (69th Cong., 1st Sess., May 12, 1926); *Hearings, Committee on Foreign Affairs of House of Reps. on H. J. R. 205 and H. R. 9782* (66th Cong., 1st Sess., October 7-10, 1919); *Cong. Debates,* Cong. Rec., 65th Cong., 2nd Sess., pp. 6029 *et seq.,* 6063 *et seq.,* 6191 *et seq.,* 6246 *et seq.* (1918). The President's regulations, irrespective of Congressional intent, will be read as requiring that definite standards be issued. *Joint Anti-Fascist Refugee Committee* v. *McGrath, supra,* at pp. 135-136. Even further support of this position may be found in the fact that were the statute to be construed as permitting the refusal of passports without sandards it would be invalid as an unconstitutional delegation of legislative power (*Panama Refining Co.* v. *Ryan,* 293 U. S. 388 (1935); *A. L. A. Schechter Poultry Corp.* v. *U. S.,* 295 U. S. 495 (1936); *Yakus* v *United States,* 321 U. S. 414 (1944); *Yick Wo* v. *Hopkins,* 118 U. S. 356 (1885); *Lloyd Sabaudo Societa Anonima* v. *Etling, supra*) a construction which the courts will avoid if at all possible to do so. *Wong*

Yang Sung v. *McGrath,* 339 U. S. 33 (1950). This view is in keeping with the frequent necessity, even in a democratic country, of leaving discretion in the hands of one or more persons, a discretion which would be contrary to the principles and history of our institutions if it could be exercised arbitrarily and without established standards. *Ex parte Young,* 209 U. S. 123 (1908); *Yick Wo* v. *Hopkins, supra,* at p. 362.

C. The action of the defendants was arbitrary and capricious.

The defendants contend that they have discretion to refuse passports when the issuance of a passport will not be "in the best interests of the United States." The defendants have never defined exactly what these "best interests" include but, assuming they have discretion to refuse passports when it is to the "best interests of the United States" to do so, it is clear that their action in this case is an abuse of that discretion. Perhaps that discretion may be used to prevent such persons as subversives, criminals, those likely to become public charges, tax evaders and the like from leaving the country (*Cf. 3 Hackworth, International Law,* 467 *et seq.,* 1942), but discretion can never be used, as it has been in this case, to suppress free and public discussion. *American Communications Association* v. *Douds,* 339 U. S. 382, 399 (1950). Administrative discretion, when carried so far, is arbitrary and capricious. *Hannegan* v. *Esquire, Inc.,* 327 U. S. 146 (1946).

The interference with freedom of speech in this case the Department of State says is "in the best interests of the United States". But the very President who issued the Proclamation (see *supra,* p. 6) prohibiting citizens from leaving the country without a passport, has recognized that the "best interests of the United States" require that "communication (be) permitted to flow, free and open, across international boundaries." *Letter of*

President Truman to Nikolai M. Shvernik, President of the Soviet Presidium, N. Y. Times, July 8, 1951, p. 5, col. 1. Indeed, the Department has bitterly complained that the Soviets have adopted the very course of conduct which the Department is pursuing in this case. See *Kohler, Soviet Isolation of the Russian Peoples,* 22 Dept. of State Bull., 430 (1950). What is sauce for the Soviet goose must be sauce for the American gander.

Without reference to the international effect of passport refusals, it cannot be said that the "best interests of the United States" require the stifling of the free voices of our citizens. On the contrary, these interests always require full and critical public discussion. Justice Brandeis put it best when he said:

> "They [the founding fathers] believed that freedom to think as you will and speak as you think are means indispensable to the discovery and spread of political truth; that without free speech and assembly discussion would be futile; that with them, discussion affords ordinarily adequate protection against the dissemination of noxious doctrine; that the greatest menace to freedom is an inert people; that public discussion is a political duty; and that this should be a fundamental principle of the American Government." *Whitney* v. *California,* 274 U. S. 357, 375 (1927) (concurring opinion).

The Department of State may not be heard to say that its position contrary to this principle may be supported by its own administrative construction. "The doctrine of administrative construction never has been carried so far as to permit administrative discretion to run riot". *Joint Anti-Fascist Refugee Committee* v. *McGrath,* 341 U. S. 123, 138 (1951). Nor is there here involved a question involving the foreign affairs of the United States. See discussion in *Barnett, Passport Ad-*

ministration and the Courts, 32 Oreg. L. Rev. 193 (1953). Even if the Department's supposed discretion be in a political matter, it must be exercised reasonably and with regard to the constitutional rights of citizens. *Bauer* v. *Acheson,* 106 F. Supp. 445, 451 (1952).

V

CONCLUSION

For the foregoing reasons, this Court should require the defendants to issue a passport to the plaintiff, or in the alternative, require the defendants to provide the plaintiff with an opportunity to be heard in conformity with the Administrative Procedure Act.

Motion for Preliminary Injunction

Comes now the plaintiff in the above entitled cause and upon the complaint herein and the affidavit and points and authorities attached hereto, moves this Court for a preliminary injunction:

(a) restraining the defendants and each of them and all persons acting by, for or under the authority of any of them from continuing to refuse plaintiff a passport solely for the reason that plaintiff might, while in Germany, comment, if asked, on the controversy between plaintiff and the State Department, object to his dismissal from his judicial position and his deportation from Spain by the State Department, explain his defense of the rights of American citizens in Germany, state his position on the

right of bail and speedy trial in general, and particularly for American citizens residing in Germany, and state his position decrying discrimination against members of minority groups, particularly the Jews of Germany, on the ground that such refusal is arbitrary, capricious, without authority in law and unconstitutional under the First and Fifth Amendments and is resulting and will result in irreparable damage to the plaintiff;

(b) restraining the defendants and each of them and all persons acting by, for or under the authority of any of them from imposing as a condition to the issuance of a passport that plaintiff if granted a passport refrain, while in Germany, from utterances of the kind mentioned in the foregoing paragraph (a), on the ground that the imposition of such a condition is arbitrary, capricious, without authority in law and unconstitutional under the First and Fifth Amendments, and is resulting and will result in irreparable damage to the plaintiff;

(c) restraining the defendants and each of them and all persons acting by, for or under the authority of any of them from continuing to refuse plaintiff a passport or, in the alternative, from continuing to refuse plaintiff a passport without a hearing, upon the ground that such refusal is arbitrary, capricious, without authority in law and unconstitutional under the First and Fifth Amendments, and is resulting and will result in irreparable damage to the plaintiff;

(d) restraining the defendants and each of them and all persons acting by, for or under the authority of any of them from revoking the plaintiff's passport, when issued, solely for the reason that plaintiff has made any of the utterances mentioned in paragraph (a) above, on the ground that the defendants threaten such action and such

action would be arbitrary, capricious, without authority in law, and unconstitutional within the meaning of the First and Fifth Amendments and would result in irreparable damage to the plaintiff.

Affidavit of William Clark in Support of Motion

IN THE

UNITED STATES DISTRICT COURT

DISTRICT OF COLUMBIA

WILLIAM CLARK, *Plaintiff,* *against* JOHN FOSTER DULLES, Secretary of State, WALTER BEDELL SMITH, Under Secretary of State, SCOTT W. McLEOD, Administrator, Bureau of Security, Consular Affairs and Personnel, Department of State, and RUTH B. SHIPLEY, Director, Passport Office, Department of State, *Defendants.*	Civil Action No.....

State of New York }
County of New York } ss.:

WILLIAM CLARK, being duly sworn, deposes and says the following:

1. I am the plaintiff in the above entitled action. I am submitting this affidavit in support of a motion for a preliminary injunction against the above named defendants.

2. As stated in the complaint, the defendants have refused to issue me a passport. The alleged reasons for the defendants' refusal to issue me a passport are made clear in the correspondence which I and my attorney, Morris L. Ernst, Esq., have had with the defendants. Copies

of this correspondence are attached hereto and made a part hereof, marked Exhibits A-1 to A-22, inclusive.

3. The refusal of the defendants to issue me a passport has resulted and is resulting in irreparable damage and injury to me, for the following reasons:

A) In the summer of 1951, I matriculated at the University of Munich towards a degree of Doctor of Jurisprudence. I continued my studies until my forced departure from Europe. The obtaining of that degree is of great importance to me and its value to me cannot be expressed in monetary terms. In order to obtain that degree I must complete my Doctoral Thesis and submit myself to oral examination at the University of Munich. The refusal of the defendants to issue me a passport has seriously impeded my progress toward that degree in that most of the source materials which must be included in my thesis are located in Germany. Further delays in the issuance of a passport to me will make it impossible for me to complete my thesis as the material I have collected thus far will become out of date and many of the sources I intended to use will become unavailable. Should the material thus far collected become out of date and unuseable, it will result in my having lost countless hours of research, research which it would be practically impossible to duplicate in the time that I have available.

B) As stated in my passport application (a copy of which is attached to the complaint), one of my purposes in going to Germany was to collect information relating to my dispute with certain officials of the State Department and my removal as Chief Justice of the Allied High Commission Courts for Germany. It was and is my purpose to present this material to appropriate committees of Congress who may act on it and before whom I may

be called to testify. If Congress is to act intelligently on certain matters concerning Germany now before it, this material must be presented to it before the close of the present session. Moreover, the material which I wish to gather in Germany and present to Congress will become increasingly more difficult to obtain as delays continue and may, in fact, become entirely unavailable.

For these reasons, I respectfully urge that the motion for a preliminary injunction be granted.

WILLIAM CLARK

William Clark

Sworn to before me this
15th day of June, 1954.

Exhibit A-1

January 21, 1954

Mrs. Ruth B. Shipley
Director, Passport Office
Department of State
Washington, D. C.

My dear Mrs. Shipley:

We have this day filed at your New York office applications for Judge and Mrs. Clark's passports. They are most anxious to return quickly. I write this letter particularly because Mrs. Clark, after examining the Judge's private papers, advised him that she had handled the return of same and hence you will note that in the statement of the purpose of the trip, there is no mention of his need for procuring his private papers.

If your office requires any further information on either application, don't hesitate to get in touch with me. We will come down immediately since the Judge is most anxious to go back as indicated on the application.

Yours sincerely,

Morris L. Ernst

P. S. The questions you asked regarding date of matriculation and father's birthplace are answered in the application as filed.

Exhibit A-2

January 25, 1954

Honorable John Foster Dulles
Secretary of State
State Department
Washington, D. C.

Dear Mr. Dulles:

I have been reluctant to believe that you have been personally responsible for the treatment I have recently received from your Department. Apart from the fact that I have had an honorable career of 30 years on the bench of the Federal and State Courts, I established and headed for five years our Government's courts in Germany. Both Germans and Americans agree that their operation was efficient and successful. I feel therefore that I am entitled to hear from you face-to-face some explanation of what was done to me.

Let me review the facts briefly. By cable I was told that I would not be reappointed although I had accepted the original appointment only on Chester McLain's express promise of reappointment. I was given the reason that I was surplus. This was patently false. It is obvious that a Chief Justice can never be surplus to his own court and it is even more obvious that he cannot be surplus to a court which has 142 appeals pending and cases pending in lower courts totaling about 2,000.

I was ordered home for consultation. There was clearly nothing for me to consult about and, to avoid embarrassing the litigants by delaying their causes, I remained at my post. I was then suspended for insubordination. This is a word entirely inappropriate to be used to a judge.

During our brief vacation on the Grand Canary your Consul General at Madrid, Mr. Hale, was ordered to Los Palmas on Christmas Day and told to demand my passport. When I refused to give it to him, he advised me that he had the further instruction to notify the Spanish Police that I was the bearer of an invalid passport and that they should arrest me. I again refused. The next noon the Consul General and the Franco Police Commissioner of Los Palmas appeared at the Iberia Air Line Office in Los Palmas and again demanded my passport. I refused for the third time.

They then told me that the Police would search me and forcibly remove the passport from my person. I have plenty of witnesses to the facts. My passport was taken up and I was issued a one-way passport good only for travel to the United States.

I have written General Smith outlining the origin of my controversy with the High Commissioner in Germany. I did my best to help him carry out his statutory duty. This was to obtain the release of American citizens held by German police authorities without counsel, without trial and without reasonable bail. Instead of cooperating with me, Dr. Conant impeded my efforts. The Americans were not released, and he ended up by abrogating by executive fiat a decision of the High Court of Appeals which would, if allowed to stand, have contributed materially to making the Germans realize our democratic way of doing things. I have never heard of a judicial decision being reversed by express executive action, and it was a sorry example to the Germans.

I dislike troubling you in these serious times. I do not believe that your Department realizes what a dangerous course it is adopting. The constitutional right of an American citizen to "freedom of movement" has been up-

held by the United States Supreme Court![1] It is incorporated in express terms in the United Nations' Charter of Human Rights.[2]

When we were young, only Czarist Russia required a passport. Two wars have changed that, so a passport is essential to the right of freedom of movement and so all American citizens have a right to its issuance. There can be only one qualification to that right— that a particular applicant will use the freedom of movement given him by the passport for criminal or subversive purposes. That I am such a person will hardly be maintained. If such a contention were to be made, I am entitled to grounds for denial and a hearing under the decision of a three judge Constitutional Court.[3] Such a hearing clearly should be given before, not after, a forcible seizure.

My attorney, Morris Ernst, represents me in the matter of application for a new passport.

If you care to hear another side of the story than the one upon which you may have acted, I will be happy to see you in Washington at such time as you designate. I wish you success on your vital mission.

Sincerely yours,

William Clark (sgd)

Exhibit A-3

January 28, 1954

Mrs. Ruth B. Shipley
Director, Passport Division
Department of State
Washington, D. C.

My dear Ruth:

I have had a further talk with Judge Clark and Mrs. Clark and I write to advise you as to the real urgency of getting the passports back in time for their departure on Fabruary 7th, for which date they have reservations. The date on the passport application was approximate and now has been firmed for the 7th.

I am sending to you herewith a copy of the letter which Judge Clark has sent to the Secretary of State. You will recall that at our brief talk in Washington reference was made to such a move on the part of Judge Clark.

I don't know why there should be any hesitancy in the immediate issuance of passports as requested but if perchance you want to see me at any time in Washington, I will rearrange my calendar to accommodate your busy hours.

Yours,

Morris L. Ernst

Enc.

Exhibit A-4

DEPARTMENT OF STATE

ADMINISTRATOR

Bureau of Security, Consular Affairs, and Personnel

Washington

February 1, 1954

Dear Judge Clark:

The Department has given consideration to your application for a passport to visit Germany and other European countries. It is noted that in your application you make the following statement as to the purpose of your trip: "I would be less than frank if I did not state that I reserve to myself my fundamental right of free speech. I shall accordingly, if I am asked to do so, make such comments as I see fit upon the recent controversy between me and the State Department. I shall feel free to object again to the State Department's having dismissed me and having me deported from Spain. I shall feel free to explain again my defense of the rights of American citizens in Germany. I shall not refrain from stating my well-known position on the right of bail and speedy trial in general and particularly for American citizens residing in Germany, and my equally clear position decrying discrimination against members of minority groups, in this instance particularly the Jews of Germany."

Appropriate officials of the Department have discussed the question as to whether activities in Germany of the character indicated by you would not conflict with the foreign policy of this country. As you know, the United

States is still one of the occupying powers in Germany, and its relationship with the German Government and the German people is one of extreme importance.

It is the considered view of this Department that activities such as you indicated you would engage in in Germany make it inadvisable that a passport be granted to you under such circumstances, as they would be inimical to the best interests of the United States.

I wish to point out, however, that if upon giving further consideration to this matter you were to amend your application so as to make clear that you would not engage in activities of the character mentioned above while in Germany, the Department would be glad to reconsider the question of the issuance to you of a passport on that basis.

The Department also wishes to make clear that it has no desire or intention to prevent you from making whatever public representations you may desire with regard to the matters you mention in your application, but it is its view that the appropriate place for this is in the United States, and not in the area of Germany which is presently occupied by the United States Government.

Sincerely yours,

Scott McLeod /s/

Scott McLeod

DEPARTMENT OF STATE

WASHINGTON

Address Official Communications to
The Secretary of State
Washington 25, D. C.

February 1, 1954

Dear Judge Clark:

Your letter of January 25, 1954 to Secretary Dulles has been brought to my attention. As you know, Secretary Dulles left for Berlin on January 21 and will be there for an indefinite period depending upon the duration of the Four-Power Talks now in progress. I will bring your letter to his attention upon his return. If you feel it desirable I will discuss with you the problems mentioned in your letter the next time you are in Washington. It would be most helpful if you would bring with you in written form such comments and observations on the matters dealt with in your letter as you consider appropriate for the consideration and guidance of the Department. Be assured that the matters which you set forth will be given full and appropriate consideration.

Sincerely yours,

Walter B. Smith /s/
Acting Secretary

Judge William Clark,
The Association of the Bar
of the City of New York,
42 West 44th Street,
New York, New York.

Exhibit A-6

February 9, 1954

Mr. Scott McLeod, Administrator
Bureau of Security, Consular Affairs and Personnel
Department of State
Washington, D. C.

My dear Mr. McLeod:

I am writing in reply to your letter of February first in regard to my passport application. In the first place, you are obviously in error when you indicate that my reference to the preservation of rights to free speech was the purpose of my trip. A re-reading of my statement will show that without the paragraph quoted, I might well have been accused of being less than forthright. This is now evident from your present misconstruction of my application. You will note, if you read the statement carefully, that I am not going over to make speeches but that I preserve my rights "if I am asked" to comment on certain subjects. It is not irrelevant, however, to ask if you take the position that lecturers and their possible remarks are within the sanctions of your office.

I do not understand whether your letter is a rejection of the passport or merely a bit of diplomatic negotiation in order to have me remove what you deem to be an objectionable disclosure on my part. I do not intend to remove the paragraph. Had I not included it, or should I now remove it, I think I could be justly criticized by my government for either not having disclosed that I did not intend to be gagged if an inquiry is made to me, or that I had agreed in advance to be so gagged.

Under the circumstances, I ask that you promply advise whether the passport will be issued or not. If not, I ask that a hearing be set as required by your regulations, at the earliest possible date. Any hour of any day next week will be agreeable to me. As an American devoted to the matrix of our Constitution, our world famous Bill of Rights on which our nation has staked its all, I wonder if you really mean to take the position that whereas we have been trying to bring the German people back into the area of free men so that they, like us, will enjoy the benefits of free speech, nevertheless comments *in* Germany should be banned, whereas any statement made outside of the borders of Germany and picked up by the press or radio to be used inside of Germany would not be found objectionable to the Secretary of State. Are you sure that it would not be "inimical to the best interests of the United States", to quote your phrase, to let the German people know that our great State Department is so insecure and frightened that the ideas of one single human being uttered when and if asked for an opinion, provide a sound basis for our government to practice (over the German mind) a kind of censorship which would not be condoned in the United States.

I don't know that I will be asked for any comment, but in pragmatic terms, how silly can our government be if it distinguishes between an inquiry made of me outside of the borders of Germany to be picked up by the German press, and a statement uttered within the German borders.

I trust that you will reconsider your position of fright and timidity, scarcely a good international concept worthy of transmission to the peoples of the world.

In closing may I repeat that the purposes for which I want my passport issued for Germany and other countries are fully stated; the issue you have raised is clear-cut;

and if a passport is denied, a hearing be promptly set. Once more, I would be less than frank if I did not say that if the passport is denied by such hearing board, I intend to take the matter to court and I am advised by my counsel that in his judgment mandamus will lie based on the abuse of discretion predicated on the philosophy of your letter.

Sincerely yours,

(signed) William Clark

Please address reply to 5 Cleveland Lane, Princeton, N. J.

Exhibit A-7

February 9, 1954

Mrs. Ruth B. Shipley
Director, Passport Office
Department of State
Washington, D. C.

My dear Ruth:

I hope I am violating no propriety by sending you a copy of a letter which Judge Clark sent to Mr. McLeod this day. If in governmental terms this act of courtesy should not have been perpetrated by me, all you need do is destroy the enclosed, or, as I once saw on a letter "burn before reading".

Yours,

Morris L. Ernst

P. S. As you know, Judge Clark received a friendly letter from Gen. Smith and he answered in equally friendly terms.

Exhibit A-8

February 9, 1954

Dear General Smith:

I have your letter of 1 February, (my sixty-third birthday). Senator Smith of New Jersey, an old friend, has suggested that I spend some time with him telling him my troubles. I shall call you for an appointment.

I still don't know what all this shooting has been about.

Yours sincerely

(signed) William Clark

General Walter B. Smith
Under Secretary of State
State Department
Washington, D. C.

Exhibit A-9

February 19, 1954

Dear Judge Clark:

In the absence of Mr. Scott McLeod, I have been asked to reply to your letter of February 9, 1954, concerning your application for a passport and statements in an addendum to your application.

Viewing your statements in the light of past actions, I think it was fairly to be inferred that it was your purpose, upon return to Germany, to continue a program of harassment of our offices in Germany without regard to the adverse effects which your activities would have upon relations between the United States and Germany and implementation of the foreign policy of the United States. The words "if I am asked" which you stress in your letter are not significant, since you undoubtedly would be asked or could arrange to be asked were you so disposed. In essence, it appeared to officers of the Department that you were willing to subordinate the interests of your government to your own personal interests in order to achieve some measure of vicarious vindication for humiliations which you brought upon yourself.

The Department would be glad to provide you and Mrs. Clark with passports to enable you to travel to Europe to visit your aunt in Scotland and your son in France, to complete your studies and prepare your thesis in Germany for the degree of Doctor of Jurisprudence, and to gather further material in aid of Congress should it wish to investigate the "issues" regarding your judgeship if it were your purpose to conduct yourself as a private citizen and avoid activities which could adversely affect relations between this government and the German

government and people. Obviously, it is possible for an American citizen who has occupied a position of prestige in a foreign country and has achieved a degree of notoriety in that country to do great harm to relations between the United States and the foreign country, particularly if he injects himself into political issues in the foreign country and takes positions in conflict with the foreign policy of the United States.

Sincerely yours,
R. S.
R. B. Shipley
Director, Passport Office

Judge William Clark,

Honorable Walter Bedell Smith
Under Secretary of State
Department of State
Washington, D. C.

Dear General Smith,

It was pleasant to see you again after so long, even if it was to discuss a controversy. As I have written you before, I shall always have an affection and admiration for you. You must not wear yourself out.

No patriotic American, particularly one who has been in two wars, could refuse to agree to say nothing, either here or abroad, that would hurt his country. In my judgment, criticism of the imprisonment of Americans and of interference with the independence of the judiciary did not and could not hurt the United States. I have checked with the German Consulate in New York and find that a visa for Western Germany is no longer necessary. I do not see accordingly how Dr. Conant can be concerned in the issuance of a passport to me.

I think that I am entitled in fairness to four things: 1. To know who is to blame for causing the State Department not to live up to Mr. McCloy's General Counsel's promise to reappoint me by making the irresponsible and untrue statement that I was "surplus". I never thought that Dr. Conant was telling the truth when he said to me on the telephone that he was acting only as a conduit in transmitting the cable dismissing me. 2. If

that person or those persons had other reasons for not wanting me reappointed, he or they should come forward and confront me with those reasons, so that I may answer them. 3. If it should be found that no such reasons exist, I should be restored to some position in the Department in accord with the qualifications of a Judge of "my ability and experience" (your Mr. Suydam's words, not mine). 4. The person in the Department who ordered me given a one-way passport, without even the opportunity to obtain warm clothing, should apologize for an action both personally discourteous and in plain violation of the rule of law laid down in the Bauer case.

I am enclosing a clipping from the Frankfurter Allgemeine Zeitung of February 16 (one of the best German papers today), which I have translated and which does not indicate any sympathy towards the State Department.

With kind regards and great respect,

Yours sincerely,

Judge William Clark.

Exhibit A-11

February 27, 1954

Mrs. R. B. Shipley
Director, Passport Office
Department of State
Washington, D. C.

Dear Mrs. Shipley:

I am in receipt of your letter of February 19, 1954 concerning my application for a passport.

Your various inferences, implications and accusations, in particular those set forth in the second paragraph of your letter, are wholly unwarranted and unfounded. I deny and resent particularly the implication that I ever did or ever would fail to subordinate my personal interests to those of my country. My service in two wars and my decorations therefor are some proof to the contrary. So much of my life has been in the public service and a matter of public record as to obviate, I trust, the need for any other or better documentation of my devotion and loyalty to this Republic.

Coming to the real issues, I respectfully request that you answer categorically the following questions:

1. Do you grant or deny my application for a passport? In this connection, please note that I will neither amend my application in the manner suggested by Mr. Scott McLeod in his letter of February 1st nor will I accept a passport granted subject to conditions. I know of no authority in law or morals which permits the State Department to require me or anyone else to accept a kind of second-class citizenship. This is exactly what I would be doing

if I were to accept the limitations you demand. This is particularly so since such limitations relate to the moral and legal doctrines embodied in the First Amendment—that matrix of our society that confirms that truth has its best chance of emergence in a public and open market place of thought.

2. If your answer to the first question is that you are denying my application, please advise me as to just what administrative appeal procedures are in your judgment provided for me as a rejected passport applicant. I must inform you frankly that I shall apply to the courts for recourse, if need be, but before doing so wish to be sure that I have exhausted all administrative remedies provided by our Department of State.

I would thank you for a very prompt answer as I am intent upon returning to Munich for the purposes indicated in my passport application at the earliest possible date.

Sincerely yours,

WC:jj

Judge William Clerk

Exhibit A-12

February 27, 1954

General Walter Bedell Smith
Under Secretary of State
Department of State
Washington, D. C.

Dear General Smith:

I have received from Mrs. Shipley an abusive letter dated February 19th. My reply, a copy of which is enclosed, speaks for itself.

Has the technique of using unsubstantiated accusations and implications really crept and spread thus far into the executive branch of our government?

Yours sincerely,

Judge William Clerk

WC:jj
enc.

Exhibit A-13

DEPARTMENT OF STATE

WASHINGTON

Address Official Communications to
The Secretary of State
Washington 25, D. C.

March 16, 1954

Dear Judge Clark:

As I told you in my office recently, you certainly can have a passport, good for travel anywhere in the world that American citizens can go under the protection of the United States and without detriment to the interests of their country. The decision not to approve your current passport application to visit Germany, and the Department's views thereon as expressed in letters to you from Mr. McLeod on February 1, and Mrs. Shipley on February 19, 1954, were reached after a careful study of the information which you submitted. These views, in which as I told you I concur, were based on your own statements as to your intended activities in a country occupied by the United States, and as I explained to you the opinion of the Department is that these activities would be detrimental to the best interests of this country.

I told you in all friendship when we talked that there is no question of your right of free speech as an American citizen. However, the statement which accompanied your passport application is very clear, and I must make it equally clear that criticism of the political or judicial institutions of a foreign state by a private American citizen is neither politic nor in good taste, and may well affect the best interests of the United States. This is especially

true in the case of the Federal Republic of Germany, where the United States is still in occupation and has a special and highly important relationship with the German Government and the German people. Your statement, as it stands, runs counter to these considerations and needs to be modified.

Aside from this, we know each other well enough so that I do not think I need to assure you that there is no one here who questions your devotion and loyalty to the United States, nor has there been any intention in previous correspondence by officials of this Department to reflect on this devotion and loyalty.

Sincerely,

/s/ Bedell Smith
Under Secretary

The Honorable
William Clark,
5 Cleveland Lane,
Princeton, New Jersey.

Exhibit A-14

March 19, 1954

Mrs. Ruth B. Shipley
Director, Passport Office
Department of State
Washington, D. C.

My dear Ruth Shipley:

We have been retained by Judge Clark to contest the denial by the State Department of the passport for which he applied. You will note in his letter to you of February 19th a request for information as to "just what administrative appeal procedures are provided for * * * a rejected passport applicant". If I understand correctly, the Department takes the position that the applicant has had ample opportunity to set forth in his application or elsewhere the basis for his application for a passport, and that no machinery has been established for formal or other hearing except for persons who are denied passports because of allegations of subversion or kindred acts of misbehavior. I don't want to bother you with arguing about the proposition, but proper procedures, including a hearing, should be provided for *all* persons denied passports. All I request at this moment is a reply indicating whether there is any procedure for a hearing open to our client, Judge William Clark, and the details of such procedure.

Do rush through an answer, or rather a confirmation of your statement to me on the telephone, if I understood it correctly, that no further procedure is open for Judge Clark within the Department in the instant case.

It occurs to me that even Adam and Eve, if I read the Great Book correctly, got a full hearing before they were thrown out of the Garden of Eden. If I understand the State Department's present position, a kind of reverse rule has been laid down: a loyal American, without even being given an opportunity to be heard, can be denied the right to leave temporarily our Garden of Eden.

Best,

Yours,

Morris L. Ernst

MLE:jj

Exhibit A-15

20 March 1954.

Honorable Walter Bedell Smith
Under Secretary of State
Department of State
Washington, D. C.

Dear General Smith,

I received your letter of 16 March with mixed feelings. I am pleased that you do not subscribe to Mrs. Shipley's theory that I am an unpatriotic person. I am disappointed, however, for two reasons:

First, I am astonished at your position that an American citizen can not criticize "the political and judicial institutions" of a foreign country in which he happens to be travelling or is stationed. It seems obvious to me that such citizen has the same freedom of speech as he has at home, provided always that he does not indulge in obscenity or blasphemy or offend against the laws of libel and slander. For example, I think that an American citizen should be perfectly free to say in England that he is opposed to a monarchical form of Government, or to say in France that he felt the multiple party system is inefficient, or to say in Italy that he thought that the laws against birth control should be repealed. On the other hand, I believe the citizens of all these countries would be perfectly entitled to come here and voice their objections to "McCarthyism".

I am particularly surprised that you should hold this view with respect to Germany. The whole purpose of the occupation was not only to criticize but to destroy its institutions. We have been disarming, dismantling, denazifying and decartellizing for the last seven years.

We not only criticized the courts but removed more than half of the judges.

In fact, I think we have gone quite beyond the limit prescribed by Art. 43 of the Hague Convention which limits the measure permitted to an occupying power to those conducive to "safety and good order". I remember my assistant Prof. Von Mehrens of the Harvard Law School and I arguing with General Clay that he had no legal right to annul a law of the Land Bavaria which limited the members of the legal profession on the ground that a lawyer had no innate right to starve. The General did annul the law but of course it has been repassed.

Second, you ignore the four conditions I suggested as reparation for my shabby treatment. I gave six years of my life to establishing and operating the Occupation Courts. It was generally agreed in Germany that we did a good job. In fact, the Courts and myself personally were praised in many German legal periodicals, although one might have supposed that the Germans would resent their presence in their country. As a reward for my work I was kicked out, publicly humiliated and my passport was lifted, as if I was a criminal or a communist. This was done apparently at the request of the pitiful Professor who resented my attempts to make him perform his sworn duties. I do not believe that the American people have approved of this way of acting towards a judge of thirty years' honorable service on the Bench.

I have shown your letter to my counsel, Morris Ernst, and we shall proceed to take all steps necessary to preserve what we believe to be my legal rights in the premises.

Sincerely,

Judge William Clark
5 Cleveland Lane
Princeton, N. J.

Exhibit A-16

DEPARTMENT OF STATE

WASHINGTON

Address Official Communications to
The Secretary of State
Washington 25, D. C.

In reply refer to
130 — Clark, William

March 22, 1954

My dear Mr. Ernst:

I am sorry that I cannot give you the kind of letter you apparently want, because Judge Clark has not been denied a passport. On the contrary, General Smith, the Under Secretary, informed him in a letter of March 16, 1954 that, as previously stated orally, he certainly could have a passport good for travel anywhere in the world that American citizens can go under the protection of the United States and without detriment to the interests of their country. Before granting a passport to Judge Clark to include Germany, we are simply waiting for him to modify his statement concerning his intended activities in Germany. As has been stated before, the Department is of the opinion that these activities would be detrimental to the best interests of this country.

Sincerely yours,

R. B. Shipley /s/

R. B. Shipley,
Director, Passport Office

Exhibit A-17

Mrs. Ruth B. Shipley
Director, Passport Office
Department of State
Washington, D. C.

My dear Mrs. Shipley:

I am writing in reply to your letter of March 22nd. The kind of letter I believe our client, Judge William Clark, is entitled to is one which either grants or denies him a passport in pursuance of his application.

Our client is most anxious to go abroad for the purposes indicated in his application. He is peculiarly happy that he made the honorable and frank statement that his lips would not be sealed if he were interviewed. This is particularly so in view of the repeated requests made to have him remove this statement from his application. I think it is apparent that the removal of such statement would have put him in jeopardy had he gone to Germany without such honorable advance notice to his government and had he, while in Germany, done other than held his lips sealed if asked for an opinion on various subjects.

Since our client will neither amend his application as you suggest nor accept a passport excluding Germany or granted subject to conditions, please let us know promptly whether the application is granted or denied.

If you deny the application, we ask to be advised promptly as to what procedure there is for a hearing or review.

As we read the present regulations they obviously have no application to admittedly loyal citizens. Whether jus-

tifiable or not, they are framed to protect the security of our nation with respect to divulging of information, confrontation of witnesses, etc. I think I have previously indicated to you that proper procedures, including a hearing, should be provided for all persons denied passports. Please let us know promptly what procedure is open to Judge Clark and the details of such procedure.

Best,

Yours,

MLE:JJ

R B Shipley Director Passport Office

Exhibit A-20

DEPARTMENT OF STATE

WASHINGTON

In reply refer to
130 — Clark, William

April 6, 1954

My dear Mr. Ernst:

It is difficult for me to answer letters from you and your client Judge Clark, since both of you, possibly by design, draw inferences from clear and reasoned statements of officers of this Department which are erroneous and unwarranted. Judge Clark has charged me with having implied that he is lacking in devotion and loyalty to his country and is unpatriotic. No such implication was made and I may say that I know of no one who questions his loyalty and devotion to the United States.

It is not yet clear to me why, of the millions of Americans who have applied for passports since the cessation of hostilities, only Judge Clark should consider it necessary to include a protective statement in his passport application. There is no reason that I can see why one citizen should receive a passport upon terms different from those that apply to all others. The case seems to resolve itself into these issues. Judge Clark professes to think that relations between the United States and the Federal Republic of Germany would not be harmed if he should, in Germany, make such comments as he sees fit in explaining again his defense of the rights of American citizens in Germany, in stating his well-known position on the right of bail and speedy trial in general, and in setting forth his position in regard to minority groups in Germany. On the

other hand, officers of the Department are of the opinion that indiscreet talk on these subjects by one in Judge Clark's position, involving, as it would, criticism of the German government and its judicial system and processes, could very seriously affect relations between the United States and Germany and be detrimental to the best interests of the United States. Judge Clark considers that he may dictate the conditions upon which he shall be given a passport, whereas the Department feels that it need not be dictated to by any individual passport applicant. Consequently, the case is at an impasse. The Department has, however, stated its willingness to issue a passport to Judge Clark upon the same conditions as passports are issued to all other private citizens. Although no prior commitment is required, the understanding is implicit that, if granted a passport, the applicant will not inject himself into political issues in a foreign country nor publicly take positions in conflict with the foreign policy of the United States.

Sincerely yours,

R. B. Shipley

Department of State
Washington, D. C.

Re: 130—Clark, William

My dear Ruth Shipley:

After years of more than admiring relationship, I am at a loss to understand your implication that I drew improper inferences from the Department correspondence. I thought we had both been frank and clear in enunciating our positions.

The reason for the addendum in the application becomes imperatively clear not only because of the prior relationship between the applicant and the Department but because of the special danger clearly seen in the Department's again reiterated position of imposing special sanctions on the applicant vis-a-vis his right of free speech. I never understood the law to be that our Government could condition its issuance of a passport on a loyal American citizen's giving up his constitutional right to take public positions in conflict with the foreign policy of the United States. Since the addendum is merely a statement on applicant's part of his constitutional rights, your insistence that it be removed, we take it, means that the granting of the passport would be conditioned upon his foregoing those rights. Our client of course asks for no terms different than those that apply to all others but the stand of the Department in this case called for the addendum.

The questions before the Department are simple ones. Does the Department grant the application as filed? Does the Department refuse the application as filed? Does the Department refuse to exercise its power in refusing or granting the application as filed? Does the Department refuse to exercise in this matter such discretion as it may lawfully possess?

Unless the application is granted or denied forthwith, we shall have no alternative but to conclude either that you are refusing to exercise whatever power or discretion you have, or that you are denying the application. In either event, we are instructed by our client to proceed to court.

Yours,

Morris L. Ernst

Democrats Ask Army How It Treats McCarthy's Ex-Aid

By the United Press.

WASHINGTON, March 4. — Sen. John L. McClellan (Ark.) senior Democrat on the the subcomittee headed by Sen. Joseph R. McCarthy (R., Wis.), said today he has asked the Army for a documented report on charges it is giving special treatment to Sen. McCarthy's former aid, Pvt. G. David Schine, of New York.

Sen. McClellan said he made the request about a month ago but has not received a reply. He said he understood Sen. Richard B. Russell (D., Ga.), senior Democrat on the Senate Armed Services Committee, made a similar request.

There have been reports that the Army complained to some Senators that it had been "pressured" by staff members of Sen. McCarthy's investigating group into giving Pvt. Schine preferential treatment.

The private, scion of a hotel owner, was an unpaid research director for the subcommittee until he was drafted last year.

PTA Position Clarified

The World-Telegram and Sun was in error on Feb. 24 when it published an item declaring that the Tuxedo (N. Y.) Parent-Teacher Assn., was among the organzations circulating petitions protesting the draining of Wee Wah Lake at Tuxedo Park. The PTA has circulated no petitions in that connection.

February 26, 1954

Mr. Edward R. Murrow
485 Madison Avenue
New York, N. Y.

Dear Ed:

You said you would be interested in a memorandum outlining the idea I had with respect to the use of new symbols in the Austrian and maybe Berlin situation.

I go on the assumption that Russia intends to stay in Germany and Austria for possibly a complete generation and that in any event our tactic must be based on an assumption of that order. I also assume that the few thousand military that we have in Austria are, in realistic terms, worth about two and a half minutes of defense and that hence they are there solely as a symbol. I think our entire international position is, in part, defective because we have thought that commercial tooth paste salesmen were competent to advise on symbols to be used in the war to the mind of man. Symbols must not only be valid but repeated and many symbols have been phony, going on the theory that you could sell a face cream even if it contains vitriol. Also the symbols we have created have always aroused bewilderment in the minds of our best friends beyond our shores, since symbols are of little value unless the deeds behind the symbols correspond with the words. With this brief statement, I think you might explore the need of entirely new symbols, for example, in Austria. How about the following idea to chew over? We announce that Russia will not allow Austria to be integrated into the free world. We announce our resentment to the excessive contribution to Russia out of Austrian economy. Cooperation with Austria and after consultation with our allies in Austria, we withdraw all of our military -- all except one person, -- at the start a sergeant who will stand as the symbol of the United States in Austria. To the extent that we are really sincere and strong, the symbol of one man is as good as 10,000. The individual to be so used could be changed monthly -- a woman, a general, a high Negro officer, etc. This individual, in a prominently located place, would raise our flag daily at the one-man garrison; over a loud speaker he would recite in behalf of our Republic our pledge to return if needed. A ceremony should accompany the withdrawal of all the rest of our military forces.

To our sole representative should be sent the flag of Iwo Jima, the flag symbolizing victory. By arrangement with the Austrian government and out of the moneys we will save by the withdrawal of our military, this symbol of our

Republic would announce monthly the winner of a scholarship to be sent from Austria to some institution of learning in the United States. He and not we, will also announce the amount of newsprint which we would give to the newspapers, magazines and book publishers of Austria each month. This basic bullet of the cold war could be given so that we would be supplying free all of the paper needed to get to the minds of Austrians. I take it the bill for this First Amendment investment would be only a small part of our present expenses.

The above is just a sample of my thinking. In brief we should treat every situation in so far as possible exactly as if Russia had agreed to a free Austria. In view of the fortunate and odd reverse veto situation in Austria as compared to Berlin, we can go very far. If you find any interest in the above and a few adventurous and unfrightened minds left in Washington, I could easily arrange for a group of four or five psychiatrists to prepare a memorandum of suggestions.

In brief, isn't it true that man lives more by symbols than by reality and that maybe symbols are matrix of our only reality.

Yours,

Morris L. Ernst

P. S. In spite of the recent surrender of the White House to McCarthy, I hope that if there be anything to the above plan that the Chief Executive of our nation will not feel impelled to get clearance in advance from McCarthy via Nixon.

Dear Ed:

On the Westminster Abbey project, if you will have someone call up Sidney Howell, at the English-Speaking Union, telephone Mu 8-9300, he can put you in touch with a film which he has recently seen, which is presently in the hands of BIS and parts of which may be good enough to use as depicting the Abbey. It is pre-war.

Best,

Yours,

Morris L. Ernst

RUSSIAN INTEREST IN U.S. ATHLETICS

FROM OUR OWN CORRESPONDENT

WASHINGTON, FEB. 11

A Russian track team's request to enter an athletic competition in the United States next month is being studied by the State Department. Officials say that the proposal is being considered on the strength of a letter received recently from the secretary of the Amateur Athletic Union. The secretary said that the initial contact made with him was for 15 track athletes to come to the United States.

A spokesman for the Soviet Embassy here, in answer to questions, said that the initial request was made more than a month ago. "Our representative talked to the secretary," the spokesman declared, "and told him we were interested in track competitions but would like to know the various competitions and conditions. So far we have not had any official confirmation from Moscow."

Dear Ed:

You, who are so diluted under the silly tense life which you lead, have no doubt forgotten your momentary high excitement about the Utopia which I am writing. I have information on hundreds of cards and have dictated about 70,000 words of notes. I have negotiated with Life magazine and they talk as if they want to buy the material for two special issues of Life magazine.

If you have not reverted to your glandular state of pessimism and if you are still interested in the project even as an optimistic buffer to your negation of the idea of my theory that inevitability only comes to pass through effort, give me a ring and let's talk further.

All of which may make me sound like a common scold derived from my real esteem and affection for you.

Dear Ed:

Enclosed find a brochure prepared by Westminister Abbey. I wish you would talk to your friend to see whether he wants to do the chore and get all the kudos. I will be glad to come up any time to talk over the prior conversations I have had with Dean Don.

I am holding open next Thursday evening for a possible date with Life magazine on 1875. Is the following pictorial?

Clothing is related to political and economic factors and are not dreamed up by some Frenchmen.

French revolution -- austere clothes.

Five day week -- growth of sports clothes.

1929 -- short skirts

In brief I have a chart showing the relation of clothing to economic and political factors.

Why do you think women abandoned black stockings? Answer: In World War I, the Germans owned the secret dye process for black stockings.

Airplanes -- 5 silk dresses weighed as much as one rayon dress. Etc. I have worked out a chart for 1975 and incidentally, the present confusion of styles for women's clothing is not unrelated to the present economic and political confusion of our land!!

Yours,

Morris L. Ernst

Dear Ed:

I noted that while you were away Larry did not use your valued capital asset WORD FOR THE DAY. I wonder if this was on purpose and whether the purpose arose from the fact that WORD FOR THE DAY may well be one of those rare capital assets owned by creative people on the radio. In brief, I don't know why CBS should not buy WORD FOR THE DAY from you for a substantial sum taxable to you on a capital gains basis. In any event, it might be worth exploring.

Yours,

Morris L. Ernst

Dear Ed:

In the Wilson matter, give me a ring in case you are interested in further comment on the entire subject of conflict of interest statutes. For example, do you recall that the Nimitz Committee resigned because even though they were to report on the communist problem, they felt they might be disqualified from dealing with the government in the future. This should not be overlooked by Charlie Wilson because some day he may go back to General Motors. Do you remember that McCarran would not grant a waiver for the members of the Nimitz Committee, and even a member of the Catholic Church issued a statement at the time that his Church might have some kind of business with the government, etc?

Wilson has been stupidly advised. He can now get a ruling that if he gives his stock to his heirs, such gift will clearly not be deemed to be in contemplation of death. He will make a fortune by such compulsory gift, since gift taxes are lower than inheritance taxes, and his heirs would get the income of the dividends and no doubt receive same at much lower brackets than Wilson's tax brackets. Etc. Etc. How would you like to do a cute broadcast giving Wilson some sound advice.

Confidentially, in my various communications with the Eisenhower group, I pointed out weeks ago that a commission should be organized at once to consider all of the problems relating to conflict of interest, and this would not overlook the horrible evils that arose through the appointment of dollar a year big business men.

Did you notice that my suggestion on revision of press conferences appeared in David Lawrence's column. I did not give it to him and you can guess who gave it to him. Be sure not to mention my name, ever, on any of these levels. I think I can be of some slight value to the nation if I remain anonymous.

Best,

Yours,

Morris L.Ernst

Dear Ed:

Do let me know when I can see you for a few moments. I want some guidance, of course confidentially.

McCarran has sent his top man to see me who has indicated that McCarran will write me a letter proposing that our REPORT ON THE AMERICAN COMMUNIST be used as a Manual by the CIA, the FBI, the State Department, etc. Of course McCarran will indicate that he disagrees with my position on the McCarran bill and my criticism of the work of the Committee but that he agrees with the basic thesis and techniques to get people out of the party. Most of my liberal friends tell me I cannot afford to take such support. Something is happening that confounds me. I received a letter from Monsignor Sheehy, of which I am sending you a copy. Is our climate facing a change because of the election? If so, maybe David and I have really made a minor contribution toward a new approach.

Do let me know when I can see you for half an hour.

Yours,

Morris L. Ernst

THE RIGHT REVEREND MAURICE S. SHEEHY, PH.D.
The Catholic University of America
Washington 17, D.C.

November 15,1952

Dear Morris:

REPORT ON THE AMERICAN COMMUNIST is an excellent study which should pave the way to a commonsensible approach to the problem which confronts us. To get at such an evil as Communism, as we must get at root factors rather than symptoms. I found much that was enlightening on the question - why do Americans become Communists in the first place?

I also think we should open wider the door by which ex-Communists may return to society. The Catholic Church is not afraid to open with welcome arms anyone who shows repentance.

With every best wish and the hope that you will pardon my tardiness in acknowleding your book, I am,

Sincerely yours,

Pl. note

Dear Ed:

It slipped my mind, for some reason Dr. Freud will have to explain, but I now recall that you had asked me the other evening the date of the publication of REPORT ON THE AMERICAN COMMUNIST. The publication date is November 13th. I must say I was more delighted probably than I showed, ~~that you~~ thought that there was merit in our approach. I know that many Senators think that our material and proposed solutions may pave the way for a new bit of social engineering in this mucked-up field of life. Of course I am anxious to have our material and the thesis enter the arena of public debate in the hope that in a clash of wits we may at last come to grips with the problem and how to evaporate the American communist party.

Let's get together soon. Give me a ring when you get a night off.

Yours,

Morris L. Ernst

UNITED STATES DEPARTMENT OF JUSTICE
Federal Bureau of Investigation
Washington, D.C.

June 28,1952

Mr. Morris L. Ernst
Greenbaum, Wolff and Ernst
285 Madison Avenue
New York 17, New York

Dear Morris:

I have your letter of June 26,1952, with further reference to the idea of a television program on fugitives wanted by the Bureau. By coincidence, Ernest Chappell called me this morning for the purpose of further discussing the matter.

I told Chappell that while we, of course, would always by glad to see him, that since we had decided not to participate in such a program, it would be a waste of time, money and energy to pursue the matter further. I explained to Mr. Chappell we were opposed to the idea for a variety of reasons, i.e.,we have more things than we can do at the present time and should not be taking on additional work; that we still have a grave misgiving over the propriety of going into so much detail on a large number of fugitives and, then, of course, there was the matter of sponsorship, which we had previously discussed.

Naturally, Chappell wondered if the door was permanently closed. I told him we like to follow the old adage "Wise men change their minds, fools never do," that we would be glad to reconsider the matter at some future date, but for the moment there was certainly no use of imposing upon his time or our time.

With best wishes and kind regards,

Sincerely yours,

Louis

Mr. M -

Chappell talked with Nichols on Friday - he'll let you know about it.

DM.

For Mr. Murrow

June 26,1952.

Mr. Louis B. Nichols
Federal Bureau of Investigation
Department of Justice
Washington, D.C.

Dear Lou:

I have gone over with Edward Murrow and Ernest Chappell the program I discussed with you. They are convinced,as I am, that this is a socially desirable program without dramatization which may cause even the faintest amount of confusion. As I conceive of the program, they are picturing a man wanted for a stolen auto. They would discuss the stolen auto racket, the number, the increase or decrease, the difficulties, etc. In other words, each person, in so far as possible, would be related to the general type of crime, with a few salient statistics, the difficulties of apprehension, and the like.

I have my heart set on this project and hence I suggested that Chappell go down to Washington to see you to clarify what I think may have been a misunderstanding. I am convinced that they have no desire to dramatize in pictorial form the background of the person wanted or the scene of the crime, unless there be some cases where you would want it to be done.

Best,

Yours,

Morris L. Ernst

June 20,1952.

Mr. Ernest Chappell
19 East 60th Street
New York, N.Y.

My dear Chappell:

I ran into considerably more trouble with the FBI. Lou Nichols told me that Edgar Hoover was sorely troubled because of the dangers which will arise from dramatizations. They have in mind that you want to go back as near as possible for taking pictures at the locale of the crime, a picture of the street, the house, the bank,etc. and that this might lead to complications.

I think we ought to get together for a moment to decide how to proceed before you spend any money on the project. Best of all would be if we could arrange for you, Ed and myself to sit with Edgar Hoover in Washington. I will be there one day next week and could try to set up an appointment.

Yours,

Morris L.Ernst

June 16, 1952.

Mr. LouisB. Nichols
Federal Bureau of Investigation
Department of Justice
Washington, D. C.

Dear Mr. Nichols:

Morris Ernst has told you we are quite sure we can secure a national TV sponsor for "This Man Is Wanted" and that Ed Murrow and I would like to make one pilot film.

If you will establish an FBI liason contact for us and give us a selection of the fugitive and the details concerning him we will proceed.

We understand we will be making this pilot film entirely on speculation. The FBI is not under obligation in any way. We will secure FBI okay of the script before we start shooting. We will not show the film to a sponsor until the FBI has approved it. The National sponsor must be acceptable to the FBI.

Thanks for your cooperation. We are sure we can make #This Man Is Wanted" a potent force of which you will be proud.

Very truly yours,

Ernest Chappell.

New York, New York

Dear Mr. Chappell:

With reference to your recent visit to Washington, I wanted you to know we have given very careful consideration to the matter of a television program.

It is our considered judgment that too many problems would arise regarding sponsorship on the part of individual stations to warrant our cooperation. Then, too, we are exceedingly pressed at the present time and simply do not feel that it would be appropriate to give this project any further consideration.

Perhaps at some future time under different circumstances, something might be worked out.

With best wishes and kind regards,

Sincerely yours,

Louis B Nichols

My dear Chappell:

I am leaving by plane for Paris in a few minutes. Lou Nichols just telephoned to me and told me that Edgar was primarily averse because of separate sponsorship in each locality which properly would require a check-up by the FBI. I think they will feel very differently about the situation if you could work out a single national sponsor, particularly of an institutional type. I must say that I sympathize with the FBI on this point. I have a feeling that if the above could be accomplished, the program could be established but not until near the end of this year. I have a hunch that they don't want to get wrapped up in any controversial political debates during an election year. Obviously your proposition is so good that it will evoke envy from potential competitors who have not thought of it, and the FBI might be accused of playing you as a favorite as against the field.

I understand from Lou Nichols that he will drop you a line. I will be back in a fortnight. Let's get together then and see what the next move should be.

Yours,

Morris L. Ernst

Dear Ed:

A few weeks ago you mentioned that you were wading through the Loth - Ernst volume FOR BETTER OR WORSE. I thought, in case you wanted to discuss the divorce problem in connection with using the book as a springboard, which of course I would greatly welcome, the enclosed may be of interest to you. I am sending you a photostatic copy of a letter received from Bishop Oxnam, a letter from the leading judge in this sphere, Paul W.Alexander, and a photostat of a postal card, which is a sample of a great number of letters received from Catholic priests. I could locate, if you want it as a base for interviews, etc., a flattering and praising review of the book by the Reverend Dr. Bonnell of the Presbyterian Church. I have permission to use all of these except the card from the Catholic priest.

I hope to hear early next week from Hoover in regard to the "missing men" program.

Yours,

Encs

Mr. Simon Michael Bessie
Harper and Brothers
49 East 33d Street
New York 16, New York

My dear Mr. Bessie:

I regret the delay in reading FOR BETTER OR WORSE by Morris Ernst and David Loth.

During recent weeks I think I have received perhaps fifty books from different publishers asking for opinion.

I may say frankly that it was with some little reluctance that I turned to the task of reading this volume because each hour given to volumes I do not choose means an hour lost from volumes I do choose. However, since I hold Mr. Ernst in such high esteem and am most appreciative of the significant service of Mr. Loth, I decided I would take this volume and go through it with care.

My reluctance was soon transformed into rich reward. This, I think, is the best volume I have read upon the subject of divorce. It deals with human beings. It refuses abstractions that becloud the problem. It rejects generalizations from limited facts. Its insights are penetrating and illuminating. Its recommendations discard hypocritical sham and I believe will make significant contribution to the solution of the divorce problem.

This is the first book that I recall that ever asked, "After divorce, what?" It is one of the few treatises that consider the vital question of the child's welfare. The remedies do provide "an appropriate court for a dissolution of marriage and get it (the divorce) on the merits of their case rather than on the amount of animosity they can engender or the amount of chicanery they are willing to expend." These remedies remove hasty and hysterical action. They do give an opportunity for couples that really want to solve their problems to do so. It seems to me that what is proposed here gives opportunity for intelligence and morality and goodwill to play upon the problem of the family approaching the rocks. These factors sometimes may be like the experienced helmsman who can steer a new course that may lead to quiet seas.

Ever sincerely yours,

G. Bromley Oxnam

JANUARY PREVIEW

THERE ARE many books being written on the subject of marriage and divorce—some are good, others only mediocre, and some are actually harmful. Whether good or bad, however, all of these books talk *about* the people involved in marriage and divorce. The unique and outstanding contribution of this new book is the fact that here it is the people who have been divorced who do the talking. Out of their deep experience in the law courts on the one hand, and in counseling on the other, the authors have in this book, with the collaboration of hundreds of participants—the divorced people—produced a living testimonial of what it is that actually happens to the lives of people who marry, divorce, and then sometimes marry again—what happens to them and, even more important, to their children.

The book contains valuable and interesting statistics. During the last ten years, eight million Americans have walked out of court with a divorce decree, and in 1951 there will be an additional eight hundred thousand. Moreover, annulments are being granted at the rate of more than twenty thousand per year. Generally speaking, we have known a good deal about the statistical phase of this problem. But what we did not know was the tragedy, the despair, and the frustration that divorce implies for these hundreds of thousands of people.

Of course with a little empathy we can project ourselves into the future lives of the people who contemplated or achieved divorce, but no imagination of our own can take the place of these "candid camera shots" of the hundreds of collaborators who make up this book.

In ten vivid chapters the authors, through the mouths of their collaborators, portray the loneliness, frustration, money problems, the effects on children, the jealousy, failure, and occasionally the success, following divorce and remarriage.

(Continued on last page)

THIS MONTH'S REVIEW . . .

. . . is written by John Sutherland Bonnell, minister of The Fifth Avenue Presbyterian Church, New York City, and author of *Pastoral Psychiatry, Psychology for Pastor and People,* and *What Are You Living For?* Dr. Bonnell's writing stems from a profound and rich experience in counseling, much of it marriage counseling.

THE JANUARY SELECTION

For Better or Worse

A New Approach to Marriage and Divorce

by MORRIS L. ERNST and DAVID LOTH

$3.00

THIS NEW BOOK fills a great void in the literature of marriage counseling, for here for the first time is a book not *about* divorced people, but *by* the individuals themselves who have gone through divorce. This is first-hand witnessing — the real story of divorce in the poignant testimony of those who have *been* divorced, with all its tragedy, desperation, loneliness, and heartache. It is a story replete with invaluable hints for the minister-counselor as to how he might aid his people who come to him for help before, rather than after, divorce.

The growing problem of divorce has always been of serious concern to society in general, and to the Church in particular. Unfortunately, this concern in the main has centered not in a positive approach of understanding and strengthening the family, but rather in a negative and restrictive one, consisting primarily of finding ways and means of making divorce harder to obtain. Such an approach, without its constructive quality, inevitably resulted not in amelioration of the problem, but in merely concentrating and multiplying the degree of hostility, hatred, self-contempt, and contempt of others which the unwilling continuation of a marriage between two people who had nothing left for the marriage inevitably implied.

Neither our present nor any other type of restriction can save the family, any more than juvenile delinquency has been affected in the slightest by the passage of stringent legislation against it. It is only the understanding of and insight into the *causes* of juvenile delinquency which have begun to make a dent in the problem. Similarly, only knowledge, insight, and empathy into the genesis of divorces can bring about a real solution of the problem of divorce.

There is no better way to this understanding than the re-living of the lives of these divorced couples as they are portrayed by themselves in this book.

The minister will not find here the all-too-logical answers, the all-too-clear solutions with which so many books in this area abound. But what is infinitely more important, he will find here the materials which will enable him to see the lives of his people who need his help as they themselves see their lives, and all of those jagged stresses on which their emotions have been torn to shreds.

The Current Dividend Book

A free Dividend Book is automatically sent to each member of Pastoral Psychology Book Club with every third Club Selection he purchases. The Dividend for November, December, and January is:

Sex and The Law

by Judge MORRIS PLOSCOWE
Executive Director, Commission on Organized Crime, American Bar Association

(Bookstore Price—$3.95)

THE CURRENT FREE DIVIDEND BOOK is a unique contribution to the basic store of specialized knowledge needed by every minister engaged in counseling. Written by a distinguished jurist with broad experience both in the law and in modern psychology and sociology, it details the legal considerations involved in marriage, annulment, and divorce, and in all forms of sexual relations. Moreover, it probes deeply into the effect of outdated mores and laws on our lives and on society.

Thus it serves a dual purpose. It provides the minister-counselor with essential data on the statutes which may be a factor in a great deal of the guidance he is called upon to give. At the same time it illuminates the fundamental problem of bringing both the law and the social structure into greater harmony with man's spiritual and psychological needs. As Dr. Roy A. Burkhart says: "Here is a great book not only because of its legal resources, which are wonderful and needed by the counselor, but also because of its fine analysis of the field of sex and its social interpretations. It is an unusual book—it is an amazing resource not only on the legal side of sex, but on the whole field."

THE CONTENTS

I. Marriage
II. Annulment
III. Divorce
IV. Illegitimacy
V. Fornication, Adultery, and Indecent Exposure
VI. Rape
VII. Homosexuality, Sodomy and Crimes against Nature
VIII. Psychopathic-Sex-Offender Laws and Crimes Against Children
IX. Prostitution
X. Marriage, Sex, Crime and Social Policy

The Authors

Morris L. Ernst was born in Uniontown, Alabama. For the last thirty years he has been a prominent practicing lawyer in New York City. As an integral part of his law practice he has been concerned with the problem of divorce and its effects on the family.

David Loth was born in St. Louis, Missouri, and graduated from the University of Missouri. For a number of years he was acting director of the Planned Parenthood Federation, and has also served as delegate to the White House Conference on Children.

In a personal letter to the editor about the way For Better or Worse *came into being, the authors write:*

THIS BOOK, unique in that it seeks to approach the problem of divorce from the standpoint of what happens to the couples and their children afterward rather than before, grew out of a deep interest and awareness of a need for a deeper understanding of the emotional problems of the people involved in divorce—the men, women, and children.

For thirty years, Mr. Ernst has seen clients pass through his law office on their way to the divorce court. He wondered what happened to them after their decree. As he puts it, he was like a manufacturer who wanted to know how his product stood up under actual use. So he and Mr. Loth checked after two or five or ten or even twenty years, not only with the couples but with their children, too. How did they fare? Would they do it again? And so on.

We concluded, as a result of our study, that one of the great lacks in our approach to the divorce problem has been ignorance of what happens afterward. Thus our book has two main purposes. One is to give for the first time some comprehensive data on what life after divorce may hold, and what those who have been through it think of the experience as they look back on it from the vantage ground of several years later. Second is a proposal for making our divorce procedures fit the problems of married people rather than an outdated set of legalisms and prejudices.

The accounts which are given of life after divorce should be of great interest to anyone who is contemplating such a step or is in a position of advising such a person. The proposals for modernizing divorce procedures are of special importance to those who practice the new skills of counseling—the minister, the marriage counselor, the psychiatrist and psychologist, the social worker. It is to these people that the public must look for a continuation and completion of the work begun in *For Better or Worse.*

The authors do not attempt to supply complete answers as to why people seek divorce, nor do the collaborators themselves supply the answers. Pathetically they admit that they do not know the answers. Almost invariably the reasons given are a series of trifling minutiae which are but proof of how unconsciously the lives of these people have been slowly but surely moving in the direction of their marital breakup. But while they do not know the answers, all through the stories of these individuals runs the thread of conviction—had they had some help during the critical stages of their marriage, much of their unhappiness might have been averted.

This is one extremely significant conclusion which one draws from this book. The other conclusion which will disturb ministers is how small a role the Church has played in the lives of all these people. Sometimes this is said without rancor, at other times with a great deal of resentment—" "Until the clergy gets 'wised up,'" says one of these collaborators, for example, "the church has nothing to offer except doubt and fears."

The section of the book that deals with the effect of divorce on children is especially good, and may help us to realize why a quarter of a million children appear annually before the courts as delinquent.

One of the best parts of the book is the final chapter, "Remedies." To summarize this excellent statement, the courts today are not concerned with the results of divorce. They are only concerned with its form. As a result, the courts' present procedures not only do not contribute anything constructive but, on the contrary, engender hatred, lies, and contempt.

Accordingly, the authors recommend that when a couple institute a divorce action, "the court would inform them that there must be a waiting period of, say, six months. The court would appoint a skilled counselor, psychiatrist, marriage advisor, minister, doctor—to consider their problem with them at frequent intervals during the waiting period. It would be his duty to discuss with them the real basis of their decision —not some trumped-up reason or evidence to fit the law—and the probable results. Such discussions would give them a chance which few now get to appraise their marriage in an atmosphere of friendly calm."

Ministers who have had experience in marriage counseling will wholeheartedly agree with the remedies recommended by the authors, even though they might question some of the details. Undoubtedly such counseling, if it is to be really preventive, should begin long before formal action for divorce is made or is even contemplated. It is encouraging to see the responsibility which the church is now taking in this area in developing counseling and family life services for the "normal" family rather than waiting for the emergency. The contents of this book, the experience of those who have already been hurt because they lacked such counseling, should be an invaluable tool for helping those yet unhurt.

—JOHN SUTHERLAND BONNELL

From the Editor's Desk . . .

Neighboring ministers occasionally drop in at our office to discuss some of their problems in dealing with people This is always a grati ying experience, for it enables us to share directly in the minister's day-to-day work

One such minister arrived at our office the other day to talk over the problem of a couple in his parish who have been coming to him for help with their marital problems. The minister was puzzled by the discrepancy between the intensity of the emotional conflict between the two people and the obviously trifling details by which this conflict seemed to be nourished. "I just can't take them seriously," said our friend. "There's nothing to the actual problems that they bring to me. When I talk with them I can't help laughing at the absurdity of these little things causing so much furor, and yet, somewhere inside of me, I feel that in spite of this absence of tangible reasons for it, the marriage is going on the rocks."

It just happened that while the minister was talking about this problem the galley proofs of *For Better or Worse* were on our table. Because we wanted to give the man some help with his problem, as well as to test the value of the book on an actual situation, we offered to lend him the proofs for the weekend. On Monday morning at nine sharp, the telephone rang. The minister was at the other end of the wire. His voice was exultant. "This is an eye-opener!" he exclaimed. "I never saw the relation of cause and effect in human living as vividly as I see it now as a result of this book!"

Perhaps we may be pardoned for taking some small pride in such concrete verification of the practical value of our choice of Club Selections.

"This Man Is WANTED"

a proposal for television

from

Ernest Chappell and Edward R. Murrow

THE IDEA

We want to produce on motion picture film a series of three minute shorts publicizing criminals wanted by federal, state and local authorities.

Each short would deal with one criminal. It would set forth his crime together with a physical description and his personality characteristics.

PURPOSE AND SCOPE

An aroused, aware and cooperative public can make it much harder for the criminal to hide out and can hasten his apprehension. The television screen is perhaps the finest means for circulating the facts.

THE APPROACH

No adventure or cops and robbers appeal. No glamor or sensationalism. The treatment of the material would be without personality and strictly factual.

The screen would supplement, punctuate and bring alive the quiet running commentary of the voice.

No promise of rewards. No publicity appeal. The public would simply be urged to "watch for this man", and should they see him, quietly report to the proper authority.

AUTHENTICITY

We seek the cooperation of the FBI and all other federal, state and local authorities. The facts would be official, unembellished.

DISTRIBUTION

Since this is a film proposal, the program series would be availanle to every television station in the country. We would syndicate the shorts on a one, three or five times per week basis.

COSTS

The organization, production and syndication costs would be covered by syndication fees from the local station or a local advertiser sponsoring the series in the public interest.

CONCLUSION

Mr. Chappell and Mr. Murrow are ready to organize a unit for the production of these films. Sufficient inquiry has been made to confirm a ready acceptance of the series by the TV stations. The audience is waiting. Much good can be accomplished in the public interest.

With the proper official cooperation the series can be ready for summer release.

July 5, 1951

Dear Morris:

1. Sorry I couldn't arrange a session with Levy last week; he wasn't available. I reckon it will have to wait until September.

2. Friendly has had a talk with Nichols and Hoover, but that, too, will have to wait until we get back in September.

3. Here is my check for $499 in payment of your bill dated March 1. (I need the extra dollar for aspirin). Please have your office send me a receipt. I am building up a small file on the practices of the legal profession.

Dear Ed:

Mrs. Otis stays in my mind. Don't hesitate to tell her to get in touch with me when I am down next Wednesday. And don't forget to call up Jerome Frank.

Incidentally, stop your nonsense of your "forgetting" and send me a check for the bill which we sent you months ago. In fact, if you still think the amount is too high send a check for whatever you think reasonable, which means you can either decrease the amount I suggested or increase it!

As ever, itwas exciting to see you again.

Yours,

MLE:EH

Dear Ed:

1. I called Jerome Frank about the FBI.

2. Please have your tax accountant get in touch with me in regard to the silly wastage, if your report is to be believed.

3. I am holding open Wednesday lunch and afternoon next week, and do hope you can get your Philadelphia friend to join us. If not lunch or afternoon, I can even arrange dinner and the evening, which might give us more time.

Yours,

SVO

Dear Ed:

How about lunch Tuesday, Wednesday or Thursday of next week?

Thanks for sending back the suggestions for programs.

I did speak to Lou Nichols of the FBI and he is awaiting your call. In confidence, may I tell you that Judge Jerome Frank, at my suggestion, is doing an article on the FBI with particular reference to the College run by the FBI for local police officials. Jerome is going to Washington next week for a few days. It might be well if you could arrange to have someone go down there with him. Possibly you could go down at the same time. This will be a great convenience to Hoover and Lou Nichols, and you might even learn something from Jerome's inquisitive mind.

I would like to help you on this project if you have a spot where you think I can make a contribution.

Best,

Yours,

Morris L. Ernst

June 1, 1951

Dear Morris:

I am incompetent, but not unappreciative. Herewith, the batch of suggestions you sent me around March 7. I apologize for the delay in returning them.

Have you had opportunity to talk with the boys at the F.B.I.?

And would you have opportunity to lunch with me any time in the course of the next week or ten days?

I inscribe myself "dubitante" the second.

As ever yours,

Mr. Morris L. Ernst

Dear Ed:

Seeing you at lunch was quite joyful.

I have gone to work on the FBI program. I will be in Washington tomorrow, Thursday, and will pick up sufficient in a week to give you a complete outline. Frankly, I would like to do a job like this once a month for you, although I don't know exactly why I have this urge. On the one hand I would not mind being paid for such jobs out of the coffers of CBS. In fact, I would rather take their money than yours, although I assume, in the final analysis, any compensation that would flow to me would in reality be paid by Uncle Sam to a very great extent. On the other hand, I would not be interested at all except for the relationship we personally have between us.

I don't need the dough but have long felt that the way to live was á lá Robin Hood, taking wealth from those who make it so as to contribute services for nothing for the less lucky ones in life who happen to be the same as the group which is more likely to be pushed around.

I am sending you, for your eyes alone, a batch of subjects I sent to DeWitt Wallace. Some of them may make sense for use for your vast parish. After you have glanced over the material, please return it to me promptly; and bear in mind that it was prepared for a very different medium.

You are a swell guy.

Yours,

Morris L. Ernst

Enc

On re-reading the above, I also want to make clear that entirely aside from anything I have said in this letter, I have been and will continue to be flattered to have you telephone me for hunches that I may have in your field of effort.

Dear Ed:

I am sending you direct a letter received from Lou Nichols. I was about to follow up your suggestion that I give some ideas for an FBI hour. I have got a lot of angles that might amuse you, but I am leaving for the Nile tomorrow for a couple of weeks.

In the meanwhile you might want to look over the material I received and, of course, don't hesitate to contact Lou Nichols. I do trust that in any program,you will be sure to clarify the public mind on what the FBI does not do. The job done by Edgar Hoover has probably made a greater impress on our folkway than any other department of our government over the last decades. The impress done to our young kids is so profound that it has resulted in confusion. I doubt if you would have answered correctly the items mentioned on page 2 of Lou's memorandum.

I may bring back some good stuff for you from Egypt and Greece.

Best,

Yours,

Morris L. Ernst

Mr. Morris L. Ernst
Greenbaum, Wolff and Ernst
285 Madison Avenue
New York 17, New York

Dear Morris:

With reference to our conversation the other day, we would like to explore further the idea you advanced on a program with Edward Murrow.

In this connection, I am enclosing a short memorandum dealing with some of the activities of the Bureau and some of the things which we don't do, along with a copy of our annual report which has not as yet been made public but which does give a good account of our activities. I am also enclosing a copy of the Director's statement before the Kefauver Committee on Monday, along with a copy of the current issue of U. S. News and World Report wherein the Director has a rather good interview on the subject.

Sincerely,

Tolson

Enclosure

M E M O R A N D U M

March 29, 1951

The Federal Bureau of Investigation engages in the following Activities:

Investigates violations of the laws of the United States, collects evidence in cases in which the United States is or may be a party in interest and performs other duties imposed on it by law.

Functions as a service agency to all law enforcement.

Conducts training programs both in Washington, D. C., and in the Field for the benefit of local law enforcement agencies.

Conducts laboratory examinations in criminal cases being investigated by local police and other government agencies.

Maintains a national repository of identification data in the form of fingerprint cards for the benefit of all law enforcement and the public at large.

Coordinates the investigations of espionage, sabotage, and subversive activities on a national basis.

Conducts investigations concerning the loyalty of applicants and employees of the executive branches of the Federal government.

Conducts applicant type of investigations for the Department of Justice and other governmental departments.

Conducts character and fitness investigation of applicants and employees under the Atomic Energy Act.

The FBI exchanges identification data with many foreign police organizations.

The FBI conducts investigation of violations of the civil rights of individuals on the specific recommendation of the Department of Justice.

The Federal Bureau of Investigation does not engage in the following activities:

The FBI conducts no investigation on the basis of complaints received unless the facts indicate a violation or a matter over which it has investigative jurisdiction.

Does not give clearances as such to anyone.

Does not disclose information in its files to unauthorized individuals.

Does not reveal the identity of confidential informants or individuals furnishing information who desire their identity be kept confidential.

Does not decide whether prosecutive action will be undertaken on the basis of information secured through its investigations.

Does not recommend the action to be taken on the basis of its investigations under the President's Loyalty Program.

Does not conduct investigations outside the continental United States, Territories and the Possessions.

Does not recommend legislative policy.

The FBI is not responsible for the physical protection of industrial facilities engaged in the manufacture of defense materials. This is the responsibility of the Munitions Board of the Office of the Secretary of Defense.

The FBI is not responsible for the physical guarding of Atomic Energy installations or documents or materials within these installations. This is the responsibility of the Atomic Energy Commission.

The FBI does not maintain files or dossiers on individuals who are not or who have not been the subjects of official investigations.

The FBI does not conduct investigation of violations of state laws except in cases where there is a joint investigative responsibility for the criminal act.

INTRODUCTION

The fiscal year which ended June 30, 1950, was marked by extensive activity in the FBI's chief fields of responsibility.

Broadly, these fields are two: general investigation and security. They are not mutually exclusive, of course, since frequently one will include aspects of the other.

(1) The general investigative field requires development of accurate facts relating both to violations of Federal criminal laws and to certain types of civil litigation in which the Government is a party in interest. The 8,921 criminal convictions resulting from FBI investigations during the fiscal year represented a six per cent increase over 1949. In one civil category alone, namely, claims arising under the Renegotiation Act, adjustments in favor of the Government in cases investigated by the FBI totaled $55,162,900, or more than the entire cost of operations of the FBI for the fiscal year.

(2) The internal security field involves the discharge of primary responsibility for guarding the nation against threats from within its own borders. In the 1950 fiscal year the number of FBI investigations of a security and national defense nature continued at a peak far exceeding the volume during the years of World War II.

The greatest threat to this nation from within is represented by the Communist Party of the United States, a fifth column arm of the international Communist conspiracy. In the 1950 fiscal year the trend of events both here and abroad made it necessary for the FBI to utilize a large portion of its manpower and resources for commitments related to the activities of the Communist Party, USA. Increased security consciousness on the part of the Party leadership, stemming both from the mounting international tension and from legal reverses experienced in this country, such as the conviction of eleven principal Communist Party leaders for conspiracy to overthrow the Government by force and violence, brought about a decentralization of Party administrative machinery and extensive preparations for transferral of previously open operations to an underground apparatus. These developments complicated the FBI task of maintaining coverage of Communist activity.

The success with which the FBI met its security commitments during the year is attested by the increased violence of Communist inspired attacks on FBI methods and administration. While criticism of the FBI, of course, is an unceasing Party project, varying only in intensity, the rabidness of these attacks during the twelve month period is a grudging acknowledgment of FBI effectiveness in the fight against subversion.

In addition to the open castigation of the FBI through official Communist media and professional Communist apologists, a disguised campaign of vilification is constantly carried on with the unwitting assistance of some who are sincerely concerned with what they believe to be threats against civil rights and liberties and who have been fed a Communist concocted diet of misinformation, insinuations, half-truths, and deceit. The danger in the false, even if sincere, conclusions which such Communist dupes nourish and pass along lies in the doubts they create in conscientious minds as to the true role of the FBI.

For maximum effectiveness the FBI must have the wholehearted confidence and cooperation of every honest American. When the deliberate distortions of those with axes to grind are exposed for what they are, and when sincere misgivings are allayed by an accurate understanding of FBI policies, powers, and methods of operation, no conscientious American will have any reason to doubt that the realistic thoroughness and preparedness practiced by the FBI are entirely compatible with a wholesome respect for the civil rights and liberties of the individual.

The FBI is concerned only with acts, not thoughts; with deeds, not beliefs. So far as the FBI is concerned a man may think what he likes so long as his thoughts are not translated into action by engaging in either criminal or subversive activity.

The FBI is well aware of its responsibility to protect the innocent. It has endeavored to do its job fairly and impartially. The statistics relating to the Loyalty Program which appear later in this report testify to FBI determination to avoid any implications of a "witch hunt" and to be concerned only with the facts. For instance, at the close of the 1950 fiscal year full field investigations had been initiated for less than one half of one per cent of the 2,833,846 employees whose Loyalty forms had been processed since the Program began to function on August 1, 1947.

In its approach to fulfilling its obligations under the Program the FBI has endeavored to make a positive contribution to the prevention of the hysteria which might have marred its legitimate objective to maintain the integrity of the Government service.

The FBI has continued to meet the many and various problems which have constantly confronted it, to the limits of its ability and resources and with an all-pervading regard for its duty under our democratic system to safeguard and promote the rights and liberties of the individual.

The Congress, the courts, and the highest Executive authority have FBI operations under constant observation and have evidenced a gratifying confidence in its ability and determination to carry out its assignments in the best American tradition. The FBI welcomes, also, the public scrutiny afforded through our free press and continues to invite the comments and suggestions of every good American.

As the fiscal year 1950 came to an end the North Korean aggression brought on a situation not unlike the German invasion in 1939. The FBI, due to the increasing demand for Security, activated several of its carefully prepared plans to further safeguard the United States and to insure readiness for any eventuality.

GENERAL INVESTIGATIVE ACCOMPLISHMENTS

CONVICTIONS IN FBI CASES BROUGHT TO TRIAL

GENERAL CRIMINAL FUGITIVES ARRESTED

MAJOR INCREASES IN CRIMINAL CONVICTIONS

Per Cent Increase Over 1949

FRAUDS AGAINST THE GOVERNMENT	114 %
NATIONAL BANKRUPTCY ACT	80 %
WHITE SLAVE TRAFFIC ACT	62 %
KIDNAPING	61 %
NATIONAL BANK AND FEDERAL RESERVE ACTS	59 %
EXTORTION	35 %
INTERSTATE TRANSPORTATION OF STOLEN PROPERTY	20 %

GENERAL INVESTIGATION

There was a total of 8,921 convictions in all types of FBI cases during the year, a six per cent increase over 1949. This represents convictions in 96.9 per cent of all cases brought to trial. Guilty pleas constituted 93.7 per cent of the convictions. The remaining 6.3 per cent resulted from trials by judge or jury.

Sentences imposed in FBI cases during 1950 totaled 21,102 years, 2 months and 29 days, plus four life terms.

The total of 6,097 fugitives located during the 1950 fiscal year, compared to 5,812 in 1949, included 2,745 deserters and Selective Service fugitives. The remaining 3,352 general criminal fugitives represented an all-time high for this category, 35 per cent greater than in 1949.

The FBI return to the taxpayer in the form of fines, savings and recoveries, totaled $36,152,576 for 1950. In addition, there was a 24 per cent increase in Renegotiation Act claims adjusted in favor of the Government in cases investigated by the FBI, from $44,541,305 in 1949 to $55,162,900 in 1950. It is noted that the 1950 figure exceeds the total of the funds available to the FBI for all its operations during the period by more than $1,800,000.

KIDNAPING

The Federal Kidnaping Statute, passed June 22, 1932, prohibits the abduction, interstate transportation, and holding of a person for ransom, reward or otherwise.

Since enactment of the statute, the FBI had investigated 387 cases by the close of the 1950 fiscal year. All but two, which are still under investigation, have been solved.

The 37 convictions recorded during the 1950 fiscal year constituted a 61 per cent increase over the 23 in 1949.

EXTORTION

The Federal Extortion Statute, enacted July 8, 1932, makes it a Federal offense to send through the mails or to transmit interstate by any means whatsoever, a communication threatening to kill, kidnap, or injure an individual or his property, or demanding ransom for the release of a kidnaped person.

Since the Act was passed 1,439 convictions have resulted from investigations conducted by the FBI. The 89 convictions recorded during the 1950 fiscal year represented a 35 per cent increase over 1949.

BANK ROBBERY

The National Bank Robbery Act was passed in May, 1934. In that year there were 417 bank robberies. By 1943 this figure had been reduced to 22. Through the war and postwar years there has been a steady upward trend. During the 1950 fiscal year there were 89 robberies, 119 burglaries, and 40 larcenies in banks within the investigative jurisdiction of the FBI. An increase in the more bold and daring types of bank robberies has been apparent, particularly in certain specific localities.

Approximately 90 per cent of all banks in the United States are covered by the Act.

INTERSTATE TRANSPORTATION OF STOLEN PROPERTY

One of the series of crime bills passed in 1934 makes it a Federal offense to transport in interstate or foreign commerce stolen goods valued at $5,000 or more and also prohibits the interstate transportation of any altered, falsely made, forged, or counterfeit security of any value. Another section covers stolen property valued at $500 or more which is transported across a state line and pledged.

The volume of investigations under this statute reached an all-time high during the 1950 fiscal year. A 20 per cent increase over the previous record of 346 convictions in 1949 brought the 1950 total to 414.

Professional confidence men, jewel thieves, or fraudulent check artists operating on a nationwide basis are generally involved in the violations of the Act, fraudulent check cases constituting a large majority of the investigations.

UNLAWFUL FLIGHT

Another of the 1934 series of Federal Crime bills, the Fugitive Felon Act, was amended in 1946 and revised in 1948. It prohibits flight from one state to another or to a foreign country to avoid prosecution, custody, or confinement after conviction for murder, kidnaping, burglary, robbery, mayhem, rape, assault with a dangerous weapon, or extortion accompanied by threats of violence, or attempts to commit

any of these crimes. It also prohibits interstate flight to avoid giving testimony in any criminal proceeding involving a violation punishable by imprisonment in a penitentiary.

The 444 fugitive apprehensions in this category during the 1950 fiscal year exceeded the previous record high of 426 recorded in 1949. Nine of those apprehended in 1950 were charged with fleeing to avoid giving testimony, 56 to avoid confinement after conviction, and 379 to avoid prosecution.

Although penalties are provided by this statute, the primary purpose of the FBI investigations is to locate fugitives wanted by various state jurisdictions. There are few convictions under the Act itself, since Federal prosecution is generally discontinued once the fugitive has been made available to the local law enforcement agency.

MISCELLANEOUS MAJOR STATUTES

Substantial increases for 1950 over the number of convictions for the preceding fiscal year were experienced in certain miscellaneous major crime categories, such as National Bank and Federal Reserve Acts (59 per cent); National Bankruptcy Act (80 per cent); White Slave Traffic Act (62 per cent); and Frauds Against the Government (114 per cent). There was an increase from 3,625 to 3,933 in convictions for the Interstate Transportation of Stolen Motor Vehicles or Aircraft, and 10,581 stolen automobiles were recovered in such cases investigated by the FBI, 576 more than in 1949.

CIVIL RIGHTS AND RELATED MATTERS

Alleged violations of the various Federal statutes protecting civil rights receive priority attention by the FBI. These statutes protect the rights and privileges secured by the Constitution or laws of the United States against infringement by law enforcement officers or, in some instances, by a conspiracy of two or more persons. Preliminary inquiries are conducted upon receipt of the initial complaints. Full-scale investigations must be authorized by the Criminal Division of the Department of Justice.

Local prejudices frequently multiply the difficulties incident to investigations of this type.

The increased public interest in the field of Civil Rights has been reflected in the number of related complaints reaching the FBI. During the fiscal year 1950 there were 41 per cent more convictions for offenses in this category than there were in 1949. Under the classification of Civil Rights and Domestic Violence there were 15 convictions, five under Obstruction of Justice, three under Election Laws, and one under Involuntary Servitude and Slavery, for a total of 24. The FBI has a special section devoted to the supervision of this type of case and specialized instruction is given each Agent.

Aside from convictions obtained, the efforts of the FBI have resulted in an increased awareness on the part of law enforcement officers generally of their responsibility to protect the individual's Constitutional rights.

SELECTIVE SERVICE

Although closely related to the national security because of the primary purpose of providing manpower for the armed services, cases opened under the Selective Training and Service Act of 1940 or the Selective Service Act of 1948 are carried in the general investigative category since they usually involve fugitive investigations to locate delinquents under the Act. The Act of 1940 expired March 31, 1947, but there were still 436 investigations under its provisions pending on June 30, 1950, in cases where indictments had been returned or the provisions of the legislation itself had prevented the Statute of Limitations from precluding prosecution.

The Act of 1948, originally to have expired June 24, 1950, was extended to July 9, 1951, by Congressional action.

Since the principal objective of the 1948, as of the 1940 Act, is to make personnel available to the armed services, the individual investigation is generally closed without prosecution, upon authority of the appropriate United States Attorney, when the delinquent has been located and his delinquency removed. Violations of the provisions of the Act during the 1950 fiscal year involved failure to register, failure to keep draft boards advised of changes of address, and failure to execute and return questionnaires. Since there were no inductions into the armed forces during the fiscal year, there were no violations by reason of failure to report for induction.

During the year there were 4,172 cases completed under the Act of 1948. As of June 30, 1950, there were 450 pending.

CIVIL INVESTIGATIONS

Current FBI investigations of a civil nature derive generally from the Government's numerous wartime contracts during World War II and thereafter, although some of the statutes involved have been in existence for many years. These investigations usually are quite involved and require specialized knowledge. Ordinarily they are performed by Special Agents trained in accounting work.

The major civil investigative activities of the FBI during the 1950 fiscal year obtained the results set out below.

Renegotiation Act

The Renegotiation Acts of 1942, 1943, 1948, and 1949 provide a method whereby the Government may recover excessive profits on its contracts, as determined by a Price Adjustment Board. In cases of protest, the contractor may file a petition in the Tax Court seeking a redetermination. At the request of the Claims Division of the Department of Justice the FBI conducts audits of petitioners' books and records, principally to establish the amount of renegotiable business conducted and the net profits realized therefrom.

Adjustments in favor of the Government in such cases investigated by the FBI amounted to $55,162,900 during the 1950 fiscal year.

Federal Tort Claims Act

The Legislative Organization Act of 1946 permits the United States Government to be sued in tort. The FBI will conduct investigations with respect to claims or potential claims in excess of $1,000. Great public disasters may require tremendous investigative activity. At the close of the 1950 fiscal year the FBI was engaged in investigating the validity of almost 7,000 individual claims filed in connection with the Texas City explosion. During the 1950 fiscal year savings to the Government effected in tort claim cases investigated by the FBI amounted to $5,874,357.

Court of Claims

Claims against the United States by contractors and others who have sold goods or built facilities under Government contract generally charge the United States with contributing to costly delays in fulfilling the contracts or with giving inadequate compensation for property seized under emergency authority.

During the 1950 fiscal year savings to the Government of $4,364,581 resulted from decisions in Court of Claims cases investigated by the FBI.

Miscellaneous Civil Suits

Adjustments in favor of the Government in suits brought under the Admiralty Laws against the Government or its agents amounted to $2,728,036 in cases investigated by the FBI during the year. A single case in which investigation was performed by the FBI at the request of the Lands Division of the Department of Justice resulted in a $1,169,236 adjustment in favor of the Government and other miscellaneous civil suits resulted in favorable adjustments totaling $3,630,361.

SUMMARY OF STATISTICS FOR THE 1950 FISCAL YEAR

CLASSIFICATION	CONVICTIONS	ACTUAL, SUSPENDED AND PROBATIONARY SENTENCES: Death	Life	Years	Months	Days	FINES IMPOSED	SAVING RECOVE

SECURITY OPERATIONS

SECURITY OPERATIONS

Since 1939, by Presidential Directive, the FBI has been charged with primary responsibility for protecting the internal security of the nation against subversive threats and foreign agents. The discharge of this responsibility during the 1950 fiscal year was keynoted by thorough preparation to meet any emergency within the scope of FBI authority which might erupt from the recurring international crises.

The security commitments of the FBI may be divided into two major categories. General security operations include counter-espionage, counter-intelligence, and counter-subversion. Special security operations encompass, principally, applicant and employee investigations arising from Congressional enactments or Executive directives specifically calling upon the FBI to obtain and report the facts pertaining to security, character, and loyalty in the Government service.

In its security operations, as in its general investigations, the FBI has adhered rigidly to its position as a fact-finding agency only, leaving to other legally designated authority the responsibility for making decisions as to the action to be predicated upon the facts developed. Its position as the designated coordinating agency for internal security matters brings to the FBI a great deal of unsolicited information and complaints. When information received pertains to the responsibilities of another Government agency, it is transmitted to that agency without evaluation or comment.

GENERAL SECURITY OPERATIONS

Most FBI security operations are essentially preventive or precautionary in nature, and generally their value cannot be measured in terms of convictions obtained or sentences imposed. During the 1950 fiscal year, however, there were several successful prosecutive actions predicated upon information developed by the FBI in the course of its security investigations.

Miscellaneous Convictions

Undoubtedly the greatest blow to the organizational apparatus of the Communist Party of the United States was the conviction on October 14, 1949, of eleven top Communist leaders, members of the National Board of the Party, for conspiracy to overthrow and destroy the Government by force and violence, in violation of the Smith Act. A twelfth National Board member

was indicted on July 20, 1948, along with the others, but did not stand trial with them due to a heart ailment. All but one of the eleven convicted Communists received five year terms and $10,000 fines. The eleventh, because of his war service, received a three year sentence.

On March 7, 1950, in New York, New York, Judith Coplon and Valentin A. Gubitchev were found guilty of espionage and conspiracy to commit espionage. Judith Coplon had previously been convicted in Washington, D. C., and sentenced to serve 40 months to ten years and three years, concurrently, on charges growing out of the same activities resulting in the New York convictions.

On March 9, 1950, Judith Coplon was sentenced to five years on a conspiracy count and fifteen years on an espionage count. Gubitchev, a Russian citizen, received five and ten year sentences, respectively, but they were suspended at State Department request conditioned upon his return to Russia.

On January 21, 1950, in New York, New York, Alger Hiss was found guilty on both counts of an indictment charging him with perjury in connection with statements under oath before a special Federal grand jury empaneled in the Southern District of New York on June 16, 1947, to which there was presented evidence of alleged violations of the espionage and other Federal statutes. Hiss was sentenced to five years' imprisonment on each of the two counts, the two terms to be served concurrently.

In addition to these convictions, information furnished by the FBI to British authorities resulted in the identification and conviction of Emil Julius Klaus Fuchs, a British scientist, for violation of the British Official Secrets Act. On March 1, 1950, he was given the maximum sentence of fourteen years.

Ramifications of the Fuchs case resulted in charges being filed by the FBI against Harry Gold on May 23, 1950, in the Eastern District of New York, against Alfred Dean Slack in the Eastern District of Tennessee on June 15, 1950, and against David Greenglass in the Federal District of New Mexico on June 16, 1950. They had not been brought to trial by the close of the 1950 fiscal year.

Treason Convictions

The World War II activities of two American citizens led to their convictions for treason during the 1950 fiscal year. Iva Ikuko Toguri D'Aquino, known as "Tokyo Rose," was convicted at San Francisco, California, on September 29, 1949, for her wartime broadcasts over Radio Tokyo. She received a 10 year term and a $10,000 fine. Herbert John Burgman, who refused to be repatriated from Germany at the outbreak of the war and remained to broadcast propaganda over the German radio, was convicted in the District of Columbia on November 15, 1949. He was given a 6 to 20 year term.

SPECIAL SECURITY OPERATIONS

The principal classifications of applicant and similar investigations of a security nature conducted by the FBI during 1950 are set forth below.

Atomic Energy Act of 1946

While the FBI has no responsibility for physically safeguarding Atomic Energy installations, materials, or security data, it is charged with the investigation of alleged violations of the criminal provisions of the Atomic Energy Act. In addition, the FBI is required by the Act to investigate "the character, associations, and loyalty" of every Atomic Energy Commission employee and applicant, and any other person having access to restricted Atomic Energy data. The FBI furnishes factual reports to the Commission in cases of this type, draws no conclusions, and makes no recommendations as to the action to be taken.

During 1950, request for 41,099 of these applicant type investigations were received and 40,970 were completed.

Federal Employees' Loyalty Program

The FBI first began conducting investigations into the loyalty of Federal employees in the 1942 fiscal year when the Department of Justice Appropriations Act provided for the investigation of any Government employee belonging to a subversive organization or advocating the overthrow of the Federal Government.

Similar provisions were made in 1943, but there was no specific appropriation in 1944. The Attorney General, however, instructed the FBI to continue this type of investigation under the provisions of the Hatch Act which prohibits Federal employee membership in any organization advocating the overthrow of our Constitutional form of government. These instructions

remained in effect until the Federal Employees' Loyalty Program began. Executive Order 9835 was signed by the President on March 21, 1947. On August 1, 1947, the Congress appropriated the funds necessary to implement the Executive Order.

Under the Order the FBI is required to search through its files the names and fingerprints of all employees and applicants for positions in the Government's Executive Branch and to report any information indicating disloyalty. When such information is disclosed by the file search, full field investigations are conducted and complete reports submitted by the FBI. Preliminary inquiries are frequently made to verify identity, or to confirm or determine the exact significance of information obtained from the initial file search. Experience has shown that these inquiries often eliminate the necessity for full field investigations. Under the Loyalty Program the role of the FBI is to report the facts to the Civil Service Commission without bias, conclusions, or recommendations. It is the responsibility of the employing agencies and the Loyalty Hearing Boards to weigh the facts and to decide the proper administrative action. During the period July 1, 1949, through June 30, 1950, a total of 262,784 loyalty forms were processed.

Occasionally supplemental investigations, generally predicated upon information elicited at Loyalty Board hearings, are conducted by the FBI at the specific request of Loyalty Boards after the results of the full field investigations have been reported to the Civil Service Commission.

From Loyalty forms processed, specific requests by the Civil Service Commission and other agencies, and complaints received directly by the FBI, 2,890 preliminary inquiries and 2,694 full field investigations, including 873 resulting from conversion of preliminary inquiries, were instituted during the 1950 fiscal year.

The statistical record since the Loyalty Program began to function on August 1, 1947, is indicative of the objective manner in which its provisions have been carried out by the FBI. By the end of the 1950 fiscal year 2,833,846 Loyalty forms had been processed; 12,422 full field investigations and 14,332 preliminary inquiries had been initiated.

Only 296 full field investigations and 248 preliminary inquiries remained pending at the close of business June 30, 1950. On the basis of Loyalty investigations 173 incumbents and appointees had been removed from or denied Federal employment by their respective agencies; 7,197 had been retained or accepted after the investigation; and no dispositions had been reported to the FBI by the Loyalty Review Board in 2,449 cases. Other completed cases included those terminated for miscellaneous reasons such as withdrawal from consideration because of resignation.

Special Applicant Investigations for the Department of Justice and Other Government Agencies

FBI investigations of persons under consideration for appointment to judicial positions or as United States Attorneys, Assistant United States Attorneys, United States Marshals, and to various legal and technical positions in the Department of Justice, numbered 365 during the 1950 fiscal year. Investigations of applicants for positions as Field Deputy Marshals, Office Deputy Marshals, maintenance positions in buildings occupied by the Department of Justice and various clerical positions in the Department of Justice totaled 2,105. There were also 279 special investigations of persons under consideration for highly important governmental positions other than in the Department of Justice.

Miscellaneous Applicant Investigations

During the 1950 fiscal year the FBI was requested to conduct additional applicant investigations for other Government agencies as follows, under authority of legislative enactments, Presidential directives, and Inter-Departmental agreements:

Central Intelligence Agency	2651
Voice of America Program	2202
European Recovery Program	1449

COOPERATIVE SERVICES

In addition to its primary investigative responsibilities the FBI acts as a central service organization available to all constituted law enforcement authorities in the nation. The centralization feature, particularly in such matters as identification and the collection of uniform crime statistics, is a valuable aspect of the service and carries with it no implied or actual control over the individual police agency. The FBI policy and practice have always opposed any suggestion of a national police, and continue to uphold the practicality and desirability of the democratic system of local, state and Federal law enforcement agencies, close in cooperation but independent in authority.

The public at large, in addition to law enforcement agencies, also participates directly in many of the benefits provided by the FBI's service operations. Accomplishments in the fields of cooperative service were highly gratifying during the 1950 fiscal year.

IDENTIFICATION

The Identification Division of the FBI was established July 1, 1924, with 810,188 fingerprint records obtained from Leavenworth Penitentiary and the International Association of Chiefs of Police. Twenty-six years later, at the close of the 1950 fiscal year, this nucleus had become but a fractional part of a 114,356,747 total. Amazing as this tremendous increase in number may be, however, the change in the character of the fingerprint records accumulated is possibly even more striking.

In 1924 the purpose of the fingerprint files was to provide a central repository of criminal identification data for law enforcement officers throughout the nation. The progressively successful fulfillment of this original purpose is indicated by the increasing percentage of identifications effected with the criminal prints received. In 1924 it was 14 per cent. Thirteen years later, in 1937, it was 54.4 per cent. Another thirteen years, and in 1950 previous records in file were identified with 68.55 per cent of the criminal prints received. Of these, 10,371 on the basis of the fingerprint identifications were found to be fugitives from justice.

Criminal identification, however, has now become only one phase, though still an important one, of the FBI Identification Division's functions. In the 1933 fiscal year the Civil Service Commission turned over to the FBI the fingerprints of more than 140,000 Government employees and applicants and, in addition, a Civil Identification section of the FBI fingerprint files was established to provide for the law-abiding citizen the same protection against loss of identity by amnesia or possible disfiguring death afforded the fingerprinted criminal. These innovations marked the initiation of a non-criminal file which was destined to dwarf the criminal files by comparison.

As the clouds of World War II gathered and broke, the number of fingerprints in FBI possession doubled, trebled and quadrupled. From less than 10.8 million in 1939 they multiplied to more than 42.8 million at the close of the 1942 fiscal year. Aliens, armed services personnel, and civilian employees in national defense industry added their prints to the total. The peak was reached in 1943 when 28,733,286 were received, an average of 93,540 each working day.

The accompanying chart graphically illustrates the proportions of criminal and the various types of non-criminal prints making up the total of more than 114.3 million fingerprint cards in FBI possession at the close of the 1950 fiscal year.

Some persons, of course, have a number of fingerprint cards, taken on different occasions, on file with the FBI. Therefore, the number of persons represented by the cards on file is less than the grand total. Approximately 8.5 million individuals are represented by the fingerprints in the criminal files and about 58.9 million by the non-criminal files.

Thus, the scope of the Identification Division's operations has been broadened far beyond its original purpose of service to law enforcement only. It is now a service agency to the public at large. Unknown dead and amnesia victims are identified, missing persons are located for anxious relatives through the information collected in FBI fingerprint files. The security of the armed forces and the Government service generally is promoted through the processing of the fingerprints of military personnel and civil employees and applicants for Government positions.

TYPES OF FINGERPRINTS IN FBI POSSESSION

JUNE 30, 1950

TOTAL - 114.3 MILLIONS

Striking illustrations of one invaluable type of service were provided in two outstanding instances during the 1950 fiscal year. On September 17, 1949, a fire broke out on the SS Noronic, of the Canadian Steamship Line, while the vessel was at a Toronto pier. In a matter of minutes it became a holocaust. Nearly 300 persons died. Many were identified by relatives, but several bodies were completely destroyed and others were unrecognizable. At the request of the American Red Cross the FBI participated in identification efforts, since the passenger list consisted almost exclusively of American citizens.

The Single Fingerprint Section of the FBI Identification Division, consisting of experienced technicians accustomed to working with limited fingerprint impressions, positively identified, from fingerprints in FBI files, eleven of twenty-one unknown deceased whose fingers still bore ridge details. The fingerprint cards against which identifications were effected included those of applicants for taxi driver, railroad brakeman, construction engineer, industrial nurse, narcotics agent and customs agent, as well as two arrest records.

One body, identified by relatives on the basis of a broken tooth, was proved by a fingerprint check not to be identical with the supposed victim. The experts of the Single Fingerprint Section later identified an entirely different body as that of the man sought by his relatives.

A month and a half after the Noronic disaster, on November 1, 1949, shortly before noon, a commercial air liner coming in for a landing at the Washington, D. C., National Airport, was struck by a smaller plane and crashed on the shore of the Potomac River, killing all 55 persons aboard. FBI identification experts were again called into service. Twenty of the victims had been promptly identified without fingerprinting. Of the 35 remaining unknown deceased, 22 were positively identified by their fingerprints on the basis of records on file in the FBI Identification Division. The remaining 13 were later identified by other means.

There follows a statistical summary of the Identification Division's accomplishments for the 1950 fiscal year.

	Fiscal Year 1950
Prints received and retained:	
Criminal (including suspects)	1,267,298
Alien Registration	346,217
Personal Identification	12,424
Loyalty Program	268,879
Miscellaneous	443,436
Total number of prints received and retained	2,338,254
Total number of prints received	3,068,640
Daily average of prints received	12,129
Total number of identifications answered	1,010,497
Percentage of criminal identifications	68.55
Number of contributors	12,168
Number of foreign countries and Territories cooperating with the FBI in the International Exchange of Fingerprints	80
Prints transmitted to foreign countries	1,597
Identifications made in foreign countries	181
Approximate percentage of identifications	11.33
Prints received from foreign countries	15,136
Identifications made by the FBI for foreign countries	3,180
Percentage of identifications	21
Number of fugitives identified by fingerprint searches	10,371
Prints of unknown dead received	1,698
Prints of unknown dead identified	1,301
Prints in FBI possession at close of fiscal year	
Criminal (including suspects)	20,395,749
Prisoner of War	358,735
Alien Registration	6,549,680
Personal Identification	5,295,634
Miscellaneous	70,028,703
Civil Service	8,959,896
Loyalty Program	2,768,350
Total prints in FBI possession	114,356,747
Number of latent fingerprint examinations requested and made	4,907

FBI LABORATORY

The FBI Laboratory was officially opened November 24, 1932, with one scientist and a handful of scientific instruments comprising its personnel and equipment. During the 1950 fiscal year its many highly trained technicians, with the most modern scientific equipment at their disposal,

conducted more than 100,000 examinations for the FBI, for other Federal agencies, and for non-Federal law enforcement agencies in every state in the Union as well as various Territories.

These scientific examinations were performed pursuant to 23,462 requests involving 86,008 individual specimens. The continually increasing recognition of the value of these laboratory services without cost to state and local law enforcement agencies is reflected by the 15 per cent increase during the 1950 fiscal year over the number of requests from such agencies for the preceding twelve month period.

The distribution as to types of the 100,540 examinations made during 1950 is shown in the table that follows.

	Fiscal Year 1950
Cryptanalysis and Translation Section:	
Cryptanalysis	8,369
Translation	17,215
Total	25,584
Document Section:	
Charred paper examinations	16
Handwriting and handprinting	43,162
Indented writing	181
Ink and pencil examinations	124
Latent treatments	1,904
Obliterated writing	425
Paper examinations	1,823
Photographic examinations	37
Portrait parle examinations	13
Shoeprint examinations	344
Tiretread examinations	67
Typewriting and other mechanical impressions	8,610

Total	16,999
Radio and Electrical Section:	
Miscellaneous	1
Total	1
Grand Total	100,540

POLICE TRAINING

In addition to providing initial training for new Special Agent appointees, refresher courses and specialized training for experienced Special Agents, and instruction programs for FBI clerical personnel, the Training and Inspection Division of the FBI carries on extensive training activities, both at FBI Headquarters and in local communities throughout the nation, for the benefit of all duly authorized law enforcement agencies.

FBI National Academy

The FBI National Academy, founded July 29, 1935, offers a twelve week course at Washington, D. C., and nearby Quantico, Virginia, for law enforcement officers who are nominated by their local superiors and are accepted after investigation by the FBI. No fees of any kind are charged. FBI Agents and guest lecturers from specialized fields provide the instruction. Ten weeks are devoted to a general course in law enforcement, two to specialized training in subjects selected by the students' respective official superiors. Emphasis is placed on developing the officers into police instructors and executives. It is significant that more than one-fourth of all graduates actively engaged in law enforcement work on June 30, 1950, were the executive heads of their respective agencies.

Three sessions of the FBI National Academy were conducted during the 1950 fiscal year. The 172 graduates brought the total at the close of the year to 2,196 officers representing each of the United States and every territorial possession as well as a number of foreign countries.

A Retraining Session held September 26-30, 1949, in Washington, D. C., was attended by 450 graduates.

FBI Field Police Training Schools

In order to make available professional law enforcement training to entire departments, and to police officers who are unable to attend the FBI National Academy, the FBI participates in police training schools conducted in local communities throughout the nation. The 2,979 such schools in the 1950 fiscal year constituted a noteworthy increase over the 1,510 recorded in 1949.

The 1950 total included 1,381 specialized schools in firearms, traffic, fingerprinting, practical police problems, and similar special subjects. FBI instruction was provided in response to specific requests by the local authorities in each instance.

Training for Other Federal Agencies

Upon specific request, also, FBI instruction was furnished to investigative personnel of the United States Air Force, the Navy, and the United States Park Police.

Law Enforcement Conferences

During the 1950 fiscal year representatives of the FBI met with police officials of thousands of other law enforcement agencies from all over the United States at 160 law enforcement conferences to discuss common problems, exchange ideas, and to make suggestions for the betterment of law enforcement generally.

UNLAWFUL FLIGHT INVESTIGATIONS

FBI investigations under the Federal Unlawful Flight Statute constitute an invaluable service in the locating of defendants and witnesses in certain categories and making them available to interested local law enforcement agencies. FBI statistical accomplishments in this respect during the 1950 fiscal year are detailed in a prior section entitled "General Investigation."

UNIFORM CRIME REPORTING

In January, 1950, the FBI completed the twentieth year as the national clearinghouse for uniform crime records.

Under the Uniform Crime Reporting Program more than 5,000 cooperating police agencies voluntarily contribute reports concerning offenses known to the police, offenses cleared by arrest, persons charged and found guilty, and the number of police employees.

These data are published semiannually in the Uniform Crime Reports bulletin, the only comprehensive index to the extent and fluctuation of crime in the United States. In addition the bulletin provides information on types of crime, age and race of offenders, geographical concentrations, seasonal variations, and average figures as to the number of police employees, grouped by size and location of the communities concerned. The FBI of course does not vouch for the figures compiled by the various contributing agencies and publishes the figures only as a service to law enforcement.

Approximately 28,000 Uniform Crime Reports bulletins were distributed in the calendar year 1949 to law enforcement agencies, colleges, libraries, criminologists, sociologists, judges and others interested in the crime problem. Police administrators find the publication a valuable yardstick for measuring local problems against the experience of the nation as a whole.

STATEMENT OF J. EDGAR HOOVER, DIRECTOR,
FEDERAL BUREAU OF INVESTIGATION, BEFORE
THE SPECIAL COMMITTEE TO INVESTIGATE
ORGANIZED CRIME IN INTERSTATE COMMERCE
March 26, 1951

The members of this Special Committee of the United States Senate can take pride in its accomplishments during the past few months. You have developed facts which brought out into the open entanglements between the underworld and the upperworld, and unholy alliances between the criminal element and officialdom which established a shocking disregard for law and order.

I know of no other force in American life that can render such a salutary service as a Congressional investigative committee in exposing conditions which are inherently evil. The broad powers vested in such committees give them opportunities not available to the usual investigative process. The very nature of these powers also places upon such committees a responsibility of considerable import.

Apart from securing information to aid in the legislative process, Congressional committees make their greatest contribution by focusing the spotlight of public opinion upon those forces hostile to the best interests of our country.

The work of this Committee to date has made great progress in awakening a public interest in the widespread ramifications of the underworld. Your hearings have been observed by millions of Americans on television screens and they have seen for themselves the arrogant defiance of those who conceal their endeavors and hide behind the protection of the Constitution for which they have so little regard. This awakened interest augurs well for the future. I hope it will result in increased zeal for civic responsibility. May I also express the hope that this Committee will continue its unbiased nonpolitical exposure of the criminal element which has polluted all too many communities of our nation.

There is nothing pleasant in any discussion on the subject of crime. Crime exists because of failures -- failure to prevent delinquency and failure to correct delinquency. Beyond that, there is a failure to prevent crime, a failure to detect crime, a failure to prosecute crime,

a failure to properly deal with crime and a failure to take the profit out of crime.

Since 1940 the population of the United States has increased 14.3% while serious crimes increased 18%. Last year, a total of 1,790,030 serious crimes were committed, or an average of one serious crime every 18 seconds. In an average day last year 301 persons were feloniously killed or assaulted; 146 robberies were perpetrated; 1,129 places were burglarized; 468 cars were stolen; and, in addition, 2861 thefts of other types were committed. Those figures reflect that the American people, day after day, are paying a bitter toll in death, personal sorrow, and financial loss, to the criminal. In 1950 every major classification of crime, except robbery, showed an increase.

The experience of observing the growth of crime in the prohibition era, its sharp decline in the mid-thirties and now its gradual rise convinces me that crime is a problem to be met and solved in each city, town and hamlet. In facing this task one thing is certain -- in those communities where public opinion is enlightened and aroused, crime is at a minimum. In such communities, crime has not become entrenched, it does not enjoy unholy alliances with those in public office, it does not have the protection of the very forces who have a sworn duty to exterminate it and it is unable to secure recruits from established incubators of crime.

Law enforcement is only as effective as the citizens demand. If the community, as a group or as individuals, does not desire effective law enforcement, then there will not be effective law enforcement. That proposition has been abundantly proven. The ultimate responsibility for a crime free community rests at home -- with the citizens of the community itself -- when they assume their responsibility.

The American system of law enforcement is based on the mutual cooperation of national, state and local agencies, each working within the democratic framework of government. Time after time, the strength and validity of this system have been demonstrated. In the 1930's, dangerous criminals, who brazenly flaunted the orderly forces of government, who had a vast network of aid and assistance, who were glorified by sentimentalists, were finally brought to justice when the American public became sufficiently aroused to demand and support the campaign which brought about their destruction. During the war, the manifold problems arising from the national defense of the Nation were efficiently and expeditiously handled in this manner.

This nation has no need for a national police force. Cries frequently are heard that America, to meet "the problems of the day," must create a master, over-all law enforcement agency, whose authority would extend to every nook and cranny of the nation. I disagree with this attitude. My experience has demonstrated that the present system of law enforcement, national, state and local, is the best system. The peace officer must be the servant of the people -- protecting their interests and

responding to their will. The law enforcement agency must be an integral part of the community. Otherwise, the American system of democratic government would be defiled.

There can be no concealment of the fact that law enforcement has not always performed at peak expectations. The fault is not in the system but in the way it works. The American people, if they desire competent, efficient and effective administration of justice, must be willing to provide financial means; moral support; and a practical realization of the responsibilities of citizenship. A police department, under-staffed, under-paid, and ill-equipped, cannot properly fulfill its duties. Lack of public interest may allow a small minority of peace officers, aided and abetted by corrupt politicians, crooked prosecutors and underworld "fixers," to bring shame upon the profession. Action is needed, not to revamp the fundamental structure of American law enforcement, but to strengthen, in technical skill, character and esprit de corps, the existing institutions.

I think the time has come for some straight thinking on the subject of responsibility. All too frequently in the past few years, there has been too much "buck passing" to the Federal Government. Too frequently, when pressures mount in local communities by reason of dissatisfaction with conditions, leaders, either to escape the wrath of citizens or to conceal their own inability to cope with situations, have advanced the alibi that "This is a job for the Federal Government." The time has come to take stock. The Federal Government can never be a satisfactory substitute for local self-government in the enforcement field.

The experience of people in other lands who suddenly found themselves living in a totalitarian state discloses that always the trend started with people in local communities being unable or unwilling to take care of local situations. I hope that day never comes to America, as our way of life is too precious to be supplanted by either a Socialist, Fascist or Communist form of government.

The mere fact that conditions have been exposed which are shocking, to say the least, is no reason to depart from our traditional concepts of Constitutional government. In the deplorable conditions which have been exposed, it was not the system that was at fault but the men who were responsible for its proper functioning and, more important, the citizens who failed to raise their voices or to exercise their responsibility at the ballot box.

Federal law enforcement, however, has a role to play which is a vitally important one. A Federal law enforcement agency must always be willing to lend all possible assistance to local agencies without usurping local functions, prerogatives or jurisdiction. That always has been and is today the policy of the FBI. The Federal Bureau of Investigation has the responsibility for investigating alleged violations of certain specified Federal criminal statutes. That responsibility is definitely fixed and is

well known. In the event we fail to perform our duties incident to such responsibility, the public would know what agency to hold responsible.

In the absence of a specific Federal Statute, the FBI is not authorized to conduct any investigation of what is strictly a local violation. Yet, there are many services of a coordinating and clearinghouse type which the FBI is able to offer for local law enforcement officers in connection with the enforcement of local laws. The FBI Laboratory receives evidence from local law enforcement officials and its scientists make a study of the evidence submitted and prepare a report of their findings. In the event testimony is desired, the scientists will testify in the local courts and these services of examination and testimony are available to all police agencies without cost.

The FBI Fingerprint Identification Division is another service established by Congress to assist local officers. This service includes the furnishing of criminal records based upon fingerprints, latent fingerprint identification, the filing of wanted notices for individuals whose apprehension is desired, the identification of unknown dead, the location of missing persons and similar identification services.

The facilities of the FBI National Academy are available to local, county and state police agencies for select representatives to receive training as police executives and as police instructors and upon request, assistance will be given in local police training schools. These are some of the FBI cooperative services which are available and which are made use of by the local police throughout the country on a voluntary basis.

There is no mystery about good law enforcement. It merely applies to crime detection the same principles of efficiency necessary to any well organized business. Regardless of the potential effectiveness of law enforcement agencies as such, they are powerless to give their full measure of protection unless properly supported. Your Committee has inquired into the reasons why crime exists in those communities where you have found it thriving and prospering. The people of each community need to do as you have done -- endeavor to seek answers to such questions as: What has happened to the important cases which were in the newspaper headlines a few months ago? Were they vigorously prosecuted, or were the felons allowed delay after delay while witnesses disappeared, and the final court room scene became a mere mockery of the law? Were juries tampered with, witnesses intimidated, perjury suborned? Did the criminal in a serious crime get off easier than some wayward youth who stole a car or burglarized a store while hungry? Are the operators of vice dens excused from prosecution by the paying of a mere fine which amounts to a license to traffic in human flesh? Are criminals allowed by the courts and prosecuting attorneys to plead guilty to a lesser offense than the one charged and thus receive a shorter sentence? Are convicted criminals afforded special opportunities and privileges in prison? Do public officials live beyond their means?

Are there slot machines in drug stores and restaurants? Does gambling thrive? Are there bookmaking joints on every corner? Who controls the numbers racket? Is vice kept at an irreducible minimum, or does it contaminate most sections of the city?

If vice conditions exist, who is responsible? Are there alliances between the beneficiaries of crime and officialdom? If there are, a few aroused citizens can accomplish more than the enactment of new legislation because the underworld cannot stand exposure. One vigorous crusading newspaper which does not pull its punches can do more to build up a will to enforce existing laws than the enactment of new laws which shift responsibility from local authorities and provide an alibi for their failures.

The solution of the crime problem is a simple matter: Enforce existing laws fairly and impartially, vigorously and relentlessly, and mobilize the full force of every medium of education as to the facts about crime.

I have no sympathy with the position of those who constantly are urging against the publication of information on crime. In fact, I would urge the dissemination of more information on crime which puts crime in its proper perspective and reveals it in all its horror and filth, and revolting character. Only in that way can public lethargy be forced into action.

I have always had great respect for the role of the Grand Jury in our system of criminal law enforcement. The broad powers of the Grand Jury give it ample authority, at periodic intervals, to inquire into the state of law enforcement in the various communities. I hazard the guess that if on an annual basis a Grand Jury scrutinized the administration of justice in every community in the land this would have a salutary effect.

Those who engage in widespread vice activities and rackets could not long survive without their ally -- the political renegade. No community in the land is contaminated by rackets and corruption without the assistance of local interests which hold law enforcement in restraint. Law enforcement officers are the peoples' representatives. They are not persons with unlimited power; they must obey those under whom they hold office. If they are dominated by the criminal-aligned politician, ruthless rackets and vice are inevitable. The law enforcement officials in our Nation, for the most part, are honest and anxious to do a good job. Regardless of their personal honesty, however, they are frequently powerless to act. Only aroused and enlightened citizens can take the handcuffs off their wrists and place them where they belong, upon the racketeers, criminals and corrupt politicians.

Too frequently, the police of the nation have been shackled not only by higher-ups but by technicalities of the law which make it virtually impossible for them to discharge their duty. The rights of every person must, of course, be protected -- even the criminal -- but there are occasions when the criminal has every break in his favor and the officer has every conceivable obstacle thrust in his pathway.

After thoroughly scrutinizing law enforcement the next question is: What do you know about the judiciary in the community? Is it a fountainhead of justice, or is it controlled by entrenched interests? Do the courts protect the innocent, the poor and the uneducated with the same vigor they do the privileged? Are the courts quick to detect perjury and vigorous in demanding action? If the robes of justice are not clean, then society and individuals are not secure. And the prosecutors, do they seek justice for society and the accused as well: or do they safeguard the interests of the accused by Grand Jury white-washing or improperly prepared cases?

I have always felt that the basic reason we saw the underworld develop and acquire a status during the prohibition era was attributable to two factors. The first is a simple one, public opinion was not mobilized behind enforcement. There was a lack of interest, determination and zeal on the part of large numbers of our citizens to make sure that the law was enforced.

The second reason follows: There was a widespread breakdown of law and order because the basic responsibility for enforcing the prohibition laws was not given to the "home town police," but was given to Federal authorities. A vast Federal Agency, try as it would, soon was facing the unwholesome fact that local underworld forces were being protected by local enforcement interests and the sad result was the rise of gangsterism. The sad experience of that era should be too fresh in our minds to make the same mistake again.

The widespread ramifications of the present gambling interests in my opinion are in many respects similar to the underworld alliances of the prohibition era.

The gambling problem must be viewed as a phase of the entire crime picture. Organized gambling is a vicious evil. It corrupts our youth and blights the lives of adults. It becomes the springboard for other crimes: embezzlement, robbery, even murder. But, like any other type of crime, it can be controlled. If the laws against gambling presently on the state and local statute books were earnestly and vigorously enforced, organized gambling could be eliminated within 48 hours in any community in the land. No criminal, the gambler and his allies included, can long stand up before a determined, intelligent and informed public opinion. That, in my opinion, is the basic answer to the gambling problem: an aroused public opinion which will act on a local level through local law enforcement authorities to wipe out this menace.

In many communities local and state laws prohibit gambling but, nevertheless, several forms of gambling exist. In others "betting" is legalized but bookmaking is banned. We may hear that this gambling is beyond the control of local authorities and cannot be suppressed because of its direction by national figures who reside across state lines. In just such instances, demands arise for Federal action or Federal legislation to eliminate the gambling and the gamblers from the community. What really is needed is not more laws but the will to enforce those laws already on the statute books.

I believe that in any town where gambling flourishes local gambling czars can be found. The gambling element may be headed by one man who controls all the various gambling activities, but frequently gamblers have by agreement divided the community geographically or by types of activity, each under its special gambling czar.

I submit that these local gambling czars stand at the very center of gambling in this country. The local overlord of gambling is an all-powerful figure in his community. He is the individual who controls the gambling outlets, the "bookie joints," the runners, the slot machines and the gambling centers. He is the man who controls the so-called mobs, pays for or arranges for protection and is the directing energy of the entire mob of criminality which protects such activities in the local community.

Without question, these local czars have common purposes and working tools, and may well have contacts with national figures in gambling, the so-called tycoons of the underworld. But these same national figures are themselves dependent, in their operations, upon the local gambling czars. If you would strike at the national ramifications of gambling, the only effective way I know to do the job permanently is to blast the foundation out from under them.

The evils of gang wars, gambling, vice, political corruption and organized crime can be eliminated from the American scene. The fundamental solution lies in aroused and awakened citizens, militantly demanding the action which will eliminate the gambling czar, the crook and the venal politician. Blast the foundation of the local gambling czar, by vigorously enforcing the statutes against gambling without fear or favor and he will collapse and, like a house of cards, the vast pyramid of gambling will collapse.

Local citizens must unite in surveying their communities to see that their law enforcement agencies have the manpower, the technical facilities and the will to combat the criminal menace. Vigorous enforcement of local laws will eliminate gambling in those communities where gambling has been outlawed by statute. This is the solution of the problem.

The extent of organized crime in the United States is a national disgrace. The very fact that we have a crime problem reflects an evil of even greater import. The American home too often does not occupy the place in our national life that it did at the turn of the century. We are in a state of moral depression. The breakdown of the home is both a cause and a result. The bad state of affairs in too many of our schools is another result. In many instances any semblance of religious training is barred and the mentioning of God is frowned upon while espousers of godless communism carry on under the guise of academic freedom.

No nation ever won a war unless its people were united and dedicated to the common cause.

We can never have a crime-free America until all who stand for law and order are united and determined to mobilize against those who constitute our army of lawlessness. Only a return to the fundamentals upon which this Nation was founded -- a moral reawakening -- a revitalized spirit and a rededication of service to our fellow man -- can make this a reality.

COMMUNIST THREAT IN U.S.

AN INTERVIEW WITH J. EDGAR HOOVER

Director, Federal Bureau of Investigation

EDITOR'S NOTE: *How much of a threat are Communists to the security of the United States? How can the average citizen recognize Communists? Does a drive against subversive activity bring "thought control" in its wake?*

To answer these and other questions, U.S. News & World Report *invited to its conference rooms J. Edgar Hoover, the man who fought espionage and sabotage in World War II and, since then, has taken on the problems of Communist infiltration and the possibility of sabotage. The interview follows.*

J. EDGAR HOOVER, *to many people, is the personification of law enforcement. For nearly 27 years he has headed the Federal Bureau of Investigation. He has caught criminals himself, established the FBI Academy for training police officers and made the "G man" a national hero.*

Mr. Hoover started out in life to be a minister. But by the time he finished high school he had determined to become a lawyer. He entered the Department of Justice as a file reviewer, was appointed to the FBI in 1921, became its chief in 1924.

Q *Is there a public misconception, Mr. Hoover, of the functions of the FBI?*

A Yes. In the public mind any investigation is often associated with the FBI. This is particularly true in connection with matters pertaining to internal security. The public is aware of the FBI's responsibility for the investigation of espionage, sabotage and subversive activities. Other phases relating to internal security have been assigned to other agencies of Government—illegal entry of aliens to the Immigration and Naturalization Service; the physical security and guarding of atomic installations to the Atomic Energy Commission, and plant protection to the Munitions Board.

The Munitions Board has the responsibility for establishing standards, policies and procedures of security for industries producing defense materials. The FBI has no responsibility whatsoever for physical security within a plant.

Q *What is the biggest single menace, so to speak, that we have to be on guard against?*

A Our most urgent objective is to prevent any disruption of our mobilization program, and we must take every preventive step possible to safeguard our productive might should we be faced with a grave national emergency. The most important single menace to our internal security is the Communist Party, U. S. A., its members, fellow travelers and sympathizers.

Q *You mean if there should be war there would probably be activity on the part of our enemies here?*

A There is no question as to that and an analogy can be drawn from the events of Dec. 7, 1941. Prior to that time there was widespread speculation that an outbreak of sabotage was soon to occur. It didn't occur. And one of the primary reasons it didn't was because of years of concentrated effort by the FBI. Potential saboteurs had been identified. When war did come it was possible to effect their apprehension promptly and take those regarded as dangerous before hearing boards to judge their cases. The FBI, of course, does not pass upon guilt or innocence.

Q *Are the Communists active now?*

A They are exceedingly active.

Q *By "active" do you mean that they are putting themselves in a position to commit acts of sabotage?*

A While there has been a decline in Communist Party strength, this simply means that the Party has purged itself of those concerning whom it had doubts. Others have dropped out of the party because of the pressure of public opinion, or because of a fear of legislation which has been enacted on local, county, State and federal levels. Then there is another group which has been taken out of the active membership of the party and has gone underground for possible action at a later date.

Q *The numbers that you have in this chart (see page 35)—does that represent the net remainder?*

A That represents the total number of avowed members of the party. The party hasn't issued cards for three years.

Q *Do you feel that these members of the party are potential enemies, or might be involved in actual espionage?*

A Every avowed Communist, every "hard core" Communist, every indoctrinated Communist inher-

Allegiance to Moscow, Not to America . . . Labor's Battle Against Communists . . . Why U. S. Can't Have a 'Gestapo'

ently owes an allegiance to a way of life different from that of the average American citizen.

Q *Does that mean that he doesn't necessarily owe allegiance to the Moscow Government?*

A No. He owes allegiance to the science of Marxism-Leninism and his motherland is the Soviet Union.

Q *Yet he might be in favor of revolution in this country in order to introduce Marxism, and still not wish to have it controlled by Russia—could you draw that distinction?*

A I don't think you can draw such a distinction.

Q *Do you think that Communism is Moscow-led?*

A The record speaks for itself. The Communist Party in the United States from its inception has never deviated from the Moscow line.

Q *You think, in other words, they owe allegiance to Moscow rather than to the United States?*

A There is no question about it.

Q *And you think that these people, if they really were to tell the truth, would have to admit that they prefer to have Moscow rather than Washington run the United States?*

A Very definitely.

Q *How do you arrive at that conclusion—what evidence do you have of that?*

A The evidence is clear and unequivocal on that point. It was established in the trial of the eleven Communist leaders in New York. It has been developed through the testimony of old-time Communists who have broken with the Communist Party, and the best evidence, of course, is the record which, as I indicated a moment ago, shows that the Communist Party in the United States has never deviated from the Moscow line from the time of its inception until the present time.

Q *You mean every little whim of Stalin has been followed by a veering of the line over here?*

A Yes.

Agents Follow Communists Underground

Q *When you say that the Communist Party "has gone underground," or has become more and more an "underground" organization, what do you mean?*

A By that I mean that all that remains of the Communist Party at the present time above ground is a self-constituted core, which for appearance's sake maintains a public contact. As a manifestation of what is meant by the Party "going underground" we might point to the fact that members of the Communist Party have increasingly taken up activities in other groups, in other organizations and fronts. The party itself has not issued membership cards for some three years, and there has been a rather drastic decentralization in the operation of the party. They are holding fewer and fewer public meetings.

The members have been conditioned, during the past few years, to act on their own by applying the fundamentals of Marxism-Leninism to the problem at hand. Membership records no longer exist, Communist Party clubs, which at one time would number a hundred people, have been broken down into groups which have only three to five members today. The very actions of the individuals give a pretty clear picture of the fact that they don't want to be out in the open. They're sending couriers from district to district, and by word of mouth are passing out party orders.

Q *Do you have a means of checking up on them just the same, even though they have "gone underground"?*

A Oh, yes.

Q *You have undercover agents in various parts of the United States?*

A Yes. This technique is necessary in keeping abreast with clandestine operations of any subversive organization.

Party Punishes 'Guilt by Suspicion'

Q *Do they trust party loyalty any more?*

A They have a very strict loyalty program of their own which has resolved all doubts against the individual, and if there has been the slightest suspicion he has been expelled from the party.

Q *They are thrown out by means of "guilt by association," are they not?*

A I think they go a step further—"guilt by suspicion."

Q *In other words, no matter what your reputation is, they won't accept it if they want to accuse you?*

A That's right.

Q *What are their means of punishment?*

A Their chief means, of course, is to expel an individual from the party.

Q *Isn't it quite a severe penalty to a conscientious Communist to be expelled?*

A Yes, and not only that but expulsion carries with it not only ostracization from old friends in the party, but brings down upon the individual vituperation and the recommended party treatment for so-called stool pigeons.

Q *Do you feel that their loyalty test is fair to the little fellow who is really a conscientious Communist?*

A From the standpoint of fairness I would say that Communists have falsely accused some of their mem-

(Continued on page 34)

bers who were innocent of charges of furnishing information to the FBI.

Q *A number like 43,217 Communists in America—so few, comparatively—can they be dangerous?*

A It must be remembered that there are actually six levels to the Communist Party. In the first instance, you have the professional Communist who was referred to in other years as the card-carrying member of the party. Secondly, there is the concealed Communist. Then there are the sympathizer, the fellow-traveler, the innocent who has been duped by the Communists, and, finally, there is the opportunist. The Communists themselves have made the boast that for every party member there are 10 others ready, willing and able to do the party's work.

Q *What do you think the strategically placed Communist could do in the event an emergency occurred—what types of dangers do they present?*

A There is always the fear of sabotage in vital areas. There is the ever-present danger of stirring up domestic strife, creating disturbances, bringing about slowdowns in industry. We saw the Communist at work during the period of the Berlin-Moscow pact, when for practical purposes certain aircraft plants were shut down as a result of the actions of a small group of Communists. Then, too, the party serves as a base for recruits for the Soviet espionage service.

Q *Is that a real service?*

A Very definitely.

Q *The FBI has told the public to watch out for specific matters, such as foreign submarine landings. Have you had any reason to believe that will happen?*

A It has been only a few short years since the Nazis landed eight men by submarine on our shores.

Q *Couldn't Communists just come walking over our Southern border?*

A As we become more security conscious and tighten up our security they will find it far more difficult.

Of Parachutists and Poison

Q *What is there to the suspicion about parachute landings—what makes you think they may happen?*

A We received any number of reports during World War II of alleged parachute landings. In a few instances there was some delay in reporting that information to the authorities with the consequent result that rumors became rife and near panic resulted in certain areas.

Q *In other words, the planting of rumors for the purpose of causing panic?*

A That's correct. But if there are reports or suspicions to that effect, then the information should be given to the FBI very promptly.

Q *What is the theory about the poisoning of the public water supplies—aren't you guarding those pretty carefully?*

A The FBI does not have the responsibility of guarding the water supply. That responsibility belongs to the local authorities and other agencies.

Q *You speak of various activities of a suspicious nature the public may hear about, such as individuals loitering in a restricted area. That would be a matter to report to local police rather than the FBI, wouldn't it?*

A It would depend, of course, on the area. If it were a military reservation, either the military or the FBI should be notified at once.

If it were a public utility, the local police should receive the report. In any event, if there were any basis for suspicion of espionage, sabotage or subversive activities, the information should also be reported to the FBI because subversive activities are nationwide in their scope of operation. An individual loitering in an isolated restricted area may very well come from some point far removed, and the local authorities would have no reason to have knowledge of his background. On the other hand, the FBI might very well have information on him. It is conceivable that he might be one of the individuals who had dropped out of the Communist Party for underground service for the party.

Cleanup by the Unions

Q *What is the activity of Communists inside labor unions, according to the information you have?*

A We, of course, do not investigate labor unions, nor do we concern ourselves with employer-employe relationships. We have, however, investigated innumerable instances of Communist infiltration into labor unions. The Communists today do not have the power that they once had, nor do they have the influence they once had in labor unions. The great majority of labor leaders and organizations are alert to Communist infiltration.

Q *They have done a good job in cleaning them out?*

A They've done an excellent job.

Q *And the labor unions and their leaders have cooperated to the fullest extent with the FBI?*

A That's right, in the great majority of instances.

Q *Is it possible, however, that even they may not be able to detect all the Communists?*

A It is entirely possible that a concealed Communist may hide in the most unsuspected and unlikely place.

Q *Couldn't he cause trouble even if he weren't an officer but merely a malcontent?*

A Definitely.

Q *By stirring up the men on some issue?*

A Yes.

Q *Is there evidence that that kind of thing goes on in some labor unions?*

A There has been evidence that it has occurred.

Q *In other words, when they cleaned out these Communists from the labor unions, did we get from*

. . . 'The very essence of Communism is deceit'

it an idea of how the Communists worked and what they did in the labor unions?

A Ordinarily they would try to get their members into positions of influence in the union, have them become officers wherever possible. They would have a Communist bloc at the meetings, which would usually be the first to arrive and the last to leave. They studied the issues, were very glib on their feet and were trained to speak on issues. They gave an excellent account of their ability to heckle and harass other speakers and officers. In filibustering they had few equals.

Q *It may be that many of our labor leaders were ignorant of these techniques?*

A I am sure that patriotic and loyal labor leaders are now aware of their tactics.

Q *So that popular education on the subject of the techniques of the Communists is essential?*

A Yes. Education is one of the most important factors in combating Communism. Communism cannot compete with our own American way of life, and that is one of the reasons why the Communists employ deceit. The very essence of Communism is deceit, and only by constant education in the truth can you really combat Communism, on a long-range, permanent basis.

Q *Are there any distinguishing characteristics—or is there any way you can spot a Communist?*

A By their actions.

Q *They don't look different?*

A No.

Q *Do you feel that there is less of a tendency to scoff at the charge that we have a lot more Communists in America today than there were, say, five years ago?*

A I think the public has been educated to a great extent. Legislative investigating committees and the press have helped in the process of educating the public.

Q *Would you say it was a favorite Communist technique to belittle the amount of Communist activity here?*

A Very definitely.

Q *Have you seen evidence of that?*

A As an illustration, a few years ago there was a Communist Action group which was hard pressed in a given area, primarily through the energetic efforts of a few individuals. So to counteract these few anti-Communists, the Communists developed a technique: Whenever anybody would denounce Communists, they would say, "What's wrong with being a Communist?" And the average person had given little thought to the subject. They knew they didn't like Communism, but were at a disadvantage with a trained Communist agitator.

Q *You spoke a moment ago about their being*

(Continued on page 36)

© 1951, By U. S. News Pub. Corp.

"trained in deceit." Do you think that they hesitate to lie under oath?

A I don't think there is any question but that they would lie under oath, if it would further the Communist aim.

Q *In other words, they would issue denials promptly when they are charged with being Communists?*

A Yes. A fundamental premise of Marxism-Leninism is that whatever advances the Communist cause is moral.

Why Communists Go to Court

Q *Is part of their technique to take accusations to court, or before some tribunal—would they intimidate that way?*

A There have been instances where they have been quick to file libel suits.

Q *That would be for the purpose of throwing their accusers off the track?*

A Partially, and to discourage others from making similar charges.

Q *In the various cases you have investigated, have you had many instances in which Communists had previously lied under oath before the full facts and the truth was developed?*

A Yes. There have been several instances of that type.

Q *Have you any reason to believe that those who lie under oath do so as a result of their loyalty to the party, which commands them to do it, or would you say they are just congenital liars?*

A I would say it's a dedication to the principle of Marxism-Leninism.

Q *In other words, the end justifies the means?*

A That's right.

Q *Are you always able to prove that they are lying?*

A Not always. To prove that they are engaging in falsehood it is necessary to have legal evidence. Sometimes this proof is most difficult to obtain.

Q *Do you have many Communists who are under suspicion, whom you are actually watching through your operatives from day to day? Are you watching a lot of people?*

A We have a relatively small force when you take into consideration that there is approximately one special agent to every 29,000 inhabitants in this country. With some 43,217 members of the Communist Party, and only 5,200 agents—it's a physical impossibility to keep all of them under surveillance.

Local Authorities Help

Q *What co-operation do you get from local authorities?*

A We have excellent co-operation from the local authorities. Our policy is to devote our energies and man power on a selective basis, and watch carefully those who we feel are potentially the most dangerous, and who are engaged in definite subversive activity.

Q *Don't we often hear the statement made that we are developing a "police state?" What is your answer to that?*

A So far as the FBI is concerned, the best answer is to look at the record. As a matter of policy the FBI does not undertake any activity unless it is pursuant to congressional directive or executive directive. The FBI must constantly justify its procedures and policies to the Department of Justice, to the Attorney General and his assistants, to the Budget Bureau, and, on an annual basis, it must go before the appropriation committees of the House of Representatives and the Senate.

Q *Could there be abuses by individual agents without your detecting them?*

A The FBI is a human agency and it can make mistakes, but when these occur you can be certain that we will hear about them and in such instances we always make a full inquiry into the facts. Our work is constantly under the scrutiny of the courts and other authorities, and we could not long survive if there were abuses.

Q *In other words, the safeguard of this country is the fact that when you have had somebody confined he is entitled to a fair trial and special counsel?*

A And the FBI does not arrest anybody on its own initiative. Arrests are made only after the facts have been presented to the appropriate prosecuting authorities, who evaluate the evidence and arrive at a decision as to whether or not prosecutive action should take place.

'Thought Control' Denied

Q *What would you say to the charge often made that we are engaging in the practice of "thought control" with our constant watching of the activities of Communists?*

A The FBI is concerned not with what Communists think but with what they do—their actions, just as in every other field of its investigative activity. There is no scintilla of evidence to substantiate the charge that the FBI is engaged in "thought control" activities.

Q *What about disapproving speakers?*

A The FBI does not approve or disapprove of speakers. That is not our concern.

Q *It doesn't have a record on them for which someone can write in to you?*

A No, sir. The files of the FBI are confidential, and the contents cannot be used for that purpose.

Q *Does the FBI gather data on important persons or Government officials?*

A There is no basis in fact for that.

We do not investigate anyone unless there is an allegation which, if true, comes within a congressional or executive directive assigned to the FBI.

Q *What would you say to the statement which is*

. . . 'Communist Party is subservient to Soviet foreign policy'

often made that, after all, the Communist Party isn't really different from the Republican Party or the Democratic Party? Isn't it argued that it is a political party, and as such shouldn't have any more interference than any other political party would have?

A The record provides the answer to your question. If the Communist Party had the same aims and objectives as the Republican or Democratic Party they would not be "going underground" nor would they seek to conceal their activities as they do. The concept that they are a political party is primarily derived from the Communists' own propaganda which is designed to defend their activities.

Q *Have you ever seen any record of the Communist Party filing publicly the sources of its funds, as the Republican and Democratic parties do?*

A No. There is no question about that.

Q *Don't the people who furnish money to the Communists try to hide that?*

A Definitely.

Q *Is that possibly due to public opprobrium, or is it because they get themselves into trouble—what is the reason for hiding their finances?*

A I think there are two basic reasons: one, they want no evidence of their link with the Communist Party and, two, they are fearful of the repercussions of public opinion.

Power From President and Congress

Q *What is the FBI's authority to keep track of the Communists?*

A The President of the United States has, by directive, placed the responsibility upon the FBI of receiving all information on subversive activities, and, likewise, to co-ordinate all investigation of espionage, sabotage and other related matters. Then, too, the Smith Act passed by Congress in 1940 makes it a crime to advocate the overthrow of the Government of the United States by force and violence. The eleven Communist leaders were convicted of violating this Act. Also the Internal Security Act of 1950 places certain responsibilities upon us. That statute also provides that individuals fitting into a certain category in time of war would be subject to detention.

Q *Would you say, then, that if the Communist Party operated as the Republican or Democratic Party and confined itself to a mere discussion of some different economic system than we have, you wouldn't be spending your time worrying about it?*

A But the Communist Party would never do that because the Communist Party is a way of life, and their ultimate objective is to destroy our way of life by violence rather than by constitutional means.

Q *If that's the case, would you say that it is the link between the Communist Party and this plot to overthrow our Government that differentiates them from the usual political party?*

A That is one factor. In addition, the Communist Party, as evidenced by the record, is subservient to Soviet foreign policy. It has no regard for our traditions, no respect for our institutions. It would replace all religion with a Marxist-Leninist philosophy that does not recognize the existence of God; it seeks to infiltrate and corrupt our educational system. In short, there is no basis for comparing the American Communist Party with an American political party. As Justice [Learned] Hand said, in effect, in upholding the conviction of the eleven Communist leaders, you don't have to wait until the country is overthrown before you take action against the person you know is trying to overthrow it.

FBI Against 'Hysteria'

Q *Isn't it possible that by asking for the co-operation of the citizens of the country in reporting subversive activities, some of these citizens may just be encouraged to circulate malicious gossip or idle rumor, and engage in "witch hunts"? Isn't that a danger?*

A I think that citizens co-operating with the FBI provide the greatest barrier you could possibly have against "witch hunts" and hysteria; because, if the citizen has a suspicion, it is his duty to turn it over to the FBI and from that time on do nothing unless he receives a request.

Q *We really have quite a number of investigative agencies in various Government departments, haven't we?*

A That's correct.

Q *It can't be said that we have one single agency which has complete investigative control?*

A That's correct. Each of the investigative agencies is a specialist in its own field.

Q *Do you hold that is a good thing or that they ought to be concentrated in one place?*

A I think it is a healthy situation as each federal agency has its special field of operations. An investigative agency functions best when it is highly mobile and tightly administered.

Protection in Jury Trial

Q *All investigative agencies—when they make an arrest—have to come to a court and prove their case before a judge or jury and the defendant has the right of counsel no matter how poor he is, hasn't he?*

A That is the American way.

Q *So the greatest check against a "Gestapo" in America is our free system of court procedure?*

A A "Gestapo" under the American system would be an impossibility. In addition to the protection of our courts and Congress we have a free press, which would quickly spot injustices or any excesses on the part of any Government agency.

Q *Does the Communist system offer any such benefits or protection?*

A None whatever.

Mr. Edward R. Murrow
Columbia Broadcasting Corporation
485 Madison Avenue
New York 22, New York

Dear Ed:

I have just discussed with Lindey your letter in regard to our bill. I'll take any amount you send but I think you ought to get the facts clear in your mind.

First of all, Columbia Records appraised the value of the gift in excess of $12,000. It is true that the royalties thus far paid (covering the period ending December 31, 1950) have amounted to $2,680.44. On the basis of Columbia's appraisal, royalties will continue for years.

I assume that the beneficiaries of your gift are in low income brackets. They will keep most of the income they get. If you had gotten the income, I imagine you would have kept about 25% of it. I doubt if the recipients paid 25%. On some such rough calculations, you can figure out the very substantial dollar savings resulting from the advice we gave. Moreover, Jap will tell you of the complications that arose which required extra work.

I am off to Egypt and Greece for a few weeks. I will get in touch with you when I get back.

Best to you,

Yours,

Morris L. Ernst

New York 17, New York

Gentlemen:

I acknowledge receipt of your bill of March 1 for the sum of $500 for professional services rendered in connection with gift of interest in I CAN HEAR IT NOW, VOLUME III.

In my youth, I was informed that "the gift without the giver is bare". Your accounting, in this instance, leaves the giver practically bare inasmuch as the total of the gift was not in excess of $2000. Moreover, I am informed that this particular gift of interest involves no more than the routine preparation of legal papers. If you insist, I shall of course pay this account as rendered, but I regard it as "inflated".

Sincerely yours,

Re: I CAN HEAR IT NOW, VOLUME III

Dear Mr. Murrow:

As you know, all the details in connection with the gift of your interest in I Can Hear It Now, Volume III, to Ethel Murrow and Charles H. Brewster have now been completed.

I assume that your tax man will take care of the filing of your donor's information return; and that donees' returns will likewise be filed.

I am sending along a bill for our services. I sincerely trust that you will find it in order.

Cordially,

Alexander Lindey

New York 22, N.Y.

Dear Ed:

I read every word of the Massing book. I was in no position to affirm or disaffirm each and every detail of her book. I had checked with the government authorities as to her general credibility, knew that since she left the Party she had been of great value to the nation, and have followed her work in the American Civil Liberties Union. I think the point I tried to make in the Foreword is more important than Miss Massing's interpretation of any isolated event. There are other items on which people differ even more violently than the Duggan story. Incidentally, Laurence Duggan was an old and good friend of mine, and I even have fond memories of working with his father years back.

In confidence, I don't think I am going outside of the bounds of what Roger Straus and others had a right to tell. I took the position on that particular item that taste might well have indicated that the name was not to be mentioned and that a footnote might indicate that the reason for the omission of the name was the fact that the party was deceased. In all frankness, I took the position with the previous publisher that there would be much more comment on the episode if it were changed, having once been set forth in the manuscript.

I represented no one professionally in the situation at all but I am writing you fully because I so deeply appreciated your frontal assault. I really don't think I sinned, but at worst it was a question of balancing what I thought was a real contribution which I could make in the Foreword as against other values such as you raise. I don't think I in any way vouched for every word of the manuscript, or indicated that I agreed with every thought. I doubt if I could do that for any book, even one by you !

Incidentally, I doubt if I have any influence or prestige sufficient to sell <u>any</u> books. If you want proof of this I will send you the record of the sales of my own volumes!!!

Best,

Yours,

Morris L. Ernst

P.S. I hope to get that FBI outline shortly.

March 14, 1951

Dear Morris:

It is my inclination and my duty to record what I implied at lunch today. I am appalled that you should have lent the influence and prestige of your name to the Massing book. You surely must have been aware of the statements made by the Attorney General and by the FBI regarding Laurence Duggan.

I liked your forward. It was both wise and tolerant, but I can scarcely believe that you had read the text of the book before writing it.

Sincerely yours,

Mr. Morris Ernst
Greenbaum, Wolf & Ernst

New York, New York

may be copied, reproduced or quoted without permission.

March 7, 1951

Mr. Edward R. Murrow
438 Madison Avenue
New York, N.Y.

Dear Ed:

Seeing you at lunch was quite joyful.

I have gone to work on the FBI program. I will be in Washington tomorrow, Thursday, and will pick up sufficient in a week to give you a complete outline. Frankly, I would like to do a job like this once a month for you, although I don't know exactly why I have this urge. On the one hand I would not mind being paid for such jobs out of the coffers of CBS. In fact, I would rather take their money than yours, although I assume, in the final analysis, any compensation that would flow to me would in reality be paid by Uncle Sam to a very great extent. On the other hand, I would not be interested at all except for the relationship we personally have between us.

I don't need the dough but have long felt that the way to live was a la Robin Hood, taking wealth from those who make it so as to contribute services for nothing for the less lucky ones in life who happen to be the same as the group which is more likely to be pushed around.

I am sending you, for your eyes alone, a batch of subjects I sent to DeWitt Wallace. Some of them may make sense for use for your vast parish. After you have glanced over thermaterial, please return it to me promptly; and bear in mind that it was prepared for a very different medium.

You are a swell guy.

Yours,

Enc

Morris L.Ernst

On re-reading the above, I also want to make clear that entirely aside from anything I have said in this letter, I have been and will continue to be flattered to have you telephone me for hunches that I may have in your field of effort!

OFFICE COMMUNICATION

March 2, 1951

E. R. Murrow

The attached information was sent me by Morris Ernst, he having gotten it from J. Edgar Hoover. This is a follow-up on the little discussion we had at our lunch relating to statistics on numbers of cases.

SO

COLUMBIA BROADCASTING SYSTEM, INC.
485 MADISON AVENUE, NEW YORK 22, N. Y.
WICKERSHAM 2-2000

March 2, 1951

Dear Morris:

Thank you very much for your letter of February 28 with the statistics on the loyalty program which you received from J. Edgar Hoover.

I have learned my lesson -- I am not going to get into arguments with you again.

With all best regards,

Sincerely,

Mr. Morris L. Ernst
285 Madison Avenue
New York 17, N. Y.

BC Mr. Murrow

COPY

February 23, 1951

As of the close of business February 3, 1951, the FBI had completed 13,959 full field loyalty investigations. The latest figure issued by the Civil Service Commission as of December, 1950, on the Loyalty Program reflects that 299 individuals had been dismissed as the result of ineligible determinations. As of December 31, 1950, 8,612 eligible determinations had been made by the Agency and Civil Service Regional Loyalty Boards. The statement of the Civil Service Commission reflects that as of December 31, 1950, the Civil Service Loyalty Review Board had restored, after appeal, 193 individuals to their jobs after they had been previously considered ineligible by Agency or Civil Service Loyalty Boards. In the process of appealing or pending removal were 26 cases.

As of December, 1950, the Civil Service statements reflect that 2,941 employees left the Government service during loyalty investigations or prior to the adjudication of their cases by the Loyalty Hearing Boards.

New York, N.Y.

Dear Ed:

I have got two hunches in regard to books that you might want to take a look at.

1. David Loth, an old friend of mine, has written an intriguing life of Lafayette, entitled THE PEOPLE'S GENERAL. There are parts in it that might be usable by you. I know you don't have time to read many books, so I will digest the parts that are for you, that is, the parts that show that Lafayette was a liberal, not swayed by a majority vote just because he believed in popular rule. On the other hand, he would not knuckle under a dictator, -- take a look at page 242, where he refused to be president although he knew the alternative was getting his head cut off or exile. Also, in the chapter IT IS ENOUGH, see his refusal to serve Napoleon. Note especially page 267, and the bottom of page 278; also his final speech on page 317.

2. Incidentally, boosting the Ernst family, I have asked Knopf to send you a copy of Margaret's new book, which gives the etymological history of words in amusing fashion. You might pick up something from her book for that last bit of "sermonical pap" which you hand out.

3. I got some disturbing comment in regard to two key people at CBS. It was vague so I don't know just where they are from, but I understand it was those two people who caused Hearst to start his attacks.

Yours,

Morris L. Ernst

January 25, 1951

Dear Morris:

You are right, damn it! But maybe the miners, Murrow, and Ernst will be working more days in the future. So far as years are concerned, you have the vision.

As ever yours,

Dear Ed:

Please stop talking about day wage rates. Eighteen dollars a day for a miner is a very deceptive concept unless you know how many days a year the miner works. When I was on the Pennsylvania Coal Commission in 1937, the men worked 168 days a year at what was then the outrageous wage of $7.70 a day.

Miners wives don't live by the day; they live by the year.

Wishing you the same.

Yours,

Morris L. Ernst

Dear Ed:

1. Enclosed find copy of story which Roosevelt sent me, which in a way is still the basic symbol of approach to our international trade problems. I thought you might want to use it some time. I think it was published in England after some conferences I held with the Bank of England during the war. I don't think it has ever been used in the United States.

2. Hold open lunch on Monday, September 19th. A small party is being given to Jim Bruce by my friend Ben Sonnenberg. I have a hunch that Jim will take over Lew Douglas' place. He is an odd, simple guy who did a very great, realistic job in the Argentine. I think you ought to meet him and I am sure he ought to meet you. I will give you further details in a day or two.

3. Did you ever check in on your intriguing idea of donation of radios by Americans to people in other countries? If you do check in, I think you will find that very few small radios carry small wave-length boxes, and that in many countries, because of the absence of electric power, nothing but battery boxes could be used. Moreover, I heard that in Russia, and the satellite countries there is a variation in the kind of current used from that which we use here.

Let me know if there are no insurmountable obstacles in a technical sense, and then I will be happy to pitch with you to see if we can whip up something.

Yours,

Morris L. Ernst

Dear Ed:

David Loth and I have done a book on the mass illusion which occurred from Convention Day to Election Day. It is entitled THE PEOPLE KNOW BEST. I told the publisher to send you a copy even though you are mentioned in the volume and even though there are no personal devils in the inflationary cycle of knowledge that was pumped out to the public with respect to the last election. I really think the thesis of our book is worthy of discussion, namely: Can we defend our great religion of freedom of the press if the media are increasingly out of step with the desires of the people, and incorrectly prophetic as to major events?

~~ourshelf~~
indexed

If in your own channel to the public mind you do not see fit to comment on this volume, won't you drop me a line in case you think we have made a major error. For my part I don't think that the situation can develop in healthy fashion without further public debate.

Best to you,

Yours,

Morris L. Ernst

Dear Mr. Hagerty:

While we are grateful for your opinion of December 4th, we would like very much to have Governor Dewey's opinion on the Specific recommendations of the President's Committee on Civil Rights.

Ever sincerely

Secretray

Mr. James C. Hagerty
Executive Assistant to the Governor
State of New York
Albany, New York

WW:emw

STATE OF NEW YORK
EXECUTIVE DEPARTMENT
ALBANY

December 4, 1947.

Mr. Walter White, Secretary,
National Association for the
Advancement of Colored People,
20 West 40th Street,
New York 18, New York

Dear Mr. White:

On behalf of Governor Dewey I acknowledge your letter of November 14th in which you enclosed a copy of the report of the President's Committee on Civil Rights.

A carful reading of the recommendations lead me to believe that the State of New York, under Governor Dewey's leadership, has already taken many of the steps which the report recommends.

As you no doubt know, NewYork State, on the Governor's recommendation, was the first state in the Union to adopt a comprehensive Anti-discrimination Law. This Law has been operating in our State since July 1, 1945, with complete success. The New York State Commission Against Discrimination has built up an enviable record of handling hundreds of complaints which have come before it and have been largely instrumental in breaking down prejudices which formerly existed in the employment of citizens in our State because of race, color, creed or national origin.

As a matter of fact, the New York State Law has served as a model for similar laws in many sections of our country and also as a model for the Fair Trades Employment Act, which was introduced recently by Senator Irving M. Ives, of NewYork State, in the Senate of the United States.

Sincerely yours,

James C. Hagerty

June 25, 1947.

Mr. Edward R. Murrow
Columbia Broadcasting System, Inc.
485 Madison Avenue
New York, N.Y.

Dear Ed:

I am just in town for a few days and I want to write to congratulate you on the newspaper program. In a very profound way this experiment may be the most important pro-freedom move made in the United States in the last decade, that is, if we really believe that truth can win out in the market place and that the only real corrective in life for institutions and individuals is criticism. And by that I do not mean only adverse criticism.

I like you.

Yours,

Dear _____:

Mr. Edward R. Murrow has sent on to me your recent gracious letter to him. The CBS Television Network is glad to have this expression of your views.

As to the replacement of Mr. Murrow by Arthur Godfrey during the Murrow sabbatical year, you may be interested to know that Mr. Murrow himself included Mr. Godfrey's name on his list of suggested substitutes.

I think that if you give Mr. Godfrey a chance, you will be pleasantly surprised.

Sincerely yours,

Hubbell Robinson, Jr.

10:45 - 11:00 A.M.

GODFREY: ... Tonight at 9:00 o'clock, following our show, on CBS-Television, Ed Murrow is going to do a wonderful thing. There's an ad in the paper about it this morning: The Vice Presidency - the great American lottery. Ed Murrow's "SEE IT NOW" - examines the traditional methods of selecting the Vice President of the United States. The wide range of conflicting opinions surrounding this vital issue is brought to you through the voices and actions of President Eisenhower, Harry S. Truman, Franklin D. Roosevelt, Alvin W. Barkley, and from John Adams to Richard Nixon this vivid full-hour report moves through the history of the nation's second most important administrative office. Tonight on Channel 2!

New York, New York

Goldwyn, Sam

March 16, 1959

Dear Sam:

This is a belated answer to your generous and gracious letter of February 24. It isn't an easy letter to answer because I am not a very demonstrative or voluble guy. My affection for you and Frances makes it more difficult to write to you than it would be to write to a relative stranger.

Letters such as yours place upon me an obligation to try to do something that has real substance when I return after the year's leave.

I am just off to Europe for a couple of weeks and see no prospect of getting to the West Coast before next summer, so I look forward to seeing you here in the Spring. Do let us know when to expect you and save us some time.

As ever yours,

Mr. Samuel Goldwyn
1041 North Formosa Avenue
Los Angeles 28, California

KRM/hl

P.S. I am eagerly looking forward to the opportunity of seeing "Porgy and Bess".

SAMUEL GOLDWYN

February 24, 1959

Dear Ed:

"Small World" last Sunday was an outstanding job. I think it was one of the best - and that's saying a great deal.

I am sorry, and at the same time glad, that you are going to take the next year off. Sorry because I, like many millions of others, will miss you more than you will ever know. The network may find someone to take over your time but, believe me, they will never find anyone to replace you - and we will all be looking forward to your return to CBS.

I am glad, however, that you will have a chance to relax a bit and get away from driving yourself so hard. You have been doing much too much for your own good and it is time that you should think about yourself somewhat instead of knocking yourself out because of your sense of public obligation.

California would be a great place for you to do some relaxing. It would be wonderful to have you here for a while. But if you don't make it here soon, I will see you when I get to New York in the Spring.

Affectionately,

Sam

Mr. Edward R. Murrow
485 Madison Avenue
New York, New York

Goldwyn, Sam

SAMUEL GOLDWYN

January 21, 1959

Dear Ed:

Thanks for your nice note about the check for the American Fund for Czechoslovak Refugees.

I think you will be interested in a copy of the letter I am enclosing from Anna Nangle (Mae Tinee) of the Chicago Tribune, who is the most important motion picture critic in Chicago. I could send you many others like it but you have enough to read as it is.

As per your suggestion of the other day, I think it would be a fine idea if you did another half hour out of the material you have - a great deal of which, I am sure, is even better than what was shown. From the mail I have received and the people who have talked to me, I know they are very much interested, because no medium, other than yours, attracts more attention than motion pictures.

And by the way, your broadcast the other night on sex was unusually interesting. It was like you to step out and do something daring, and you handled it in great style.

With warmest regards,

Sincerely,

Sam

Mr. Edward R. Murrow

January 14, 1959

Dear Mr. Samuel Goldwyn:

The last time you and Mrs. Goldwyn were in town, you affably suggested that I write you a letter sometime. I've often intended and wanted to do so--when I heard you were going to make "Porgy and Bess"--and on your last two birthdays, but never got around to it. However, after seeing you on "Small World" a week ago, I simply have to drop you a line of congratulations. You stole the show.

Miss Leigh was charming, but like Orson Welles, her film experience was rather long ago, and Mr. Tynan, I thought, displayed an embarrassing ignorance of the motion picture business, and a tiresome tendency to analyze. Old timers like ourselves know that, particularly in today's market, and always in your productions, quality sells, and that's all there is to it.

I could say more, but I know you're a busy man--this is just three small and personal cheers for you. I'm looking forward to "Porgy".

Cordially,

/s/ Anna Nangle

to: John Aaron - Jesse Zousmer

from: Edward R. Murrow

October 21, 1958

Sam Goldwyn rang me today to see if we would be interested in featuring any or all of his various stars in the forthcoming picture PORGY AND BESS, i.e. Sidney Poitier, Dorothy Dandridge and Pearl Bailey. All have apparently given great performances and would be good material.

Poitier's home is in New York and he will appear in a play in New York after the finish of the picture. Dorothy Dandridge and Pearl Bailey are both in Hollywood. Of these two, Mr. Goldwyn was undecided as to which would be better, if we had to make a choice, the first being very beautiful and the other a great character who lives on thousands of acres in Apple Valley.

The best time for them to appear would be a couple of months apart, starting when they finish making the picture in December.

Mr. Goldwyn has not yet mentioned this idea to the people involved, wanting to get our reaction first. I said we would let him know by the end of the week.

August 24, 1957

Dear Sam:

Just a note to tell you how sorry we all were that we weren't able to get to California on our recent trip. The death of an old friend of mine while we were on a fishing trip upset our plans.

Do let us know when you expect to be in New York.

As ever yours,

Mr. Samuel Goldwyn
1041 North Formosa Avenue
Los Angeles 28, California

Goldwyn.

May 24, 1957

Dear Sam:

As usual, you were both gracious and charming. It wasn't my intention that you should yourself read the story A STILLNESS AT APPOMATTOX, but I am most grateful that you did and for your comments about it.

Shaw.

There is a bare chance that we may be in California in late June or early August, but so far, plans are as usual, vague indeed.

I will make you a signal as soon as I know anything definite.

I am delighted you are doing PORGY AND BESS. You are the only one who should do it.

As ever yours,

Mr. Samuel Goldwyn
1041 North Formosa Avenue
Los Angeles 28, California

fc

SAMUEL GOLDWYN

May 17, 1957

Dear Ed:

I have read the screen treatment of "A Stillness at Appommatox" which you sent me and I must say that my first comment is that it is beautifully written. However, as far as a picture is concerned, I would hesitate to tackle it because it is one battle scene after another.

The narration is beautiful and if they want you to narrate it, I don't know of anyone who could do it better.

Are you planning to be out this way soon? I would love to see you again.

As ever,

Sam

P. S. My real love at this time is PORGY AND BESS.

Mr. Edward R. Murrow
485 Madison Avenue
New York 22, New York

May 10, 1957

Dear Sam:

I hesitate to do this, but nevertheless I venture to send you a script called "A Stillness at Appomattox." Could you possibly have someone read it and render an opinion. If this is too much to ask, I will understand.

Many thanks and my love to you and Frances.

As ever yours,

Mr. Samuel Goldwyn
1041 North Formosa Avenue
Los Angeles 28, California

rh

Hans Christian Anderson Program

SIR

March 19, 1952

Dear Sam:

It's churlish and ungracious of me not to have written sooner.

First of all permit me to express my deep appreciation to you and Frances for your most gracious hospitality. The role of guest suits me ill and normally produces a sense of uneasiness. On this occasion I felt completely at home both in your home and on your lot.

I should like to say my thanks to you and your associates on behalf of myself and my crew for the magnificent co-operation we received. I have now seen about two-thirds of the material we shot - some of the sound quality is not all that I could wish, but I think we shall be able to straighten that out. I still do not know exactly how to take hold of this story. We have got such a great wealth of material. Parenthetically the shots of you and Frances are quite magnificent.

We have tentatively scheduled the piece for April 13, and we will of course provide you with a kinescope of the final version for your personal use.

Perhaps at your convenience you will let me have such footage on Danny Kaye as you will permit us to use. We will of course be prepared to label it as a rehearsal if you wish.

I would ask you to extend my personal thanks to individual members of your organisation but those who were helpful are so numerous that I would have to look at your organisation chart to be able to list them all.

Having recorded a considerable variety of stories both for radio and television, I can tell you that none was more enjoyable than this one and my hope is that we shall be able to do an acceptable job with it.

As ever yours,

Mr. Samuel Goldwyn
1041 North Formosa Avenue
Los Angeles 28, California

cc Fred.

DEAR MR. MURROW:

THE SHOW WAS SO WONDERFUL THAT I FORGIVE YOU COMPLETELY FOR MAKING ME "THE FACE ON THE CUTTING ROOM FLOOR". MESSAGES OF PRAISE HAVE BEEN COMING INTO OUR OFFICE ALL WEEK - AND RIGHTLY SO, BECAUSE NOTHING CAN TOP IT.

KIND REGARDS,

Peggy Vaughn

SAMUEL GOLDWYN

APRIL 16, 1952

DEAR ED:

ENCLOSED YOU WILL FIND TWO ADS FROM THE HOLLYWOOD REPORTER AND DAILY VARIETY WHICH I THOUGHT MIGHT INTEREST YOU.

I AM HAPPY TO TELL YOU THAT THE REACTION FROM ALL OVER THE COUNTRY HAS BEEN SOMETHING BEYOND MY DREAMS. THEY HAVE ALL PRAISED THE BEAUTIFUL JOB YOU DID AND, NEEDLESS TO TELL YOU, I AM VERY HAPPY AT THE RESULTS. YOU HAVE DONE A GREAT THING FOR ME AND MY PICTURE AND I HOPE WE ARE WORTHY OF IT.

I SHALL NEVER FORGET THE BEST GUEST WE EVER HAD AND ONLY HOPE THAT YOU WILL BE COMING THIS WAY AGAIN REAL SOON. THE INVITATION STILL STANDS - AND YOU MAY HAVE BOTH ROOMS ANY TIME YOU SAY.

ALL WARMEST REGARDS.

SINCERELY,

Sam

MR. EDWARD R. MURROW
COLUMBIA BROADCASTING SYSTEM

NEW YORK 22, NEW YORK

"Congratulations to Samuel Goldwyn for as fine a piece of public relations as has ever been done for the motion picture industry!"

THE Hollywood REPORTER

'HANS' BACKSTAGE TELECAST NEAT PUBLIC RELATIONS JOB

An impressive piece of public relations for the motion picture industry was performed yesterday when CBS-TV telecast on its "See It Now" program the backstage tour of Samuel Goldwyn's "Hans Christian Andersen" made recently by the network's top reporter - commentator, Ed Murrow.

Besides proving a fascinating piece of entertainment, the program can't help creating more respect for the makers of films on the part of the millions who are unfamiliar with the enormous problems involved in making a major motion picture.

DAILY VARIETY DAILY

'Hans', CBS Open New Vistas For Pix-TV

Motion pictures and television had a brief but successful marriage on Ed Murrow's CBS-TV "See It Now" program yesterday, result being a top program for video, and as fine a piece of public relations as has ever been done for the pix industry. What "See It Now" did in capsule version was to take public into a Hollywood studio and show it the lengths to which pix industry goes to turn put top product, and result was an effective good will show for the industry.

SAMUEL GOLDWYN

FEBRUARY 21, 1952

DEAR ED:

I HAVE YOUR LETTER OF FEBRUARY 19TH AND I AM DELIGHTED THAT WE WERE ABLE TO COME UP WITH SOMETHING THAT SHOULD MAKE A GRAND AND EXCITING PROGRAM. YOUR IDEA OF THE APPROACH AND HOW THE PRESENTATION SHOULD BE HANDLED IS BRILLIANT. THERE ARE MILLIONS OF "JOES" AND "JANES" AS WELL, THROUGHOUT THE COUNTRY WHO WOULD FEEL THRILLED TO BE ON THE "INSIDE" OF THE MAKING OF A GREAT PICTURE LIKE HANS CHRISTIAN ANDERSEN, AND I AM SURE THAT IT WILL BE A PERSONALIZED THING WITH THEM AFTER THEY WATCH THE SHOW AS YOU PLAN IT.

YOUR LETTER MUST HAVE CROSSED MY LAST LETTER IN THE MAILS, BUT IN VIEW OF WHAT YOU WRITE I AM CONVINCED THAT IT WOULD BE A FINE IDEA FOR YOU OR YOUR WRITER TO COME OUT AT ONCE AND BETWEEN US WE CAN FORMULATE CONCRETELY A GREAT LAYOUT FOR THE SHOW. AS SOON AS THAT IS DONE, I WOULD SEE TO IT THAT EVERYTHING IS SET UP HERE SO THAT YOUR CREW COULD COME OUT IMMEDIATELY THEREAFTER TO DO THE NECESSARY SHOOTING ON THE LOT HERE.

BECAUSE OF THE GREAT SCOPE OF THIS PICTURE, I SUGGEST THAT THIS BE DONE AS SOON AS POSSIBLE WHILE WE HAVE ALL THE PRINCIPALS HERE AND WHILE WE CAN, IF NECESSARY, MAKE CERTAIN CHANGES IN OUR PLANS TO ACCOMMODATE YOUR NEEDS. I AGREE THAT YOU SHOULD BE ABLE TO DO THIS IN ABOUT A WEEK OF SHOOTING, BUT IF IT WILL REQUIRE MORE TIME, WE WILL BE HERE. I KNOW THAT YOU AND YOUR PEOPLE WILL ALWAYS BE COGNIZANT OF OUR PRODUCTION PROBLEMS, BUT I AM ANXIOUS FOR YOU TO GET OUT OF THIS THE BEST SHOW POSSIBLE FOR YOUR PROGRAM, AND I WILL SEE TO IT THAT WE ACCOMMODATE YOU TO THE UTMOST.

YOU MUST COME OUT FOR THIS YOURSELF, EITHER AT ONCE OR WITH YOUR SHOOTING CREW. FRANCES AND I WANT YOU TO BE OUR GUEST WHILE YOU ARE HERE AND I DO HOPE YOU WILL BE ABLE TO ARRANGE TO STAY WITH US.

ALL MY BEST.

SINCERELY,

Sam

P. S. THIS IS THE FIRST TIME I HAVE HAD A CHANCE TO WRITE YOU AND TELL YOU WHAT A GREAT JOB YOU DID ON TAFT THE OTHER DAY. I HAD PAUL HOFFMAN, ZANUCK, AND A SMALL GROUP TO AN ORGANIZING DINNER FOR THE GENERAL THE OTHER NIGHT AND EVERY ONE OF THEM MENTIONED WHAT A BRILLIANT AND DEVASTATING ANALYSIS IT WAS. YOU ARE ONE PERSON TO WHOM I DON'T HAVE TO SAY "KEEP UP THE GOOD WORK".

S. G.

MR. EDWARD R. MURROW
COLUMBIA BROADCASTING SYSTEM

NEW YORK, NEW YORK

SAMUEL GOLDWYN

FEBRUARY 19, 1952

DEAR ED:

I UNDERSTAND THAT HERBERT MITGANG OF YOUR STAFF HAS BEEN IN TOUCH WITH DAVID GOLDING OUT HERE AND TOLD HIM THAT YOU AND YOUR PEOPLE ON "SEE IT NOW" THOUGHT WELL OF THE IDEA OF A HOLLYWOOD STORY ALONG THE LINES SET OUT IN MY LETTER THE OTHER DAY. IT SEEMS TO ME THAT SINCE MITGANG AND GOLDING WORKED SO WELL TOGETHER IN THE PAST ON SO MANY PROJECTS IT WOULD BE A GOOD IDEA IF THEY COULD GET TOGETHER AND WORK CLOSELY ON THIS ONE FOR ABOUT A WEEK OR SO.

HOWEVER, I CANNOT LET GOLDING GO EAST, BECAUSE HE WILL BE BUSY HERE ON THE COAST FOR THE NEXT SEVERAL MONTHS. I THINK IF YOUR MAN, MITGANG, CAME OUT HERE FOR A WEEK OR SO AND SPENT THAT TIME WORKING ON THE IDEA INTENSIVELY WITH GOLDING AND SOAKING UP THE GENERAL ATMOSPHERE AND SPECIFIC DETAILS THAT HE WOULD NEED FOR SUCH A STORY HE OUGHT TO COME UP WITH A REALLY GOOD SCRIPT FOR YOU.

OF COURSE WHEN HE IS OUT HERE WE WILL GIVE HIM THE FULLEST ACCESS TO THE PRODUCTION AND EVERYTHING WE HAVE, AND DO WHATEVER WE CAN TO FACILITATE HIS GETTING A GREAT STORY FOR YOU. AND, IF YOU FEEL IT WILL BE USEFUL TO YOU, I WILL BE GLAD TO SPEND SOME TIME WITH HIM MYSELF OR HAVE HIM TO LUNCH SO HE CAN GET WHATEVER BENEFIT THERE MIGHT BE OUT OF THAT. I REALLY BELIEVE YOU CAN GET AN EXCITING PROGRAM OUT OF THIS.

WITH ALL WARM REGARDS.

SINCERELY,

Sam

8/10

February 19, 1952

Dear Sam:

Let's do it. We will of course require much guidance and suggestions from you, but if we are to try our hand at doing a piece on the making of a movie we could not possibly find a better counsellor.

My ideas, so far as they have taken shape, are these: We do not attempt to do a piece on Hollywood. It's too big. So we do the story of the making of HANS CHRISTIAN ANDERSEN. We make only brief reference to the competition between television and movies, but we manage to suggest that this bold venture by Goldwyn is in the tradition of the making of a better mouse trap. Our objective would be simply to take our viewers not only onto the lot, but permit them to get acquainted with both the planning and philosophy--even the financing if you agree--of a major production. We would want to film with our own cameras not only some of the major artists, but also the unknowns--the extras, the soundmen, and so forth.

Our general approach would be that of taking an individual viewer by the hand and saying: "Look, Joe, if you want a chance in person to talk with Goldwyn, wander around the lot, watch the actors working and relaxing; listen to the conversation, directions, rehearsals, that go into the making of a picture, then get a glimpse of some of the finished product, just come along with us."

I know too little about the making of a movie to be confident as to the impression we would leave with the viewer, but I would guess that it would be that the making of a movie of the proportions of HANS CHRISTIAN ANDERSEN is both a complicated and exciting business requiring great sensitivity, imagination and skill of a high order.

We reckon it would take us about six days to do the actual shooting after we had agreed with your people upon the general character of the material we would require. Perhaps you would be good enough to suggest the week that might best fit your shooting schedule and that would provide us with the most interesting material.

I would hope to come out and do part of this one myself which would give me both professional and personal pleasure because it would provide the opportunity of seeing you and Mrs. Goldwyn again.

Young Sam and his delightful bride dined with us the other night and gave us great pleasure.

As ever yours,

Mr. Samuel Goldwyn
1041 North Formosa Avenue
Los Angeles, California

SAMUEL GOLDWYN

FEBRUARY 14, 1952

DEAR ED:

I UNDERSTAND THAT YOUR PEOPLE AND DAVID GOLDING, OF MY STAFF, HAVE BEEN DISCUSSING THE POSSIBILITY OF YOUR DOING A STORY ON HOLLYWOOD FOR YOUR SUNDAY SHOW. I THINK THERE IS A GREAT IDEA IN SUCH A STORY WHICH WOULD BE TIMELY AND IMPORTANT AND MOST INTERESTING TO YOUR AUDIENCE.

I AM ENTIRELY WILLING THAT YOU USE WHAT I AM DOING NOW IN THE MAKING OF "HANS CHRISTIAN ANDERSEN" AS THE SPRINGBOARD AND KEYNOTE OF THE STORY OF HOW HOLLYWOOD FACES THE FUTURE. IT SHOULD MAKE AN INTERESTING STORY: - HERE IS TELEVISION GIVING MOTION PICTURES THE TOUGHEST COMPETITION IT EVER HAD, HERE IS THE BOX OFFICE DROPPING 'WAY DOWN, HERE ARE SWAN SONGS BEING SUNG ABOUT OUR INDUSTRY, BUT YET HERE IS AN INDEPENDENT PRODUCER GOING AHEAD AND SPENDING FOUR MILLION DOLLARS ON "HANS CHRISTIAN ANDERSEN". THIS IS THE LARGEST-BUDGETED PICTURE OF ALL THE PICTURES BEING MADE IN HOLLYWOOD THIS YEAR. IN ORDER TO BREAK EVEN, I AM GOING TO HAVE TO GROSS EIGHT MILLION DOLLARS WHICH, BELIEVE IT OR NOT, MEANS THAT SEVENTY-FIVE TO ONE HUNDRED MILLION PEOPLE WILL HAVE TO SEE THE PICTURE BEFORE I AM IN THE CLEAR. YET I HAVE THAT MUCH CONFIDENCE IN THE FUTURE OF MOTION PICTURES AND IN THE PUBLIC'S RESPONSE TO GREAT ENTERTAINMENT THAT I AM GOING FULL STEAM AHEAD.

I THINK THIS EXEMPLIFIES STRIKINGLY THE FACT THAT HOLLYWOOD AS A WHOLE IS MEETING COMPETITION TODAY - AND FIGHTING FOR ITS LIFE - BY GIVING THE VERY BEST IT HAS TO MAKING FINE ENTERTAINMENT. I AM SURE THIS COULD BE SPLENDIDLY DRAMATIZED BY DEVOTING A MAJOR PART OF THE SHOW TO A MOST INTERESTING SKETCH OF THE MAKING OF THE PICTURE AND EVEN SOME SCENES FROM IT. CONSIDERING THE PERSONALITIES AVAILABLE: DANNY KAYE, RENEE JEANMAIRE (WHO SCORED SUCH A SUCCESS WHEN SHE DANCED "CARMEN" WITH PETIT), FARLEY GRANGER, FRANK LOESSER ("GUYS AND DOLLS") WHO WROTE THE SCORE, MOSS HART WHO DID THE SCREENPLAY, CLAVÉ, THE GREAT FRENCH ARTIST WHOM I BROUGHT OVER TO DO THE BALLET SETS, MME. KARINSKA, WHO IS DOING THE COSTUMES, CHARLES VIDOR, WHO IS DIRECTING, THE SCOPE OF THE PRODUCTION AND ALL THE OTHER ELEMENTS, I THINK A TREMENDOUSLY EFFECTIVE JOB COULD BE DONE. WHEN THIS WOULD BE ROUNDED OUT WITH A PANORAMA OF HOLLYWOOD,

TOGETHER WITH INTERESTING TELEVISION SHOTS AND FIGURES AND WITH YOUR MASTERFUL OVER-ALL PRESENTATION, I AM SURE YOU WOULD WIND UP WITH A GREAT SHOW.

I WOULD, OF COURSE, BE GLAD TO GIVE YOU EVERY COOPERATION AND THE ACCESS TO OUR PRODUCTION THAT WOULD LET YOU GET WHATEVER YOU NEEDED.

THIS WOULD MAKE THE SAME KIND OF OUTSTANDING SHOW AS YOUR VISIT TO A TYPICAL COAL MINE TOWN. YOU HAD WONDERFULLY INTERESTING MATERIAL THERE AND PROJECTED IT TO THE AUDIENCE IN SUCH A WAY THAT HELD ME - AND, I AM SURE, THE REST OF YOUR LISTENERS - SPELLBOUND. I AM SURE YOU CAN GET THE SAME FEEL INTO THIS KIND OF STORY ON HOLLYWOOD.

WITH ALL WARM REGARDS, I AM

SINCERELY,

Dave

March 17, 1953

Dear Sam:

"See It Now" has run into a seemingly insurmountable problem which we thought you or someone in your office might be able to help us with. Up until now, our cutters have been working in a borrowed studio and using rented Moviecolas. It is now our plan to set up our own facilities by next September. We have begun making plans to purchase the equipment, but we have run into a bottleneck on the subject of Moviecolas. The Moviecola Company, which is in Los Angeles, (Mr. Sourrier the inventor and the President, as you probably know) cannot promise delivery for eighteen months. Fred Friendly and I thought that you or Danny Mandell might have done considerable business with the company and might be able to bring your influence to bear. I am advised that Model UC20-S is the one we require. We could manage with three if we had the promise of a fourth.

I hate to bother you with such detail, but we have gotten nowhere at this end, and this is a problem we just have to lick.

It was good to see you again last night.

As ever yours,

Dear Mr. Goldwyn:

This is merely a note in reply to yours of February 9 about the Korea show. Mr. Murrow had received a letter from Ben Feiner of CBS TV in Hollywood asking for a print to be shown to you as requested by Mr. Robert Newman of your office. A 16mm reduction print has gone out to Mr. Feiner who will be in touch with you to arrange a convenient showing time.

Sincerely yours,

Dorothy McDonough
Secretary to Mr. Murrow

SAMUEL GOLDWYN

JANUARY 17, 1952

DEAR ED:

YOUR BROADCAST YESTERDAY ON HOW PRESIDENTIAL NOMINATIONS ARE SO OFTEN RIGGED BY POLITICIANS TO DEFEAT WHAT IS REALLY THE PEOPLE'S CHOICE WAS MIGHTY FINE. IT WAS PARTICULARLY TIMELY IN VIEW OF THE FACT THAT TAFT IS SO OBVIOUSLY CONCENTRATING ON A POLICY OF LINING UP POLITICIANS WHO WILL CONTROL VOTES AT THE CONVENTION.

I AM SURE THAT IN ANY OUT-AND-OUT VOTE OF THE PEOPLE AS BETWEEN THE GENERAL AND TAFT, EISENHOWER WOULD BE FAR OUT IN FRONT. BUT HAVING IN HIS VEST POCKET THE POLITICIANS WHO, IN TURN, CONTROL DELEGATES, TAFT COULD GET THE NOMINATION.

I THINK IT IS IMPORTANT FOR YOU TO KEEP HAMMERING HOME THIS GENERAL THEME AS OFTEN AS YOU POSSIBLY CAN. YOU CAN DO A TREMENDOUS AMOUNT OF GOOD BY GETTING THIS ACROSS TO THE PEOPLE SO THAT THEY REALLY SIT UP AND TAKE NOTICE - AND DO SOMETHING ABOUT IT BEFORE THE CONVENTION.

WARM REGARDS.

SINCERELY,

Sam

MR. EDWARD R. MURROW
CBS

No true American would vote for Eisenhower if he knew the . . .

FACTS ABOUT IKE

1. Ike's father was a student of the Talmud, which sets forth a vile and malicious political-religious plan for world revolution and domination. The effect of this sinister volume on both father and son should be investigated.
2. The records reveal that Ike has never voted in his life. It is reported that he registered once without indicating what party he was for and did not vote in that instance.
3. The Communists in convention in New York City in May, 1944, adopted a resolution praising Tito (head of Communist Yugoslavia), Stalin, and Eisenhower.
4. Army Intelligence officers were repeatedly shocked during World War II by reports showing Ike was closely associated with leftwingers.
5. Ike accepted the Communist decoration, Order of Suvrov, with pleasure and has not returned it.
6. Instead of refusing to obey treacherous orders (as MacArthur has refused), Ike helped give half of Germany to Soviet Russia in order to divide a potentially-powerful, freedom-loving people. (Don't say he thought Soviet Russia was an ally. If he didn't know that the USSR was an anti-Christian reign of terror, he wasn't well enough informed to be a General.)
7. When Ike was setting up the government over defeated Germany after World War II, he called for the lifelong supporter of Communism, Sidney Hillman, to advise him.
8. Ike endorsed the Morgantheau Plan to enslave and starve the whole German nation after World War II. This was an effort to destroy one of the strongest anti-Communist peoples on earth.
9. Ike's first political speech after World War II was to an Atlantic City convention of the CIO, whose objectionable political ends are well-known. He praised this union for helping win the war when actually their strikes had contributed to a lack of supplies in the Pacific which cost many American boys their lives.
10. Ike was known as a "personality soldier" at the Pentagon. A high military source says the Pentagon was glad when Ike left there to take the Presidency of Columbia University because he was constantly reluctant to make decisions on controversial subjects.
11. While at Columbia University Ike accepted the establishment of the Chair of Polish Studies, sponsored by the Communist government of Poland and headed by a man endorsed by that government.
12. Ike showed whose man he is by writing in 1948 to the Anti-Defamation League, telling them he should not, at that time, run for President. The FBI recognizes, and Senator Jack B. Tenney (for ten years Chairman of the California Un-American Activities Committee) has recently exposed,

this Jewish League as one of the strongest Communist-front organizations in the United States.

13. In 1948 Senator Claude "Red" Pepper of Florida, in a move which could have resulted in a temporary or permanent destruction of our two-party system and our free elections, backed Ike for the Presidential nomination on both tickets—Democratic and Republican.
14. Extreme leftwingers Jimmy Roosevelt and Helen Gahagan Douglas are for Ike.
15. Arthur J. Goldsmith, known to official investigators as a leading political fixer and financial agent for the Communist-front Anti-Defamation League (see No. 12 above), backs Ike for the 1952 Republican nomination.
16. The pro-Communist New York *Daily Compass* of Sunday, August 19, 1951, said Ike is the only man "who meets one and all" of the requirements for the Presidency.
17. Collier's magazine (Nov. 3, 1952) carried a pro-Eisenhower article written by Leonard V. Finder, who is listed by *Who's Who in the East* as founder of the politically-powerful Eastern branch of the Anti-Defamation League. (See 12 and 15 above.)
18. In this same Collier's article this Communist-front author says concerning Ike: "His creed of traveling the middle of the road [in other words, a half-Communist, half-American creed] would be lived up to. While that might not make for as much speed as would satisfy impatient, extreme liberals or radicals, it would mean progress forward at an appreciable pace [that is, Ike would give the Communists what they want, only not quite as fast as they want it!]."
19. Mrs. Patton, wife of our late General Patton, may tell the whole story of Ike if he runs for the Presidency—the story which General Patton never got home to tell because he was "accidentally" killed in a jeep collision.
20. In Europe today Ike is called "The Supreme Overlord." In closed meetings in the U. S. A. he is discussed as President of the United Nations (which means Dictator of the world).

Reader, the publishers of this card urge you to back Douglas MacArthur for the Presidency of the United States. A Congressional friend of MacArthur has said, "MacArthur . . . is 100 per cent opp ' to the nomination of Eisenhower, even if he has to oppose him in the convention." The Bible declares: "When the righteous are in authority, the people rejoice; but when the wicked beareth rule, the people mourn."

(Proverbs 29:2.)

Additional copies of this card are 10c doz., 150 for $1.00.

Single copies of a detailed and documented article about Eisenhower will be sent without charge. Write to:

Goldwyn, Sam

December 19, 1951

Dear Sam:

First of all my sincere appreciation for your recent communication regarding the television show. But the real purpose of this is to tell you that I spent most of last Friday with your son, Sam, doing the narration for his film on SHAPE. I think it an excellent job in view of the necessary limitations under which he had to work. I have sent off a couple of cables to his superiors telling them what a fine job I think he has done and asking for permission to be the first to use it on American television. It seems to me that your son is a credit not only to you but to the Army and you will be interested to know that he has agreed to come and work with me for a couple of weeks during the political conventions in Chicago next summer. He is a grand guy and I enjoyed working with him.

As ever yours,

Mr. Samuel Goldwyn

November 12, 1951

My dear Sam,

Bob Wolff gave me a private peep at "I WANT YOU" and once more I find myself having to write to thank you for an experience which makes me feel that after all it is worth while being a movie critic. Honestly, with my long record behind me, I find it hard sometimes to maintain my enthusiasm, sitting through the routine stuff of to-day.

But "I WANT YOU" moved me very considerably and I cannot quite make up my mind whether that was because of the situations so tenderly handled or because of joy at seeing a picture so perfectly presented.

I have no doubt that the film will be a tremendous success here. Once again you have found the way of making a national subject international in appeal. It is a perfect piece of Americana, but almost every part of it has its parallel in this country today where we, too, suffer the weary agony of wanting to get on with a fruitful civil life and find all our aspirations killed by the international situations.

Apart from being first-class entertainment, "I WANT YOU" must do a lot of good in this country by showing that our American friends have similar problems and react to them in similar ways to ourselves. It is a vital work to-day to help bind our two peoples together and to remove the petty doubts we, unfortunately, have for each other. Your picture will be of great value in this respect and I am proud to be able to claim the friendship of the man who made it.

My wife saw the picture with me and she was equally moved and full of admiration. If it cannot claim quite the same weight as "THE BEST YEARS OF OUR LIVES", it is certainly well up in the same class and easily one of the two or three worth-while pictures of the year.

I shall not be reviewing the film until after the normal press show in the week after next. If you find it

CONVENIENT TO LET ME HAVE SOME COMMENT ON YOUR MOTIVES AND HOPES IN MAKING THE FILM, TO BE RECEIVED HERE BY NOVEMBER 26 OR EARLIER, IT MIGHT BE USEFUL.

MY KIND REGARDS TO YOURSELF AND MRS. GOLDWYN,

Dear Ed:

I thought your broadcasts while in London extremely interesting, and as usual your devoted fan listened to you every day.

You made a dull election very exciting to me, and I look forward to the pleasure of again spending an evening with you and your charming wife before I leave for Europe on April 14th.

I am at the Sherry-Netherland Hotel, and hope to hear from you soon.

Warmest regards.

Sincerely,

Sam

Dear Ed:

Thank you for your wire. I was delighted to hear from you and to know that you are in Washington, as I expect to be there next Monday to see the "Big Boss."

I am asking Jock Lawrence to check with you so we can have a drink -- or something -- as we are arriving there in the early afternoon. I shall be at the Mayflower.

Looking forward to the pleasure of seeing you again, I am

Sincerely,

Sam

Dear Ed,

Just a note to thank you for everything. I arrived back here Monday with the tracks and so far everything fits perfectly. The last ending you did is particularly good.

Incidentally your wire to General Ianham pleased him and everyone else here. He tells me that he is making arrangements with you for the release of the picture on TV. As you can readily understand that issue is out of my hands and I retain no more than a paternal interest in seeing it well shown.

I saw your Television show last Sunday before I left and its everything Time said it was. I thought that the bit on the Koreans Orphans was very moving

Again Ed, many thanks for everything; the narration, the lunch, the Marshall record, the "I Can Hear it Now" and above all for the pleasure of working with you.

With every best wish to you, your wife, and Casey for a Very Merry Christmas and a Happy New Year, I am,

Very Truly yours,

Sam

SAMUEL GOLDWYN Jr.

P.S. I'm looking forward to the presidential convention trip with you.

on Hollywood hearings.

Dear Mr. Murrow:

I read the broadcast which you were kind enough to send me, and I must say that I whole-heartedly agree with you. I think it was a beautiful piece of writing and found many of the things you said profoundly significant. Thank you for letting me read it.

Please don't forget to phone me the next time you come to California.

With warmest regards and best wishes to yourself and your charming wife for a happy Christmas, I am,

Sincerely,

Samuel Goldwyn

Dear Ed:

Thanks for your letter. I would be terribly disappointed if you don't get down for at least a few days visit in November. Keep in mind the beginning of the hunting season which is November 20. I hope you can fit your trip into it. Judge Langdale of Valdosta has a large hunting preserve and will arrange for us with a few days notice in advance.

Yes, I will respect your wishes and arrange no lectures. I will give a little reception for you and have some of the most interesting people in Atlanta.

Let me know well in advance of your trip back and just when you will be in New York. I may get up there for one day and we could come back together. Don't fail me as I can give you a hunt you'll never forget.

Have a good time and let me hear from you occasionally.

Sincerely yours,

Cullen

Cullen B. Gosnell

August 24, 1959

Dear Cullen:

Belated thanks for yours of August 3. This is a hasty note written on the day we sail. My plans still remain indefinite but I am bound to be back here for about a week some time during November. I am not sure that I could get down to Georgia during that time, but will do my level best. If I do go, I would prefer to just sit and talk and listen, and not to do any lecturing. Sorry to be so vague, but I have no alternative.

As ever yours,

ERM:skh

Mr. Edward R. Murrow
580 Park Avenue
New York, N.Y.

Dear Ed:

I have just read the delightful piece about you in "Look". Somehow, I think more and more what kindred spirits we are. If there is anything I hate most it is conformity. I am a nonconformist and that is why, I too, dislike being an official. I once was and got enough. Actually I have learned in this day and time that there are few officials that are not S.O. B.'s. Is that not true?

It was good to see a picture of your charming wife. I want you, of course, to bring her along to Georgia and your boy also. Here we have cows, beautiful hill country- I can see far off into the blue hills of Alabama from my hill. I milk a fine Ayrshire cow daily myself. Just as you did when you were a boy, I milked about six cows morning and evening before and after school.

My wife is busy fixing up our little farm house for you and family. Quail are all around here. I see covies looking like droves of blackbirds. But our best hunting will be in South Georgia. Plan to bring that fine pointer along. I have two fine setters, one the son of the famous field trial dog, Mississippi Zev. I think we can get a jeep to run around here in, but can hunt on foot when we like. What sort of car do you like? I think I can get any sort for free.

This farm place ## is to come to when you want rest and recreation. We will arrange quarters at Emory for the family when in Atlanta. I would like for you to give a few lectures on world affairs at universities and can get a good fee for each. Just two or three lecture subjects will be all you need.

When you make up your program for the year bear in mind that I want you for a long stay, preferably in the hunting season which begins November 25 and lasts through February 25. I will take off for the period to be with you. We will see such people as Ralph McGill and other noted liberal friends. I believe the stay in the

South will give you a big lift, for people are so friendly and appreciative of you and your great work. Today my wife and I dined with the Millers and had that delicious broiled country -cured ham with red eye gravy. Your ham last year came from the Millers.

Why don't you consider doing one of your two documentaries on "The Changing South"? It really is changing today. Massive resistance is caving in after what happened in Virginia. Ralph McGill and Ellis Arnall have been responsible for this in Georgia. You will see a different country side from what you saw in the old days and such a resurgence of new industry as you have never before witnessed.

Just keep this trip in your plans. I am not pushing you for an answer as to when, but just wanted to lay some plans before you.

Glad you liked the peaches.

Sincerely yours,

Cullen

Dear Cullen:

Many thanks for your letters. As I told you, I am most eager to spend some time in the south and cannot think of anyone with whom I would rather spend the time, but right now I don't know what my movements will be or when I will be going and where. I will certainly make you a signal as soon as possible but I am afraid it cannot be before the autumn. I am grateful to you for offering to hold my hand while I rediscover the South and I shall certainly take advantage of your offer of hospitality.

As ever yours,

Dear Ed:

I was a little fearful after you read my letter of yesterday that I might scare you off. When you decide on the time that you will be with us, we will work out a schedule of just what you wish to do or just leave everything fluid. I can arrange lectures if you like but only if you like. What I am thinking you might most enjoy is an occasional seminar with some of our top students.

Here in Atlanta and the South you will find a contrast with New York. There is such warmth of feeling and hospitality that I will really have to protect you or they will wear you out. You can count on me.

With every good wish, I am,

Yours sincerely,

Cullen

Dear Ed:

Thanks for a wonderful lunch and chat. It was awfully good to see you.

Keep me informed of your plans. I will be your manager and host down here so that you will not be bothered except when you wish to be. I want you to stay at my farm house where I have a grate for coal fire and you can sit down in a big Morris Chair and relax. You can hunt or ~~do~~ do anything you like. I will arrange some big hunts in South Georgia. The season begins November 20 and ends February 25- a rather long one.

When I get the word as to the time I will make plans, I must save you from too much kindness which you will find down here. Warmth of feeling is what you will find. Of course I will put you in touch with our best people in my club and you can move around and find out what is going on. The South is really in a ferment. I can arrange enough lectures at colleges to pay your expenses if you are interested in doing some of that.

Let me know later just where I can reach you when you start out from New York.

Thanks again for the very kind hospitality.

Sincerely,

Cullen

Dear Ed:

Thanks for your nice letter and observations on Europe. I hope things are looking better by now.

I plan to come to New York in May. You are the person I want to see most of all, but I will have a few other ~~engagements~~ engagements. Could you let me know soon whether you would have a little time either May 12 or May 26 and if so which date would be better? I would come up on a Monday and stay two days.

There is so much to talk to you about. At a conference which I held here last week former Governor Ellis Arnall set talk a buzzing by coming out flatly against closing the schools and for abolition of the county unit system. He declared that he would run for Governor if he could not get anyone else to carry the ball. He has quite a national reputation, as you undoubtedly know. At the moment he is a big lawyer, is President of the Independent Moving Picture Society, is personal attorney for Walt Disney, and others. Just before Ellis came clean, Herman Talmadge had announced that he was for some change in the county unit system.

Things are popping and I am anxious to tell you about it all.

Sincerely yours,

Cullen

Cullen B. Gosnell

P.S. An integration suit against the Atlanta Board of Education is set for trial June 5.

PROGRAM

Conference on State Government
Institute of Citizenship
Emory University

(In Cooperation with the American Assembly of Columbia University)

Tuesday, April 14, 1959

9:00 a.m. Registration - Assembly Room of Church School Building

9:30 a.m. Opening Session - Assembly Room of Church School Building

Presiding: Dean William M. Hepburn, Chairman
Executive Committee of the Institute

Keynote Address: "Reorganization of the State Government of Georgia" - Dr. M. W. H. Collins, Jr., Director of Institute of Law and Government, University of Georgia

10:30 a.m. to 12:15 p.m. First Session of Discussion Groups

Group A - Conference Room A, Alumni Memorial Building

Group B - Conference Room B, Alumni Memorial Building

Group C - Conference Room C, Alumni Memorial Building

Group D - Council and Senate Chamber, Alumni Memorial Building

12:30 p.m. Luncheon - Alumni Memorial Building

Address: "State Government in the Space Age"
The Hon. Ellis Arnall

2:30 to 4:15 p.m. Second Session of Discussion Groups

8:00 p.m. A Panel Discussion - 245 Woodruff Building

"The Reorganization of the Legislature"

Mr. Frank Edwards, Legislative Council of the Georgia Legislature
The Hon. James A. Mackay, House of Representatives
The Hon. Mac Barber, House of Representatives

Wednesday, April 15, 1959

9:00 a.m.	Third Session of Discussion Groups Alumni Memorial Building
12:15 p.m.	Luncheon - Alumni Memorial Building Address: "The Changing Role of State Government" The Hon. Garland Byrd, Lieutenant Governor of Georgia
2:30 p.m.	Final General Session Assembly Room, Church School Building
4:30 p.m.	Adjournment

April 6, 1959

Mr. Cullen B. Gosnell
Institute of Citizenship
Emory University
Atlanta, Ga.

Dear Cullen:

I am just back from a couple of weeks in London, Paris, Berlin and Bonn. Interesting, but rather depressing. The Russians are clearly making great headway in their old objective of splitting the Western alliance.

So far, I haven't made a single plan about next year, but your gracious invitation warms my heart and I shall be writing again when I have even a vague idea of when I can go wandering about the south.

As ever yours,

EEM:skh

March 30, 1959

Mr. Edward R. Murrow
485 Madison Avenue
New York, N.Y.

Dear Ed:

Thanks for your letter. I am delighted to hear that you plan to carry on. You belong to Jack Kennedy's "Profiles in Courage." Certainly it would be a blow to liberalism for your voise to be silenced.

I certainly like your idea of spending several weeks in the South. Make your headquarters in Atlanta and vicinity. It is a place where things are happening. I wish to offer you my humble farm cottage as a place to rest. It is about sixty miles Southwest of Atlanta in beautiful rolling hill country. I have all modern conveniences including water pumped from a spring 1500 feet away. It is on a dirt road which is secluded. Only two or three families live on the road. The road is passable at all times. I have some quail there but our best quail shooting is in South Georgia. It is yours for as long as you wish to stay. We can have those good hunts we have talked about. In Atlanta I have a very fine study club made up of the best minds of the town. Contacts with them would be stimulating now and then. Consider this seriously.

I will certainly look you up when I come up. It may be this spring. How about another ham? Will you be where you can use it?

Sincerely yours,

Cullen

February 26, 1959

Mr. Edward R. Murrow
485 Madison Avenue
New York, N.Y.

Dear Ed:

One of your greatest admirers and a very dear friend of mine is coming to New York for a three day visit March 21-23 inclusive. He is George Goodwin who is Vice-President in charge of public relations of the First National Bank , Atlanta's largest bank. George is a graduate of Washington & Lee University and was for some years a feature writer for the Atlanta Journal. In 1946 he won the Pulitzer Prize for his exposure of fraud on the part of Eugene Talmadge that year.

He is anxious to see you at some time that might be convenient to you during his stay in New York. I would consider it a personal favor if you can grant him that privilege. You would enjoy him, I feel sure, as he is a person with very high ideals. I had lunch with him today and I believe no one admires you more than he except possibly myself and that is real admiration. George is a very unusual banker ; he is a liberal. I believe you would enjoy talking to him as I consider him to be one of the top men in the power structure in Atlanta. He is a very close intimate and adviser to Mayor Hartsfield who has been named by Fortune Magazine as one of the top half a dozen mayors in the country. Hartsfield has been President of the American Mayors' Association. Today he is the leading spokesman of Georgia liberals in politics. Hartsfield brought the last suit against the ignominious county unit system; I brought the first one in 1946. Goodwin could give you a run-down on the segregation problem in Georgia. We have been threatened with closing the schools. Goodwin has a good understanding of this situation.

I believe that not only would he profit ~~for~~ from a

meeting with you but that you would get something in return. I believe that you would realize from such a meeting that not all liberals in Georgia are academic people but that we have a number in the ranks of business and other fields.

If you can see Goodwin at any time during the days mentioned, I will let you know where he will be staying a little later. Please let me know at your convenience.

With my best regards, I am,

Yours sincerely,

Cullen

Cullen B. Gosnell

March 23, 1959

Dear Cullen:

I am just off for a quick trip to London, Paris and Berlin, but I cannot leave without answering yours of February 24.

I deeply despair of doing anything worthwhile with this instrument of television, but that's not a new conclusion and had nothing to do with my decision to take a year off, and will not prevent me from having another try at it after the year is over.

I have so hoped that during the year I can find time to travel in the South for three or four weeks just looking and listening. If that comes off I will certainly come to see you.

Thank you again for writing, and don't fail to let me know when you will be in New York again.

Sincerely yours,

Mr. Cullen B. Gosnell

February 24, 1959

Mr. Edward R. Murrow
485 Madison Avenue
New York, N.Y.

Dear Ed:

Thanks for the verbatim record of your business sex broadcast. I have read it over carefully and found it carefully documented with facts as I knew it would be.

I have seen ~~recently~~ in the newspapers that you plan to take a year's leave from radio and television. Your voice will be greatly missed by a lot of people but I believe you have earned a rest from the tensions which you have been subjected to for years. Mercer's article on you was a great tribute to a great man.

You are a man after my own heart. You have been a great national leader for years who has done a lot of good. I like a man who has character and courage such as you have displayed. It takes "guts" to do the things you have done and it is costly in terms of dollars. I know from my own experience that this is true. You gave up an official position because the price was freedom. You are too big a man to pay such a price.

This age in which we live demands conformity. I am a rebel; I am a nonconformist and so are you. I am reminded of what Dr. Zhivago says in Pasternak's novel: "I cannot go on saying what I do not believe." And to an old friend who had told him that he had been reeducated by the communists, Dr. Zhivago says "you remind me of a horse which has broken itself in." I am the same sort of rebel.

Conformity has gotten into our universities. I had always believed that a university was a place where people are supposed to blaze new trails and to think. I have believed that professors were supposed to stimulate students

to think. But university executives today want us to be toad frogs. If a man thinks for himself, he is suspect and he must pay in terms of salary. Read "A.B. Academic Bureaucracy" which appeared in the October 12 last issue of the New York Times Magazine for corroboration of this point. While I have built a national reputation in my field for my publications (8) and other things, I am paid a half salary. That is the price one must pay ### for freedom. But I hold up my head and at least have some respect for myself.

I say to you go on in the way you have been going. You will be long remembered for the great work you have done. I am sure that radio and television must be just as disillusioning as university work. Really there are so few programs on the air that I care to listen to nowadays. We get comics and westerns that sell soap, cigarrettes, ###### Geritol, Anacin, etc., but few that are designed to feed our minds. When will TV executives find that they should call the tunes instead of letting the callous advertisers do it.

While you are resting I hope you will be able to come our way. Just keep your chin up. I was bowled over when the greatest program appearing on TV came off. I refer to your "See It Now."

My vert regards as always, I am,

Yours sincerely,

Cullen

Cullen B. Gosnell

February 12, 1959

Dear Cullen:

Many thanks for your nice note of February 5th.

I am so glad you liked THE LOST CLASS OF '59. It seems to have been one of our more successful efforts.

I am enclosing a copy of the script of BUSINESS OF SEX, so that you can see what all the fuss was about.

I would dearly love to come and hunt quail with you, but unfortunately, I cannot make it this season.

Sincerely yours,

Mr. Cullen B. Gosnell

Dear Ed:

I liked your program on the Virginia situation very much. But I am sorry I did not hear the famous "sex" radio broadcast which caused so much raising of eyebrows. I told my friends that they could be sure you had the facts, knowing something of the thoroughness with which you go about preparing for your programs.

I still hope you can come down for a hunt some week-end before the quail season ends which is February 25. Some time ago I saw where you were to make a TV cast on Susan Heyward. If you come this way, let me know well in advance.

Sincerely yours,

Cullen

Dear Ed:

I saw the summary of your talk in Chicago in the Atlanta Constitution this morning. It makes me proud to know a man like you with so much courage. You are truly a man after my own heart. It was a great speech.

It was awfully kind of you to see me when you were so busy. I was delighted that you liked the ham and since you liked it I will have one reserved for next year. There is one thing above all else that I want you to do and that is to come down for a quail hunt this coming season. As I told you the other day, the season begins November 20 and ends February 25. The best hunting is usually up to Christmas time, although I find good hunting afterwards. Plan early so I can line up a hunt you will never forget. You can come down from New York now in a little over two hours.

Thanks for your suggestions on our proposed TV program on "Georgia's New Horizons." I want to send you an outline of it a little later for comment.

With every good wish, I am,

Yours sincerely,

Cullen

Baked Ham

Place whole or half ham, fat side up on rack in open roasting pan. Cover, and add 2 cups water. Bake in slow oven say 300° allowing 25 to 30 min per lb. add a little water all along during cooking period and baste with ham drippings.

Fried Ham

Slice — cutting off
hard edges —
Cook slowly, use a
frying pan [over low heat]
very little
some fat (trimmed
from ham)
Turn ham often to
cook uniformly —
Cooking time for
well-done ham 9 min.,
add 1/4 cup hot water to
fat to make a delicious
red gravy —
(after slicing ham
put on a board and
roll out thin)

Dear Ed:

I shipped ham today. Enclosed are recipes which you can use if you wish. The miller said the ham was sugar-cured and should not be salty. If you taste it and find it salty, soak in hot water overnight. Sincerely,

Cullen

Dear Ed:

I am deligthed that you like country-cured ham and so I am arranging to send you one in a few days. It will be about a week before I go to my farm, but I am having one of the best reserved for you. Friends of mine who own a 1500 acre farm near mine cure a few each year and they do them better than anybody else, I think. These people have some recipes which I will also send along, but you probably have your own. A recipe which they have for broiled, or what they call "fried" ham is the best I have ever known. You may, however, prefer to have yours baked. These hams have a flavor all their own and need no mustard or sauce to go along with them. A few years ago I brought one up for my club and the chef told me he knew all about cooking Georgia hams. The result was that he served the ham with Champagne sauce and just all but ruined it. Should you wish to broil the ham, water ground grits go mighty well with it.

Let me know where I should send the ham, that is, to your home or office address. If the latter, please supply it. Should you care to broil some of it and want grits, I will send them along. Just let me know.

With very best wishes, I am,

Yours sincerely,

Cullen

Cullen B. Gosnell

Gosnell, Cullen

May 16, 1958

Dear Cullen:

Many thanks for your note. How very nice of you to want to send me a country-cured ham! Of course, I will be delighted to have it.

As for those ignorant persons who had been known to throw out a ham merely because it had a little mold on it, have you forgotten that I am a country boy?

I hope all goes very well with you. With best wishes.

Sincerely yours,

Mr. Cullen B. Gosnell

Dear Ed:

I wonder whether you like country-cured hams. We have a man down in our farm neighborhood who makes them just as they should be made. Since you were born in the South you no doubt know how delicious they are. If you like them, I would like to send you one with my compliments. Please let me know.

The reason why I inquire in advance is that some people in the East do not know what a real country-cured ham is like. I have heard of hams being thrown out when they had mold on them because the person thought they were spoiled.

With best wishes, I am,

Yours sincerely,

Cullen

THE PROBLEMS OF URBAN GROWTH IN GEORGIA

Introductory Statement

For over three decades farm population has been declining in the South. In 1920 over half of the South's population or 51.3 percent lived on farms, while in 1950 farm population constituted only 27.1 percent of the total population or just over one-half of what it was in 1920. In 1920 urban population was only 25.4 percent of the total population of the South, while by the new census definition the urban population had increased to 47.1 percent in 1950. Between 1940 and 1950 farm population in the South declined by 7 percent.

From 1940 to 1950 some 99 counties in Georgia lost population and the trend has been about the same since 1950; 62,000 people have left the farms in Georgia since 1950. The causes of this migration are many: mechanization and diversification of crops, devotion of large amounts of land to growth of trees, and industrialization. Within a period of twenty years the South has gone from a colonial economy to a mature economy.

Below a list of the places which have experienced considerable growth in Georgia is given. From 1940 to 1950 the following counties had increases:

Bibb 36.2%	Dougherty 52.9	Houston 85.5
Chatham 28.4	Fulton 20.5	Muscogee 56.3
Clarke 28.7	Glynn 32.5	Richmond 33
Cobb 61.6	Gwinnett 11.1	Troup 19.4
DeKalb 56.9	Hall 14.9	Whitfield 31.9

So important is this problem that the National Planning Association on February 3 of this year called for a White House conference on urban growth. Not only does the NPA urge a national conference but also regional conferences on this subject. The report of the NPA reads in part as follows:

The urban centers of the United States are becoming absolete in many ways. Traffic strangulation; spreading slums; bankrupt mass transportation systems; inadequate schools, parks, hospitals, water supplies and sewers; air pollution; the flight to the unprepared suburbs; and aggravated social frictions are symptoms of a developing situation of dramatic seriousness to the welfare of the American people.

The condition of our larger cities handicaps the operations of business, increasing the costs of production and distribution, and thereby makes America poorer. Cities do not provide those amenities of decent urban living which are well within the grasp of our productive and growing economy. And even more serious is the fact that our urban social and governmental institutions are unsuited to cope with the changing needs of the times.

Within the next 50 years, moreover, the national population may well rise by 130 million or so, of whom at least 120 million will settle in and around our metropolitan areas, judging by current trends. This will greatly aggravate all of the difficulties and shortages we now encounter.

In the face of these massive needs there is but limited awareness, and our piecemeal programs, Federal state and local, are only nibbling at the growing problems. Half a million slum families have been cared for in new public housing since 1933. But more slums spawn each day and five million families now remain ill-housed. We build a fine new limited-access highway and speed up urban traffic with one-way streets, only to see worse congestion and bottlenecks elsewhere; we cut the work-week and develop a wage system under which every working family can have a car, and then destroy the value of the car with parking problems and congestion both on the highways and in working, living, shopping, and recreational areas; we encourage homes in the suburbs and then destroy their advantages with crowded schools, inadequate water and sanitary facilities, suddenly conceived shopping centers, and the lack of protective zoning and enforced building codes. In too many mushrooming suburbs, overeager and irresponsible "developers" and inexperienced local officials, often working with inadequate controls and no comprehensive plans, are laying the basis for bad communities for tomorrow and for new suburban slums for which society will pay and pay for decades to come.

Following this announcement by the NPA the Atlanta Journal editoralized on February 4:

Atlanta has every reason to endorse a White House conference on metropolitan growth as suggested by the NPA.

This city, like most others in the country, is struggling with many complex problems associated with rapid population growth and it needs whatever sound guidance is available.

The NPA, is properly concerned with the rising tide of urbanism and feels that cooperative planning would ease some of the headaches that are sure to come over the next 10 or 15 years.

This nation-wide trend toward urbanism is proceeding more rapidly than many Georgians may realize. The New York Times has just completed a survey on the way the face of America is changing. Metropolitan areas are growing toward each other, and in some places the rural country side as we know it has all but disappeared for great distances.

Some of these urban areas are virtually obsolete. Their handling of the problems connected with increased traffic, spreading slums, inadequate schools, parks, and hospitals has not kept pace with the sweeping growth....

There is certainly plenty of evidence to suggest that our present piecemeal programs - federal, state and local - are only nibbling at problems that call for a broadside approach.

As a result of the rapid industrialization and the great concentration suddenly of people in urban areas many serious problems arise. Among them are the matters of water pollution, air pollution, transit, housing, schools, sewage disposal, and a host of others. Realizing that the people where concentrations are taking place will soon face these problems unprepared, the Institute of Citizenship at Emory University is calling a conference on "The Problems of Growth" to be held at Emory University April 22-23. Representative citizens from all places affected will be invited to participate in this conference.

Below is a list of topics to be discussed.

1. Population growth and economic change
2. The problem of movement of people within an urban area - Transit
3. Services--water, sewage, schools, etc.
4. Government
5. Planning
6. Land use
7. Mass communications
8. Institution and organizational resources to meet the problem
9. Finance

Fundamentals of

AMERICAN NATIONAL GOVERNMENT

CULLEN B. GOSNELL — Professor of Political Science, Emory University
LANE W. LANCASTER — Professor of Political Science, University of Nebraska
ROBERT S. RANKIN — Professor of Political Science, Duke University

McGraw-Hill Series in Political Science
Joseph P. Harris, Consulting Editor

A Sheaf of Fine Comments

"I like very much the approach that Gosnell, Lancaster and Rankin have made in this book in terms of its usefulness for beginners and for very simple analysis."

• *Professor William Y. Elliott,*
Department of Government, Harvard University

"*Fundamentals of American National Government* is an excellent piece of work. It is concise yet not so brief as to ignore any important detail. It is particularly suited to the one-semester national government course. The style upholds scholastic standards of writing, but with a high degree of readability."

• *Professor Clarence C. Schultz, Department of Social Science, Lee College*

"It is an excellent volume, fortunately brief and compact. It is well written and well composed. The authors' premise of avoiding both fact *qua* fact and theory *qua* theory is a most commendable one. In that regard it is refreshingly unique among current texts on national government."

• *Professor Henry J. Abraham, Department of Political Science,*
Wharton School of Finance and Commerce, University of Pennsylvania

"In my opinion the textbook is excellent. I am particularly impressed with the skillful blending of principles of government and description of government in operation."

• *Professor B. O. Quillian, Jr., Department of Political Science,*
University of Georgia (Atlanta Division)

"It seems to me to be a well-balanced, thoughtful elementary text."

• *Professor George A. Graham, Department of Politics, Princeton University*

"I find this text far superior to all others. Its profound yet straightforward presentation of theory, its unusual accuracy of detail, its thoroughness respecting function and structure, and above all its balance and penetrating insight—all tend to elevate this work from the status of just another text in American Government."

• *Professor Spencer R. Gervin, Chairman,*
Department of Political Science, Milligan College

"I am especially impressed with this text's readability, its lively style, and the fine scholarship evident in the careful documentation and the fitness of cases, of illustrations and examples."

• *Professor Paul S. Jacobsen, Department of Political Science,*
Colgate University

"I am impressed by the excellent job that the authors have done in presenting a large and complex body of material in a book that can be used in a one-semester course."

• *Professor Albert L. Sturm, Department of Political Science,*
College of Arts and Sciences, West Virginia University

"It represents a new and refreshing approach to American government at the national level."

• *Professor Francis M. Wilhoit, Department of History, Mercer University*

BREVITY, CLARITY, AND BALANCE are the three most distinctive virtues of this fine new text for the introductory course in American Government. Here, in simple, nontechnical language, the authors set forth (1) the principal ideas and ideals underlying American political institutions; (2) the machinery of the national government, with illustrations of its operation as a going concern; and (3) brief treatments, combining both principles and facts, of the important functions performed by the national government.

Theory and practice are related in a concise, simple presentation. It does not emphasize merely the theoretical principles and functions, nor does it attempt to describe the machinery of government in detail. Balance is the constant guide: theory is dealt with at the outset, followed by details of practice.

Highlights of the text are the authors' impressive handling of such significant matters as individual rights and the Congress, and the superb final chapter on "The American Political Achievement." Never before has a text of this kind placed in the reader's hands such a cogent affirmation of the stature of our democratic system in the world today.

CLAUD HENRY RICHARDS, Jr.
Wake Forest College

WILLIAM HAYS SIMPSON
Duke University

This manual has been prepared for the use of teachers of American Government and has been planned to supplement the textbook *Fundamentals of American National Government,* by Gosnell, Lancaster and Rankin.

Materials included consist of discussion, multiple choice, and reverse multiple choice types of questions. While many important cases are mentioned and used in the text, there have been included in the manual brief statements of background cases that may be of aid to those teachers who want to go more deeply into certain topics. For each chapter there has been prepared a short bibliography of current documentary and periodical materials. A similar list of books is found at the end of each chapter in the textbook.

The Manual is free to teachers using the text

Dear Ed:

I expect to be in New York March 12-14 and would like to see you while there. We have a committee of the Southern Political Science Association on Teaching of American Government and we are planning a session next fall on television. It is this that I wish to talk with you about.

I saw your film on Burma and thought it was excellent. It seems to me that some of these would be good for the course in American Government if they were not over half an hour long. Your films are available through McGraw-Hill for visual education. Incidentally, I have a textbook with this firm which is doing quite well.

With best wishes, I am,

Yours sincerely,

Cullen

Cullen B. Gosnell

P.S. I am now making up my appointments for my visit and would like to see you at your convenience.

Dear Ed:

I enclose a copy of a letter which was sent to CBS in New York and WAGA in Atlanta. A copy of my reply is also enclosed. I do this because I do not think the great concern with which you are connected would give such a person much comfort. I remember too well the fine programs you put on and the great courage with which you speak your mind.

I hope to be in New York in March and want to see you. I will let you know later when I will be there.

With best wishes, I am,

Yours sincerely,

Cullen

F. GRAHAM WILLIAMS CO.

Atlanta 9, Georgia

January 17, 1956
(Dictated 1/16/56)

W A G A Radio Station
1018 W. Peachtree St.,
Atlanta, Georgia

Gentlemen:

Yesterday, Sunday January 15th, I heard most of a program which was on the CBS radio station WAGA entitled "Georgia Sees the World". Apparently there were two or more men talking on the radio that seemed to be having fun, like disc jokeys sometimes do. However, pretty soon these men began to talk about the South and claimed that they knew what they were talking about; and said that the South was now more isolationist than the West, and that the South was asolescent, etc., etc.

I called the station in an effort to find out who was responsible for the program, and the man talking did not seem to want to tell me who he was, but did advise that Mr. Les Hendrikson was the Program Director. I called him at his home and he advised that he was not the one responsible for the tape recording program and that he had not heard it, or did not know anything about it; but advised that Dr. Gosnel was the moderator, or the Program Director.

This is to advise that I do not think it is for the good of the country, or any section of the country, for any individual or group of individuals to "spout off" about a whole section of the country things that are not true. I feel sure that our two Senators from Georgia, Senators Walter George and Dick Russell, are as interested in world affairs, and as far from being isolationists, or adolescents, as anybody anywhere.

One of the things that Mr. Hendrickson advised is that these so-called men (or animals) on the radio program are professors at Georgia Institute of Technology and Emory University. If they are, I would certainly hate to think of their having an opportunity to disseminate misinformation to the young people who attend these two institutions; and I do feel that they should not be permitted to give out misinformation on the radio.

Sincerely,

F. GRAHAM WILLIAMS,

FGW-T

January 27, 1956

Mr. Graham Williams
1090 Boulevard, N. E.
Atlanta, Georgia

Sir:

Your letter to WAGA (a copy of which was sent to CBS in New York) has just come to my attention). I am the moderator of the program "Georgia Sees the World." Some time ago we had a discussion of isolation trends in the South and this is the program to which you take exception. Having been born and reared in South Carolina, having taken my doctorate at Princeton University, and having taught over twenty-eight years at Emory University, I believe that I am a loyal American as well as Southerner. In your letter you roundly abuse me and hurl epithets at my panel simply because we do not happen to agree with you. Let me ask you, Mr. Williams, what sort of world would this be if all of us agreed? That is the sort of place Russia is. Do you approve of Russia? The great founding fathers put a Bill of Rights into the Constitution of the United States and it provides for freedom of speech and freedom of the press. We have a similar bill of rights in the Georgia Constitution. The right to disagree is a fundamental principle of the American system. A former Governor of Georgia has a TV program on WAGA once a week in which he often proclaims the isolation doctrine, opposes foreign aid, abuses the United Nations, and so on. He has a right to do so and I have a right to disagree. I admire both Senator Russell and George; in fact, I helped to make Senator Russell governor by furnishing him with his main issue in 1930.

Let me quote your last paragraph:

"One of the things that Mr. Hendrickson advised us is that these so-called men (or animals) on the radio program are professors at Georgia Institute of Technology and Emory University. If they are, I would certainly hate to think of their having an opportunity to disseminate misinformation to the young people who attend these two institutions; and I do feel that they should not be permitted to give out misinformation on the radio."

Come, come, Mr. Williams! Are you not ashamed to make such a statement about honorable men. I am 62 years of age and never in my life have I been so abused before. Such abuse demands an apology from an honorable person.

Let me quote you something from one of the greatest justices who ever sat on the Supreme Court of the United States:

> "Persecution for the expression of opinions seems to me to be perfectly logical. If you have no doubt of your premises or your power and want a certain result with all your heart, you naturally express your wishes in law and sweep away all opposition. To allow opposition by speech seems to indicate that you think the speech impotent, as when a man says that he has squared the circle, or that you do not care wholeheartedly for the result, or that you doubt either your power or your premises. But when men have realized that time has upset many fighting faiths, they may come to believe even more than they believe the very foundations of their own conduct that the ultimate good desired is better reached by free trade in ideas— that the best test of truth is the power of the thought to get itself accepted in the competition of the market, and that truth is the only ground upon which their wishes safely can be carried out." (Holmes dissent in Abrams et al v. U. S.)

Are you afraid of the truth, Mr. Williams? If you are, then God help you.

As you sent a copy of your letter to CBS in New York so shall I send a copy of mine as well as yours to my old friend, Edward R. Murrow, VP of CBS, and a friend of over twenty years.

Sincerely,

Cullen B. Gosnell

November 15, 1955

Mr. Edward R. Murrow
485 Madison Avenue
New York 22, N.Y.

Dear Ed:

Thanks for your letter. I still hope that you will be able to work in a hunt even though it is not more than one day. You see we have a rather long season for quail. The season comes in November 20 and goes out February 25. You might find that you could get off some time during the Christmas holidays or after Christmas when the hunting is still fine. If you take one quail hunt down in Georgia I don't believe that you will ever forget it.

John Crosby wrote an awfully good piece about you about the time you were beginning your new series on See It Now. He expressed my sentiments exactly when he pointed out that you ha great power which you had never abused but that you had used it always for good purposes. With that I agree one hundred per cen Sorry I missed your first show as I was engaged in an Institute affair at the time, but I will be looking forward to your next one.

Try hard to juggle your heavy schedule and get in a hun with me. Just give me a ring some time if you can work it out.

With best wishes ever, I am

Yours sincerely,

Cullen

Cullen B. Gosnell

Gosnell, Cullen

November 2, 1955

Dear Cullen:

As of right now it looks like I'm ruined for this year's quail shoot, but I still have faint hopes. If I see a chink in this miserable schedule, I will make you a signal forthwith.

Sincerely yours,

Dr. Cullen B. Gosnell

New York, New York

Dear Ed:

Thanks for your letter which was forwarded to me on my vacation. I understand perfectly about the broadcast. Back in June I saw something in the paper about the change in sponsorship. Maybe we can fit in later on.

Now, I want you to remember about that quail hunt we planned last spring. I have already taken up the matter with a friend at Thomasville and was told that we could hunt on a big preserve down there with sufficient notice. The season opens November 20 and I would like for you to give me some possible dates when you could come. I want you, if possible, to be with us two or three days and I believe I can guarantee you the best hunt you ever had.

I will let you know when I am coming to New York again. In the meantime let me have some possible dates during the quail season when you can get off. The season closes about February 25.

With very best wishes, I am,

Yours sincerely,

Cullen

August 23, 1955

Dear Dr. Gosnell:

Sorry I missed your telephone call.

Sorry, too, to tell you that the format for SEE IT NOW has been changed radically within the last few weeks. During the coming season we will be doing between six-hour or hour-and-half programs rather than the previous weekly half-hour schedule. This means that we should be unable to deal with as many subjects that have been under active consideration. It may be that at some point during the winter we can find a place to undertake the program we discussed, but the prospects are not promising. In any event do not fail to let me know when next you are coming to New York.

As ever yours,

Dr. Cullen B. Gosnell

Dear Mr. Murrow:

As you requested last spring when I was talking with you in New York, I am writing you now concerning a possible broadcast on your "See It Now" program. You indicated at the time I saw you quite an interest in such a broadcast. As you will recall I suggested that one of our adult education projects be used and that possibly a discussion on "Cotton and World Trade" by a group of small cotton farmers might be the best bet. This would be a panel discussion led by a moderator and two experts. Both sides of the question might be presented briefly by the panelists and then questions and discussion might come from the farmers.

I called your office a day or two ago and discovered that you were out of the city until the first week in September. When you return I would appreciate it if you would contact me.

With best wishes, I am,

Yours sincerely,

Cullen B. Gosnell

Noted by E. R. M.

June 14, 1955

Mr. Edward R. Murrow
485 Madison Avenue
New York, New York

Dear Mr. Murrow:

I am enclosing a few ideas for the possible television show concerning the Emory Institute of Citizenship which we discussed last March. I have tried to develop the idea of basing the program on the growth of cotton and its relationship to world trade as you suggested. As I remember from our brief conversation I believe you suggested the possibility of televising this program sometime in the fall. It occurred to me that it might be necessary to take some of the shots depicting the stages of the growth of cotton and the harvesting of cotton sometime fairly soon if these pictures are to be taken in season. Let me know how your plans are developing and whether there is anything further we can do along the line of information or cooperation. I do think that our Institute experience here has been interesting and exciting and that it would provide good material for one of your fine "See It Now" programs.

Called 6/23 you were on Pawling.

Our field consultant, Paul Rilling, will be in New York during the week of June 20 to report to the Foreign Policy Association on the progress of our Institute program this year. He will make a courtesy call to your office just in case there are any points you would like to check with him. Mr. Rilling has handled the bulk of the field operations for the program and is well qualified to further explain the exact nature of the work that we are doing if that would seem necessary or advisable.

Sincerely,

Cullen B. Gosnell

Suggestions for the projected

See It Now

program on the

EMORY INSTITUTE OF CITIZENSHIP

Topic: Cotton and World Trade.

Purpose: To show the operations of the Institute in a local South Georga community. The topic "cotton and world" trade is utilized to emphasize the way in which the world situation impinges directly on the welfare of the average cotton farmer.

1. Picture of the Emory campus. Explanation of the Institute work and aims.
   President White
   Dean Hepburn, chairman of the executive committee of the Institute
   Dr. Gosnell, director of the Institute

2. Comments from representatives of the supporting agencies.
   Dr. John Nason, president of the Foreign Policy Association
   Robert Blakely, Fund for Adult Education

3. Film of growing cotton in South Georgia with narration emphasizing the inter-relationship of cotton and world trade. Film might trace cotton through stages of growth, harvesting, marketing, and into the stream of world trade.

4. Shot of Institute activities in progress in a small South Georgia community. Perhaps ten or twelve local people are participating in a discussion of world trade. Short statements are given by speakers on various sides of the question, followed by a brief, spirited question period.
   Moderator: Paul Rilling, field consultant, Institute of Citizenship

October 9, 1957

Dear Phil:

Thanks for the note about the TIME piece.

Group journalism is a curious thing - particularly when the writer cannot recognize his own copy when it appears in the book.

Thanks for the kind words. I have a feeling that the guys who work in print will be around for a long time.

As ever yours,

Mr. Philip L. Graham

PERSONAL

Dear Ed:

I am home in the sack with a runny nose, have read the TIME piece, and have spare moments to send you a few comments which you may carry up to Pawling to your Mrs. and to Casey if you wish.

(1) On page 49 - "Beyond personality and technique" - one of their fancy writers gropes around for a lot of high-priced, non-illuminating words. There are simpler ones that explain why Casey's papa is respected, and down here, being old-fashioned, we use words like "character" and "courage".

(2) That closing crap about TV's inadequacies in news - "an adman's medium" - is especially hilarious this week. The nightly shots from Arkansas, the special half-hour on CBS Tuesday night, your Clinton show, etc., are major hopes for the kind of better national understanding that may prevent Fort Sumter the second. (I know of two actors - Governor Collins of Florida and Deputy Attorney General Bill Rogers - who were affirmatively motivated to good action by specific things they saw on TV.) Moreover, individual station operators like ourselves are improving news activities as we never dreamed we'd dare, and largely because of your example and leadership. (In last sentence, "dare" does not involve courage, but means dare spend dollars for no quick, obvious return.) I confess I'm primarily a newspaper fellow and I think our own stuff has been pretty good on Little Rock. But I print almost as much soap opera as Mr. Luce does and I can't go in for too much looking down on you new boys.

(3) Tell the Pawling group about how thoughtful I was in telling you how to run Person to Person of Eugene Meyer; and how instead of shooting me you even called Kay and me up after you had carefully given the old man a nothing ball so he could knock it out of the park.

(4) Finally, tell them about old Mike Fodor and how easy it would have been to be too busy to come way down here to help prove to those Howard Business School fellows that they had better not fire him.

Heavens, I must have a very bad cold to be so damnably pleasant.

Your friend, intimate or not,

Philip L. Graham

Mr. Edward R. Murrow,
Columbia Broadcasting System, Inc.,
485 Madison Avenue,
New York, New York.

P.S. I'm sure they meant to be nice. I just wish people nowadays wouldn't be so constipated when it comes to amiability. PLG

Graham, Philip

September 13, 1957

Dear fellow pondsman:

I cherish your sage counsel and will hope to bask in the sunshine of your wisdom when next I visit what they refer to on the radio as the nation's capital.

I have indeed built, or caused to be built, two ponds: the one I built myself was passed 100% by the Conservation Department, the Bureau of Public Health and the ghost of Fiorello H. LaGuardia. The one I had built (I am about to sell the farm to pay for it) is now being questioned and disputed by everybody in the community including small boys with sand buckets and shovels.

I deeply resent your implication that I am incapable of building a pond and my resentment will adhere until the dam goes out in the spring.

I will be in your fair city next week, but only for a day. However, I shall hope to make crude noises on the telephone.

As ever yours,

Mr. Philip L. Graham

Dear Ed:

I have always thought you a basically decent fellow despite your preoccupation with such exotic matters as freedom of speech, tolerance, world affairs, and the like. So I am delighted that you have at last developed a healthy interest and built a pond.

You are indeed fortunate to have in me a friend who is a great authority on ponds. You have already made one ghastly mistake - building it yourself - so I must rush in with a preliminary briefing to prevent further errors:

(1) Be sure to name this one for your wife. This will seem generous but more important you are bound to build a bigger pond soon. That one can then be called Lake Edward. I followed the plan, and we now have Lake Katharine (1 1/2 acres) rather overshadowed by Lake Philip (6 acres).

(2) Remember the following as an article of faith: The Department of Agriculture knows absolutely nothing about ponds. If you are in doubt about anything, a good rule of thumb is to do the opposite of their recommendations. Thus:

(a) Do <u>not</u> fertilize.

(b) Do not follow their fish stocking ideas.

(3) The only man who knows anything about ponds is Clinton J. Riley, Galena, Maryland.

(4) An absolute essential for your pond is a Packet boat, which you order from the Porta Company, Canton, Massachusetts.

(5) Avoid Abercrombie & Fitch.

(6) Avoid free fish from the U.S. or the State. Buy them.

(7) I shall send further instructions on the following when you demonstrate an approach to mature pondsmanship:

(a) Muskrats.

(b) Snapping turtles.

(c) How to have a sandy beach.

(d) How to have a boat dock.

(e) Weed and Algae control.

(f) Tax deductibility of farm ponds.

Sincerely,

Philip L. Graham

Mr. Edward R. Murrow,

Dear Ed:

When I learned of your 3:00 a.m. arrival, and further saw how generally tired you were, I realized what an absolutely revolting thing I had done in inflicting that performance before the Advertising Council on you. But I do want you to know how much I appreciated your being there, and also I wanted inadequately to tell you what a marvelous job you did.

I had a detached and disinterested observer in the audience in the form of my wife. Her most perceptive observation was to note how the tyranny of the broadcasting clock had disciplined you to say ten minutes' worth in three minutes.

I do apologize for the strain imposed on you, and I do further take an oath never to bother you again until you give up your present mad schedule and decide to retire to the presidency of George Washington University.

Sincerely,

Phil

Dear Ed:

Reading over the excellently done CBS news memorandum on Clinton, dated January 21, reminds me of my failure to write you about this.

Kay and I looked at the program with our 21-year-old house guest of that weekend, Harsha Hutheesing, who is the son of Prime Minister Nehru's youngest sister. So we offered an audience of somewhat varying ages and origins.

I don't know how to tell you about the program, because we Scots try occasionally to avoid superlatives. So I will just say that you and Fred Friendly never have done and never will do anything better.

Sincerely,

Phil

Dear Ed:

Further report on "Clinton" to you and Fred Friendly:

Wednesday night your unpaid helper, Danny Kaye, blew in, along with Sylvia and Mr. and Mrs. Max Rabb, for dinner with us. Danny and Justice Frankfurter have a burgeoning mutual admiration society under way, so we called the Justice and were invited over after dinner. Half way through dinner, Sylvia told me of their regret and remorse over missing "Clinton."

Knowing that the Justice resists all technological advance after the age of Marconi, and so has no TV set, I decided to see what could be done.

WTOP had a copy of the film on hand, because we had brought it down to show it to all our reporters and editors who had missed the show. They managed to produce it along with a portable screen and projector by 11:30. So we took over the Justice's living room and made a tolerable theatre out of it and wound up at a quarter to one. To put it briefly, the audience reaction was all, and a great deal more, that you could have hoped for.

Sincerely,

Phil

PERSONAL

Dear Ed:

You have probably heard that the busy bureaucrats have succeeded in suspending Mike Fodor's paper, Die Neue Zeitung. This leaves the field clear for German publishers who can sustain the morale of West Berlin through lots of leg-and-bosom art. I am confident that this step will balance the budget, restore free enterprise, etc.

Mike writes me that he is being given a job in the U.S. Information Service here, returning some time in April. I suspect that you believe with me that he is almost a Great American (even though he may not know Arthur Godfrey).

I doubt very much that the Moguls in USIA have any true idea of his present value or past services. I have been considering pitching a whing-ding luncheon for him on his return. Not many people, but all Terribly Eminent, like you. This would serve two purposes: (1) impress the not too knowledgeable Moguls at USIA; and (2) offer a pleasant change from the usual luncheons given for horrible characters.

What are your views? Do you think this might help ensure Mike's being adequately protected? If so I may get in touch with you when he gets here to see if you could possibly find an April day when you could slip down for such an occasion.

Sincerely,

Phil

January 14, 1955

Dear Ed:

Thanks for yours of January 10th.

The so-called "Washington Futurama" is shaping up strongly. It will be a good exhibit of the whole community problem. It's sponsored by all the eminent groups in town, will be held in our biggest department store, and will be seen by a quarter of a million or more people.

Of possible interest to you are large-scale "futurama" models they will have made; crowds ogling exhibits; gathering of nabobs, etc.

Ergo, would it be wise for Mr. Friendly or you to peek at the scene pretty soon, so that he could gear your date in with this exhibit? It is now set for first week in May, but probably could be shifted a bit if necessary.

If either of you can come down I'll be glad to make any arrangements to eliminate waste time and yet give you a feel.

I hope you are wise and mean enough to make Mr. Friendly do all your work. So I enclose a carbon you can send him. If he wants to call me direct I'll be glad to be of service.

Sincerely,

Philip L. Graham

Enclosures

TV News and Views:

C. B. S. 'Eye' to Be Upon Us All the Live-Long Day

By C. J. SKREEN

KTNT-TV's reaffiliation with the Columbia Broadcasting System may represent a net gain in revenue for the station, but for the viewers it is likely to be a net loss, apart from those who have been unable to pick up the KIRO-TV signal.

The affiliation, in effect, cuts the choice of programs for viewers from five to four in the Seattle-Tacoma market, with Channel 7 also carrying C. B. S. programs.

Although Channel 11 has not announced its network-program policy, it seems safe to say the station will be forced to carry the full complement of C. B. S. programs offered, since its performance will determine to a considerable extent whether it will continue as a network affiliate when contract-renewal time arrives in two years.

At that time, C. B. S. will have to re-evaluate its position in the Seattle-Tacoma region. The ratings of C. B. S. shows, which heretofore have been woefully weak in this area, will be a determining factor on what action the network takes.

Ironically, with the C. B. S. "eye" turning up on the tube over both Channels 7 and 11, Puget Sound viewers who also can pick up Bellingham's Channel 12 have three C. B. S. channels at their command. This must represent the ultimate in saturation coverage for a network.

●

NEEDS DOCTORING: N. B. C. is carrying a show tonight on Channel 5 that may find viewers running for the smelling salts.

Titled "M. D.—U. S. A.," this March of Medicine offering, dedicated to the work of the American physician, definitely is not for the squeamish.

Those with sufficient fortitude, however, will see a cut lip being sewed up, an abdominal operation, a child being fitted for a brace and a young woman whose muscles are turning to stone.

Unfortunately, this overly clinical presentation seems more intent on sensationalism than honor for the physician.

Incidentally owners of color sets will be able to see this one in livid color.

MURROW RETURNS: Tonight also will see the return of Edward R. Murrow to the TV wars after his year-long sabbatical. The C. B. S. Reports offering, "Who Speaks for the South?" should prove engrossing to those who are not allergic by now to the Southern segregation issue.

The Murrow documentary has had a haphazard fate in the wake of the summit conference. Late last week, the network announced the program would be pulled and sent Murrow off to Berlin for a substitute report on what was expected to be the German crisis. The best laid plans of C. B. S. went astray when the unpredictible Khrushchev decided not to press the Berlin issue.

Oh, yes—and don't say we didn't warn you: Edd (Kookie) Byrnes, who had been on strike for higher wages at Warner Brothers, returns to action tonight on 77 Sunset Strip over Channel 4.

Seward, J.

JAMES M. SEWARD
Executive Vice President

May 25, 1960

Dear Saul:

I am sorry to report that I am still unable to talk. Beyond that my throat is still quite sore as a result of a third minor operation last Thursday. Consequently it would only be frustrating for you for us to attempt to discuss Ed's Queen City stock ownership.

But here's the story as I know it. A day or two before I wrote you Ed telephoned me to say that he had decided that it would be a mistake for him to continue as a Queen City stockholder. The fact of his holding stock in a broadcasting operation labels him in the minds of those that know about it, and his necessarily minor ownership and inability in any case to participate in policy decisions makes the situation more embarassing. He wishes to withdraw completely and as soon as possible but at the same time would like to do so in a way which would cause minimum problems for you.

That's all I could write out for you in long hand if we got together, but nevertheless I'll come to your hotel or meet you here if you wish me to do so. I am sending Ed a copy of this note and I am sure he will telephone you if he can get out of the cutting room long enough.

Sincerely yours,

Dear Saul:

To continue on from where we left off earlier this afternoon while sitting over lunch in the Squire Room of the Fairmont Hotel....you will recall we were discussing a person of mutual interest, Mr. Edward R. Murrow.

Long before becoming a member of the School of Radio at Washington State College under the capable direction of Allan Miller, I was an ardent fan of Mr. Murrow. During my early days at WSC we spent many hours studying various programs and announcers. My favorite was Ed Murrow.

It was about this time that his recordings of "I CAN HEAR IT NOW" were first issued and became so popular. I have a complete set of his albums to date. It was during the latter part of my Junior year in school that I was to meet the great Mr. Murrow. He visited his alma mater and gave several lectures to the advanced class of News Writing. Of course, these meetings just added to my continuing interest in this man. In the years that followed I have listened to his daily radio newscasts and watched his "Person to Person" TV program whenever possible. Since our initial meeting I have been in the broadcasting business about seven years and I hope to someday have the opportunity to again meet and talk with Mr. Edward R. Murrow.

It was a genuine pleasure to be with you today, Saul, and I hope we can sit down over lunch again in the near future. I will be looking forward to seeing you when I come to Seattle about the middle of February.

My very best regards to you and your wonderful family.

Sincerely,

Frank

August 15, 1958

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York 22, New York

Dear Ed:

I have in my office a private number that does not go through the switchboard. It is both a convenience and an inconvenience because I can't answer it when I am away from my desk or in the television building across the street, or anywhere but at my desk in my office.

Naturally, long distance calls must be person-to-person when placed to me at the station. The private number does not involve person-to-person calls since it rings directly in my office.

This number is ATwater 3-9155.

Sincerely,

Saul
pf

Saul Haas:pf

Haas.

August 13, 1958

Dear Saul:

I, too, am terribly sorry we weren't able to arrange to meet, but it was a most hurried trip, and I thought at last to give my mother a little vacation in Victoria.

It was also disappointing to miss Bill Douglas. As you know, I am not my own boss when it comes to time.

I will pass along to Howard Smith the clipping on THE RUBLE WAR.

Forgive me for the negligence about the picture for Dossa. I am sending it today. Don't forget to let me know when you are coming East again.

As ever yours,

Mr. Saul Haas
KIRO-TV
1530 Queen Anne Avenue

mac

KIRO-TV 7 1530 queen anne ave. seattle 9, wash.
OWNED AND OPERATED BY QUEEN CITY BROADCASTING COMPANY

July 25, 1958

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York 22, New York

Dear Ed:

I am sorry we weren't able to get together when you and Casey were out here, but we found out from your mother that you had left for the Rogue River and had to be back in New York on the 13th.

Bill Douglas, when he got to Portland, called me. He told me that you were somewhere around here and indicated that you might visit him. He thought it would be a good idea if I drove you and Casey to Glenwood. He had some awfully good fishing spots in mind.

I wanted, of course, very much to see you and Casey -- I haven't seen Casey for several years -- so I put an able young lady on your trail (she comes from Tennessee), and she found out about your movements from your mother. She was actually enchanted by your mother, and they apparently have a tentative agreement that Miss Freeman will someday visit your mother. It was plain to see that they had enjoyed a good old time visit on the telephone.

So, I called up Bill and told him that your stay on the Rogue would be very brief because you had to get on to New York. He told me that you had called him not ten minutes before, so he already knew what I had to tell him.

Well, if the mountain can't come to the man, the man can go to the mountain...so I expect you'll hear from me, and try to save me a little time when next I go East.

Incidentally, I don't know Howard K. Smith -- though I'd like to -- but I think you might be interested in the fact that, like some of your big shows, "The Ruble War" did get some attention "in the sticks". I am sending you a page from The Seattle Times which carried the story. Would you

be good enough to pass it along to Smith and to such others who might be pleased by reading the story?

Dee and I were sorry that you couldn't spend a little time with us....and that reminds me to dun you! You doubtless remember the night that Charlie Collingwood and you and I, and a couple of other guys, were talking in Colbee's. At that time, both you and Charlie agreed to send Deesa autographed pictures. These assurances were repeated when I explained that if you both sent these pictures to Deesa on the theory that you were sending them to the daughter of an old friend, it would raise my stature with my child. Since I haven't gotten the pictures either from you or Charlie, I thought that I could "explain all" when she saw you personally.

Kindest personal regards.

Sincerely,

Saul

June 3, 1958

Dear Alex:

First of all, you guys have done a real good job from Paris.

Second, many thanks for taking time to brief me on VERA.

Third, there was no flap re the Paris circuit on the night of the Assembly vote. When there is a flap you will hear from me in unambiguous terms. Your piece stood up - the agencies all went mad, as usual, except in this case Reuters was right, or maybe just lucky.

So far as the repeat is concerned, I will confess to you that I damned near forgot we had one it's been so long since the news has caused us to repeat. Normally it just drools out of Chicago - West by recording.

As ever yours,

Mr. Alex Kendrick

LONDON BUREAU

May 29. 1958

Dear Ed:

Two things.

First, since Charles is participating in the downfall of the Fourth Republic, I have been checking on your May 28 request for information on the BBC electronic tape machine VERA. The BBC Chief on the engineering and technical side, Sir Harold Bishop, says that they have built two prototype machines, which were given a TV debut on Panorama a few weeks ago, and are now being installed at Lime Grove. They will try to put them into active service in a few weeks' time, and as soon as they are in working order, we can have a look. Bill McClure is much interested in this, so he will be having the look and will communicate his opinion.

Bishop frankly says they are having their teething troubles. When VERA is in good form, she is magnificent; when she has an off day, she is mediocre. It may be months before they get her into dependable operating mood. I saw the Panorama test and VERA was on the ball that night; the kinescope was virtually indistnguishable from the live, and the taped segment was played back on the air just nine minutes after the original recording. I gather the only real time factor involved is that of rewinding the tape.

BBC has no present plans for manufacturing VERA on any scale, but Bishop says they may eventually do so if she is highly successful. There have been several nibbles from manufacturing concerns, and probably ultimately somebody will start making machines and putting them on the market. This is still some way off.

One other angle. VERA works only for the British 450-line system. She could not be used at present for either the American or Continental systems. If she is manufactured here, she would have to be modified for export purposes.

Item Two. I gather there was a bit of a flap on the Paris circuit the night of the Assembly vote because (1) I did not update my piece and come up on the live circuit for your 7.45; (2) because I did not come up on your repeat circuit at 8.45.

I plead not guilty to goofing-off. I would have been on the 7.45 live if I had had a story. But the vote count began just 20 minutes before your air time, and since it took 50 minutes to complete -- and I knew it would take 50 minutes -- I washed out the circuit and notified New York why I was doing so. It is true you got a vote flash during your air time. I was in the AP office when this went out, and knew it was strictly a phoney, based on thumb sucking. It turned out to be about 120 votes off, and actually -- not counting the Communists -- would have meant Pflimlin was defeated instead of winning. As I look back, I think my piece, which tried to explain what was going on and what some of deGaulle's parliamentary problems would be -- not only held up for the 7.45 but would have served usefully as a backgrounder for the repeat.

So why wasn't I on the repeat? What repeat? Nobody told us on our 2130 circuit that the 7.45 was repeating, though we were told that the World Tonight was repeating. If we had known, I would have been there.

Bill has told me about SEE IT NOW. No need to say to you and Fred that everybody will miss it, we over here as much as you. Best regards.

ONE OF THE NATION'S GREAT STATIONS

SeattleTeleviews:

Election Returns On KOMO-TV Tuesday

BY W. F. JAHN

KOMO-TV will telecast results of Tuesday's primary election, live and direct from the King County Auditor's office as the returns are tallied following the close of voting.

News editor Herb Robinson and reporter Howard Shuman with a two-camera remote set-up, will report returns during a special program from 10:30 to 11 p. m. on Channel 4.

Interviews with the various candidates will be a feature of the telecast.

If any of the races for council, comptroller or city treasurer are undecided by 11 p. m., further returns will be given on the "Deadline" news or during the "Jack Paar Show," Robinson announced.

Channel 5 will carry election returns during station breaks and on the 10:30 p. m. news with Ted Bryant.

KIRO-TV's FIRST week end of programming was a technical success judging from our viewing on Channel 7 Saturday and Sunday.

Video quality of the station is excellent, with high contrast pictures that I found made fine viewing.

The move of CBS Television programs to KIRO, incidentally, returns to Seattle viewers a number of programs that had been temporarily off the air during the pre-changeover period.

"Person To Person," the Ed Murrow hosted live interview show is perhaps the one "most missed" by the viewers. It will return Friday at 9:30 p. m. Others include "Robin Hood," Mondays at 6:30 p. m., "Name That Tune," Tuesday at 6:30 p. m., "Sergeant Preston," Thursday at 6:30 p. m., and "Leave It To Beaver" on Friday.

October 29, 1956

Mr. Saul Haas
Radio Station KIRO
1530 Queen Anne Avenue
Seattle 9, Washington

Dear Mr. Haas:

On the evening of Wednesday, October 24, 1956, one of our officers heard the regular 5:00 P.M. radio news broadcast of Edward R. Murrow over your station. In this broadcast Mr. Murrow discussed the principles of Imperialism and Nationalism as they apply to the recent crises throughout the world, and particularly to those in central Europe and the Middle East.

Mr. Murrow's treatise, this officer felt, was a paragon of clarity and brevity on a subject so vast as to normally fill volumes.

Our Air Force ROTC curriculum for both our Freshman and Senior classes includes within its subject matter lectures which give our students a basic understanding of both these factors in International Relations. We feel that Mr. Murrow's broadcast would be of great value in our presentations, if we would be permitted to use it.

I would greatly appreciate your assisting us in obtaining a recording or tape of this broadcast for use in our classrooms. If the recording or tape is not available, a second choice would be a copy of the script with necessary permission to use it for this purpose.

Thank you very much for anything you can do for us in this regard.

Kindest personal regards.

Cordially,

Utley Spencer

September 19, 1956

Dear Ed:

Tried to get you several times while I was east. This was not only because I have never felt a visit east is complete without at least a phone conversation with you, but because I have been asked to inquire about an invitation sent you by the Mayor of Seattle to be the principal speaker on the occasion of having natural gas come to our state.

In checking with others connected with your staff, I found that it was practically certain you couldn't make it, even if you wanted to. Because of this, I talked with Frank Taylor, my opposite number on the Seattle Star when I was ME of the old Seattle Uniom Record (he is now Executive VP of the New York Herald Tribune) with the idea that he might have one of his very well named people pinch-hit for you if you decided finally that you can't come. Or would you suggest someone?

Would it be asking too much for you to get in touch with Frank and let him know what your plans are?

Meanwhile, Dee, Deesa and I send our affectionate best to you and yours,

As always,

Thank him — tell him they didn't arrive

Mr. Edward R. Murrow
Columbia Broadcasting System Headquarters
Republican National Convention
Chicago, Illinois

Dear Ed:

Didn't get a chance to see you during the few days I was in New York last week when the Affiliate met. On my way home I stopped in Boise where I had left my car and where Dee met me. We have been driving back to Seattle and listening to the coverage on the convention.

The proceedings have been hot and again and again my car radio told me that even the air conditioned convention hall was 84°.

In Yakima I stopped to see my old and dear friend Elon Gilbert, whose people came to this Yakima Valley when it was a desert. Elon now is one of the biggest fruit growers and packers and it seemed to us that you and Frank and Charlie Collingwood and the boys might in the Chicago heat enjoy some of the fruit nourished by the snows of Mount Rainier which you know so well.

So, by weekend the fruit will be delivered and I will look to you to get someone to distribute it. — not received

Please see that Frank gets his share and give him my affectionate greeting and tell him I am sure things are going to work out well soon.

It is quite possible that I will have to go East the third time if Frank and George Storer arrange a meeting between conventions. I hope to see you then.

Meanwhile, Elon and I want to send our congratulations on a great job you fellows are doing in covering the convention and we both hope that you will enjoy the fruit.

Sincerely,

Saul

Mr. Edward R. Murrow
Columbia Broadcasting System, Inc.
485 Madison Avenue
New York 22, New York

Dear Ed:

We've been in such a mess that I don't remember for sure whether I thanked you for your swell anniversary message. I think I did, and if that's the case, there is no harm in thanking you again -- I do, we all do, very sincerely.

Maybe you will find time to look over -- perhaps read -- the enclosed ad which we ran in the Sunday papers. I tried to include a statement of principle as well as a report on how we have discharged the responsibility which goes with a broadcasting license.

If we can get our labor negotiations concluded, I'll be starting East very soon. I think that by Wednesday night, we'll know whether we're going to have real trouble or not. The negotiations have lasted for months, and a lot of the trouble is due to ill-will and conflict of jurisdiction between the unions.

If you do get time to read the ad, I'd appreciate your comment. It was worked over so much that it finally became almost meaningless to me, especially since there was ten thousand distractions while it was being prepared.

My best to you.

As always,

Saul

W. S. C. Regents Shift Blame to Legislature

REGENTS of Washington State College have stated another side of the case in the controversy begun by farm leaders over the agricultural policies of the Pullman institution of learning. The W. S. C. regents, through Stanton Hall, vice president of the board, has issued a statement in The Pullman Herald in answer to the contention of the farm leaders that greater emphasis on agriculture and agricultural research should be given by the college administration. The regents' statement stressed these points:

"First—That approximately 40 per cent of state appropriated funds and 88 per cent of federal funds allocated to the college currently are going to agriculture directly or indirectly, and that statements to the contrary are seriously in error.

"Second—That both state and federal law designate that the State College 'shall teach such branches of learning as are related to agriculture and the mechanic arts in order to promote the liberal education of the industrial classes in the several pursuits and professions of life.' Thus the proposal by some extremists that the college give predominant emphasis to agriculture is not possible or legally feasible.

"Third—That 'if any neglect of agriculture exists, it exists in physical facilities for agricultural sciences,' and responsibility for this must rest with the Legislature, and not the Board of Regents."

Criticism of the W. S. C. Board of Regents had not necessarily been implied in the contentions of the farm leaders. Their recommendation was that the regents select a president of the institution with a distinctive and distinguished agricultural background. They felt that such an educator would best be able to impress the Legislature with the need for "physical facilities for agricultural sciences" such as the regents themselves imply may have been neglected. And that such an educator would be more vigorous in the pursuit of that policy than one whose interest in agriculture was less predominant.

In any case, the regents' point of view is worth presenting and fully entitled to the consideration of citizens of the state.

* * *

The smear and countersmear having reached the sloppy stage, why doesn't the Washington crowd just haul off with tomatoes, now in plentiful supply?

Dear Ed:

Of course, we were very much disappointed when on talking to Frank Stanton, and telling him that I expect you in Seattle any minute, he replied that you were already in New York.

I suppose that the next time I see you will be in New York City.

I am enclosing a letter which you might find interesting. I am very curious to know what reply the disturbed gentleman received.

My affectionate regards.

Cordially,

Saul

August 22, 1950

Dear Mr. Severeid:

I heard your radio commentary last night, praising Socialism, the first step toward Communism.

You are the first person to whom I have listened, who thinks the British are doing even half well despite the fact that we have poured billions into that country. In just what respect is the British "common man" so well off?

Both English and French economies were dominated by labor unions and "welfare statists" before the war. These elements now have more of a strangle hold on these two countries than before and Uncle Sam is a sucker to continue underwriting a way of life which will destroy us if it gets fully under way here. It already is well advanced.

The tardy and "too little" help which is coming to the United States in the Korean War from countries which we have been "financing" is only another evidence of the attitude of peoples who have become accustomed to the welfare, give away, labor union, socialist philosphy of existence. When it comes to doing their share it is "Let somebody else do it". Evidently you are trying to cover-up for their present failure.

What a pity that we should have socialist propagandists like you on the air, at a time when this country needs sound, straight thinking, and when we should have facts, not propaganda.

I send no good wishes.

Yours truly

W. Hume Logan, Jr.

Tucson, Arizona,
January 30, 1950.

Mr. Edward R. Morrow,
Columbia Broadcasting System,
45 Madison Avenue,
New York City.

Dear Ed:

I got a note this morning from my secretary saying that about a week ago you had tried to get me by phone "after everybody had gone home."

I am sorry I wasn't available when you tried to reach me. The fact is that for some days now I have been on a ranch in Tucson Arizona with Bill Douglas, who as you know is recuperating from a very serious accident.

Yesterday -- perhaps because it helped him recuperate, he induced me to get on a horse and ride eight miles. I haven't been on a horse for two years and have never been on such a little crazy cayuse.

The first few days here I had a chance to go over the galley proofs of Bill's book. There is -- I thought -- in the book a tendency here and there to detail and preciseness which are not easy reading, but the book as a whole is, I think, something you might want to call attention to (if you ever do such things).

Please give my best to the family and to all. And if you get a moment which you can afford to spend gratifying my curiosity, please drop me an Air Mail letter letting me know about the phone call.

My address here is c/o Justice William O. Douglas, Box 5158. If you have occasion to call me, the number for the next few days is 5-4331. If we leave here before I go to Seattle or East, messages will be forwarded to me.

Best as always,

Saul

March 20, 1952

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York 22, New York

Dear Ed:

Yes, of course. In the new era which begins for me after April 14, I would be extremely happy to consider myself available for an occasional short piece for your show.

I wait with interest the outcome of the other approach by the M.S.A. people. Personally, I am not convinced yet that it's sound journalism. I always look with distrust on a project which derives from propoganda motives. I shall neither be surprised nor disappointed if nothing comes of it. I hope that if by any chance CBS shows interest it will be because of confidence in its journalistic merits, not out of any desire to please the M.S.A. people.

My original query to you was primarily to test the merits of the project against your judgment.

Cordially,

Joe

Joseph C. Harsch

1293 Natl Press Bldg
August 22

Dear Ed:

1) The name of the guy I spoke to you about (who admires your records) is
Dr. Charles Ceppi
Jamestown, Rhode Island.
Please autograph an album for him (he has the records and they are perfectly good) and send. And I would like to pay the freight.

2) Roscoe Drummond phoned me from Frankfurt this morning. He is coming back with Paul Hoffman on Saturday for a week over here. He is doing this because he thinks Paul has something to say which should receive the widest possible publicity. He asked me to line up a talk for Hoffman with the Overseas Writers here, and with the radio commentators in New York. I called John MacVane of ARNA, and John said he would call an ARNA lunch, but that during August he doubted that he could get more than five customers. Can you suggest any better way of getting a useful gang together to hear Hoffman's story -- providing you think he should be heard. Hoffman's date here is Wednesday, August 31. You could have him in NY any other day that week, except that he would a little rather come on Thursday or Friday than on Monday or Tuesday.

3) It was a swell evening. I'm very glad I came. My thanks to Janet -- and I will certainly come again this fall with Anne.

Dear Ed:

(Personal)

Just for your information.

The Monitor has proposed that I take over running their Washington Bureau for one year begining August first.

Drummond, the Bureau chief, is going to Paris for one year to run all European publicity for ECA -- I suppose this means Al Friendly is coming home.

I am strongly inclined to accept. I think I'd like to try running a good Washington Bureau for a year, particularly since the job includes doing Drummond's daily column.

If you know of any reason why I shouldn't do this better let me know by cable promptly. I know of no such reason.

Best

Joe

Dear Ed:

Report on Poland

Your letter says that some people at home are wonderring what will happen "If peace should break out". Personally I don't see much danger. But if it does I am fairly sure of one of the result. The communists will have an opportunity they need desperately to consolidate their position in Poland.

It has been assumed too widely, I think, that the first few years -- the years already passed -- were the crucial years for the communists. That, I think, is a complete mistake. I think they have had a relatively easy time of it up until now, and that this is a period when they pass over from having things almost their own way with hardly any effort at all, to having increasing difficulties.

The opposition to communism in Poland was never as romantically absurd as it was in Hungary, but it too based its tactics on a general tendency to assume that war was just around the corner, and that the mass of the people really wanted to step back into the olden times. But war has not come, and the lure of the olden times has proved extraordinarily inaffective as a lure for the masses.

What the communists did in Poland was to hitch their cause to the one great national urge of the Poles -- the reconstruction of Warsaw and the revival of national life. In Warsaw, more than anywhere else, you find conservatives, liberals and socialists all making excuses for the communists and all saying that "after all they did do a pretty good job of getting the country on its feet". And in many respects its quite true. The basic fact about the post-war period in Poland is that the communist leadership concentrated on making the country run, meanwhile deferring for a later date the erection of the Marxist state. They have gone so slow about posing as communists that Poland hardly seems yet like a communist country. The outer trappings have been kept at a minimum. The cap badge of the army is the Polish Eagle, devoid of crown, but not yet ornamented with the red star. Hammers and sickles are seldom seen. Icons are few and far between. (I mean the political icons). The Church appears supperficially to be undisturbed. Troops still march in formation to service as part of their regular military exercises. No priest is ever arrested without at least a specious pretext of justifiable prosecution under civil or criminal code. The communist party still declines to call itself such, and only the few old communists go aruno calling themselves communists. Communism still hides discretely behind the smoke screen of the "United Workers Party". In Poland communists have practiced the art of seeking the substance of power, while most carefully ~~xxxxxxxxxx~~ eschewing the outer trappings of power.

Thus, Polish communism has had the better part of four years in which to pose as the champion of Polish recovery. And while neither you nor I would ever want to say it in public, we had better recognize in our own minds that ~~that~~ when it comes to putting a badly battered economy back in working order the devices of the tyranical state make for quick and psectacular results. There have been no "strikes" in Poland during the past period. Communism "solves" the problem of the "slow down". I would say that in actual operation the beaurocratic dictatorship which Poland has had for four years has been almost indistinguishable from a fiarly efficient and ruthelss

dictatorship of any variety, fascist or classic. Polish postwwar dictatorship has done a spectacular job of rebuilding Warsaw, has put people into the "reclaimed territories", has made the factories and the mines produce, -- has "made the trains run on time". And while the political opposition is potentially almost the total of the population, still the same total has by and large approved of getting these things done. The opposition is not directed against the way the country has been governed, but only against what it is assumed will come eventually out of the new dictatorship. Anyone who thought the Polish people would revolt against a government which was actually making the country run, while it was making the country run, was a fool.

But now, I think, a change is in the making. It is compounded of many factors. The prime factor is that the communistx leaders have their own special reason for wanting to convert Poland into the "most loyal" of the dependencies of Moscow. Their own personal positic hinges on their success in this direction. If Poland can be made a truly dependable satellite then Warsaw can command benefits from Moscow Warsaw wants benefits from her neighbors which only Moscow can bestow. Warsaw will obtain those benefits only if it can ~~xxxxxxxxxxxxxxxx~~ convince Moscow that it is in factx more dependable than the neighbors. For one thing, Warsaw wants to raise its own economic level at the expense of the Czech level. It wants trade with Czecho under a formula which will ~~xxxxxx~~ contribute to the rapid rise of Polish industry. For another thing, Warsaw wants security of tenure of its new western provinces. But only Moscow can force the Czechs to trade with Poland to Poland's advantage, and only Moscow can protect Poland against German revisionism. Thus, Poland's desires depend on ~~xxxxx~~ convincing Moscow of Poland's reliability as a satellite. And that is becoming difficult.

For example, fulfillment of Polish committments to Britain under the British trade agreement are incompatible with any major speed up towards communization inside Poland. The market for Polish coal is dwindling as British mines increase their production. The time ahead will see a Poland, which must import machinery from the west, reduced more and more to dependance on food exports as the wherewithall for purching this machinery. Committments to Britain will require an annual increase in food production. If the process of farm collectivization were to be pushed now production would fall, not increase. Yet Moscow does not trust a satellite which defers farm collectivization. And pressures on the Church, if increased, would cause ~~xxxxxxxx~~ unrest, and unrest cuts production. And a communist party which came out more openly under its own colors would rouse grave uneasiness and uneasiness cuts production. The dilemma is that while Moscow wants Poland communized, it also wants Poland productive. So the government in Warsaw is laborring under conflicting pressures.

And coinciding with this development is a seriously emerging weariness with the ~~xxxx~~ pace of reconstruction. The best Stakanovites have been buried with pomp and honors, but they have been buried just the same, and the Polish workmen is begining to think that the speed-up is something to be avoided. Tricks are being employed. Workers form little groups. One is made the Stakanovite for the day. The others do the permissable minimum in their own name, and add a bit extra for the day's elected. Thus on successive days each one of the group makes a good record, but the effort expended is less than if ~~xx~~ each one tried to overfulifill his norm to the maximum. It amounts

in effect to a most carefully concealed slow-down within the framework of the speed-up. It is symptomatic of the fact that the great patriotic urge to get things going is finally wearing out and that the law of diminishing returns is begining to operate, as it must in any spped-up system.

Now of course communism exercises the actual power in Poland. But it has not been forced to exercise that power blatantly or very painfully, not up until this time. It has been able to exploit patriotism for the first task of getting the country running. But that process has not produced a "loyal" or dependable satellite. Only Poland's government is loyal to Moscow. The great majroity of the people are profoundly anti-Russian in sentiment. The fact that Poland alone of the satellites does not put the red star on the cap of the soldier is symptomatic. Communism and Russianism are too synonymous in the Polish mind to permit the communists to emerge as the open masters, or impose their ideologies vigorously, without trouble. Yet until they do they can not win that confidence of Moscow which is essential to their survival.

Most telling is the story of farm collectivization. One would judge from the papers that it is being launched fairly seriously. Eight big collective projects have been publicized, with much purported detail about peasant entheusiasm, and pictures of batteries of tractors, and accounts of early results. The Embassies have sent out scouts to investigate each one when this happens. Seven of the eight were completely non-existant. The eight was a small and falterring begining. They have no collective advanced far enough to be showable to the press. Western correspondents ask to visit one in vain. Collectivization in Poland is today a Potempkin village existing only in newspaper columns. Why this device? The only plausible explanatinn I could get is that Warsaw is trying to have its cake and eat it -- trying to persuade Moscow that communism is being pushed ahead, and at the same time holding back for fear of arousing the peasants, for fear of hurting production, for fear of upsetting a fairly successful apple cart.

This came out in the Gomulka demotion. It seems to be showing up again in the "illness" of Minister Minc. Minc is by common agreement the ablest man in the Polish government. He is also an advocate of maximum production, if necessary at the price of very gradual communization. Officially, he is still due to return to his post. Apparently he is somewhere in Russia. And no one seems seriously to think that he will ever return. He is being replaced by a man named Szyr (pronounced like Norma Shearer) who is Polish and gentile, but who spent most of his life in Moscow and is a thoroughly indoctrinated communist. Under Szyr there presumably will be a much faster communist pace.

Put it all together and you have a satellite which is loyal to Moscow only on the top government level, but which must be made loyal at progressively lower levels if it is to retain Moscow's confidence. Yet as that process is undertaken resistance is bound to mount, and perhaps the Poles, like the Yugoslavs will begin to think in terms of doing something for themselves about their own problems.

This brings me to a subordinate point about our own policy. I think the weakness of the opposition in all these countries has been the very large extent to which they have thought of relief in terms of western interference, rather than in

terms of their own efforts. We have encouraged that by the nature of our propaganda, and by such matters as the behaviour of Bliss-Lane in Warsaw, Patterson in Belgrade and Seldon Chapin in Budapest. We have continued to feed the assumption that some day we would march in and do the job for them. Only the Jugs, who didn't want us marching in, had the mental foundation for acting on their own. I would submit to you that only when the Poles abandon the idea that we will march in, will they begin to develop a sense of relying on their own devices. And at that point I suspect that effective resistance will begin to develop, but not before then.

Other points. The Polish army is considered to be just strong enough today to maintain public order inside Poland. It amounts to less than half a million men, is poorly equipped, and is used more as an internal police force than as a potential component of the Russian army. It is neither sufficiently reliable, nor sufficiently modernized or equipped, to do much more.

Russian troops are concentrated in the western recovered areas, particularly around Stetin and Breslau. This is logical as support for the occupation forces in Germany. But it also means that Russia possesses the physical power to dispose of the western territories at will.

Churches have never been so well attended in modern times. But Church tactics suffer from (1) the terrible decimation of the clergy during the occupation when the best of the priests died, and (2) an apparently incorrigable tendency to think that the old days were best and that there is nothing good in what has happend since the war. Since Warsaw is in fact being rebuilt, to the joy of most of its people, there is a serious danger that the Church will find itself drifting away from the public. If the Church can not learn the lesson Senator Taft has learned, then it will ultimately leave to communism a monopoly on modernism.

Dear Ed:

Herewith my report on Yugoslavia.

I am far from an expxrt after ten days. Even George Gallup would hardly considerring my samplings sufficient to justify long conclusions. I have seen three goverbment officials, including Bebler. Have picked the brains of our colleagues; the Embassy and the best of the British boys; and taken a quick trip by car into Mecedonia — Skolpje. Thats all. Yet I am willing to stake my reputation on two conclusions;

1) The Tito break is real and irreperable,

2) There isn't anything the Russians can do about it, short of war, beyond what they have already tried. They can increase the tempo of what they are doing. But there is no new trick availalbe. And I am satisfied that what they do isn't going to work, because its only effect so far is to increase the self respectk, pride, intependance, and courage of these curious Yugoslavs.

In other words, I think the Jugs have already "gotten away with it". Of course they could be smashed by war. But that would be a war, and almost inevitably a general war. If you can think of a way whereby the Russians could overcome Tito by war without precipitating a general war then you may have the key to their strategy. But I can't see it, nor can any of the peopoe here whose judgement seems sound to me.

What can the Russians do? First there is propaganda pressure — particularly the charge they the Jugs have sold out to the western capitalists, or gone nationalists. They keep it up, but there is not the slightest evidence anyone can produce around here that it has made any deep impression inside the country (on the contrary if anything it has more than likely made a majority of the peopl say, 'I just hope its true'). As for its effect in the satellite neighbors. Bebler says, and I suspect he's telling the truth, that there is evidence that Czechs, Poles, Hungarians and Bulgars, are prfoundly uncerned about Tito's nationalism or his allaged deals with the west -- except perhaps that they feel some jealousy.

Second there is the possibility of appeals to minorities, particularly Macedonians and Albanians. This did have some slight effect. They had to do a little purging down in Skopje. But apparently it wasn't much. I have seldome seen a more tranquil city than Skopje. Considerring the appalling primitivness of life down there I don't know why they should be tranquil, but it is alleged by all who seem to know the score that Macedonians and Albanians are considerrably better off in Jugo than they are in Bulgaria, Greece or Albania. So whey should they want to change? I know of no evidence that any significant number do.

Third, there is the possibility of infiltration into the top ranks of the party. That has been tried. Hebrang has disappeared. Jovanovic was shot. But that is all we know about. Defections seem to be fewer than in other satellite countries. Perhaps if the regime had been 30 years old bribery might have worked. But there is no evidence that the top ranks have yet been tainted with corruption. They still have too much of the early Christian ardor. It is outpinted as significant by our Embassy people that the party is made up of less than one per cent pre-war communists, 30% people who "were in the woods with Tito" and 70% those who have joined late in the war or since, who are devooted to Tito and the leadership which did the war job, and who have almost no knowledge of or training in Marxism. This is a party structure which is peculiarly non-susceptible to Moscow. There is no reason to think that Moscow has been able to penetrate it seriously

Fourth, there is frontier provocation. The Jugo Government explanation of this is that since the Cominform charges of nationalism are getting nowhere they hope to provoke incidents which will engble them to allege Jugo "agressions" against her neighbors. And of course if the Jugs did loose their heads and attacked somewhere it would certainly play into Moscow hands. This gambit might have the additional effect of discourging western loans to Belgrade on the "bad risk" theory. There is danger in this, of course. The Serbs can get hot headed. But so far they aren't. They recognize the danger. There is, seriously, no troop concentration around frontiers. (Don't use this, please, but their deployment mostly back of the main rivers — the Sava, Danube and Vardar. The frontier is held lightly, mostly with frontier guards, not regular army.)

On this same point, there is not, and never has been, any reliable evidence of troop concentrations against them. The stories of mobilizations in Hungary came either from Cominform sources — planted particularly in Vienna and Rome — or the alcohalic dreams of our so-called military attachees in Budapest. (That is a shocker which ought to be told some day. Remember the two attaches thrown out of Budapest for being drunk and disorderly with blonds at a frontier hotel? Thats just exactly what it is. Good God, when will we get some real spies. Those babies were supposed to be spying, of course. The trouble is that instead of doing what they were sent to do, they were actually whoring. We should have had them court martialed). But to return to the point. Moscow would make it appear that there is danger of frontier incidents, and mobilizations and all that — its war of nerves. But its all phony. These boyds aren't impressed. And they aren't taking any chances either of being caught with their army on the eastern frontiers, or or where they might be overrun if an attack did come. But it just isn't to be taken seriously. I am satisfied that it is war of nerves and only war of nerves — and it isn't working.

Then finally, there are economic sanctions. I suspect that this is the strongest weapon. But it has its advantages for Tito as well as disadvantages. He has been getting trimmed on his eastern trade deals, although probably not as badly as his press contends. He has been getting a lot of second class materials. The boycott hurts him most in oil, because his biggest and best refineries are on the Danube, to receive Roumanian oil. Now what he gets must come through Split or Fiume. He most import more refined products and less crude, simply because he can't handle the crude. But the boycott gives Tito a wonderful scapegoat for the fact that the five year plan has much too ambitious. They are going to have to set their sights down, and the Cominform is a convenient scapegoat, and a popular one. And he can get better stuff from the west than he was getting from the east. And he can also get sounder technical and economic advice.

Of course there is the possibility of assination. Always possible. Another danger is that we will take the line that this is a wonderful chance to get rid of Tito. (Strictly on the QT, some of our brighter boys in Triest played with the idea) That would be a beautiful way to hand Jugo back to Stalin on a silver platter. If there is an promising alternative to Tito, know one here can figure it out. Tito has in effect founded a new dynasty by classic Serbia methods. Its rought and tough. The people can think of happier ways of living. But Tito is strong enough to keep the Cominform out, and no one who would like to supplant him, is. If we were to back the Croats, and the Ustachi and thinks like that it would just be opening the plates of the ship to let Moscow back in. We may not like the ship. We have many reasons for not liking it. But at least it hasn't the slightest affection for Moscow -- which is what matters, I think. For the love of heaven, lets us not be the agency for handing Belgrade back to Moscow

To sum up, I am satisfied myself that Tito is over the hump. Not only has he survived the first wave of attacks. He has gone over to the counter offensive. Their propaganda is definitely counter attacking, all over the lot. I have no proof, but I am satisfied that they probably have done a better job infiltration the cominform countries, than the other boys have done here. These boys have a brusading religion of their own now. Its the idea that a country ought to be independant. They are saying to Poles and Czechs, Hungarians and Bulgars — lok at us, we aren't satellites any more, why don't you join us? The taunt of "satellite" hurts around these parts. The Jugs are hurling all around every day in every way. They think its sinking in. I couldn't prove that it is, but I incline to think they have something. Indenepndance is a heaider wine than "brotherhood of the proletariat". I don't see the others pulling out very soon. But I do see a good deal of infection developping which might someday become significant.

That leaves the question of what form communism will take in this country. I'm sure they will continue to consider themsleves communists for a long time to come. But as Charles Peake points out; Henry VIII continued to burn heretics to his dying day, and didn't have the vaguest notion that he was a Protestant. Right now the Jugos are overdoing their communism, just to prove that they really are. They are stepping up farm collectivization . And there are signs that they might start a new campaign against the Catholic Church. They are sensitive to the charge that they have abandoned communism. But it is my experience that one can now talk to their people as westerns talk to each other. But that I mean this. In Prague the local boys all gave me the good old party line; undeviating, admitting of no flaw. Here, they exhibit an interest in possible variations from the party line. In Prague I was assured that the American depression was coming.

Here they ask me if it is coming, and listen with ~~interest~~ respectful interest to my reasons why I don't think it will. I don't think I convince them. But I do know that I interest them. That is: I think there is the begining of a rebirth of the inquiring mind, only of course among the unbelieving masses, or at the sophisticated top leve of the party.. But here the middle level of the thoroughly indoctrinated Marxist is not very large. It is the soft spot in Tito's armor. If he didn't have such a good police, so much popularity, and such tight control over his party, he could be hurt here. But I don't think he will be. This doesn't mean that JUgo isn't a communist state. It is the most communized state in eastern Europe. They have put the ring through all noses except those of the paasants. And they are doing it pretty fast there, although a big majority are still private operators. But a lot of new seeds are sprouting. I have a feeling that they have gone so far with their communization now, that they simply can't go anywhere now except ultimately a little bit backwards. How far would be pure guessing, or how or when. Right now I just hope that Tito doewn't do the kind of moving anywhere or in any direction which would upset his apple cart. Its doing all right -- from our point of view. They like us a lot more than they are prepared to admit publicly. (Cannon, wisely, doesn't try to see Tito. It would only feed the fires of Cominform propagadan. And it isn't necessary). I think Tito has consolidated his position and is perfectly safe now against anything except assination, or some stupid blunder on our side. (Bebler talks as though he didn't really care too much about Greece, Carinthia or Trieste. He has a propoganda position to maintain. He can't be less Yugoslav than the Russians. But I am sure all three can be settled whenever a face saving device can be found).

Regards

Joe

PPS. After all the talk in my last about a ten day trip through the country I feel I should explain that after a wild ride down to Skolpje, and a foolish dinner on a chilly roof top I came down the next morning with a fairly nasty case of something or other, so turned my tailed between my legs and railwayed back to Belgrade. I'm just as satisfied. I think I learned all I needed from getting to Skolpje. The rest would have been sightseeing, not journalism. Dubrovnik would have been like Lake Placid, when bigger things are under way. Anyway, I took part of the week just convalescing. No Hungarian visa. So I'm off in the morning for Warsaw. I'll return to Hungary from there if I get the chance. A cable from you to Baldisar at the Hungarian Foreign Office expressing surprise that they won't admit your correspondent, might just conceivably do some good, although probably not. By this time they probably feel that their pride is involved.

Part #25
Paid 6/17/49

Dear Ed:

I could write you a very long report about this country, but I won't because it can all be told quite briefly. It is simply this; that the American legend of the "sturdy Czechs" always was and today is a complete phony. They aren't sturdy; they are profoundly plaint and, I think, still resilient. I think the most revealing incident I have encountered was this. A certain name was mentioned. I said, "is he a communist?". The answer was; "oh no, he's in the party". Everyone seems to be "in the party", except the really tough boys, who keep out of sight. The principal effort of the regime right now is to try to break down the memory of the days before "the events of February (1948) as being good ones". They are begining to attack the memory of Benes; trying to sell the theory that the Benes government was counter-revolutionary and plotting to undue the social revolution. One could get quite worked up about this but to me there is only one really important factor about this country; and that is that it must live with both worlds, east and west, to survive, and that goes for the communist government quite as well as for the country. The regime is on a spot. They have increased eastern trade a little. But Czech industry was built so heavily on western trade that the country simply can not survive without it. And if western trade should be stopped either by action of the west or the regime, then Czecho would at once become an enormous liability to the east. A workshop is valuable to its owner, or occupier, only when it works. This workshop works when it has raw materials, markets, and reasonably satisfied workers. The raw materials and markets are in the west. Without them, the workers can't be satisfied. It isn't too hard for them to satisfy the workers. They seem to be fairly happy now. They think they have made gains under the new order. I would say that the gains consist of about six parts soothing syrup, three parts security from unemployment from any causes except political deviation or total breakdown of the economy, and one part actual material gains. The soothing syrup still seems to taste good. They tell of a former Bata director who is now a timekeeper at the gate. They say the workers rather like going by every morning and evening and noting this "levelling" effect of the regime. I've no doubt they do. In my own present bruised state I would rather enjoy seeing a certain gent I know being office boy for a change. It would be dangerous, I think, to underestimate the value to the worker of being told every day that he is king, and of being secure from unemployment so long as he keeps his political mouth shut and so long as the nationalized state keeps running. And the worker, here as in any country on our side of the curtain, is glad that the black market is being controlled and the spivs being put behind bars. They are. Of course the reforms we perform in the west are being performed here too, the difference being that here the communists claim credit for communism and there is no voice to challenge them openly, or remind anyone that an improving currency and elimination of the black market are reforms which can be achieved without as well as with communism. The regime is managing now largely from two conditions which have nothing to do with politics or ideology. One is the expulsion of the Sudetenans, which provided a lot of wealth and land and a shortage of workers. The other is the going industry. Both were inherited. Both give the regime

its capital reserve which it is using in trying to build a viable state. It can in truth claim no credit for this capital, although of course it does.

The real question is what happens when the capital begins to run out, if it does. That depends on trade with the west. I am sure that we could wreck this regime in no time flat by a tight embargo on all trade. But of course there would be the retaliation to be reckoned with. Western Europe would suffer too, perhaps in the net as much or more. I couldn't make that calculation. I only make the point that a communist regime is managing here now because there is trade with the west. Condition are not too bad. Food in the hotels and restaurants is dull, nationalized cooking leaves much to be desired. Portions are small, though adequate. In fact its almost a relief after the flesh pots of the Park Hotel in Frankfurt and the Press Club in Vienna. The experts (ours) insist that the workers are actually getting a little more food on their rations, and more clothing, than at any time since the end of the war. The troubles you hear about were mostly the result of an almost total crop failure in 1947 coming after suspension of UNNRA aid. The government bridged that gap of short food by importing food at the expense of raw materials. Now they really worry about their raw materials. If they get them they can manage for a while longer. If they get enough I don't see any reason why they can't gradually improve the physical livingstandard of the working population, and plainly, that is what counts. Matters were improving before the Putsch. I suspect that one of the reasons for it was that only by seizing power could the communists hope to monopolize credit for improvements which were coming. With all due respect to John Gunther, I think he created a false impression by saying that you couldn't get shoes here because the leather had all gone for rifle straps for the workers militia. I wish it were true. Barefooted workers would make the soothing syrup less tasty. I just wish myself that we could trade off Italy for Czechoslovakia. I think it will be something of a miracle if we succeed there, and it will take an awful lot of communist fumbling and stupidity for them to fail here. This is a set up for anyone wanting to make a good propaganda record. Fortunately, they are doing some things which are not calculated to endear them to all the people all the time. I dismiss the wails of the dispossed as being political irrelevant, no matter how heart touching. I wish the communists would disposses more Czechs than they have. They haven't done enough to suit our purposes. They haven't hurt a majority of the population either by dispossesion or "class levelling" or even by police power. They have the Church worried, but they are using pretty shrewed tactics there. The only way a Church can recapture its integrity here is to go on a basis of living off the contributions of the faithful. But the recognized Churches here, which includes all except Mormons and Seventh Day Adventists and such numerically insignificant groups, are accomstomed to living off the state. Here the state maintains the Church buildings and pays the clergy. The Church budget is bigger this year than last. How can a Church ever be morally and spiritually independant of the state which roots the bill? If the Churches here are being prostituted to state ends, as they are, I am sure it is far more because the State pays the bills than because they maintain an average of about ten priests from each diocese in jail, on a rotating basis. It isn't the same ten all the time.

But still the commies are making one mistake, or what I think may turn into a long range mistake. That is the police power. Right now it serves their purposes. Its the goblin that'll get you if you don't watch out. It isn't being exercised nearly as brutally, yet, as the Nazis police power was. Its just there, as a potential threat. But there is the profound difference that these police are Czechs. The Czechs are used to be beaten up by foreigners, Austrians or Germans. But they've never been pushed around by Czechs before. I think they resent it. I think that in the long run even the worker will find the he resents ~~&~~ arbitrary Czech police power more than he likes the soothing syrup. That's only a guess. It depends on whether the regime does use its police power ~~more~~ blatantly than it yet has. And that depends on whether the raw materials flow to the factories fast enough to permit a regular increase in the standard of living of the majority of the people. Speaking as a westerner, I would wish that the regime here were to use its police power more roughly than it does. If that happened you might see some real resistance. But, truthfully, there isn't any resistance worth talking about. And I don't see myself where it is going to come from. This country doesn't start great political movements, not at least since the days of John Huss. It goes along with the tide. I don't think its too happy about the tide its riding now -- although that is only a guess and perhaps quite wrong. I think it would switch to a new tide if it ever started running, quite happily and easily. But it won't be out in front, It will probably be the last man ~~aboarmixtx~~ aboard the new band wagon. And if I sound bitter or cynical let me add this in fairness to the Czechs. They were apparently ready to change their nature in 1938. If their allies had stood by them then, they might have developped a new nature -- might have broken with their tradition of passive resistance. We of the west must certainly share a heavy portion of the responsibility for the fact that they bowed quite as easily to their new masters as they bowed to the German. We encouraged them to ~~xxxxxxxxxxxxxxxx~~ continue to be what they have been since 1620, always the last of the band wagon climbers.

I'm off to Belgrade on Monday. I may take quite a long trip -- as much as two weeks -- around the country. So you may not hear from me for a whole. I'm finding this part of the world quite fascinating and will certainly spend more time ~~here~~ than I contemplated, and therefore less in Paris and London.

Best

Joe

PS If you want to reach me while I travelling in Yugoslavia try to do it through the UP. I'll be travelling with their Belgrade man, Korry or Corry. Ed Allen can problem do something. Please tell Church about this. Porphyrogenis insists he would welcome me to his mountains. I'm no person to go off on wild adventure. But if I should happen to be around when the Greek civil war ends I might well have a look at the old battlegrounds.

May 6, 1949

Dear Joseph:

This must be brief. You will understand why when I tell you that it is being dictated at about midnight. As you know there is just never any time to keep level with correspondence.

First of all, my thanks for your letters. They have been enormously useful; also your cable from Prague on the Greek guerrilla Minister of Justice gave us a small exclusive although the times had a quarter-column on it the next day. I only wish it were possible to use your analysis on Vatican policy.

There's a bare chance that I will be flying to Paris for a week at the end of this month to have a look at the Council of Foreign Ministers.

Of CBS gossip there is very little. Steve Laird has been fired. There is increasing dissatisfaction on the part of management with the operation and administration of the Public Affairs Department. A guy named Murrow--much to his surprise--was elected a member of the Board of Directors of Columbia where his counsel won't be listened to.

The lifting of the Berlin blockade and the Greek move have caused real uneasiness in Washington, and financial circles here in New York are wondering what the hell will happen if peace should break out.

I send you my gratitude and my best salute and tell you that I am most anxious for a long weekend with you as soon as may be.

As ever yours,

Mr. Joseph C. Harsch
c/o Hugh Cumming

Vienna Press Club
Thursday, April 28

Dear Ed:

I keep longing for a good spot news piece I can cable you, but Vienna is another "situation", rather than a story. I've sent off several mailers to the Monitor on the subject which you will probably see and this may be something of a duplication. But it may be worth your while just for general background if I put down in more spcific form matters which can be stated quite so sharply when intended for publication.

Coming here was for me quite an exercise in adjustment of perspective. Perhaps you had yours under better control than I did, but I fully expected to find a city terrorized by kidnappings. That impression is both a reflection on our journalism, and also a service to the Russians, for it has obscured the true story of how very successful the western operation is in this funny little country.

Let me put the kidnappings in perspective first. There have been a lot, but mostly in the first year. The rate is progressively lower. The Austrian press kicks up an awful stink over each one. The Socialists lead the parade, and the commies have to take it lying down. There isn't any answer. Each kidnapping has in fact been an enormous asset for our propaganda. Frankly we must hope that they continue to pull off an occasional one, for the Russians are certainly on their best behaviour here now, so much so that the occasional "drunk" the GI goes on, inevitably, is now more conspicuous than anything the Russians do -- and of course the commies go to town with each one.

Further, our intelligence people tell me they are satisfied that the kidnappings do not represent a deliberat campaign

of intimidation. That was suspected at one time, particularly when they arrested several second rung Austrian officials. Obviously we done't know the whole story behind each incident. But, speaking privately, our boys say that there is a reason which a Russian would consider adequate behind each one. In most recent cases the person snatched either was in fact one of our agents, or a person who had "contributed to the defection" of some Russian solider. The desertions are at a high rate and it naturally worries them. Most kidnappings take place in the Russian sector, or in the international zone during months when the Russians have the guard duty. Our boys say that an Austrian who leaves intelligence alone and who keeps away from Russian soldiers is perfectly safe anywhere -- so far as the Russians are concerned.

The case of the two Russian fliers was a mile stone. It was the first time we openly granted asylum to a military deserter. We have done it sub rosa before, but in theory we returned deserters. There was a terrific battle over it. The Generals were scared to death, at first wanted to turn the boys back. Clay was worried about his air lift pilots. The Generals are the nervous nellies here. This is a nice life and they love the apple cart.

There is a feeling now that perhaps we took the Ross case lying down. The Generals were scared of it, didn't want a fuss. I think we should have made a real stink just because Ross was an American citizen. But there were several odd angles which had our people scared. For one thing, they found a batch of blank US passports in his room. The best version I get is that he was acting on his own as a sort of clearing house for political refugees from the Balkans. And the gal with him was known to have been an agent.

All of this seems important to me only because the way the story has been told has tended to obscure the bigger story of the weakening of the Russian grip on this place. Austrian cabinet ministers are not in the least afraid to go into the Russian z one and make anti-communist speeches. They do it constantly. The commies have been pretty well purged from the police force -- although not as completely yet as in Italy. The biggest victory for the west was, I think, in the ability of the Socialists to keep control of the trade unions even in the Russian zone. Next only to that is the gardual recapture of Austrian industry. As Wiston reported when he was here, the Austrians have just licked the Russian factories by superior operations in their own. The Russian factories always did make most of their money out of black market sales and since the black market is drying up the Russian business methods have become obsolete and their factories are loosing business so heavily that they are in effect bankrupt.

What are the true centers of power in any European country today? Certainly one is control of the police, a second is control of the trade unions and a third is control of industry. Here the Russians got a grip on all three, and have been loosing it. They have lost the trade unions completely. Police power is firmly in anti-communist hands and industry is being reclaimed. I am satisfied that Russia has only one device left for capturing Austria -- and that is the Red Army. But to use it would be an act of war, -- wuldn't it?

Gruber says the news about lifting the Berlin blocakde proves to him what he has always suspected; that the Russians operate on a limited risk basis. They take what the traffic will bear, but are careful not to go too far.

General Balmer, second in command here, insists that so far as he can deteremine the Russians here have never yet violated a specific written agreement regarding Austria. They pushed the written word pretty far, but have been careful not to go over. Do you remember all the fuss last year about British passes to their air field, and closing the road to Tuln and all that? There was speculatio at the time that they were going to pull a blockade of Vienna. Balmer read what he considers to be the real record on it. According t to his version it all started with a decision of ours to toss the Russian Repatration mission out of our zone. The Russian told him they would retaliate, and precisely how they would do it, and then proceeded to do it. And when we let the mission back the retaliation stopped. Balmer had opposed tossing out the mission. He argued that eight Russians in uniform are easy to spot, and tail, and so no danger in them. He didn't see why they needed to be put ought when our real worry ought to be over all the ununiformed commies less easy to spot.

(I don't think either Gruber or Balmer would like to be quaoted, but I thought you might like to know what they say)

I do not conclude from the above that there is any "good will" or sweetness or light in the Russians here. I do conclude that there overall strength is not sufficient to permit them to do what they would undoubtedly like to do here. The price would have been too high to break the local ground rules. And they needed Austria for east-west trade -- particularly when they decided to blockade Berlin.

And of course the Berlin blockade has been a good thing for Austria. It built up their transit traffic.

Military governments are wondrous things! How quickly the occupation governor fights for everything his subjects have always wanted. Clay tried hard to have ECA supplies for Austria channel through Hamburg and Bremen. Our top boys here beat him by teaming up with the Trieste crowd. Trieste is in fact once more the seaport of Vienna. The Trieste command regards itself as the defenders of the Trieste right to serve Austria. They have also welcomed any traffic they can for Czechoslovakia. They are the rivals of Hamburg and Bremen. And the Austrian command clings with a firece tenacity to what independance it has from Clay. I begin to understand why the Russians have so much difficulty coordinating their new empire. If Clay is pro-Anschluss, and Keyes and Airey are pro-Austria think of what strains there must be behind the curtain. I keep hearing interesting sounds of troubles in Czecho and Poland. I trust that by the time I emerge from those places I'll have something worth reporting. I still have a residual hope of reaching Budapest and Belgrade, but so far nothing to back it. I find it will be easier to reach them from Prague -- direct air connections and no gray cards for passing the Russian zone in Austria.

I feel a nostalgia for the usual CBS gossip. If you have a moment do bring me up to date via a letter care of Hugh Cumming, American Embassy, Stockholm. I expect to reach there anywhere from the middle to the end of May, depending on whether I get back to Budapest and Belgrade.

Regards

Joe

April 12

Dear Ed:

There is certainly nothing I have gathered during the past week to justify cable tolls, but I do feel that my own perspective has been improved and I would try to convey some of it to you.

Coming to Italy straight from the rubble of Frankfurt provides quite a contrast. Rome seems miraculously clean, tidy and happy. I have long been hearing returned travellers go into ectasies over the way the Italians "work", and how they seem to be better off for having lost a war. I would doubt that there is any peculiar virtue in loosing a war. If that were so one would expect the Germans to be exhibiting the same joie de vivre so allegedly characteristic of the Italians. But this much does seem to be true; that the Italians, being politically more adult than the Germans, do not brood over their misfortunes, or indulge in paroxisms of self-pity. The German face is long, pale and full of self pity. The Italian face bespeaks a mind intent on making the most of each moment -- particularly if it offers a chance to gauge a tourist. There is a striking contrast. I note particularly the difference in appearance of goods in the shops. German goods appear to be make-shift, Italian goods look as finished and professiond as never. The rate of recovery in both is about the same, according to the statistics. The the prices to the consumer are about the same, in both cases completely out of reach of the average consumer. In Germany the percentage w ich can not buy consumer goods at present prices is estimated at about 85. In Italy it would run nearer ninety. But since 90 per cent of the Italians never did enjoy anything beyond pasta and a few dirty rags on the floor the awareness of privation is less.

Then apply this to Italian politics and ECA. Here there is rejoicing among all those in authority. Recovery is running ahead of expectations. The psychological corner has been turned. The mobile police are masters of the piazzas and the barricade has become an anachronism. The American bandwagon is rolling. The opportunists are all aboard. The feeling is plain, that the American cause is the winning cause. There is no "story" in Italy today, there is only a "situation". It is a good situation as of the moment, in fact its excellant. The fear of communist insurrection is gone. The government estimates the communist strength is down by 700,000. A better guess would be about 400,000, but even that is quite a loss. On the surface its beautiful.

But there is a worm in the apple. That worm is the Italian system. ECA is trying to do in four years what Mussolini failed to do in 20 years -- make Italy a modern and self sufficient industrialized country. ECA has two assets denied to Mussolini. 1) It provides real capital (Musso had to use paper money). 2) It is freer from the influence of the "vested interests", i.e. the old monied famlies. But it is also subject to the impediemtn which played such a role before in keeping modernism back; traditional methods of doing business based on a surplus of population.

I give the ECA boys credit for sensing what they are up against and for trying to do something about it. They have no illusions. They have a plan and an approach, but they are worried. Joe Alsop missed the point completely when he fumed about delay in breaking up the big estates. The big estates are only a manifestation of the underlying trouble; not a cause of it. You couldn't just parcel off the King ranch in Texas and expect people to live on it. First there must be water and then shelter and then after that perhaps people could set up viable farms. They are

approaching it that way. First land improvement, which begins with roads and artesian wells and irrigation. Then various devices for transferring land ownership to farmers. In the meantime attention to improvement in the laws of ~~xx~~ farm tenancy, which are at present probably far more damaging than the large holdings. Its a good plan. If it could be carried out it would do infinitely more good than an immediate parcelling out of the big estates. But can it be done? Four years is a short time. What we have succeeded in doing so far is restoring the kind of surface prosperity which was normal to Ita y in the pre-war period. But this is a prosperity founded on what is in effect the equivalent of a slave economy. The old rich and the new rich are beautifully well off and American wheat has filled the bellies of the mass of the people and they feel so much better that for the moment there is no pain. The communists are at a loss for their next move. They have been beaten in the first round, completely.

But there is a second round coming, not now but three or four years from now. Italian nature drags its feet on what must be done if in four years Italy is to become really viable. The government is all for reform, but it is coming so slowly that even Jimmy Dunn is anxious about the future. Can tax reform ever be achieved. The rich don't pay taxes. You can take their land away, but unless you can bring them under the tax laws they will be just as happy as ever, from putting their money into industry instead of lands. Land reform without tax reform would still leave the colossal dispartiy between the few and the many which is red, raw meat for the communists. And the goverhment moves so slowly towards reform, in spite of its apparent sincerity, that it is loosing its socialist left-wing. The Sarragat party is slowly melting away. If it disapears eventually then deGaspari looses the balancing force in his government and the communist regain control over the mass of the workers and peasants. In other words, the first, easy battle has been won hands down, but the second battle is opening and that is going to be much the harder one, for it is a battle against everything that is traditional in Italy. The problem is to convert a slave economy into a free economy which can be done only by eliminating the labor surplus in Italy. But the old system is built on the existance of a labor surplus. The ECA boys insist that the labor surplus is not inevitable for all time. But there are vestedintersts in a labor surplus. If it were removed then industry would have to become efficient, and the rich would have to learn to do with fewer servants. So much is tied to the concept of the labor surplus that a change requires first of all exorcising the belief in its inevitability, which is quite as fervent as the faith of the peasant in his church. The American m nd believes that it can be done. For example, they have licked malaria on Sardinia which opens that island to settlment by as many as three million persons. Then they are tapping undergound, natural steam for power. And they hope to make about 5 million acres of largely unused land productive. ~~If~~ By such means they hope to expand the domestic market. In theory Italy does not have a surplus of labor. But in practice and in the dogma of its own people, she does. Its quite a tall task for Americans to perform in four years. Perhaps they can do it. If they don't the communists will ~~have a xxxxxxxxxxxxxx~~ come to bat again. As I said; its not a news story, its a situation.

I saw dalla Torre. He wasn't as enlightening as I had hoped. He says that we think the Russians want war and the Russians think we want war, but that in realiyt neither of us wants war, so we can have peace if we can each convince the other of our pacific intentions, but he sees no way of doing that. He just hopes one will be found. Then he

adds that the great Catholic communities in the eastern countries will never be liberated by any means short of war. So I can't decide whether he thinks war is avoidable, or desireable.

At the moment it looks bad for my Jugoslav visa. The only reason I can think of is that matters are getting so touchy that they don't want any more American journalists looking at it. The Trieste observers keep reporting that they hear gun fire across the frontier and that obviously cominform revolts have begun. They also say that Tito has had to disarm all but three of his divisions; the three being the only ones he can trust. I shall be extremely disappointed if I fall to get in, but don't quite see what I can do about it, The local Yugoslav Legation writes me formally that the authorization "has not been granted".

Cordially

Joe

Dear Ed:

I haven't cabled you yet partly because I had nothing which which seemed of an argent character, and partly because the first week is always a bit baffling. As a matter of fact it seems to me that what I can get of most value anywhere can probably go just as well by air mail as by cable. My inclination at the moment is to write you such letters whenever I feel sure of myself and then I can always go on the air in more formal fashion if any of the ideas in the letters seem to fit your needs as of any particular time. You will see from the letters what I am getting and can call on me at will for details by cable or voice.

By now I do have some observations on Germany which I think are worth passing on to you.

First, the air lift. (The correcness of this observation is confirmed, off the record, by Tunner). The current average daily tonnage has passed the 5.5 thousand ton mark and is working up towards the 6 thousand mark. But it is going up more slowly now and is bound to level off somewhere between the 6 and 7 marks during the summer. It is doubtful that they can ever sustain an average of much above 6 thousand tons. And that, as you know, isn't good enough to ever take west Berlin off the dole. If they could get another hundred C-47's they could probably take the average up to 8thousand tons. But there aren't any more.

Just about every limiting factor has been licked now except the capacity of airplanes. There are nearly as many flights into Berlin each day as is possible in such a congested area. Maintainence is getting close to maximum -- although the Air Force admit they can learn some tricks from the Navy. The two Navy squadrons beat the Air Force squadrons on tonnage every day, due largely to superior personnel and maintainence. (This is not just Harsch, the Navy propagandists talking. Tunner admits it.) The supply system to the lift is more than adequate to keep traffic moving at full capacity. Loading and unloading systems admit of only minor improvements in efficiency. So the only real way left to get more tonnage is to increase the carrying capacity of each flight. The British are retiring their 3.5 ton Dakotas as fast as they can replace them with 7 ton Hastings, but they only have 14 Hastings operating now and the replacements are very slow coming in.

If Clay and Tunner had their way they would at once order about 300 new 25 ton cargo planes. That would be settling down to break the blockade over a period of about two years. You could really break it that way. If you could bring the average daily tonnage above 10,000 then west Berlin could flourish. Right now its an old lady sitting in her invalid chair changing scarcely at all from day to day, and yet you know that her energy is just a tiny bit less each day. On anything less than 9,000 tons she is a perpetual convalescent gradually approaching a quiet death. The death might take two or three years in coming, but it would come. About 9,000 tons she could get up on her feet again and take a new lease on life.

But here we come, I think, to the meat of the matter. To commit major resources for breaking the blockade would be to commit ourselves to a battle which is rapidly becoming irrelevant. The Air Lift has served its purpose. It checked the advance of communism in Germany. In fact it discredited the communist party. Due partly to the air lift, partly to the beurgeois character of the Germans, and partly to American occupation policy communism has lost its momentum in Germany and ceased to be an effective implement of Russian policy in Germany -- at least at this time. If we put great effort into expanding the Air Lift tonnage we will be like the old Generals fighting the last war. The field of battle is shifting. The Air Lift belongs to the old battle. It has little importance in the new one now in the preliminary rehearsal phase.

Clay insists that he is leaving soon. Says he won't be here when I get back from my tour through the satellites. If so, it is probably all to the good. I still think he was a good front line fighter for the old days when the battle was on the bareicades of Berlin. But he, like so many of his subordinates, have become so engrossed in that battle and so accostomed to its tactics and strategy, that I think them neither equipped for nor aware of the new issue now coming. In fact it seems to me that we have devoted so much energy to the battle against communism in Germany that we have unwittingly manufactured the very elements which will most aid the Russians in the new battle.

My own guess is that the Russians will one fine day just lift the blockade, perhaps without saying a word about it. I doubt if the time is quite ripe, but I think its coming fairly surely. It will be the signal that the Russians have shifted their strategy from the communist weapon to the "we will do business with you" weapon directed at the promising middle grade professional soliders, at the Rhineland industrialists, and at the combination aristocrat-diplomat. We have been fosterring all three groups as weapons against communism. Now they are getting up into influential position again. Hans Thompson is out of the woodwork. So are a lot of others of their ilk. And they are all easy game for the Russians if Moscow elects the alternative strategy.

The industrialists would be the first to go the moment the blockade is lifted. They are highly dubious about ever recapturing their pre-war western markets. Take the drug trade for example. The German drug houses had a monopoly on the South American drug market in the days of Beyers aspirin. But now penicilin is the new thing, and the American manufacturers have completely captured the markets. The Germans are too far behind to be able to catch up. Their only great potential market lies to the east. We won't trade with the east. They will -- and gladly. Their mouths are fairly drooling over the prospects of supplying that eastern market. The big shot Rhinelanders would shout their glee to the skies were the blockade lifted, not because they would consider it a deaft for Russia, but because it would open the way for their goods into the eastern countries.

Then take the professional soliders. Mark down for future reference the name of Vincdnz Mueller. Paulus and Seydlitz are kept around in the east for the value of their names. But they are has beens. Mueller was at the corps level at Stalingrad. He is the next generation. His only interest is having experience in troop command. He runs the constabulary in the Russian zone, and many an officer of his level looks longingly in his direction, not from love of the Russians but

because there is where an officer can get experience in troop command. Mueller is a wonderful decoy for the Russians, just as the eastern markets are a decoy.

Finally the aristocrat-diplomat. Nadolny came west to see where he could get with his old cronies. On the surface it was a failure. But was it? Adenauer had to repudiate Nadolny when the story got out in the papers. But Adenauer was glad enough to see him. It was a feeling out operationx -- the Nadolny visit west. All respectable western Germans had to repudiate it. But there it was, One of Russias "Kept" diplomats making his first exploratory visit west. Was it really ad failure? I don't hink so. Suppose the blockade is lifted. Suppose Moscow decides to play it on the high level. She wins the industrialssts with the eastern markets. She wins the professional soliders with troop experience. She dangles before the eyes of the old diplomats the prospect of regaining the eastern provinces. What happens to our influence in westerm Germany when that time comes? I wouldn't give a tinkers damn for it, unless we shift our strategy as fast as the Russians do. It would be an envelopment of Germany on the upper class levelmx, and we have already nearly made it possible by reviving that upper class level.

If we don't look out in a hurry we may destroy our only possible line of resistance by our economic policies. Right now the Socialiss are doing fairly well. But Clay was so anxious to end inflation that he has deflated below the danger line. Unemployment and bankruptcies are booming. You hear about the shops being stocked with goods -- but so were ours during the great days of the depression. One major effect of the currency reform too frequently overlooked is that it raised the costs of retns and utilities. A worker feels his rent bill now. He would love to use that money for foods and shoes. This is no boom economy. This is an incipient depression economy. And a real depression would be duck soup for the Russians. The bright boys at the Farben building know all this. They know that they must do some fast "counter-deflating". Perhaps they will move quick enough. The trouble is that when you work so long and so hard to stop and inflation, and are so proud of your currency reform, its difficult to adjust to the new problem. Leon Keyserling still thinks our problem at home is inflation. Clay is so proud of having licked the inflation here that he can hardly grasp the sudden change in the nature of the danger. It can wreck everything he has built, and turn western Germany over to the elements most ready and eager to sell out to the Russians. I think we are in the most dangerous mmm period of the whole occupation. We must come to realize -- and fast -- that communism isn't the only avenue of approach to Germany available to the Russians.

Incidentally, I couldn't find a single barricade at the sector line in Berlin. East sector police stop cars going out for a quick inspection. The day I played it the inspection was completely cursory and done with an amused grin. Had a lunch at the Adlon restaurant. No difficulties. East sector coupons supposedly required, but none needed.

Regards

Joe

P.S. I go to Rome on Friday, April 8.

March 24, 1949

Dear Joe:

That's right--about two cables a week and don't hesitate to use the phone if you think it's worthwhile. Incidentally, it would be helpful if I could have some sort of itinerary, or maybe the Washington office will know.

God go with you.

As ever yours,

Mr. Joseph C. Harsch

March 15, 1949

Dear Ed:

Just in case I don't see you again before taking off:

My recollection of your conversation is that you want from me an average of about two informative cables weekly, plus an occasional recording whenever I think I have something worth saying. Is that correct?

I overlooked saying that in all probability there will be occasions when you in your editorial chair in NY will will have a want which I will not sense on the groun itself. You know the gaps in the flow of news better than the correspondent. By which I mean, please send queries. I maintain that the best stories are not the volunteered ones, but those resulting from questions in the mind of the guy in the home office.

And I would like to make one point clear. I will send you what I can quite regardless of whether CBS pockets the payment or not. If Zack Becker thinks they have the right to it let Zack decide. I feel that I owe CBS something during this trip, but I'm going to discharge that obligation through Edward R., rather than over some mid-saturday afternoon waste time period, to the limit of my ability.

I'll return the Laird letters tomorrow by separate cover. They are excellant, and thanks for letting me have them.

The conversation with Velotta was good. I like him. I would like to do business with him. He seems to be a straight guy, intelligent and sensible. What comes of it is problematical, as of course everything seems to be these days. But I'm quite pleased with the way matters seem to be shaping up.

Good luck
and thanks
Joe

February 24, 1947

Dear Joe:

You are a gentleman and a very sensitive one, but I can't help feeling that in connection with the Campbell-Young affair you are inclined to take too much of the blame upon yourself.

The whole affair is altogether understandable and I think probably the situation arose as much as anything else from my casual and unspecific assumption that I could outstraighten the whole matter. I beg you not to let the incident disturb you further. I am quite certain that I can work out alternative plans for Miss Campbell.

As ever yours,

Mr. Joseph Harsch

February 17, 1947.

Dear Chief,

I was in the middle of writing you a long letter when yours of February 10th arrived with the one from Joe enclosed. It is just as well that nothing really surprises me any more! Not knowing what you said to Joe during the telephone conversation he mentions, I am in the dark concerning the cause of the sudden change of mind.

You say that you find Joe's letter surprising in view of my report of our conversation in Washington. The report I gave you on my return was perfectly accurate. Joe said he was convinced that I could do the job to his satisfaction. I was certain that I was capable of handling the work and would enjoy doing it. The one outstanding unsatisfactory element was the uncertainty concerning Miss Young's assignment. I said frankly to you, to Joe and Miss Young that in my opinion the London Office under present circumstances would not be able to provide Miss Young with the background and experience she seeks. It seemed to me only honest to make this clear to all concerned. As you may remember, I suggested Paris as the most suitable spot.

I resent very strongly Joe's somewhat rambling inference that I permitted what he calls my "eagerness" to cloud my judgment, thereby creating the present mess. It would seem to me that the crux of the matter is that - and I quote - "the protracted uncertainty has been too much for Miss Young, who has now decided firmly that she is no longer interested".

I will later resume my other letter to you, which is mostly chatter about conditions in general over here. Meantime, I wanted to tell you that my quota visa was granted within ten days of my return to London. If it is not used by the end of April it will be cancelled, and I shall have to start all over again with fresh affidavits. So until I hear from you again I shall be feeling very Micawberish!

My warmest regards to you and Mrs. Murrow, and love to the adorable Casey.

As ever,

K.S.

Edward R. Murrow, Esq.,
C.B.S., New York.

February 4, 1947

Dear Edward:

I gather from our brief conversation of last Saturday (fitted in with Miss Campbell's parting telephone remarks) that an essential element in the transfer problem has not been conveyed adequately to you.

Perhaps Kay, in her eagerness, failed to register in her own mind the impact of her description of work opportunities in Europe on Miss Young. Kay thoroughly convinced the lady at this end that there is no place at all for her in London. And nothing else has been proposed in sufficient detail to permit serious consideration. The way it was left between the two ladies was that Kay would canvas the possibilities with you, and after she got back to London, and report to us. As we understood it, unless something turned up quite different from what anyone here at the time could foresee, the deal was off.

Since then the protracted uncertainty has been too much for Miss Young, who has now decided firmly that she is no longer interested.

I am inclined to think that it is better this way, for a number of subsidiary reasons; including Eric's strong feeling that my job is not one which would satisfy Kay, or in which Kay would satisfy me.

It seems to me that all that is left to do is for me to explain to Kay why what was once a good idea must be laid aside, and regret profoundly that I let you in for a lot of unproductive exploratory work.

Regretfully

Joe Harsch

Mrs. Edward R. Murrow
Pawling, New York

Dear Mrs. Murrow and Casey:

The gap between words and feelings cannot be bridged at this occasion. Let me just say this simple truth; Ed was the first American whom I met when Buchenwald was liberated; he returned there a few days later to bring me news from my brother and friends who had heard his broadcast. I knew then that I had met a great man whose mind and heart were tuned to each other in perfect resonance. This knowledge was confirmed a thousand times whenever I heard his voice or saw his face; both expressed his wise and deeply felt concern for humanity. The world is better for having had him, and we all are grateful, but saddened and deprived.

With the expression of my and my family's deepest sympathy,

Sincerely yours,

PAUL HELLER, M.D.

Dear Ed:

On November27, 1955 I sent you a letter which, I am afraid, might have been lost in the Christmas mail rush.

I hope you will forgive me this second attempt to reach you. Enclosed is a copy of the letter which, I fear, has not reached your desk.

With many good wishes to you and your family for a peaceful 1956,

cordially yours,

Paul

November 27, 1955

Mr. Edward R. Murrow
Columbia Broadcasting System
New York, N.Y.

Dear Ed:

To-day I meant to write to you solely about my own affairs, but after having seen and listened to your masterful study of Jefferson County, Col., and especially to the eagerly debating ladies of Pine and Buffalle, I cannot help adding my praise to the many which you probably have received by now. And the commercials were magnificent.

To my own problem:
As you knew the German Bundestag passed an indemnification law for the intende benefit of Nazi victims. My lawyer tells me that I am entitled to a substantial claim if I can prove that my health has suffered and my earning capacity has been impaired as the consequence of the imprisonment. As the law consists of unclearly formulated and confusing regulations the lower authorities do their own interpreting , or better misinterpreting, with the result that until now only very few claims have been settled. (By the way, this is a matter which Dick Hottelet might find interesting).

In support of my claim my lawyer wants me to furnish strong and convincing documentary evidence. Since there are apparently no official lists of former prisoners available, it is necessary to submit statements of witnesses who saw the claimant in the camp.

May I ask you to help me to establish my identity. Is there still a copy of your Buchenwald broadcast available?

If so, could you let me have one, or could you send me a statement that you met me in Buchenwald.

Also in the matter of the impaired earning capacity I would like to ask you for your help.

In 1946 I had a severe hepatitis which had an unusually protracted course. I was out of work for more than six months. The delayed convalescence was attributed to the previous damage to the liver by the many years of malnutrition. My physicians will certify this.

During that time you were kind enough to lend me 500 Dollars. I am sure this is a preposterous request, adding work to your kindness, but my lawyer believes that a note from you stating that you lent me money during my illness in 1946 would be helpful. Forgive me this strange and unusual request, but strange and unusual is the mind of the German Herr Beamte.

As you see our address has changed again, this time only the residence, and it is our first own home. I still am at the Westside V.A.Hospital in Chicago, having recently been promoted to the "Chief" grade, the highest possible under the system of the V.A.Medical Department. In addition I am Assistant Professor at the University of Illinois College of Medicine, and enjoy the work tremendously.

My family is fine, the kids are growing and growing. I trust that Janet and Casey are in best health. Many thanks for your kind help,

with best regards from house to house,

sincerely yours,

Paul Keller

Heller, Dr.

December 22, 1954

Dear Paul:

Very many thanks for your nice letter.

It was good to hear from you again and I am delighted to know that you are so well established in Chicago.

It hardly seems possible that almost ten years have passed since we first met, but I know this to be true; and I know also that you have put those years to the best possible use.

I am sorry I missed seeing your brother, Erich, when he was here last year. I hope you continue to have good news of him.

Janet and Casey join me in sending very best wishes to you and yours.

As ever,

Dr. Paul Heller

Chicago 44,Ill.

December 12, 1954.

Mr. Edward R. Murrow
Columbia Broadcasting System
New York City

Dear Ed:

In a few months it will be 10 years since I had the great fortune of meeting you in the shambles of Buchenwald, 10 years since you helped me to be reunited with my family and friends in the midst of the organisational turmoil of the first few weeks of peace.

Very, very often during the subsequent years I felt like reaffirming in writing my gratitude , but somehow the almost daily closeness of your voice, and during the past few years your weekly presence in the living room seemed to render writing an almost paradoxic act. One just does not write to a man whom one sees, and to whom one listens that often. In this intimate atmosphere, brought about by technical wonders, it seemed more appropriate to say "Thank you" when "you were there". When the temptation of a letter to you was greatest - after your historic McCarthy telecast - I felt too humble to add my small voice of approval to all the other testimonials of great praise heaped upon you at that time. With 1955 around the corner during which I shall celebrate the 10th birthday of freedom I want to add this little letter to our Christmas greetings.

The more distant the liberation is removed in time the more intensely I find myself pondering about its significance for my little soul and - more pretentiously - for the world. Let us hope and believe that the act of liberation in 1945 may still become the symbol of the reassertion of western culture against evil forces.

PAUL HELLER, M.D.

We have been in Chicago since last January. I am Section Chief of the Medical Service of the V.A.Hospital here, and am on the Staff of the University of Illinois Medical College. I also have become a Specialist certified by the American Board of Internal Medicine. Ten years ago all this was not more than a dream during the restless sleep of apparently hopeless imprisonment.

My brother Erich was here last year lecturing at Harvard and the University of Chicago. When he spent a few days in New York you were in Europe.

With all our best wishes to you ,Janet and Casey

Yours

Paul H.

Please, give my best regards to Miss Campbell.

Heller, Paul Dr.

October 9, 1950

Dear Paul:

I'm sorry to hear that you have been ill again and hope you are feeling much better by now. Please do forget about the loan until such time when it is altogether convenient for you to pay it.

I hope to see you soon.

As ever yours,

Dr. Paul Heller
4103 Fourth Street, S.E.
Washington 20, D.C.

PAUL HELLER, M. D.
4103 FOURTH STREET, S. E.
WASHINGTON 20, D. C.

9/25/50

Dear Ed:

These few lines only to tell you how deeply embarrassed I am: I had promised you that I would return the loan, with which you helped me so kindly during my illness, this fall.

A second time my liver threw me out of normal gainful life and work for quite a while since I saw you the last time. To-day is the anniversary of my illness, and I am painfully reminded of the personal setbacks which the year brought me. This past - I know it is past - illness ~~will~~ probably will deprive Uncle Sam of a soldier, and myself of a more appropriate expression of thanks to him for everything he has done for me.

You will understand that I am more in the red than last spring, and I should like to ask you for your consent of a deferment of payments until next January or February. After this last year the calculation of my budget has become a tough problem.

I hope you and your family are in best health.

With many, many thanks, wishes, and regards

Yours Paul H.

Dear Paul:

I am delighted that you're recovered and back at work. Won't you come have lunch with me one day next week?

I trust you didn't inconvenience yourself by sending the check. Please don't feel that there is the slightest urgency about repayment. In the American vernacular: Put the whole thing at the bottom of your priority list.

As ever yours,

Dr. Paul Heller

April 17, 1950

Mr. Edward R.Murrow
Columbia Broadcasting System
Washington, D.C.

Dear Ed:

It is good to hear your voice now coming from nearby. Although it certainly is not gratifying to listen to the news of the state of the world these days, it is at least a great intellectual pleasure to follow your keen analyses which sound like chapters from a future history book.

I hope, Janet, you, and Casey are in good health, and not even the Washington spring fever has affected you of which you gave us such a vivid clinical account tonight.

My illness lasted longer than I expected, and it was only at the beginning of this month that I started to work full time. I feel fine again - at least I believe so - and it seems that the long forced vacation has done me some good, but not financially. The latter cicumstance is somewhat embarrassing, as it forces me to ask you for permission to remain your debtor for a few more months.

Please, take the enclosed as a token of my gratitude. It would be very kind of you, if you agreed to my settling the balance later in the year.

With best regards from Alice and me for you and your family,

very cordially yours

Paul

PAUL HELLER, M. D.
~~4302~~ THIRD STREET, S. E.
WASHINGTON 20, D. C.

November 29, 1949.

Dear Jeanet and Ed:

I hope you and your family are well. It is an easy guess that you, Ed, are in good health and in as good a mood as the blessings of the atomic age permit: The invigorating freshness of your broadcasts and your renewed phonographic record achievement testify to this. Congratulations.

My - may I say: promising - career in the States has recently been interrupted. In September I suddenly fell ill with virus pneumonia and virus hepatitis (inflammation of the liver). Since it seems to be an unwritten law of nature that a disease in a doctor does not run a smooth course, and probably also because my liver had been somewhat mistreated before in the long years of malnutrition and impaired in its power of resistence, the hepatitis is still with me, and is not expected to disappear before March of April, as estimated by the best Washington physicians. This is a sad situation. I am not permitted to do anything else but to lie flat in bed, to follow the dietary* and other prescriptions of my doctors, and to let thoughts and worries cross my troubled mind.

A now aggravating matter is the fact that we are expecting another baby in January, a fact, which was believed to be a proof of our "family optimism" (with the world ... that is different), and a source of enjoyment and looking-forward-to a few months ago. Nevertheless - let us not be too gloomy - this expectation has not lost its thrill completely.

As you will imagine, the savings of a year's practice in Washington are just about to be exhausted, and my horizontal position will deprive me from any earning power in medicine for the next 3 to 4 months.

It is with great hesitation and with some embarrassment that I ask the question whether you

* By the way, you may tell Bob Dickson, that French-American belongs to my diet.

would know of any way how to get a short term loan which would help carrying my family and myself over the next 3 months. I certainly shall be able to start repaying in March or April, when I expect to be back at work.

If you could help my imagination and have some advice how I could make some money out of the horizontal, I should gladly accept it.

With many thanks and many friendly regards from house to house

Yours,

Paul

Heller, Paul Dr.

December 7, 1948

Dear Paul:

Today you will be taking your oath of citizenship; that is altogether fitting. It is the anniversary of an event which caused my country, however reluctantly, to start deploying its strength to redress some of the evil things that had been done to your former country.

I regard this event that has occurred today as a useful and happy acquisition on the part of my country, and tonight I shall drink a small toast--maybe two, to you and yours.

As ever yours,

Dr. Paul Heller
4302 Third Street, S.E.
Washington 20, D.C.

PAUL HELLER, M. D.

Mr. Edward R. Murrow,
Columbia Broadcasting System,
New York City.

Dear Ed:

I hope you and your family are well, and I am sure you enjoyed the turkey dinner as much as you were looking forward to it at last night's broadcast.

This is my ~~real~~ first real Thanksgiving's Day, and I feel as if I had just joined the Mayflower Compact: yesterday I was informed that I was found worthy of American Citizenship, and I was invited to take the oath on December 7th.

I believe I h a v e to notify you of this great event in my life, since you were the first American to whom I spoke after the liberation, and since you contributed so much to overcoming the difficulties in the way to my early arrival in this country. It is partly your merit that I shall probably be the first of the liberated prisoners to become a citizen.

I wish I could celebrate the day in New York as I should, and I hope I can arrange for it; if not on the 7th, so some time in the near future.

Tommy continues to be a source of undiminished enjoyment.

With best regards from house to house

yours
Paul

Greetings to Miss Campbell; please, let her know of the development of things.

May 15, 1947

Dear Dr. Daugherty:

It gives me pleasure to answer your letter of May 1st. I first met Paul Heller on the day of the liberation of the infamous German concentration camp at Buchenwald. He was in charge of a group of barracks housing Czechoslovakian prisoners. His leadership was immediately obvious, and it was clear that he was held in respect by his fellow prisoners. After the liberation of the camp, Heller remained for some several weeks assisting our Army Medical Corps. Subsequently, with the help of some of my friends in London, I arranged to get him to Paris and finally to London.

I cannot, of course, speak of his professional qualifications, but I can vouch for his character and integrity. He makes friends easily and is devoted to his work. I know little enough of his family background, but do know his brother who is a professor at Oxford. In spite of six years in a concentration camp, he seems to me a remarkable well-adjusted, intelligent, young man who shows surprisingly little evidence of the experience he underwent. Heller's decision to seek an appointment outside of New York is, I think, wisdom. He wants to become an American and feels that this is not the ideal place to do it. The only additional comment that I could usefully make is that I have met his wife once or twice and she seems to me an attractive and altogether acceptable individual.

If I can assist you in securing additional information regarding Mr. Heller, I shall, of course, be delighted to do so.

Sincerely yours,

Dr. R. Oswald Daugherty

Isaacs, Dr Harold R.

April 30, 1959

Dear Harold:

Thanks for your thoughtful letter of April 24. I am afraid you are right. My question was not very well phrased and Blair's answer probably was not very informative.

I would like to write at length, but the pressure is just too great. I am an example of what Bob Hutchins meant when he said: "We all become so much concerned with the urgent that we never get around to the important".

I, too, have appetite for a long talk. Is there any chance of your being in town between now and the middle of June? If so, I will juggle the schedule so that we can have an evening together.

Thanks again for your, as always, candid comments.

As ever yours,

April 24, 1959

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York, New York

Dear Ed:

Your conversation last night with Blair Clark drives me to my typewriter. If I caught it correctly, you asked Clark whether things in West Africa were turning out as the European powers had "expected" and he said they were not, and went on to cite the less-than-democratic evolution of affairs in that area.

I am ready to share anybody's grim forebodings about the shape of politics to come in many of these new African states. I think we and they are in for a very rough time in this department. But reasonably now, just what were any "expectations" to the contrary by Europeans based on? When did the colonial systems become training grounds for democratic politics? Indeed, how late in the game did the colonial administrations themselves become anything that could even be called "a guided democracy"? Only the barest outlines of any form of representative government appeared in almost all of these countries only since World War II and then only with no real power democratically granted to the majority, much less any true freedom for an opposition. And before that of course -- well, we know at least the outlines of the story of colonial power as it was exercised in Africa as well as elsewhere. Add not only the nature and experience of the political institutions on which Africans were raised by their Western guardians but the very nature of the states which they inherit. Virtually every "state" is shaped by boundaries that were drawn without regard to any geographic or ethnic sense, so that there are divided peoples and built-in hostilities which have to be reconciled, federated, or somehow otherwise liquidated following independence. This set of problems alone presents the Africans with truly formidable if not insurmountable obstacles to the successful achievement of orderly democracy for quite some time to come.

Just why, out of all of this may Europeans "expect" the immediate establishment and smooth functioning of some ideal kind of democratic machinery anywhere in Africa? And why should anyone now feel entitled to shake his head and cluck over African failures to accomplish this miracle?

I would like to suggest that there is a pressing need for Americans to appreciate these starting points in Africa. That we have to realize that the handicaps are enormous and that they were created in very considerable measure by the colonial past. And that this colonial past while it was being lived, <u>never</u> envisaged its own end and therefore

never really prepared for it. We and the Africans are going to have to wrestle hard for our birthrights in some new common interest, some new common cause and it is no simple matter to see where we will come out. Indeed, considering the whole past -- in which we willy nilly shared by the assumptions we always accepted about both Europeans and Africans and by a great deal of our actual behavior -- we will be miraculously fortunate if African developments in any way favor our future success, not to say survival in the world. It is really a matter of how heavily the children are going to be called upon to pay for the sins of the fathers.

I write because I have begun to hear and read a good deal of a kind of self-purging, finger-pointing, history-ignoring, self-righteous criticism of emergent African politics and politicians. I wouldn't dream of charging you with this kind of simple minded clap trap. But where you stand there on your bridge, we all look to you to stand as firmly as a man can.

Before you take off on your year's sabbatical I would like a chance to have some talk with you. I have been for the last seven or eight months interviewing top American Negroes to get at the impact on them of world affairs in general and Africa in particular. I am about to start to try to put my findings on paper. It makes quite a story.

Meanwhile I trust that nothing in the hugger-mugger in which you are engaged involves any real danger that we won't continue having you on the air to prove what it could be like.

Yours,

Harold R. Isaacs
Research Associate

Mr. Edward R. Murrow
485 Madison Avenue
New York 22, New York

Dear Ed:

Thanks for your note. I could never have considered the possibility of your doing anything else but a "legitimate news item."

Without quite generating enough thrust to get into orbit, this little experimental tilt at apathy has managed to legitimize itself as news to a surprising extent, to wit: An AP story originated out of Providence about the spread of the chain letter there. All the Boston papers picked it up. The Harvard Liberal Union staged a collection in all the dining rooms. From Harvard, no doubt, the word spread to Smith whence we got a call from the paper's editor and there they evidentally are planning some kind of campus campaign. Then I understand Drew Pearson's column reported the receipt in Clinton of a number of contributions. He was quoting one of the frustrated Clinton money raisers who went to Washington last week. He actually mentioned our names along with a number of others, all from this area, suggesting that they all must be listeners of Louis Lyons. Lyons had read the letter as a news item of a reaction occuring in these parts to the Clinton bombing. There has been a fair amount of telephoning from various points, letters and other messages and somebody from Clinton sent me a copy of the Clinton paper with items in it about these efforts.

It struck Viola and me that the Clinton High School bombing provided the most direct opportunity for people to express their feelings on the whole business. Surely a massive and demonstrative response to Clinton's need would be the best kind of answer to Faubus and his letters asking for money for a private segregated school system. We just wonder whether the impulse to make this response is present.

On another front, many cheers for your speech the other night. I don't think these two situations are unconnected.

I think it is high time we had one of our biennial or triennial luncheons. I was by to see Fred a week or so ago, but it was late and you were deep in your broadcast. I will try giving you a call one of these weeks when I am in town.

Yours,

Harold R. Isaacs

May 20, 1957

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York, New York

Dear Ed:

I have noticed that in the recurring discussion of the China entry business at the Dulles press conferences the issue of Bill Worthy's passport seems to have largely disappeared.

Shouldn't somebody be asking Dulles at these press conferences why Worthy should be the only one of the three reporters who went into China to be penalized for his action? This situation comes about, I gather, because Worthy's passport happened to be the only one that expired at this particular time. He had to apply for renewal and this renewal is being denied. Since passports of none of the three were yanked at the time, Stevens and Harrington remain in possession of theirs and are free to continue functioning in their normal duties. Which is a fine and good thing. But how about Worthy? Why, pending resolution of the larger issue, should he have to bear what amounts to a rather severe penalty?

I understand that he has to go through a prolonged procedure within the State Department itself before he can properly make a court case out of it. Dulles said in his last conference that he would welcome a court test of the issue. Would he be willing to cooperate by expediting or even bypassing the State Department procedures, hearings, etc., on Worthy's passport--assuming that these would all result in negative decisions for Worthy--so as to allow the case to get before the courts immediately?

I believe that Worthy, who finishes his Nieman Fellowship at Harvard next month, is hoping and expecting to resume his normal work and that this would include going to Ghana in October for the projected Pan-African Conference. Is there any chance that by judicious and persistent questioning at the press conferences he can be helped in resuming his regular livelihood and his normal pursuits?

In discussing this matter with Worthy I have found a certain natural diffidence on his part, since he is

anxious not to be put in the position of seeming to suggest that the others should be "punished" equally with him. He has therefore tended to avoid pressing his case too hard. I think this is a tough spot for him to be left in and I have therefore taken upon myself to write you and others in the hopes that something can be done to give him a hand.

I have just about finished the opus on which I have been working so long. It will bear the title SCRATCHES ON OUR MINDS and will be published by The John Day Company about seven months hence. I am leaving for England on July 3 for six or seven weeks, partly on an assignment, partly to get some direct impressions of England-in-transition, partly--maybe--plain holidaying.

With best regards,

Sincerely,

Harold R. Isaacs

Dear Ed:

Would you go so far as to discern a glimmer of hope that the new situation might lead Eisenhower to begin acting like a President of the United States? The new congressional picture, it seems to me, would at least give him the opportunity.

He could appoint Adlai Stevenson secretary of state after elevating Dulles to the Court. He could send Chester Bowles as a special presidential envoy to Asia to pave the way for a fresh orientation for American policy there, let in new breezes, etc. He could send Ralph Bunche as special presidential envoy to Africa with the mission of traveling the continent from North to South to re-examine and redefine American interests and possibilities in that continent and come back with a report which in itself could have major repercussions on our whole world policy picture, especially in Asia and most particularly in India.

Is this a completely insane notion? What would happen, do you think, if suggestions of this kind of a turn toward real bi-partisanship and re-orientation were to begin emerging from the right places?

It is wonderful how incorrigibly optimism can thrust itself through the general bleakness. I am at least enjoying the sensation of having these thoughts.

Warmest regards,

Harold R. Isaacs

May 20552

Dear Ed:

I have been holding off writing to say thank you for your prompt and extremely kind note to Morgenthau in hopes that I could at the same time report a resolution of the matter. It has taken longer than I had been given to expect.

The Morgenthau Plan (!) fell by the wayside as a result of one of those academic snafus. It turned out that the money wasn't there!

However, I have been working at the National Opinion Research Center this past month and it has been interesting, though precarious. I appear to be scheduled for work there that will keep me engaged at least through July.

Experience seems to consist of either landing on one's feet or landing on one's can. Having had 20-odd years of the former I am now learning - with as much objectivity as possible - about the latter posture. It's only the flesh that sits: the spirit remains upright.

Thanks again for everything.

regards

hri

EDWARD R. MURROW

April 17, 1952

Dear Professor Morgenthau:

I venture to write you this brief letter at the suggestion of my friend , Harold Isaacs. My information regarding the nature of the post for which he is being considered is too limited to permit me to relate my comments regarding Mr. Isaacs directly to the project itself, so perhaps you will permit me to make a few general observations regarding him.

I am familiar with his writings and with his professional record; I have had ample opportunity in the course of prolonged conversations to appreciate his respect for truth and his determination to base his opinions on fact. I am no expert upon Far Eastern affairs, but I am aware of the high regard in which Mr. Isaacs is held by those whose knowledge of the area far surpasses my own.

Recently in replying to an inquiry regarding Mr. Isaacs' loyalty and integrity, I had occasion to say that were it possible, I would be prepared to trust him with my conscience or my country.

If I can supply you with further information which might be more pertinent to the project you contemplate, you need but to command me.

Sincerely yours,

Professor H. J. Morgenthau, Director
Center for the Study of American Foreign Policy

NEW YORK 25, N. Y.
MO. 2-5264

Jan. 2-51

Dear Ed:

During a New Year's Day call yesterday, I saw your roundup show on TV. Some of it was quite impressive.

However I write, by way of some mild needling, to point out what you doubtless well knew: how gaping the hole was on Asia in that program. Considering the part played by Asian affairs in the crisis, the program was something less than adequate. Even by judicious use of personalities available here during the last few months (Romulo, Mohammed Roem, Rau, Pandit, etc), the balance could have been redressed without undue difficulty.

This may sound like a plug, which can't be helped, since that's what it is; but I could have taken care of a chore like that quite handily. And there will be so many such!

If Tom Paine could become the American Patron Saint for this Year of Big Trouble, all indeed would be well. I've been thinking too of a line Victor Serge gave one of his characters in a little-noticed novel a few years ago: "The world is always new - if your nerves are strong enough."

Yours,

hri

June 29-50

Dear Ed:

I suppose that somewhere down in the bowels of CBS a check is on its way to me for the four Philippines pieces. It would be convenient if I could receive it before the end of the week.

Am still trying to act as though I'm going to carry out my summer plans. I suppose you are too.

At any rate, I will have to leave as shceduled Saturday because I cannot fail to do so without damaging my daughter's belief in the good faith of my commitments. She cannot see that a war is more important and by god she's right.

I'll probably not stay up there long, though. I've been doing pieces for the NY Post, and they want me to continue for awhile and I'll probably do so.

From Mr. Isaacs---

Manila--Regarding Acheson's request for military funds, including money earmarked for the Philippines, it seems useful to point out that the problem in these islands right now is only in a minor degree military. It's true that agrarian unrest, headed by the Communist-led Hukbalahap guerrilla movement, represents a focus for the developing social crisis. But, at the same time, it is not accurate to suggest, as some current reports are doing, that there is in imminent military crisis. The essence of the matter is precisely that there is still time to make an attack on the social problems here which are most directly feeding Communists their prime material.

According to the most solid intelligence reports, the Huks currently represent a military force of some fifteen thousand men. They were, until recently, concentrated in six provinces in Central Luzon, but during the last two months they have moved under military pressure, spreading northeastward into Cagayan area, which is a remote valley noted mainly for producing the tobacco which goes into Corona cigars. They have also spread thinly into new areas to the south.

They are well organized, have the capacity to make coordinated raids and have no trouble keeping supplied with ammunition.

But, while the administration seems incapable of suppressing them, they are not now, nor in the forseeable immediate future, capable of forcibly taking power. As one political leader put it here, "We have discontent to fight more than the Huks."

It is acknowledged here by all but the most hairbrained irresponsibles that a purely military approach to the problems of the Philippines is bootless. Actually, the Philippines armed forces heavily outnumber the organized Huks and are equipped with the best American weapons. But, as Malayan, not to say Chinese, experience shows, successfully fighting revolutionary guerrillas is not simply a matter of arms and equipment. This is particularly so here where the major accumulating problem is that of a government that is breaking down on the rocks of corruption, maladministration and incompetence, but most of all on unwillingness to come to grips with basic social problems.

It so happens in this case that American State Department representatives here are acutely aware of this. They know, for example, that its probably correct to say there is more danger to peace and order from unruly constabulary and, more particularly, from growing groups of so-called special policemen who are expanding as virtually private armies of civilian governors in several provinces.

These conditions go back to the responsibility of the central government in which such drastic reforms are so badly needed if any kind of American aid program is going to achieve its purpose of helping the country to achieve inherent stability.

C. EDMONDS ALLEN, Director

FOR Edward R. Murrow--CBS

Paid $50 pd 6/23

Baguio, May 28--(UP)--In this mountain town, five thousand feet up, in Luzon, representatives of seven South Asian and Pacific countries (India, Pakistan, Ceylon, Thailand, the Philippines, Australia and Indonesia) have been timidly exploring, for the last three days, how they might get together on some kind of program for regional cooperation.

These Asian countries have been feeling the immense pressures of their internal problems and the closing in of the pressures of the cold war. They all sense the desire to huddle together in the face of a gathering storm. But none feels it decisively or clearly enough to take any bold steps toward greater regional self assertion. Hence, the prime note here has been caution and timidity.

It was about this region that the foreign secretaries of the United States, the United Kingdom and France made fateful decisions only two weeks ago. These decisions have to do with stepping up the cold war as it is centered in Viet Nam by lending military aid to the French army and to Bao Dai, who is generally regarded among Southest Asians as being the hopeless puppet of the French.

Among South Asians there seems to be a kind of helpless resentment that the Western Powers go on making decisions about Asia without asking for the views of Asian nations. But, if the attitude of the delegates here at Baguio is any indication, they seem particularly fearful of mustering themselves to act in their own behalf.

Wayne Butler

Oddly enough, the boldest figure at this conference has been Carlos Romulo, the man who fathered it against all sorts of obstacles

and reluctance. Romulo is personally willing to go farther in the way of bod assertion of Asian attitudes than any of the others present here. He is seeking, for example, a decision on setting up a permanent cooperative operating body for South Asia. But, he will be lucky if he even gets an agreement on a mild form of future consultation. Once again it seems that the opportunity for the new South Asian nations to rise above narrow localisms is being missed.

This can be understood only as an expression of deeper underlying weaknesses and a lack of dynamic strength caused by an inability to grapple with their own enormous problems.

Dear Ed:

I am sorry I missed you before you took off for Washington. I wanted a chance to suggest to you that if there was ever a time for "saying harsh things" about this Indochina business, the time is now. Today's announcement of a naval-air "show of strength" in the area is a further indication of how incredibly far the myopia has gone. The very idea and the very term come out of the history and the lexicon of 19th century colonialist strutting. If anything were needed to confirm the apparent nature of US policy and US intentions in Indochina, this is it. For what conceivable purpose could this demonstration serve? It is an expression of that ancient and obsolete notion, applied traditionally by the powerful Westerner to the benighted heathen, to the Ay-rab, the fuzzy-wuzzy, all the animals that walked liked men: force is the only thing they understand. I remember a Frenchman in Casablanca once shaking his fist under my nose and saying: "This, this, this is the only thing they know!" And now, preposterously, the United States navy is going to fly 80 planes over Viet Nam in order to show the local benighteds that Bao Dai is good for them or else. Or else precisely what? That the next time the bombs will drop? Or what?

The extent of the disarray, confusion, and frustration among friendly South Asian nationalists over this issue now defies exaggeration. The "show of strength" by the navy is being matched by a clumsy continuation of pressure on the Filipinos, the Indonesians, to come along. And they aren't buying. How much heavier will the pressure get? The Siamese govt was broken in two by this pressure. Similar splits would threaten the others. How, precisely is this going to serve any useful American purpose?

Since we met before your departure for England, the situation has progressively worsened. I have begun my sting for the Monitor and sent them my first piece yesterday - on this subject - and I've got my fingers crossed as to their reaction. I've done another piece for Max Ascoli's Reporter. But it won't see the light for some weeks. The McCarthy headlines over the security risks in the State Dept make pretty mordaunt reading when the fact is that the security of the United States is being actually threatened infinitely more by the makers of these policies.

Let me add only one story: during one of the many talks I've had with South Asians in the last few weeks, one of them, a man of age, experience, wisdom, and goodwill, said to me: "Tell me, what is the chance of there being a United States government in the next year that will follow a policy in our part of the world with which we can really associate ourselves?" I said I didn't know. He threw up his hands and said passionately: "But I've got to know the answer to that question. I've got to decide it in my own mind. I have the responsibility of shaping policy, policy over the next several years. I have to

estimate our own course in the near future. And everything hinges on that, one way or another. What do I say to my government?"

What does he say to his government? Where do they go if they follow us? Where else do they go if they cannot follow us? Or can we find the wisdom to begin to follow them?

The head is on the block on this one, Ed. Nobody's taken it up because nobody yet seems to realize the full significance of what's been done. I suggest to you the clips on Chris Rand's pieces in the Tribune in the last few weeks. Especially the one today. And if the Monitor is true to me, my own first piece for them might be worth your while picking up. I will also send you a carbon of my piece for the Reporter.

Dear Ed:

I was bothered by your mention of the exchequer this morning. I respect your thought. But let us not risk a misunderstanding. Professionally-earned revenue is one thing. But neither you nor I would, I am sure, know how to put a price on mutually-interested friendly conversation.

Have a fruitful trip to England.

best,

HR Isaacs

December 27th, 1949

For my friends, this is notice of a major shift in my working arrangements.

For those concerned, this is a notice of change of address.

For all, this is season's greetings.

I hope nobody minds my combining these functions in a single communication.

I am leaving Newsweek, as of January 1, 1950, to devote myself to writing in my own major field of interest: Asian affairs, American Asian relations, Point Four, the problems of colonies, ex-colonies, and everything to do with the so-called "backward" world.

First of my new tasks is a booklet pertaining to Point Four, part of a bigger project being carried out by the Public Affairs Institute of Washington, D. C. Then I have a book to finish and, concurrently, some special writing and lecturing assignments.

Please note: My quarters for the next few months will be at the Institute of Pacific Relations, 1 East 54th Street, New York City. Telephone: Eldorado 5-1759

Please note: My permanent mail address will be at my home, 333 Central Park West, New York 25, New York.

Sincerely,

Harold R. Isaacs

SP

From Harold R. Isaacs

Re: Biographical details accompanying application

.....

1. Business address: Newsweek, 152 W 42 St, NYC; Home: 333 Central Park West, NYC.

2. Born at NYC, Sept. 13, 1910; Nationality: U. S.

3. Education: Columbia College, NY, 1926-30, majors in political science and philosophy, Bachelor of Arts, February, 1930; University of Hawaii, summer 1930, international relations. Travel across United States, 1927; Europe, 1928, also Middle East, partly as working seaman.

4. Previous Employment and Activity:

1928-30	New York Times, assignment reporter (while at college, working nights, weekends). Shipped out of NY as seaman, March, 1930.
1930	Mar-Sept, Honolulu Advertiser, reporter.
1930	Oct-Dec, freelancing in Philippines, travelling throughout islands.
1931	China Press, Shanghai, city editor. Extended travel across Central and West China, by boat, bus, pony and on foot.
1932-34	China Forum, Shanghai, editor; Havas News Agency, rewrite; travel in Japan.
1934-35	Resident at Peiping, library research and writing study of Chinese revolution of 1925-27; travel in Manchuria.
1936-40	New York, Havas News Agency, rewrite, with bulk of spare time devoted to completing Chinese revolution study, published in 1938.
1940-43	Columbia Broadcasting Co, NY and Wash DC, writer of documentary public affairs show, "Report to the Nation."
1943	Newsweek, Washington bureau, assigned to make special studies of post-war problems in foreign affairs, production, transportation, communications, labor problems, etc.
1944-46	Newsweek war correspondent, China-Burma-India, Korea, Japan, Indochina, Indonesia, etc.
1946-48	Newsweek, New York, Special Projects Editor. In this period I set up editorial handling of Newsweek's international editions and then undertook series of special reports on wide variety of subjects. Also wrote and completed No Peace for Asia, published in May, 1947, and New Cycle in Asia, a selection of documents on international relations in the Far East, 1943-47, published in November, 1947.
1949	Newsweek special foreign assignment to India for the Delhi Conference on Indonesia, and to Indonesia, Malaya, Burma, Siam, Philippines. Just completed.

5. Present Employer: Newsweek, 152 West 42 St., NYC; Associate Editor, responsible for special reports and studies. Prior to special South Asia assignment, these covered among other miscellaneous subjects reports on foreign monetary problems, foreign trade, the merchant marine, American public opinion on world affairs, problems of American Far Eastern policy, etc. Employment dates from Aug. 1, 1943. Present salary: $10,500 per annum.

6. War Service: as correspondent in CBI and in the Pacific area postwar. Reported Burma and Salween campaigns, 20th Bomb Command, Chinese political developments, occupation of Korea, first phases of Japanese occupation, early phases of postwar nationalist conflicts in Southeast Asia, etc. Awarded War Dept Certificate of Merit and the Pacific Theater ribbon.

7. Publications:

The Tragedy of the Chinese Revolution, London, 1938
No Peace For Asia, New York, 1947
New Cycle in Asia, New York, 1947
contributor to As We See Russia ("Russia in Asia"), New York, 1948
in preparation: Independence Is Not Enough, a report from South Asia, scheduled for 1950.

Besides reports to Newsweek, have published articles in Harpers, Toronto Star, United Asia (Bombay), Modern Review (Calcutta), Hindustan Times (New Delhi).

Have lectured at Knox College, University of Washington, Reed College, etc. Conducted seminar for Nieman Fellows at Harvard, also for the Far Eastern Regional Studies Program at Harvard (i.e., single sessions); Served on faculty of Northwest Institute on International Relations, 1948; Lecutred to successive classes of the Army Information School, Carlisle, Pa., 1946-48; Presenting a panel paper on "The Problems of South Asian Nationalism" at the University of Chicago in May, 1949. Numerous radio forum participations etc.

May 24, 1949

To the Advisory Committee on Fellowships,
Council on Foreign Relations

From Harold R. Isaacs

Re: Purposes in applying for Council Fellowship

.....

I have spent a total of nearly eight years residing or travelling in the Far East; more than five years prior to the war in China, two years during and just after the war in China, Burma, India, Japan, Korea, Indochina, and Indonesia, and most recently on a special Newsweek assignment to South Asia, during which I visited India, Burma, Siam, Malaya, Indonesia, and the Philippines. I have only just returned from this assignment. Beside my current reports, my published work includes a history of the Chinese revolution of 1925-27, an account of immediate postwar conditions in Asia, and a selection of documents on Far Eastern international relations covering the years 1943-47. I am currently engaged upon a series of special reports for Newsweek on South Asia, and on a book which will discuss the problems of emerging nationalism in Asia, the new Communist movements, the changing relationships between Asia and the West. In due course I would expect to return to other parts of the Far East for further work.

I am interested in this Fellowship as an opportunity to spend a year studying American Far Eastern policy. That policy stands today in a kind of vaccuum, emptied of all immediate practical perspectives in China and undefined as to the rest of Asia. On my recent swing from India down to Indonesia, it was made abundantly clear to me that American opportunities there are running out, that unless in the near future the United States makes a turn toward a forceful, bold, and intelligent policy in that area it will face there the same contingencies now faced in China.

In this year I would propose to find out what actually goes into the making of American Far Eastern policy. This would include any university courses that promise to contribute to my understanding of the subject, although I would also expect to find in the library and other research facilities of the Council a great deal of what I would need by way of documentary and current materials. Beyond these, it would be my purpose to examine in Washington the people, the attitudes, and the specific official machinery involved in the making of Far East policy. I want to examine, for example, the channels through which matters relating to countries like India, Burma, Indochina, Indonesia, etc. must pass before they reach policy-making levels in the State Department. I would want to find out how Far Eastern matters stand in the thinking of top policy makers and the members of the Senate and House Committees on Foreign Relations.

It would be my hope that the Fellowship would give me the opportunity through the council to meet with various specialists in Far Eastern affairs, to match, check, and test data, to pool ideas, and see perhaps whether out of the whole common examination of the problem it might be possible to develop some useful ideas on what American Far Eastern policy might be in the coming period. Certainly it

would be possible in this way to shake down the main elements, the alternatives, difficulties, and obstacles, and to put a finger on the spots where changes are needed, in attitudes or in the machinery we have for carrying out existing policies.

My working program, tentatively, would include intensive library work; such courses as I find it useful to take; the spending of considerable time on a quasi-commuting basis, in Washington for first-hand research. Finally, I would be much interested in any suggestions from the Council on methods of bringing together other people to broaden the use of the information thus gathered.

It goes without saying that I would expect to learn enough from this year's work to write usefully about it. But I would regard the term of the Fellowship as primarily a period for learning things rather than a subsidised period for writing. I would assume that the Council's ideas on this would be just about as flexible and tentative as my own. I am of course concerned with equipping myself with a better-informed perspective on American Far Eastern policy. The obligation to put the knowledge gained to good use is more than that of a journalist. It is a matter of discharging the duties of a citizen.

Dear Ed:

Herewith the material going in with my application for the Council Fellowship. It is being accompanied by a number of sample pieces of mine of recent years from the Newsweek files.

My many thanks for your friendly interest.

Sincerely,

HR Isaacs

[redacted]. I believe that both he and the profession that he represents would benefit greatly from a year's study of the sort provided by your fellowship.

[redacted]

May 23, 1949

Joseph Barber, Secretary
Advisory Committee on Fellowships
Council on Foreign Relations
New York 21, N. Y.

Dear Mr. Barber:

On behalf of the Editorial Board of Newsweek, I am happy to endorse the application of Harold Isaacs, a Newsweek associate editor, for one of the Council's resident fellowships for American foreign correspondents.

Mr. Isaacs' experience as a correspondent has been impressive, as shown in detail on his application. In our opinion, he combines an admirable degree of unusual abilities as a reporter, as a writer, and as a student of public affairs. I believe that both he and the profession that he represents would benefit greatly from a year's study of the sort provided by your fellowship.

Newsweek would be glad to grant Mr. Isaacs a leave of absence for this purpose.

Sincerely,

Edward W. Barrett
Editorial Director

Batavia, Mar. 1, 1949

DUTCH BLIND ALLEY IN INDONESIA -I

by Harold R. Isaacs

.....

The Dutch have driven themselves up a blind alley in Indonesia. Their policies and behavior, even when viewed in terms of Dutch self-interest, are a curious compound of malevolence and myopia, of desperation and plain stupidity. In their effort to retain the largest possible measure of power and position in the world's richest archipelago, they are bankrupting themselves and paralyzing the Indonesians. They are sowing a crop of hatred and violence. They are ensuring that when they leave, as they eventually must, Indonesia will be rent by bitter and costly internal divisions.

Three years ago when I last visited Java, it was difficult to find a Dutchman who favored independence for the Indonesians; it was a preposterous notion imposed upon the simple minds of a docile people by the Japanese. Since then they have become dimly aware that Indonesian nationalism is a forced to be reckoned with, to be adapted and converted, if possible, to Dutch advantage. Now it is difficult to find a Dutchman who will not insist, verbally at least, that Indonesian independence is his dearest, indeed his only desire. Only he wants to grant it in his own way and he intends to do so whatever the cost to the Indonesian people.

This Dutchman likes to see himself as the stern yet kind parent of a family of wayward children. He knows best what is good for them and intends to do his duty. From conversations with Dutchmen right across Java, this parental figure emerged repeatedly, the familiar and terrible man of good intent with rod raised, saying: "This hurts me more than it hurts you." He simply does not understand why this attitude evokes resistance and even hatred. He sees the Indonesians as a mass of recalcitrant ingrates whom he must nevertheless serve with his superior wisdom and guidance even if he has to beat them into submission. He goes about it with an air of self-sacrifice. He is baffled by the world's condemnation and is strengthened in his conviction that he is sorely misunderstood and must bear this trial too.

His mood of self-sacrifice is fed by the fact that life is no longer comfortably pleasant for the colonial Dutchman in Indonesia. The advantages of colonialism were not only the means to easy wealth it provided. It also offered access to the attributes of wealth at pretty low cost. Even the small man, the employe or petty official, could exchange the dullness of lower middle class life at home for the comparative grandeur of spacious homes, docile and numerous servants, club life in the grand manner, and a sense of superiority fed every hour of every day by the teeming presence arpund him of a subject race dumbly contributing to his comfort and well-being. That is largely gone now. Dutchmen in Indonesia not only have to put up with the incomprehensible hostility and ingratitude of many Indonesians. They also have to put up with conditions of life which are anything but comfortable.

Housing is scarce, crowded, and costly. Out of salaries that run up to an average of 1,000 guilders per month (for older, more experienced men(, the single man has to pay up to 600 guilders for his room and board, 400 guilders for a suit of slothes, more

than a guilder for a pack of cigarettes. Good liquor is beyond his reach. Cheap amenities have disappeared. But what is worse, economic incentives are disappearing. Dutch businessmen have no real confidence in the future. Young and old alike, they are oppressed by uncertainty and insecurity. And even where there is money to be made, current regulations make it difficult to reap adequate benefit from it. Dutchmen may now repatriate to Holland no more than 25,000 guilders, and that only at a rate of 10,000 guilders a year. The Dutchman is not noted for sentimentality in business affairs. I met a number of businessmen who said quite simply: "We're getting out as soon as we can."

Other Dutchmen with deeper roots in the country and a personal stake in official or military positions or in older established businesses with large fixed capital investments will, on the other hand, almost hysterically insist that they could readily settle the Indonesian situation "if it were not for foreign interference." Their resentment of the UN action in Indonesia is immense. Their newspapers have stooped to printing scurrilous and libellous comments on UN personnel. In all official relations there is a constant strain placed on UN officials, who are made to feel like unwanted intruders. From the standpoint of these Dutchmen, the outside world simply does not understand what is going on in Indonesia. UN interference is at best a matter of ignorance, at worst a thinly-cloaked attempt, especially by the United States, to wrest the wealth of the Indies from Dutch hands.

For their part, the Dutch say, they want to see Indonesia "free" - but free under conditions of "law and order" and "avoidance of chaos." What they mean by this is a transition to some new system in Indonesia in which the Dutch will lose as little power and economic position as possible. That is why they have so stubbornly resisted the Republic. They could not bear to have any independent force in Indonesia, with its own army, its own unassisted government, its own ideas of what it wants to do with its freedom. On this issue every set of negotiations and agreements during the last three years has broken down. On this issue, first in July, 1947, and again last December, the Dutch set out to crush the Republic and leave the field clear for a Dutch-dictated "settlement" between themselves and more tractable politicians whom they have placed in positions of nominal power in a patchwork of contrived states and special territories in the rest of Indonesia.

As a result, the Dutch in acting to enforce "law and order" have completely disrupted law and order. To prevent "chaos" they have created a state of affairs that looks very much like chaos in large sections of the country. And they remain completely unaware that these are the consequences of their own acts. For their failures they blame the Indonesians, the United Nations, the United States, everyone, indeed, but themselves.

The unrationalized reality of this process is an ugly one. There has been a lot of killing, by Dutch and by Indonesians. The war the Dutch have launched is inevitably a war of terror that follows the pattern set by the Japanese. Whenever a Dutch patrol runs into a guerrilla band or is attacked by unseen opponents, the nearest kampong, or village, pays the price for it. So-called "nests of gangsters" or places suspected of harboring guerrillas or aiding them are promptly razed by gunfire and burning. The Dutch do not allow foreign military

observers to accompany their patrols. But there have been numerous reports from other sources, from Indonesian villgers bringing their wounded into nearby towns, from guerrilla contacts. From one source in north central Java I was told of ten kampongs in the vicinity of Bati that were shot up in this manner.

But the most decisive evidence has from Dutch soldiers themselves. The Dutch use Indonesian soldiers as a rule to do the dirtiest work. In their Ambonese troops, schooled as mercenaries for many decades, they have willing tools. Eurasians, who suffer all the consequences of being fully accepted by neither community from which they spring, are, as everywhere, the readies to prove their worth as jailers and executioners. Dutch troops who went through the humiliating experience of being defeated by the Japanese and maltreated through four years of prison camp life, have profound psychological scars to erase, if they can, in action against a weaker enemy. But young Dutchman, coming out from Holland ill-trained and without combat experience of any kind, perhaps with memories of their own life under Nazi occupation, are still often untouched by the notion that a master race can do no wrong. Some of them have written horrified letters home describing some of the incidents that have taken place. The Nieuwe Rotterdamse Courant, aliberal paper, has quoted these letters as speaking of "inhuman treatment of prisoners and killing of inhabitants" and demanded a government investigation.

Terror begets terror. Indonesians fighting the Dutch in the hinterland can hardly be expected to observe the niceties that the Dutch themselves ignore. They have to fight the way they can, attacking isolated posts and estates. The Dutch, who never report their own punitive activities, are pleased almost daily to announce acts of murder, arson, and kidnapping perpetrated by Indonesian "terrorists" and "gangsters." Many of these reports are true. Even organized and controlled guerrilla warfare is no picnic. The regular Republican forces today in East and West Java are confronted with the problem of fighting their war in such a way as not to bring terror down on the villagers on whom they must depend for food and assistance. They also have to contend, inevitably, with freebooters who invariably crop up in such conditions and prey upon friend and enemy alike.

The tragic fact is that in Indonesia a lot of people are getting hurt because they happen to be in the way. This does not help the Republicans. Neither, certainly, does it help the Dutch. It is, in any case, the unanimous testimony of every source in Java except the Dutch that "law and order" prevailed in the countryside until the Dutch moved in to establish it. Then it disappeared entirely. The Dutch say confidently they will "mop up" comfortably in two, four, or six months. It is much more likely that for a long time to come neither the Dutch nor the Indonesians in Java will know any peace.

00

Batavia, Mar. 1-49

DUTCH BLIND ALLEY IN INDONESIA - II

by Harold R. Isaacs

The Dutch are defeating themselves in Indonesia. Their own acts conspire against them. They have demonstrated a remarkable genius for achieving almost always the precise opposite of what they say they intend. This may be in a way more of a study in psycho-pathology than politics, but here are some of the clinical details:

Military: The Dutch said they had to move with force against the Republic because Republican forces were infiltrating Dutch-held territory and threatening Dutch positions. Their object was to destroy or otherwise eliminate the Republic's armed forces. They occupied Republican towns and cities without difficulty but they by no means eliminated the Republican army. Large forces filtered right past the invading Dutch troops and moved in considerable numbers east and west. They re-occupied the "pockets" in East and West Java from which they had been evacuated under the terms of the Renville Agreement in 1947. The Dutch themselves acknowledge that as many as 4,000 Republican troops moved eastward and slightly more than that westward. Republican sources incidate that the figures were much larger. The Siliwangi division, the best single Republican unit, has arrived nearly intact in West Java where it will be heard from before very long.

The result is that the Dutch who moved to execute a "police action" in Central Java now have a guerrilla war on their hands in all of Java. By all accounts, the Dutch are incapable of imposing a decision by force. They have only an estimated 30,000 combat troops and their military efficiency is not highly rated by foreign military observers. Their training has been inadequate, the food given them is execrable. Replacements of both menand equipment are scarce. The Dutch are chary of giving out casualty figures but up to Feb.15 they admitted a total of 302 killed and 897 wounded. Many times this number must be sick, especially from gastro-intestinal illnesses.

Military information is scanty. The Dutch make it exceedingly difficult for UN military observers to see what they want to see wherever they want to see it. They give out very little information on their own. But daily reports in the news of guerrilla actions in territory hitherto held secure by the Dutch are sufficient testimony that the guerrilla war iswidening and that the Dutch are in no shape to cope with it, at least not without considerable reinforcements and new material.

Economic: The Dutch justify their course in Indonesia by arguing that they have large interests there which must be protected, that Dutch economy is dependent in large measure on a stabilized and profitably-functioning economy in Indonesia. But to bring about this presumably happy situation, the Dutch are going deeply into the red. In 1948, a relatively peaceful year, the military cost was officually stated to be 600,000,000 guilders. This did not include the cost of material shipped from Holland, the cost of operating the navy, or of Red Cross medical services. With these items included, the actual cost was probably closer to 800,000,000 guilders. At the official rate of 38 U.S, cents per guilder, this amounts to $306,000,000, or more than $800,000 per day.

Taking the smaller, official figure of 600,000,000 guilders, a number of rather striking comparisons can be made. This sum represented 120 percent of the total return on Dutch investments in Indonesia prewar, which was carried at 500,000,000 guilders annually. In the Indonesian budget, it swallowed up 70 percent of all revenue received. Measured against trade figures, it was 300 percent of the Indonesian favorable trade balance in 1939. Finally, the total cost almost equalled the total of American ECA funds given to Holland during 1948 and was nearly twice as much as ECA funds alldted to the Indies.

These figures apply to the costs for the year preceding the military action that began on December 19 last. Since then, in action, the Dutch army has been consuming material at a greater rate and requiring a greater expenditure of money both for men and equipment. Where is Holland to get these resources? However the book-keeping is done, it seems impossible to avoid the clear-cut implication that American ECA aid to Holland is the one factor that keeps Dutch policy in Indonesia going. And if ECA funds are rnewed for the Netherlands for 1949 on a similar scale they will constitute the ultimate source of the money spent by Holland to wage its war in the coming months.

The Dutch presumably hope that these costs can eventually be recovered from resumption of large-scale profits from Indonesia. At least they constantly reiterate that that their purpose is to restore stability so that the big estates can resume production. But here again their action is having quite the opposite effect. There is no consistent or complete economic information from various parts of Java since the military campaign began. But the closing down of sugar and coffee and other estates in East Java is being reported almost daily. In West Java the trouble on the estates is only just beginning. In Central Java the Dutch attack was countered by the Republicans with large-scale scorching of the earth. Millions of dollars' worth of buildings, shops, railroad installations and factories were dynamited. Economic recovery in Central Java has been set back for many years to come.

Political: In the sphere of politics the boomerang thrown by the Dutch has come around and struck them hard and true and with maximum disabling effect. The Dutdh believed they could eliminate the Republic from Indonesian politics by occupying its capital and its territory. Their spokesman did indeed jubilantly announced: "The Republic is dead." But the Republic remained very much alive. Its leaders were weakened vy dissension on the eve of the Dutch attack. They were firily united after it. They were losing ground popularly because of the Dutch economic blockade of the Republic. After the attack, exiled in remote places, they became unassailably the high moral symbols of Indonesian nationalism. Not only was the attention of the whole world focussed upon them. but internally in Indonesia the Republic became the decisive factor to a greater extent than ever before.

The Dutch had hoped that with the elimination of the Republic

they could form a suitably pliable United States of Indonesia out of the conglomeration of states and special territories they have created ad hoc during the past three years. These now number 14, with a 15th being formed in Central Java. Only a few of these states correspond in any serious sense to the ultimate federal structure that Indonesia obviously must have. The rest are creatures of Dutch policy and of Dutch imagination. Their representatives were brought together in what was called the Federal Consultation Assembly. When the Dutch attacked the Republic the two most important of these states, East Indonesia and Pasundan (West Java) had government crises and resignations. Their delegates to the Federal Assembly have since taken the stand that no settlement is possible without the Republic and they have been followed in this stand by five other Federalist states.

When the Dutch, after two months of faltering and hesitation finally came forward with a proposal for a new conference at the Hague, the success or failure of the plan actually dependedon the assent of the Republican leaders. Peter Koets, No. 2 man in the Indonesian government, flew to the island of Bangka to proffer the invitation and returned to Batavia, crestfallen, with a refusal. Louis Beel, High Representative of the Crown, insisted the conferennce would be held anyway. But everyone knew the invitation had fizzled. The Dutch thought they had killed the Republic but they are haunted still by a very live Republican ghost. They cannot even hold a conference unless the ghost agrees to sit in.

MR

RH 217P

December 30, 1948

Dear Mr. Isaacs:

Thank you for yours of December 22nd. I have communicated with Ed Allen. We shall, as discussed, pay you $75.00 a piece over a period of three months.

I am quite willing to designate you as a "Newsweek" correspondent, but feel entitled to add to that something to the effect that you are doing a certain amount of special digging for my program.

Let's lunch before you push off.

As ever yours,

Mr. Harold R. Isaacs
"Newsweek"
Broadway and 42nd Street
New York 18, New York

December 29, 1948

Dear Ed:

I have made a deal with Harold Isaacs from "Newsweek". He will file for us from the Pacific--probably one piece a week. It is suggested that he will use Undigrass via Montreal to "Edallen for Murrow CBS". I assume with the utmost confidence that you will bill us for same.

As ever yours,

E.R.Murrow

Mr. Ed Allen

Mr. Edward Murrow
Columbia Broadcasting Co.
485 Madison Avenue
New York, NY

Dear Mr. Murrow:

Re our discussion yesterday, I will be sending you at least one piece a week, by cable or airmail, and more if it seems advisable, from various points in Sputh Asia during the next three months or so. For your information, may I note here the following:

1. Query Desk at Newsweek will be in touch with my whereabouts in the event you want to reach me.

2. Checks covering payment for these pieces should be sent to my home address at 333 Central Park West, NY 25.

3. For cabling I will use Unipress channels, filing via Montreal to "Edallen for Murrow CBS" and Allen will bill you directly for cable charges. It would be useful if you would drop a line to Allen confirming this arrangement.

4. This arrangement is acceptable to the editors of Newsweek with the understanding that when my material is used I will be identified as a Newsweek correspondent.

Sincerely,

Harold R. Isaacs

March 19, 1956

Dear Mr. Jones:

As far as the poll tax constitutional amendment is concerned, I am already on record for its adoption. As a matter of fact, I have advocated abolition of the poll tax for many years and that plank was part of a program which I presented publicly last Fall.

As for Mr. Murrow's news broadcast, I am very surprised that he would even suggest that I might lend my name to the "Dixiecrat" movement. In the first place, I know of absolutely no one who is advocating such a movement and in the second place anyone who has studied my record should be aware by this time that I would not lend myself to a party splitting movement.

As for the document issued by a number of Senators, I thought you might be interested in a statement that I made on the issue, which I am enclosing for your study.

Sincerely,

Lyndon B. Johnson

March 14, 1956

The Hon. Lyndon B. Johnson
United States Senate
Washington, D. C.

Dear Senator Johnson:

I am a Texas resident and voter, currently doing graduate work at a New England school. I am writing to express my appreciation for your courage and statesmanship in not signing the so-called Manifesto of the One Hundred, the declaration by a group of Southern Congressmen which has the effrontery to challenge the authority of the Supreme Court as the final interpreter of the Constitution. In a time when we have all become very nervous about "subversive" activities, it seems to me that nothing could be more subversive of law and order than a direct challenge to the supreme judicial body of the land. Unfortunately, however, there are many people who are willing to put personal prejudice and political expediency ahead of constitutional principle and the welfare of the nation. I am delighted that you are not among them.

I was, however, quite distrubed at Edward R. Murrow's news broadcast last night. Mr. Murrow suggested that you might lend yourself and your distinguished name to a new "Dixie crat" movement, which, as Mr. Murrow correctly pointed out, would have only one certain result: the defeat of the Democratic Party. I hope and pray that you have no such plans. It would be a shockingly cynical and unprincipled act for the Senate Democratic Leader to join himself with Eastland, Talmadge, Byrnes, and men of their ilk in a last-ditch stand for unreasoning bigotry, and it would certainly be in contradiction to everything for which Lyndon Johnson has stood.

My family has lived in the South for many generations. All four of my great-grandfathers were plantation owners in Mississippi. But it is my firm conviction, as it is of most of my living relatives, that the United States can not long continue either to merit the respect of other nations or to respect itself unless it puts an end to second-class citizenship. That the problems are many and that the process of desegregation must be gradual, I readily admit. But much can be done immediately--for example, adoption of the constitutional amendment, now before the Senate, for abolition of the poll tax. Most nations fine their citizens for not voting; we are the only country which fines them for voting. I hope you will lend your support to this amendment.

Sincerely,
/s/ George F. Jones

COPY

EDWARD R. MURROW WITH THE NEWS
C.B.S. RADIO NETWORK

TUESDAY, MARCH 13, 1956
7:45--8:00 P.M., E.S.T.

This is the news:

Thi first presidential primary of the election year was held today in New Hampshire. The main contest is between Senator Kefauver and supporters of Adlai Stevenson..the first test of strength between the two Democratic candidates. Most of the polling places will close in about 15 minutes. No significant trend is to be found in the early, scattered returns. C.B.S. Radio will broadcast a special report on the primary at 10:05 tonight, Eastern time.

Mr. Eisenhower had a private talk today with Vice President Nixon. The nature of their talk was not divulged. There has been a lot of speculation over whether Nixon will run again for vice president. Last week, the President said he had told Nixon "to art his own course."

Mr. Eisenhower had his regular weekly meeting today with Republican congressional leaders. Afterwards, Senator Knowland said he believed the President's mind was "open" on the question of the Bricker Amendment, relating to the chief executive's treaty-making powers. The wording of the amendment has been revised, and Knowland said Mr. Eisenhower had agreed to talk it over with his top advisers. The President was also quoted as being pleased with the progress the farm bill is making in the Senate..where, so far, efforts to junk flexible price supports have failed.

It now appears that the Senate will not complete action on the farm bill until Friday, and possibly not until sometime next week. Today, the Senate set up a two-price plan for wheat. It tacked an an amendment whereby farmers would be guarantedd full 100 percent parity. for wheat used for domestic human consumption. For wheat that would be exported, or fed to livestock, farmers have to be satisfied with the going market price. This amendment was sponsored by Republican Senator Carlson of Kansas. It was passed by a vote of 54 to 39.

The House passed measures today..cancelling the scheduled cuts in ex-cise taxes and taxes on corporation profits. Under existing law, the taxes would be reduced automatically on April first, and cost the government 3-billion dollars in revenue. The legislation, continuing the higher rates, now goes to the Senate.

Florida will challenge yesterday's Supreme Court ruling that Virgil Hawkins..a Negro..must be admitted to the University of Florida law school. The Florida cabinet, composed of Governor Collins and six other state officials decided to ask the court to reconsider its ruling. The cabinet also proposed a conference of school and state officials next week, to discuss means for circumventing the court order.

Secretary of Defense Wilson said today that congressional investigations into military matters whould be "carefully handled", so the Pentagon will not be forced to make public information of value to tn enemy. Wilson told the National Press Club that the nited States. now.. and for the foreseeable future..has the capability to inflict "vast destruction" on any aggressor. And this capability, he said, "cannot be thwarted". Wilson said that, if properly spent, the money prescribed in President Eisenhower's budget will be sufficient to carry out the military program.

The Army issued a call today for 12-thousand draftees in May. That's double the quota for recent months..and will permit the early release from service of about 8 thousand draftees in June.

Greece took the Cyprus question ot the Uni ed Nations today, in a formal request that the matter be taken up by the General Assembly. The assembly does not meet until next fall. Butt the Greek delegate said the case might be taken before then, to the Security Council. Greece charged that Britain.. in its negotiations .."never had the intention of restoring freedom to Cyprus."

Britain said the Greek action "was calculated to inflame the situation," and that Cyprus is not a matter for U.N. debate.

In Washington, eighteen senators prepared a resolution saying that the legitimate security interests of Britain should not be used "for the frustration of the legitimate aspirations of the people of Cyprus." The resolution asks the State Department to express this view to the British government.

In Athens, American Ambassador Cannon called on the Greek foreign minister today, to express the "sympathetic concern" of the United States over recent developemtns in Cyprus. This action surprised British officials in London. And the British ambassador in Washington has been instructed to seek an explanation from the State Department.

The British foreign secretary..Selwyn Lloyd..arrived in Tel Aviv today, to confer with Israeli leaders and the chief United Nations truce supervisor, General Burns. And the British ambassador to Jordan conferred with the Jordinian prime minister in Amman.

Jordan said today that an Israeli fighter plane burst into flames over Jordinian territory, and crashed into the demilitarized zone. It did not say whether the airplane had been fired upon.

In Algeria..in the last 24 hours..clashed with Arab nationalist forces have cost the French at least 15 dead.

Secretary of State Dulles arrived in Thailand today, and signed an agreement to help Thailand in the peaceful uses of atomic energy..including the construction of a small nuclear reactor. Dulles also conferred with Thai prime minister who said afterward that it was impossible for Thailand to follow a neautralist policy.

The "manifesto of the 96" againsts school integration, which was laid before Congress yesterday, has now become the manifesto of 100, and presumably more names will be added. This is an impressive number to join in denouncing

the Supreme Court, for what is called "an unwarrented exercise of power, contrary to the constitution", and accusing it of creating chaos and confusion.

But this number of 100 is fewer than one-fifth of the total membership of the two houses of Congress. That is, it is a minority view. In the segretation crisis, the nation is facing two minorities. The negroes are a minority fighting a for equal rights under the law. And the Southern opposition to the Supreme Court's ruling is a minority. It is inherent in a true democracy that monorities are free to state their case. The maiifisto took full advantage of that right.

Some satisfaction has been expresed because the maniststo did not, as in its original draft, call the court's action "illegal and unconstitutional", though it went nearly that far. The final draft also omitted endoresment of the interposition policy, by which some states would interpose their soverign rights between the Supreme Court and their citizens.

But the manifesto also did not askfor congressional action. The floor of Congress was being used to generate political power, rather than to exercise it. The only action Congress could take, would be to amend the constituion, or to impeach the court, and a demand for either step would bet nowhere now. What the Southern members were doing, was to marshall their forces For one thing, they were giving citizens in the South who dislike integration, but like to be lawful, a respectable formula for denouncing the Supreme Court. The manifesto showed how a southerner can oppose the highest expression of law under the constitution and yet feel that he is the one supporting the highest expression of law, while the Supreme Court is against it. This must be designed to help organize the full weight of latent oppsoition in the South.

What seems to be shaping up is not congressional action - amendment of the constitution or impeachment - but an appeal to voters. The possibility now looms up of a third party movement. It would be much more formidable than the states' right revolt against President Truman in his last election. It is too early to say this is going to happen, or is even likely to happen. In the end, the decision about it should depend on what result the Southern opposition expects to get out of it. As things look now, the only sure result would be to make a Democratic defeat in November absulutely sure. Mr. Turman managed to be elected despite the loss of votes to two splinter parties, the States Righters and the Progressives. The Democratic candidate this year could not hope to do ao well.

A third party could have a sensational effect on the election. It might well prevent either major candidate from receiving an absolute majority of the electoral votes. Then, by our obsolescent system, the election would be thrown into the House of Representatives. The House would have to meet at once - that is, concurrently with the electoral college in December. It would be the present House, not the one chosen in November. And it would have to vote for the President by states, each state casting a single vote.

An overwhelming Republican victory at the polls, or in the House, would nor further the South's fight on integration. It would not open the door to legislation to nullify the Court's ruling. The Court's personnell would not be changed, nor would its judgement be affected so far as can be foreseen. The only result would be to break up the long and not always happy marraige between Northern and Southern Democrats, and that would assure the Republicans easy victories until the marraige was mended.

This being the outlook, a third party seems improbable unless the South consults its passions rather then the dictates of political prudence. Perhaps that is the way things are going. But two distinguished Southern names were absent from the manifesto - Sam Rayburn and Lyndon Johnson. They have worked zealously to prevent a party split over civil liberties. Senator Johnson now is being mentioned as possible leader of a third party, even though he didn't sign the maniststo, and States' Rights spokesmen say they much prefer him to Adlai Stevemson.

If it should develop that the only way to save the Democratic Party from a suicidal split would be to nominate Senator Johnson, the country would be in the odd position in November, of having to choose between two men, both of whom have recovered from coronary thrombosis.

This is Ed Murrow. I'll be back in a moment with the Word for Today. Now, here is Bob Hite.

HITE: COMMERCIAL

MURROW: A major issue..segregarion..is being decided by the democratic process. Plato said, "Democracy is a charming form of government, full of variety and disorder." Some conflict is inherent in democracy. For as Juscice Robert Jackson observed, "Thoughtful, bold and independent minds are essential to wise and considered self-government."

Good Night and Good Luck.

This reporter stands before family and friends of Edward Klauber, as a result of an undertaking given several years ago. It was a request casually asked, and almost laughingly agreed to, without a thought of the total absence of qualifications to honor the pledge, when it was called. On that happier day Ed Klauber said to me: "When I am finished, I want you to do something for me - just say a few words." Having lightly agreed, I realized his seriousness and inquired as to what I should say. He replied: "That's your problem." And he added: "You'll at least be brief, though not brilliant, and this will give some pleasure to those friends who may be there.

He wanted no eulogy, and I shall attempt none. He fully realized the futility of words, when friends draw together for a few tranquil moments of remembrance and respect.

Being unable to voice what is in <u>your</u> hearts, I shall try to speak of what is in <u>mine.</u>

Ed Kaluber was an intolerant man - intolerant of deceit, deception, distortion and double talk. He was also a man equipped with great curiosity, prepared and eager to pursue the truth wherever it might lead him. He was willing, and indeed determined, that the citizenry should be supplied in abundant quantity, with that most dangerous and explosive force known to mankind - knowledge. He deeply believed, that equipped with this weapon, they would in the end of the

day, consolidate and secure the position of tolerance, human dignity, due process and forbearance, the vision of which had sustained and uplifted our ancestors. Democratic processes were to him not something to be jettisoned in time of peril.

Upon one occasion this reporter was unable to finish the draft of a speech. It had to do with these very subjects wo which I have referred. I sought Ed Klauber's advice. He said: "You have it all there, in your fashion." And then he leaned back in that red leather chair, and said: "It is our heritage, and it must remain our habit."

Ed Klauber believed that: "Search for the truth is the noblest occupation of man. Its publication is a duty." He was always willing to "give to every other human being every right that he claimed for himself."

He was a great editor, always insisting that it had to be right, before it was written. He was sparing with his praise and penetrating with his criticism, sometimes satisfied with the best a reporter could do, but always expecting improvement. If there be standards of integrity, responsibility and restraint, in American radio news, Ed Klauber, more than any other man, is responsible for them. Insofar as those elements are lacking, those of us who worked for him have departed from his teachings.

He was not a doctrinaire man. He believed, I think, that a man should be held accountable for everything he said, not throughout eternity, but until facts

or events caused him to change his mind. He believed in what has been called the long, sober second look of the American people. He did not, I think, require agreement with his views as aprerequisite for friendship; and he would, I think, have stood with Thomas Moore when he said: "Shall I ask the brave soldier, who fights by my side in the cause of mankind, if our creeds agree? Shall I give up the friend I have valued and tried, if he kneel not before the same altar with me?"

I have said that Ed Klauber was an intolerant man. Someone once said: "It is easy to be tolerant when you do not care." He cared till the last. He believed that democracy was both workable and exportable. He knew that there were mysterious areas in human faith and belief, and he was prepared for them to remain mysterious. But he wanted no mystery about discernible, ascertainable facts and actions. He would, I think, have agreed with Milton, who said: "Though all the winds of doctrine were let loose, to play upon the earth, so truth be in the field, we do ingloriously by licensing and prohibiting, to misdoubt her strength. Let her and falsehood grapple who ever knew truth put to the worst, in a free and open encounter." He believed that the greatest friend of truth is time. Her greatest enemy is prejudice." And the greatest weapon against prejudice is knowledge and yet more knowledge. He knew of no alternative.

I do not know whether he believed in the essential goodness or badness of man, but I do know that he believed passionately that the communication of information, unslanted, untarnished and undistorted, was the only means by which mankind would progress. He knew that just because injustice, indignity and inhumanity was not happening to him - he knew that it was still happening. He was capable of feeling the suffering of others, capable, too, of great confidence in a future that often appeared to him both dim and dismal.

His confidence and friendship were not easily won, and once given were not lightly withdrawn. I do not know that he loved his fellow men, but he trusted them collectively.

It would be presumptuous of any reporter to attempt to express what an old and well-beloved friend believed. But I do know that last year - ill, tired and thoughtful - Ed Klauber cut out of a newspaper and kept, these lines written by Wallace Stegner:

"In all honesty, what I believe is neither inspirational nor evangelical. Passionate faith I am suspicious of, because it hangs witches and heretics, and generally I am more in sympathy with the witches and heretics, than with the sectarians who hang and burn them. I fear immoderate zeal, Christian, Moslem, Communist, or whatever, because it restricts the range of human understanding,

and the wise reconciliation of human differences, and creates an Orthodoxy with a sword in its hand.

"I cannot say that I am even a sound Christian, though the code of conduct to which I subscribe, was preached more eloquently by Jesus Christ than by any other. About God I simply do not know; I don't think I can know.

"However far I have missed achieving it, I know that moderation is one of the virtues I most believe in. But I believe as well, in a whole catalogue of Christian and classical virtues; in kindness and generosity, in steadfastness and courage and must else. I believe further that good depends not on things, but on the use we make of things. Everything potent, from human love to atomic energy, is dangerous; it produces ill about as readily as good; it becomes good only through the control, the discipline, the wisdom with which we use it. Must of this control is social, a thing which laws and institutions and uniforms enforce, but much of it must be personal and I do not see how we can evade the obligation to take full responsibility for what we individually do. Our reward for self-control, and the acceptance of private responsibility, is not necessarily money or power. Self-respect and the respect of others are quite enough.

"All this is to say, that I believe in conscience, not as something implanted by divine act, but as something learned from infancy, from the tradition and society which have bred us. The outward forms of virtue will vary greatly from

nation to nation; a Chinese scholar of the old school, or an Indian raised on the Vedas, has a conscience that will differ from mine. But in the essential outlines of what constitutes human decency, we vary amazingly little. The Chinese and the Indian know as well as I do, what kindness it, what generosity is, what fortitude is. They can define justice quite as accurately. It is only when they and I are blinded, by tribal and denominational narrowness, that we insist upon our differences, and can recognize goodness only in the robes of our own crowd."

I have attempted no words to describe our collective sense of sorrow, nor our sympathy for the members of Edward Klauber's family, because I do not command such words. And even if I did, they would be altogether superfluous. Those of us who worked for him, and with him, will remain in his debt. We are beholden for what he taught us, for he lived a life and not an apology.

Klauber, Ed

EDWARD R. MURROW

November 28, 1952

Dear Ted:

I hear tell that there is some thought being given to a special Peabody Award for Ed Klauber. This would be very good news indeed if your committee decides to do it. There has never been anybody associated with radio news who made a greater, and less recognized, contribution to such standards and policies as radio news may have. Klauber was a tough-minded guy of great integrity. I know, because I fought with him for years and came out of it with respect, admiration and deep affection for him.

I am not unappreciative of the Peabody Awards I have received - indeed they are about the only ones that I value, but I would gladly have them all melted down and handed to Ed Klauber in a lump for he is more deserving than I ever was.

As ever yours,

Mr. Edward Weeks

November 20, 1952

Dear Paul:

Taking up the subject of our recent conversation about Ed Klauber:

In doing some consulting work in the television field, I have been both surprised and pleased at the extent of the recognition among radio news veterans of the pioneering work done by Ed Klauber. Among first-rate newsmen on all networks I have repeatedly run into such comments as: "Whatever integrity radio news has is due in large part to the early efforts of Ed Klauber;" or "Radio's handling of news would probably not be half as good today if it were not for the pioneering work of Ed Klauber."

I believe some belated industry-wide recognition is due Ed. Although I have not seen him for several months, I know it would mean much to him and would probably actually add to his life.

Since talking with you, I have talked with Ed Murrow, Jap Gude, Jim Fleming, and a couple of others. All are most enthusiastic about the project for seeking a special Peabody Award for him. Ed Murrow, for example, said he would be glad to write a strong letter to Ted Weeks or whoever is the appropriate person. I feel confident that Elmer Davis would be happy to do so also.

The proposal, of course, is that the Peabody Jury simply create a special one-time award for the purpose.

I called you originally, of course, because you are a member of the Peabody Committee. How do you suggest we proceed from here?

Sincerely yours,

cmb/fmb

P. S. I need not add that obviously none of us should mention this to Ed.

Klauber, Ed.

December 19, 1945

Dear Ed:

I have read the document and am much impressed. It is a powerfully persuasive presentation. You have plowed a straight furrow, but I have the feeling somehow that it is a little too deep and wide.

My only experience with the presentation of such projects was when I was associated with Foundation work, so my comment may be without validity. However, for what it's worth, it seems to me that you have presented such a variety of activities that a prospective backer may be in some danger of concluding that you propose to spread yourself too thin. It seems to me that the presentation would be strengthened if you could establish, perhaps somewhere near the end of the document, a list of priorities, indicating especially those that could reasonably be expected to yield results in the course of the first year or two of operation.

The only other thing I want to say is that I am more than ~~half~~ persuaded of the value and, indeed, the urgency of undertaking such activity.

Sincerely yours,

Mr. Edward Klauber

FINAL
HOME EDITION

Dear Ed,

Hurrah for your mention of a national information institute. This is in keeping with the subjects we discussed on At Random the other day.

If I can be of any assistance in pushing for this one, please let me know.

And, again, my thanks for your cooperation the other day, even tho the "moment of silence" threw me for a few seconds.

Warmest,

Kup

Kup

This is a proposal for the creation of a privately financed National Information Institute.

Its purpose would be to better the whole pattern of information in America.

It would be an organization staffed by men experienced in public affairs, journalism, probably the law, and certainly the appropriate social sciences. They would devote themselves continuously for an experimental period of seven years to independent measurement, study, exploration, experimentation and public education in the methods used and the results obtained by the principal media of mass communication of information.

Thus, this institute would be the only organized and independent body in the entire world wholly devoted to continuous study and examination, solely in the public interest, of the methods and the results of written and spoken journalism, including discussion on the air and news on the screen.

In the period of its experimental life it would be continuously gaining skill and experience. It would

develop expertness in techniques and procedures, and gradually acquire authority and standing which would give it a growing influence for good. It would therefore be enabled year by year to make larger and larger contributions to the public welfare. Steps toward converting it into a permanent institution would be taken when it had proved its value.

Vast sums are devoted by foundations and individual philanthropists to education and to many other worthy social causes. Yet the immediate day-to-day impact on men's minds of the radio, the press, the movies and the magazines is of at least equal importance in the critical years now upon us. The information field as one for independent research, study, analysis and public education has been unbelievably neglected. Endowment has tended to follow conventional grooves rather than to create new cultural undertakings. The situation is made worse because the media themselves--as opposed to the industries which affect men's bodies rather than their minds, which spend vast sums on research--spend very little and that little far from disinterestedly.

PURPOSES

The institute would have four main purposes:

(1) To encourage and help to bring about improvement in the purveying of information, discussion and argument by existing publications both written and oral. It would do this in two principal ways. One is by making the public more and more aware of what it wants and needs, thus creating consumer demand which is bound to react on all the information disseminating industries. The other is by finding out and helping others to find out by experimental methods what the public wants and needs, what helps it and what hurts it and what economically feasible methods can be developed to serve it better.

(2) To create a more favorable climate in the form of readier public acceptance and reward for all those now controlling or managing oral or written publishing enterprises who want to do a better public service job in the information field and for all who wish to come into the field with high ideals and high purposes.

(3) To analyze and publicize threats to the public welfare that take the form of assaults on freedom of the press, including all efforts or factors tending to hamper or limit the purveying o information to the American people such as legislative, regulatory or economic factors and efforts at censorship or suppression by individuals or organized groups.

(4) To make ever larger numbers of the public more and more proof against bad news handling, bad editorials or poor arguments by teaching people to weigh and judge for themselves in reading listening and looking and to detect at least the more obvious devices of inadequacy, unfairness or intellectual dishonesty.

The institute would be modern in its methods so as to serve effectively in these times of swift change. Its techniques would be as nearly scientific as qualified experts can possibly make them in a field which to some degree is always subjective. Its spirit would be wholly

scientific since it would seek to make no preconceived notions of its own prevail and since it would publish its results whether it or anyone else liked them or not.

To sound techniques, acceptable to reasonable men of science, would be wedded lively, interesting, forthright and ingenious promulgation of its work and of other pertinent work in the field. Information about information would be made news. And the widest possible public interest in information would be stimulated so that there would be increasing discussion of all problems and points of view. Thus specially interested groups and the public as a whole would become more and more aware of what it needs, when it gets it, when it does not, and why.

WHY THIS INSTITUTE IS NEEDED

There are three main reasons why such an institute should be created as speedily as possible and armed with enough funds so that it can do an effective job in a modern world.

First, the faith on which our democracy is founded--and on which great numbers of thoughtful persons think it must always be founded--is this: There can be no real, lasting and improving democracy unless the people understand the basic political, social and economic issues upon which their welfare depends. Understanding, the people can

intelligently exercise their voting right and exert the force of public opinion. Thus they can choose and change their Government and affect its actios, as well as the actions and influences of large organized groups, to the end that the public welfare is served.

If a deceived or a confused public is betrayed into creating or allowing to be created an America in which it loses faith, democracy will not survive. Neither will it survive if the combined effect of all the skilled and the unskilled, the selfish, unselfish and in-between efforts to inform people, to enlighten them and to argue with them finally convince them that the nation's problems are beyond their grasp. If the people finally come to believe either that they cannot grasp and cope with America's problems or that those who inform, those who argue and those who act are inept or malign or both, then distrust, dissatisfaction, fear and laziness can combine to turn them in desperation to that "strong man" who can take them only to destruction.

There are many faint-hearted students of the American scene who believe that our form of government, at least to the degree that free private enterprise is a major element in our present structure, cannot survive another severe economic collapse. The more the pattern of

information contrives to be confused, distorted and manipulated, the more likely are these prophets to be right, because cynicism, distrust and despair will be added to the physical sufferings and the fears of the population.

Furthermore, there obviously are many penalties short of the extreme one that the nation pays and will continue to pay for an information job that is less adequate for modern needs than it could be.

Second, improvement today is slow, sporadic, haphazard and far too dependent on the character and purposes of a few men and far too much at the mercy of a few others. And by no means is all change in this field improvement, nor are all competitive pulls upward.

Third, this is peculiarly a field in which Government can do little and ought to do less. This is true because freedom of the press must be preserved at all costs, and every time Government steps in or tries to step in, it destroys or threatens to destroy the very thing it is trying to preserve in the interest of the public. (1)

---

(1) - In such fields as patent medicine advertising, lotteries, obscenity and things of that sort, the FCC and its predecessor Commission have regulated with some success. The same cannot be said about the program field generally or the field of news, and discussion in particular. It is also true that to the extent that the Commission has succeeded it has too often done so by the undemocratic, extra-legal and dangerous method of the nod or the frown. Moreover, even if it were possible to devise a satisfactory system of regulation (and no one has yet) two factors in the near future would militate against

In virtually every other field intimately and importantly touching human lives, there is one type of regulation and often several. We have Federal, State and City departments of health. We have the Interstate Commerce Commission and State public utility bodies. We have Better Business Bureaus and Pure Food and Drug Acts.

None of these things and nothing like them is safely and properly applicable to the information field.

---

such regulation. One of these is the multiplication of channels which will come with frequency modulation broadcasting. It is obvious that the more channels there are, the more does broadcasting become like newspaper publishing in the sense that there is no adequate reason for the Government to regulate it except for policing the physical traffic. The other factor is the vast increase there undoubtedly will be, judging by the applications for FM licenses, in publisher-ownership of broadcasting stations as FM becomes fully operative. The publisher interest already is great and when it becomes something like dominant, or very nearly dominant, hope for radio improvement through any act of the Congress will virtually disappear. This is true because Congress looks upon broadcast proprietors as lucky people who have become easily and quickly rich through its own largesse and knows that with their relative lack of editorial pages they are without political influence. Congress, on the other hand, gives very great consideration to newspaper publishers and their interests. In addition, new technical developments in broadcasting may some day make the number of possible radio stations virtually unlimited. Regulation under these circumstances, except regulation against lotteries, obscenity and such, would either be expunged or become a dead letter. Before this happens the public should learn vastly more than it knows today about how to listen and what to expect in the way of information, analysis and discussion because only the public will then be in position to see that this incalculably important instrument actually serves the public interest in the field which is all the writer is here concerned with.

The result has been that the operators in this field have been by and large the principal spokesmen about it and, to far too great a degree, their own judges. Because of the lack of other voices speaking loudly, consistently, accurately and in the public interest, publishers have been less affected than the operators of most other industries either by the intervention of Government or by the demands of a public properly aware of its rights and its needs.

This absence of adequate and informed public opinion is particularly dangerous in this field because it is a field in which the public cannot spontaneously educate itself, as it can to a great degree in the field of commodities. There probably are ten men or maybe a hundred who can tell what is a good automobile or a good suit of clothes to one who can tell what is a good information service.

There are two main fields in which this institute could be a highly useful public servant. One is the general field of disinterested study, experiment and education already described. The other lies in those situations where the Congress, the courts, some such commission as the F.C.C., or the Administration itself is considering a broad public question of information. There exists no

trained, competent and disinterested body to ascertain facts and let them be known in the public interest in such recent or current situations as:

> The radical alteration of the whole structure of broadcasting by the F.C.C. with its so-called network rules.
>
> Proposed changes in the basic radio law.
>
> The assault on the motion picture industry by a group of Senators not long before the war started.
>
> Currently proposed legislation regulating commentators and analysts on the air.
>
> The current question of the whole program of information about America for the rest of the world.

In such situations interested voices create a loud clamor and are not likely to be objective, fair and disinterested. Even when they are right, they are so suspect of self-interest that they are often ineffective. It is true that in a given situation which is important enough, some sort of public commission can be created But this is seldom done, and even when it is, men so acting must divide their time between their own interests and the public job. Besides, they lack the <u>independence</u>, expertness and experience that such jobs require, and which only a permanent institute could develop. The institute would always be able and ready to step into any given stituation on the side of the publisher or the public, or both, with facts and indications as to where the public interest most nearly lay.

Such intervention with fact-finding studies and analytical summaries of arguments in debatable information questions in which Government either is a party to the argument or needs trained, honest and public-spirited information specialists to illuminate for it, would be only one line of activity, and that an occasional one.

There are these main questions to answer about the institute's more general activities: What would it do? How would it do it? How would it create public awareness of its activities? How would it be organized? And what would it cost?

The answers here submitted are the fruit of a year's maturing of this project and discussion of it with a few competent persons able to approach it from angles differing from the proposer's own. They are submitted with full recognition that they can be fruitfully modified and improved by the contributions of other minds.(1)

---

(1) - There is now in existence a temporary commission for a two-year study of freedom of the press set up by the University of Chicago with funds supplied by Henry R. Luce. Its members were chosen for general public standing and divergence of points of view, and appointed on a part-time basis. All persons having either professional experience in journalism or financial interest in any of the media were excluded. Except for its public announcements, the writer is not authoritatively informed as to its precise scope or the methods it has pursued. It is expected to make its report in six or seven months. That report should be closely studied for leads it may uncover, competence manifested by members of its staff, and light it may possibly throw on useful methodologies and procedures.

THE FIELD TO WORK IN

The principal media sources from which the public derives information, in the broad sense in which the word is used throughout this presentation, are these:

The daily and Sunday newspaper--headlines, news, pictures, articles, editorials, cartoons, comic strips, and so forth.

The radio (and soon television)--news, comment, analysis, forums and debates, and speakers.

The motion picture--newsreels, documentaries and shorts of a news-giving or opinion-forming nature.

The weekly newsmagazine--news, analysis, opinion (both openly expressed and disguised as news).

Publications carrying news articles with or without overt editorial opinion, such as Reader's Digest, Saturday Evening Post, Collier's, Atlantic Monthly and Harper's.

The labor press.

The weekly or country newspaper.

The farm press.

The Liberal press-The Nation, The New Republic, and such newspapers as PM and the Chicago Sun which stand in a category that differs radically from the conventional press.

The extreme left-wing press-the Daily Worker and such.

The special interest magazine, circular or bulletin ranging all the way from the organs of fraternal orders through journals of special pleading for various economic, social and political points of view, including both valid and phoney research.

Privately and limitedly circulated utterances in behalf of special interests.

The nego press.

The foreign language press.

The religious press.

Trade journals.

Educational and scientific journals.

With the foregoing elements in mind, there follows an exposition of the kind of work the institute would do. Some of its activities would be continuous, whereas others would be completed within a given year or even less.

The projects fall into two main groups: research and experimental. The first category further divides into two sub-groups: first, those which involve study of the media themselves, with a view to determining whether they could be improved and how they could be assisted; and second, those directed at the reader and the listener, with a view to finding out how he gets information, how it impresses him, whether he gets what he wants, whether he realizes its importance to him and how far he can be helped and educated information-wise.

MEDIA PROJECTS

To take first those research projects which are concerned with the media:

The principal continuing project or series of projects would be studies of fairness and unfairness, slanting, distortion, suppression accuracy and adequacy of news and the disguising of opinion as news. This is the most difficult of all and the most important. It can be done and it needs to be done. It would involve both broad analytical surveys of total content and research into the treatment of particular kinds of news or specific news items. The last-mentioned kind of research would in turn involve two things: a study of the actual news available on a given topic--its accessibility and the way it is handled by the press associations, by the radio and by the press. This type of study could be applied to a given newspaper or a given magazine, a particular city or a scientifically selected sample of newspapers, radio stations, or both. It would entail first of all examination of the facts originally available and the the additional facts that would have been available through the reasonable use of the normal resources of the press association, the newspaper, the magazine or the broadcaster.

Next would come examination of headlines, position text, length, substitution of opinion for fact, omission of fact, lifting of fact or statement out of context. Other factors to be studied would include general

layouts with regard to relative space and emphasis given to component elements of the story, introduction and interpolation unjustified by facts used and statements quoted or by facts and statements available but omitted in whole or in part. Still others would be use of labelling words unjustified by the context or available material, interjection of unmistakable editorial bias in other identifiable ways, broad general statements that the reporter could not possibly know to be true or about which he could not have informed himself in time to justify his assertions, use of source phrases which the reader cannot possibly assay as a means of making the editor's or broadcaster's opinion seem to emanate from other mouths, and use of follow-up stories in support or rebuttal.

Another way to study slanting of news in appropriate instances would be to show how many different ways the same story had been handled by different newspapers. This would help to make the reader strikingly aware that the same sets of facts or circumstances or the same utterance frequently is offered to him dressed up according to the political or other editorial bias of the offering newspaper.

Still another way would be to prepare an "upside down" pamphlet in which it was shown how a whole series of

"editorial" or crusading stories can be presented from a completely opposite angle by one possessing the original material and the skill, thus helping to teach the reader to "beware!".

Here are a few notable instances of the kind of story which could be so studied:

(a) Stories favorable or unfavorable to the Administration. Research could determine whether there are discernibly important differences in the way a given story is handled in Democratic newspapers, in Republican newspapers, and in independent newspapers and to what extent.

(b) Labor news in general or news about a labor-management situation at a particular period such as the current strikes, negotiations and threatened strikes. Are both sides presented fairly according to criteria which can easily be set up and applied as a yardstick against the facts, statements and ancillary discussion available? Are the economics of both sides fairly presented to the extent available? Is there pyramiding, which magnifies the extent of labor troubles? Do facts or utterances favorable to one side get the same play in the general layout that is given to similar material

favorable to the other? Is there deliberate identification of the public's interest with that of one side rather than the other? Are guilt and responsibility steadily ascribed to one side rather than the other in news stories?

(c) Study and analysis such as the foregoing about economic news--taxes, trade, tariff and the like.

(d) Unfavorable news about corporations. Does it get the same play and the same prolonged follow-up as does news unfavorable to other group interests? Is there discernible difference, due to identification by the publisher of his own interest with the interests of other businesses, or for any other reason, between the treatment accorded to corporate elements and to other groups? On the other hand, are there large groups of publications which magnify newswise the sins of capital and belittle or belie those of other interests?

(e) Fact-finding study and analysis throughout a political campaign of how the news is handled in the press, in the magazines and on the air, with announcements of the results during the campaign if practicable, afterwards if not. Are the commentators and analysts on any network editorializing in favor

of one side? If so are they balanced by others favoring the opposite side? Are newspapers printing both sides fairly or are they favoring one or the other in their news columns? If so, how are they doing it? By the leads on their political stories? By labelling the utterances of one candidate as "sincere", "honest", heartfelt" or "frank" in news stories, when they can't possibly know his feelings or motives? By smear words which make it difficult for the reader to form his own opinion? By the omission of obviously available facts? By flooding the paper with supplementary crusading stories all on one side? By playing the political utterances of one party chairman and neglecting the other? By the technique of "damn you, reader, don't you dare to think what you want to think about this, you be sure to see what our Mr. So-and-So says on page so-and-so"? Are the press associations fair? Are they unfair, either quantitatively or qualitatively in ways that can be identified and demonstrated? Were there any discoverable differences between the way the Associated Press handled political news before and after the Federal anti-trust suit was brought against it? Do newspapers or press associations feature endorsements of one candidate and not

of the other by persons of the same relative importance? Are there cities or regions where the reader, the listener, or both, do not have adequate, two-sided information as a basis for deciding how to vote? Do the papers print fair reports of debates? Are there changes in make-up. headlines or context between editions indicating deliberate purpose to weight the news? This of course does not exhaust the list of readily detectible devices of unfairness. Positive proof of unfairness if it exists is something the reader is entitled to and something that would make news.

(f) A series of searching studies of editorial pages. Do the attitudes reflected on them palpably and demonstrably affect the handling of the news? Is there a high degree of intellectual honesty in their arguments? Or do they deliberately cheat the reader's mind, taking advantage of his lack of either a memory or a reference library? Are they consistent or inconsistent over a period of time? Do they reflect the immediate econonomic interests, habits and social predilections of the publishers rather than those of the mass of readers, particularly with regard to labor, taxes, and so on? To what degree do editorials reflect the opinions of those

who write them? Is the selection of editorial page letters fair and balanced? (Editorial pages are further treated under projects concerned with the reader.)

Another important series of projects concerned with media themselves has to do with existing conditions which affect the gathering, editing and publishing of news. These would include:

(a) A study of the finances and economics of the press with a view to finding out, for example, whether the public ought to pay more for newspapers in order to get better ones. It might be found that advertising revenue was insufficient in some localities or too preponderant in others, or that total revenue did not permit the production of an adequate newspaper at a reasonable profit.

(b) A study of the financial picture of the reporter and the editor. Are union conditions now satisfactory, or could they be improved to the benefit of the employer, the employee and the public? Would it be economically worthwhile for men to be longer and better trained?

(c) Studies of sources and availability of

news. These would divide into official sources and unofficial sources. To what degree is news about municipalities, states and the Federal Government available? To what degree is such news suppressed? Should there be a Federal fact-finding service supported by the taxpayer rather than groups of Administration and bureau head "information specialists", as at present? Are these specialists today truly informers of the people or are they largely press agents for their bosses? Could a Federal service be set up so that it would be incorruptible and independent? Would it serve to make news more readily accessible to the press and the radio, to the publisher's benefit and the public's, or would it soon be corrupted to super-press agentry and make things worse?

A study of the State Department's information work--at home now and abroad as soon as the new set-up has had a chance to function--would uncover facts of value to all interested in information and serve as an index to whether present methods are adequate or whether they could be improved.

Similarly there would be examination of availability, accuracy and adequacy of news emanating from some of the main unofficial or semi-official news sources.

(d) A study of the actual gathering and editing of the news in a given newspaper, press association, broadcasting station or network, or magazine. Take a given story and find out what instructions were issued to reporters and correspondents, what was received, how much it was changed and how and why, and what was left out. If no gatherer or disseminator of news would permit an honest and disinterested study along these lines, at least the public would be made aware that the whole process of gathering and editing news was a secret process.

Other projects of primary importance aimed at affecting the quality of the media themselves would include such things as:

(a) A complete and searching study, from both theoretical and practical standpoints, of our schools of journalism. What do they teach? How do they teach it? To what extent do they do original work? To what extent are they an influence in the various information fields? What has been the practical result in terms of the activities of their graduates? Are they trade schools dependent upon the media for employment

of their graduates to such a degree that they dare not be a substantial voice on the side of good journalism? If so, can they be made more useful and how? Should the term of professional training be extended? Would a group of publishers or other employers cooperate in the experiment of higher pay for better trained men over a period sufficiently long to determine whether longer training would be financially profitable to the employers and to working journalists as well as of benefit to the public?

(b) A study of journalistic ethics. Is there an unwritten code? Are there written ones? How many men are conscious of and guided by such a code? How many newspapers and how many broadcasters have formulated one? Do the press associations have one? Should they? Are such codes lived up to? If not, could they be? Publishers, news and editorial management, personnel and working journalists could all undoubtedly be set to thinking and made more keenly aware of their obligations, responsibilities, duties and opportunities. Such a study might well be carried to the point where it aroused widespread interest. Then

a mixed panel of professionally interested and disinterested persons could be set up to promulgate something like a model code. This would further stimulate public awareness and heighten the effect upon publishers and those who work for them.

(c) A series of studies relating to radio in the information field, such as: (1) Are radio speeches censored beyond elimination of libel, slander and defamation? (2) Does sponsorship unduly affect idea content or news handling? If so, do unsponsored presentations balance the picture? (3) Five-minute and fifteen-minute news broadcasts--do they cover the news? Do they successfully inform or do they only hit the highlights and lead the listener to a mistaken belief that he is informed when he isn't? Does the public adequately fill in from other sources or do people rely too much on radio news? Would longer units of news time be more or less desirable and why? What areas of news are left uncovered on the radio? (4) The opionated commentator, the news analyst, the straight news broadcaster--which is the more effective and why? (5) The whole field of discussion on the air--how it is handled, whether it

is commensurate with demand, or whether those who shout for more represent only small minorities whose desires are already sufficiently considered.

(d) A broad general study of newspapers on a regional basis. Are there parts of the country which are well served and others that are ill served? Parts where there is little special correspondence and the stereotypes of one or two press associations furnish all the news of the rest of the world? How many newspapers throughout the country are balanced in content, in terms of the things people need to know in their own self-interest and in the interest of the country? What news do the people in, say, Denver get in comparison to what New Yorkers get? Do they get what they want? Do they get what they need? If parts of the country have deficient service, is the lack general, is it in the South, the Middle West, on the Coast? To what extent do people served by scanty newspapers in small communities resort to reading metropolitan newspapers as well? What parts of the people, in terms of income groups or literacy groups, rely wholly on the press or wholly on the radio? How many read

weeklies, too? Would cheaper press rates result in greater individuality and diversification in news presentation? If they are needed, how could they be obtained for both press and radio while avoiding the inherent danger of government subsidy of the media? Are there other economic obstacles to adequate information for the whole nation (if inadequacy is found to exist) which could be overcome, and how?

(e) A study of the special departments of newspapers. Are financial pages and some other departments made up to any important degree of free reading notices with ads" thinly disguised, or do such departments actually strive to serve the public How about real estate pages or columns? Are there important news areas of this kind in which the press serves the industries involved (and those on a rather mathematical basis in proportion to the advertising[1]) instead of serving the public?

(f) A group of studies on the techniques

---

1 - It is not proposed that the institute concern itself with truth or taste in advertising. If it dealt at all in this field it should confine itself to broad studies of the social implications of certain types of advertising and with the current tendency to shift the argument of controversial public questions to the advertising columns.

of persuading and convincing. Not enough is known about how to change people's minds, particularly in the face of emotional blocks due to cultural backgrounds and other obscure factors. And probably even less is known about practical methods of applying the knowledge that does exist. To illustrate, it may well be that both conservatives and liberals are far more adept at pleasing disciples than they are at making converts. The result may be that both sides leave the open-minded seekers after truth puzzled and offended--the conservatives by mistakenly identifying their own interests and emotional biases with those of the masses; the liberals by believing that the righteousness of their purposes justifies them in doing violence to men's minds even while they are arguing for the sanctity of the individual. Much might be learned and then applied in two ways--actual improvement of present techniques for adults, and experimental educational efforts directed at the young and designed to keep them open-minded and receptive.

Case studies in the effect on selected groups of different manners of presenting material should

furnish valuable guides for all who seek to inform and persuade others. Some of these studies would be objective studies of the effect on persons of present methods; others would explore the effectiveness of different types of exposition, argument and persuasion. The startling growth in literacy in America betwen the two world wars and the vary marked increase in literate persons that is projected for the next ten years may well be found on exploration to have made new methods of argument and persuasion timely and serviceable. This is particularly true if there is found to be a vast and growing array of persons more eager to know what is right than who is right.

(g) An elaborate and exhaustive study of the laws of libel, slander and defamation in America and how they actually work. This study would be devoted to finding out whether the facts indicate that there should be a national law; whether state statutes should be strengthened or made more uniform; whether in practice the libel laws are a deterrent to any injured person getting redress; whether they could and should be strengthened, or whether the price of strengthening would be dangerously to inhibit the press and the radio; whether British practices are better or worse from the standpoint of the public interest, and whether th

differences lie in the laws, their interpretation or the defences built up by the publications themselves; whether there exists something like a conspiracy of silence on libel suits; whether or not libel, slander and defamation statutues should protect groups as well as individuals; and so on.

The importance of such a study seems manifest. It is one thing to believe in freedom of the press, and another to believe in license-- one thing to believe that a thing is priceless and another to believe that therefore a needlessly high price should be paid for it. Character assassination can become a sort of free enterprise in which the individual victim throws up his hands either beaten or intimidated. Conditions can grow up under which persons of sensibilities do not dare engage in public activities or do so at too great peril. And the whole labelling and smearing technique can tend more and more to inhibit unemotional appraisal of either ideas or acts. It is one thing to expose a villain; it is another to breed cynicism and distrust in the public by seeking to destroy every opponent with an epithet.

WORK WITH READERS AND LISTENERS

These research projects comprise a sampling of the kind of work that should be done to stimulate the media, with the hope of arousing interest among journalists, publishers and broadcasters in doing a more accurate, fair and disinterested job. These efforts, however, must be supplemented by others, designed to find out what makes the reader and the listener tick as they do, and what could be done to stimulate in them an interest in and demand for the kind of journalism which is their right. Many of the faults and deficiencies of the information picture of today are the faults and deficiencies of the reader and the listener who, if they demanded better information, published in their own interest, would probably get it.

A second series of research projects, therefore, should include such studies as these, with properly selected segments of the public serving as guinea pigs:

(1) Research into the public's attitude toward news and toward the various media. Does it believe everything it reads? Does it discriminate? Does it read mostly for entertainment and excitement and

therefore with relative indifference to accuracy and fairness? If it distrusts the news does it have any fairly well-formed reasons that could be dealt with? Can the public be taught by the use of simple guides to discriminate? Are newspapers generally what it wants or does it simply read them because they are the only ones available?

(2) Psychological studies as to how the emotional attitude of the informer affects what is offered, and how the emotional attitude of the informee affects how he receives it. For instance, can anything be gained by making either the producer, the consumer, or both, aware of emotional biases? Are there other practical ways, discoverable by psychological research, to overcome the effects of neurotic or psychotic attitudes on the part of those who make news, those who publish it and those who receive it?

(3) (a) Study of readers and the editorial page. How many readers read it? Have they any discrimination? Are their minds changed? Do they have any awareness of the paper's editorial attitude when they read its news columns and particularly its special stories? Do they discount accordingly, if they do have? To what degree do readers of various classes

detect misstatements about recent or current news when embodied in editorials?

(b) What has been the effect of columnists? Do they weaken the editorial page or strengthen it? Have they led the reader to believe that the paper doesn't get the inside news, but the columnist does? Do they lead to confusion or clarity? Do they affect public opinion?

(4) Exposition through careful studies of the actual effects on the public of topics covered in the news. This would be a long-time effort to make the individual aware of how selfishly interested he is in the news and thus to make him read good newspapers, demand better ones and listen to the radio with similar discrimination; and to try to convince him that the press should not be a form of titillation and entertainment. He should be taught, to the extent possible, not to choose his newspaper for its sports, comic pages and other features. He should be shown that news is the very stuff of life to him and that therefore he should do some work at it not only because as a good citizen he has a duty, but also because he is directly concerned in and affected by discussion, decision and action in social, economic, political and other

fields.

(5) A whole group of studies would be made and a continual educational effort would be maintained to induce the public to regard news the way generals regard military intelligence and the way industry regards market research. People can least afford to be deceived about the things in which they are most vitally interested. Yet vast numbers of them in all economic and social classes gulp down great draughts of pleasing pap and allow themselves to be kidded and deceived. Thus their interests suffer incalculable harm, particularly in the form of sudden and over-drastic political or regulatory action. Much of this harm often could have been avoided, and reconciliation of opposing interests often could have occurred had there been ample, open-minded recognition of the facts of life and the state of public opinion. This is true for many in each special interest group-capitalists and industrialists, labor, politicians, liberals and for all others to whom information is an agreeable mixture of hops and soothing syrup--until they come out of their euphoria just too late.

The foregoing projects are intended to indicate the

scope and variety of work to be undertaken. These and all others would be conducted by skilled and trained social scientists and other professionally qualified persons. No attempt is made here to describe methodologies exhaustively. Suitable techniques would be developed and tested for each project.

EXPERIMENTAL PROJECTS

There is another whole group of projects which the institute could undertake, with profit to the public in general, and to the purveyors of information in particular. These are experimental, cooperative and creative projects which are not undertaken by private interests because they involve too much risk or because they lack the stimulus to try them. Here are examples:

(1) The institute would conduct or supervise controlled experiments, with selected newspapers or radio stations willing to cooperate, in ways of presenting news or argument. The journals might be newspapers of general circulation or they might be school or college newspapers. In conjunction with this and similar projects the necessary research would be done among the readers, and control groups would be

established to determine both the informative effect on the reader and the acceptability to him of the methods.

(2) It would finance and conduct experiments in oral and written publications in appropriate instances when the publisher or broadcaster was willing but could not afford to test radical changes. A small newspaper that was losing money and was willing to try a radically different type of news presentation would be an ideal vehicle for such experiments. Such a newspaper probably would be willing to experiment if the experiment were underwritten and if skill, experience and ingenuity were made available to it for the proving period. A small radio station would be another. A newspaper with organized instead of haphazard news presentation would be one type of such an experiment. One with only label headlines such as "The Pearl Harbor Inquiry" would be another. It might, for instance, thus be ascertained that exaggerated importance is given to speed and that a newspaper which resisted the competitive urge to go off half-cocked, that would cease the prophesying type of "dope" story and let many news stories await complete denouement before it printed them would

have wide public acceptance. Various Elements of a theoretically "ideal" newspaper could be combined in such experimental publications. Whether reader time would be saved, reader confidence gained, and the degree of reasonably accurate information possessed by the reader would rise, no one knows--yet. Efforts to change reader habits by experiment to which the reader was made a conscious party with full understanding of what was being tried on him and why, might well yield a mine of valuable information for both publishers and the public.

(3) The institute could work with a newspaper willing to try substituting a fair, intelligent and sprightly general opinion page for an editorial page devoted to propagating its own views. The very fact that a newspaper was trying this in conjunction with the National Information Institute and that the institute was doing research among the paper's readers as to the acceptability and the effectiveness of that type of page would arouse widespread interest in the community, be a fine promotion stunt for the paper and quite probably get nationwide attention, at least among professionals and social leaders.

(4) A series of experiments should be conducted in cooperation with suitable persons or organizations willing to work with the institute to see what could be done in certain specialized types of writing. The best example and the most glaring need for improveent lies perhaps in the field of economic writing. Any one who reads knows that a better job could be done than is done today. Other methods should be tried and tests made both of reader acceptance and of results. The same thing is true of writing in at least two other fields, namely, education and medicine. Popular writing on medicine, particularly in the psychological field, is needful of scrutiny and study. Similar cooperative experiments could be well and fruitfully tried in connection with broadcasting.

(5) Another primary project would be to take the lead in creating, or in helping to create, a text book or a series of standard text books on journalism. These would be designed to improve technical standards and methods of gathering, editing and presenting news. At the same time they would contrive to make both students and teachers more aware of the obligations of their profession and their duty to their communities.

PUBLICITY AND EDUCATION

All of these projects--research projects aimed at improving the media, research projects aimed at helping the public, and experimental, cooperative and creative project--must finally be made to come alive. Therefore there must be continuous and intensive publicity and educational output. There follows an outline of resources and methods:

(1) The institute would publish a journal of information. The principal contents would be the results of its own work, supplemented by reports of all other useful work in the same field. Whether it would be a quarterly or a monthly would depend on the amount of sound and interesting material available. It would be as widely circulated as it own funds or reader interest and support would make possible. Every effort would be made to reach ownership, management, working news men, editorial writers, publicists, analysts and commentators, faculties and students of schools of journalism, teachers, educators, social scientists, parent-teacher associations, women's clubs, church groups and many other group leaders, as well as just as many of the general public as possible.

(2) It would issue press releases on its work.

(3) It would supply articles and material for articles and get them placed as widely as possible.

(4) It would enlist the cooperation in publicising its work of every suitable kind of professional journal.

(5) It would supply speakers for meetings of appropriate and interested groups.

(6) It would discuss on the air and induce others to discuss phases of its work which are of broad general interest.

(7) It would create or try to induce others to create appropriate motion picture shorts for general presentation or presentation to interested groups.

(8) It would maintain liaison through properly selected personnel with organizations of publishers, journalists and broadcasters to build up interest in its work and confidence in its integrity. It would maintain similar liaison with educational institutions, research organizations, public libraries and with authors and speakers who might find its product or any phase of the general subject of information suitable for oral or written discourse.

(9) It would publish pamphlets. Some would be addressed to specially interested professional groups. Others would be aimed at the general public in varying income groups and age levels.

(10) It would endeavor to have pamphlets suitable for such use widely circulated by various organizations, either inducing them to do so at their own expense or, if necessary, supplying reprints at cost.

(11) It would endeavor to interest primary schools, high schools and colleges in teaching students of all ages how to read, how to listen and how to look. It would supply basic information and outline study courses, charts and guides as a basis for such teaching--all, of course, subject to such modification and testing as any institution or teacher chose to apply.

(12) It would hold an annual or a biennial forum or seminar on important phases of information problems of broad public interest. Publishers, working journalists, the institute's own staff and other competent persons, both interested and disinterested, would be invited to participate.

(13) It would offer awards and prizes to oral and written publications, schools of journalism, research organizations and individuals for distinguished contributions to the art of information.

(14) It would establish a library of information on information accessible to all writers, students and research workers.

(15) It would keep Congressmen and other legislators informed about its work, not only in order to get some of the results before the public through them, but also to heighten their awareness of, interest in and ability to use the techniques of information.

Neither the foregoing list nor the prior list of projects is all inclusive. Nor have they benefited by the fertility of all the minds that would be brought to bear upon them before the institute actually started operations. The list of projects especially has been compiled to show the scope and variety of public service such an institution could render.

In the first year the institute should begin at least one main line of research into fairness, adequacy and accuracy of news. It should also start its broad basic study of reader and listener attitudes toward news and the media, and the reasons therefor, and it should embark upon one cooperative experimental project in either the newspaper or radio field or both. Whether these things, with the launching of the journal of information about information, would constitute an adequate first year's program would depend upon how rapidly the institute could be organized, how soon effective liaison could be established with educational and other groups and how much time was needed to devise, test and perfect procedures and methodologies of operation.

METHODS OF OPERATION

The institute would work in these several ways:

1). It would conduct research, make studies and undertake analyses and educational efforts through its own staff.

2). It would set up special groups suitably constituted, for a given project and working under the institute's guidance or control, with or without its active participation, as the circumstances indicated.

3). It would arrange for and finance to the extent necessary specific research projects, wholly within schools of journalism or other suitable research or educational institutions.

4). It would carry on, as already indicated, experiments in conjunction with publishers or broadcasters who were willing to devote their own funds and efforts to projects that would be to their own and the public's interest, and who believed that they could profit by the institute's expert help and gain public attention and goodwill by such collaboration. It would work similarly to a limited degree with publishers or broadcasters needing financial assistance for experimentation.

5). It would farm out segments of certain broad research projects among various institutions, many of which should be able to conduct such studies along with their other investigations at little or no expense to the institute. By assembling these scattered results from different institutions into a coordinated project with over-all interpretation, the institute could make such a project searching, profound and conclusive.

6). It would provide fellowships and grants-in-aid for able and brilliant post-graduate students prepared to conduct research and to write theses or books in fields appropriate to the institute's own work. This would increasingly help to develop a body of trained personnel

not only for the institute's own growing program but for similar work for other instiutions.

7). It would seek to stimulate independent research and educational work in the information field by all scientific and other appropriate groups either directly or remotely concerned with any aspect of the subject.

ORGANIZATION

An institute of this kind would normally have a Board of Directors or Trustees with final authority and responsibility. Since suitable men would have many and varied interests, they might well be reluctant to assum such responsibility for this unique enterprise and to accept the kind of criticism or attack which some of the institute's operations might encounter, at least before it had had sufficient opportunity to gain the confidence of some of the interests involved. An alternative therefore would be to have the President or Executive Director and the principal members of the institute's staff become the directors or trustees with an advisory council made up of individuals selected for their character, varied public orientation and general knowledge of public affairs. Under this arrangement the operating staff would have full authority and responsibility, but would benefit by the advice of the council.

Whether there is to be a board of directors or trustees or an advisory council, it should be comprised of men of high public standing. Various social, economic and political groups should be represented to the extent possible without making the board or council so large as to be unwieldy.

Under either of these types of organization the institute must be so set up that it can be operated by a small executive group in position to make decisions and commitments after full consideration and discussion. The important thing, of course, is to devise the simplest possible form of organization that will work and that is most appropriate to the nature of the undertaking.

STAFF

The institute itself should be so staffed that it could carry on many of its projects with its own personnel. Only in this way will there be created a body of trained persons continually enriched by their studies in the field and steadily accumulating a body of information about information such as would exist nowhere else but which would be available to any one who wanted to make use of it. It would be suitably strengthened for given projects by drawing on temporary personnel from

other institutions. Such men would return to their normal pursuits with a new outlook on and new interest in information problems.

The institute would be headed by a President or Director, and would include an assistant director, a fiscal and management officer, a Director and an Assistant Director of Research, a Director of Public Relations, counsel, and a librarian or head of a records and analysis department. It should have a group of persons trained in fact-finding and analysis, some of whom could well be young lawyers, others of whom could have been trained in journalism and others in schools of political or social science. There would need to be two or three highly skilled publicity people, expert in modern techniques. There shall also be a Director of Education, whose concern would be the education (as distinguished from the publicity) work, and there should be a liaison man between the institute and educational and scientific institutions which could participate in, support or supplement its work.

It may well be that the educational work and the liaison work, which would need to include contact with women's groups, church groups, labor groups, industry groups, publishers and broadcasters, could be

one and the same person. On the other hand, dependent upon the whole scope of the institute's efforts, two or three persons might be needed to carry on these various activities. Also, unless his research talents were combined with other talents in the person selected either as the Director or Assistant Director of Research, there should be one good psychologist among the top staff members to organize and direct the proposed psychological studies and to contribute to the thinking of the whole group his special and valuable point of view.

The number of general research people, fact-finders, assayers and such, would obviously depend on the number of projects to be undertaken and the intensiveness of the necessary research in a given instance. This staff should be selected with the greatest care and picked slowly so that when it all came together there would be in existence a group of balanced talents supplementing each other and invigorating the whole stream of thinking and activity. The small group of top-most persons should be assembled as soon as possible and they then should carefully pick the others. It is doubtful if these persons could be assembled, working quarters found, a small basic library got together, and projects sifted, refined and adopted in less than

six months. During that time, discussion, exploration, public reaction to the institute and its purposes, opposition from various quarters and approval and suggestion from others, would all serve not to affect main purposes but to modify projects and procedures through the educative process that the institute heads themselves would undergo.

COST

The following estimate of costs on a minimal and a medium basis does not pretend to offer "hard" figures. It is, indeed, at this stage loose and tentative both because the project is unique and experimental and because the proposer has devoted his time largely to developing and refining the ideas for the venture itself and has lacked the resources to explore costs thoroughly. Also, the degree to which groups and institutions can be prevailed upon to contribute assistance without charge cannot be forecast.

Costs can, of course, vary within fairly wide limits but the institute could not be effective without a budget adequate for the conduct of many of the major activities described. It would be most unwise to launch

it without provision for adequate operation. It would be impossible to enlist a staff of imaginative, courageous and competent men. Moreover, too restricted an outlook would seriously jeopardize the possibility of winning public attention and support and the respect and interst of publishers, broadcasters, scientists, educators and others. It should be pointed out, however, that the table on the following page is based on peak operations, which would not be reached until the end of the second year, or possibly even the third:

ANNUAL BUDGET FOR PEAK YEARS

Executive Salaries	Minimum		Medium	
Director or President	$20,000.		$30,000.	
Assistant Director	15,000.		20,000.	
Fiscal and Management Officer	10,000.		15,000.	
Research Director	10,000.		20,000.	
Assistant Research Director	8,000.		15,000.	
Educational Director	8,000.		15,000.	
Public Relations Director	10,000.		15,000.	
Psychologist[2]	10,000.		12,000.	
Counsel (possibly part time)	6,000.		12,000.	
		$ 97,000.		$ 154,000.
Staff Salaries				
Librarian (records and digests)	6,000.		10,000.	
Editor of Publications	6,000.		10,000.	
Research Associates (5)	37,500.		50,000.	
Research Assistants (10)	30,000.		40,000.	
Publicity Assistants (2)	8,000.		10,000.	
Educational Assistant	4,000.		4,000.	
		91,500.		124,000.
Office Staff				
Secretaries (8-10), typists (4-5), clipping, filing and mailing force (6-10)	40,000.		50,000.	
		40,000.		50,000.
Operating Expenses				
Office Supplies and Postage	5,000.		5,000.	
Telephone and Telegraph	2,400.		2,400.	
Travel and Conference Expenses	3,000.		5,000.	
Rent and Services[3]	10,000.		15,000.	
Publication Costs	8,000.		52,000.	
Library and Record Costs	1,000.		2,000.	
Office and Field Studies, experimental projects, grants to Institutions	125,000.		250,000.	
Fellowships and Grants-in-Aid	10,000.		30,000.	
		164,400.		361,400.
Total		392,900.		689,400.

1 - Specific provisions has not been made in this estimate for capital expenditures for furniture and fixtures and an initial library, for insurance, salary increases, workmen's compensation if applicable, or accounting and auditing expense. To attract good men and women from permanent set-ups, it would probably be advisable to provide some sort of retirement fund with contributions by the institute and its employes, the proceeds to be distributed if the organization does not become permanent.

2 - The talents and skills possessed by the various members of the institute as they are assembled may make one or more executive or staff positions, or both, unnecessary.

3 - It might be found economical to rent or buy a suitably located large house if one could be found which with minimal alterations could be made adequate. It should be borne in mind that the institute would be tax free.

OFFICE OF THE PRESIDENT

July 17, 1964

Dearest Janet,

How nice of you to write me that charming longhand letter--this I really appreciate, and I think I would not write any letters if I had to do that.

Well I am not in Brazil yet until next week, and I am told that it is winter in Recife and Bahia, which means 80-85°, and that they have been freezing to death in Rio which means 60°. I do not think I will die of the cold there, do you, but certainly it is unpleasant in New York now. I think July and August are two lost months anyway, and now with the nice job the Republican delegation have done I think we are in for a bad four months, ~~don't you~~. I cannot imagine that Ed is too happy about anything either. At the moment I am just holding thumbs for Johnson's health.

I will ask Fred, certainly, to let me see the tape--imagine missing Ed the first time he has done any broadcasting in ages. I think Ed is merely modest about his contribution and I imagine it will be wonderful because those were very much his happy days, don't you think?

Your postscript I am interested in and I think this really might be fun for him to do when he feels like writing.

Are there any messages you have for anyone in Brazil? Mail is slow, but if there is anyone you can always me c/o the office to forward and I

may receive it. Otherwise I should be back mid-August and will call you.

Much love to the three of you.

Devotedly,

Blanche

July 13, 1964

Dearest Janet,

I am delighted to know that Ed has done that tape on London during the war. I am going to miss it because I will be going off to Brazil at the time it is on and will be in the plane, to my horror.

But thinking over our talk and my suggestion that he might want to go back and do a book on Europe--but chiefly London during the war years--he might well like it. I would think it would come very easily and happily to him, but I could be very wrong. Think it over and talk to him about it if you like.

Devotedly,

Blanche

OFFICE OF THE PRESIDENT

June 29, 1964

Dearest Janet,

It was heavenly being with you and Ed -- and, may I add, Casey. I think Ed looked in pretty good shape but I was afraid of tiring him, and that is the reason I left when I did. Tell Ed that we found a marvelous picnic spot on Quaker Hill, with a lovely breeze, and all went well.

Janet, I did not talk about books as I told you because it seemed not the right moment and I am not too sure that Ed really feels up to writing. But he did mention one subject that interests him and that he would have liked to have done for television, and that is the dissecting of the Congress -- a brilliant idea. Could he put it into a short book, I wonder? I think it would be better than my "apathy" idea and something he is really interested in and knows about. Talk to him about it if you feel like it.

Again thanks for a lovely day and for seeing the most beautiful house and the most heavenly country I have seen for years -- Casey has promised to call me here and I hope he will and I would like to see him some more.

All the best to you both.

Devotedly,

Blanche

Dear Ed:

There is something I would like to say to you. Can we meet tomorrow? I understand you will not be back until the 1st of August and I am going to London next week and will not be back till then either. You probably have a bad day on Thursday, but if there is a chance will you please have Miss Hogg call me. At least you are back -- that is a comfort.

All my best.

As always,

Blanche

Dear Ed,

I could not reach you before I had to leave the office. I just saw Bliss and of course was enchanted with him. I don't know whether there is a book or not, but certainly in talking it sounded like something very different from the statement he sent me and what we have now planned is for him to do a very brief outline, rough, with perhaps six or eight pages of writing, which he has promised to let me have by the 16th which will be a good ten days before you take off. I wanted to discuss this with you obviously, as it is not anything you can write about. What a nice person!

All my best,

Blanche W. Knopf

Knopf, Alfred A.

November 18, 1958

Dear Alfred:

How right you are. I did not belabour the advertising agencies because I knew from long experience it wouldn't do any good. As a matter of fact, it didn't do any good to belabour sponsors, but I had a lot of fun doing it.

By sheer accident, I did see "Heart of Darkness" and it was one of the most vulgar and offensive things I have ever seen on television. Believe me, that covers a lot of offence and vulgarity.

As ever yours,

ERM:skh

November 10, 1958

Dear Ed:

That was a most impressive talk you delivered in Chicago and The Reporter has done a real service by reprinting it. I have only one reservation: Don't you think you went rather easy on the advertising agencies? They seem more and more to me to be the curse of our age and of our society and I am sure they wield a basic influence whether of a negative or positive kind. By that I mean that I would be immensely surprised to learn that any advertising man has ever tried to stiffen the backbone of a sponsor when the sponsor became uneasy about a decent program.

As an old admirer of Joseph Conrad's work I tuned in last Thursday to Playhouse 90 for HEART OF DARKNESS. This was such an insult to the memory of a great writer and to the intelligence of the viewer that I propose, if I can find their names, to write protesting letters to every sponsor and agency involved in this shoddy affair with which thank goodness you had nothing to do.

And while I am writing you I do wish you'd give us more Murrow and less of your colleagues at seven forty-five PM. I don't think you realize how you stand up above the best of them.

Yours always,

Dear Ed:

I don't know whether you're back from the West or not. I have just come from there including your pet river in Oregon. What I really wonder is what you think now of a book by Rickover. You will remember that several years ago you and I talked this over and you suggested that Graham Swing might write it. This turned out to be nothing, at least no book was forthcoming, so where do we go from here now that he is again in the public press, I don't know. I still think it a good idea but maybe it is all too late and he's done it or has had somebody else do it. You were way ahead of everyone as you usually are.

What chance of seeing you if and when you are back.

Bless. All the best.

WHY ECHO PARK DAM MUST BE STOPPED

Once again, a group of Western senators and congressmen are attempting to authorize the multi-billion dollar Upper Colorado River Storage Project in the 1955 Congress.

The same attempt was made during the 1954 session of Congress, but it failed. Whatever other reasons may fairly be ascribed to this failure, certainly the main reason was the concerted opposition to one small factor in the Upper Colorado Project: the erection of a dam which would flood out a large part of a fabulously beautiful area in the national park system, known as Dinosaur National Monument—so called because one section of the park contains a large deposit of Dinosaur remains. This dam, known as the Echo Park Dam, (although an effort is being made now to change the name to "the Yampa-Lodore Unit" as a subterfuge) is hailed by some ***supporters*** *as the key to the entire Upper Colorado River Project—but is regarded by all* ***opponents,*** *including many prominent engineers, as a costly and unnecessary invasion of the National Park System for the alleged advantage of a small section of the country—a political windfall for Utah.*

Opposition to Echo Park Dam is joined by millions of citizens who want to preserve the National Park System. These people ***do not oppose dams generally,*** *and they definitely* ***favor*** *the wise use of water resources. The majority are fighting the Upper Colorado River Project soley because of Echo Park Dam.*

Because a quarter-million dollar campaign is in progress, financed by the proponents of the Echo Park Project, intended to confuse the issue, it is important that the facts be set down in a clear and straight-forward way.

HERE ARE THE FACTS:

1. Echo Park Dam, which would destroy much of the park area, is a relatively small segment of the entire Upper Colorado River Development Project and one for which there are several acceptable alternatives. Interior Secretary McKay confuses the situation by saying: "About 1200 people visit the Monument each year. Three million people need water. Which is the most important?" This fantastic statement, indicating that Echo Park Dam would supply three million people with water, is one of the most deliberately inaccurate statements ever made by an official of the United States government. According to original plans, **Echo Park Dam, for all its multi-million dollar cost, was designed as purely a power and storage dam—to generate power for which there is no necessity, to store water which could be better stored elsewhere, and to supply NO IRRIGATION AT ALL.**

McKay's quoted statement that 1200 people visit the Monument each year is equally inaccurate. In 1954, the park was visited by 70,000 people and the number of visitors each year is multiplying at a much greater rate than at **any other area in the National Park System.** It is surprising that the Secretary of the Interior would be so wide of the mark unless he had been deliberately misled.

2. **Conservationist, outdoor, garden and women's groups throughout the nation, many of whom enthusiastically favor sensible water reclamation projects, are virtually solid in opposition to Echo Park Dam.** Literally thousands of local and dozens of national groups, and millions of citizens who do not belong to any group, are determined to protect this famous park area from invasion.

THE UPPER COLORADO RIVER BASIN

Photos by H. C. Bradley.

Secretary McKay says:
"What we have done to Lake Mead and the Great Smokies is what we have in mind for Dinosaur." Pictures at left, above and below, taken at Lake Mead, illustrate what McKay promises.

3. **Members of these groups are not necessarily against dams in general nor the Upper Colorado River Project** in particular. All of them will agree that the West needs water and should get it through some practical plan. But in opposing Echo Park, many have investigated the entire project, and as a result are inclined to look with disfavor upon the project as a whole because there is great evidence that it has not been thought through. **The original opposition of Conservationists to Echo Park Dam has delayed authorization of the entire project long enough to give people an opportunity to investigate the facts. As a result, there is a growing opposition to the entire Upper Colorado River Project as an economic monstrosity; as an unfair tax burden to provide a give-away program for the few states that will directly benefit; and as an unwise use of precious Western water.**

4. THE REASONS FOR THE GROWING OPPOSITION TO ECHO PARK DAM ARE AS FOLLOWS:

a. The National Park Service, a Federal Bureau as important as the Bureau of Reclamation, differs with the Reclamation bureaucrats and admits flatly that the effect of Echo Park Dam on the monument would be "deplorable." But what is even more important, **it is a totally unnecessary invasion of a national park area.** This would be the first such dam in a protected park area since creation of the Park Service in 1916, and thus breaks a tradition never before broken. Parks and monument areas, traditionally and legally protected by Congress from just such invasions as this, have been kept out of bounds for the lumber interests, stockmen, and others—including Reclamation engineers—who want to set a precedent for invading national parks and monuments. It has been established that **seventeen specific invasions, in nine national parks and monuments, have been planned.** Several are in the blueprint stage, and action upon them will be taken as soon as the protection of the National Park System is weakened. Because of this, potential invaders are keenly interested in Echo Park, because it will mark a major policy break with the past—it would prove to be an "Open Sesame" to all parks for commercial exploitation. This may account for some of the unreasonable stubborness with which Echo Park is maintained as part of the project, although the project might easily have been authorized by an earlier Congress if Echo Park had been deleted.

If for no other reason, conservationists are determined to continue militant opposition in order to prevent the beginning of the end of the National Park System.

b. Many outdoor and wilderness groups oppose Echo Park Dam because it would profoundly change the nature of Dinosaur National Monument from a breath-taking, scientifically important wilderness area to a partially denuded site with, at times, 34,000 acres of repulsive, unhealthful mud flats and unsightly areas exposed. This menacing landscape which local supporters are pretending would become a "playground" would have the same serious limitations as all similar mud-flat areas across the nation. **There are already too few real wilderness areas left in the nation, and this one must be protected at all costs, for sound conservation purposes as well as for aesthetic reasons.**

c. Several engineering and economic groups, as well as well-informed individuals, are convinced that **Echo Park Dam is a great waste of precious water and a cataclysmic economic mistake as a source of power.** Competent authorities have determined that power from Echo Park Dam may likely cost far more than power from alternative sources—unless the government takes an unconscionable loss. Local private power companies are inclined to favor the dam, if they can buy power from it cheaply enough to resell at a profit (which is doubtful). They have stated, however, that they are fully capable of supplying all power needs of the area without Echo Park Dam.

d. It is generally agreed—except by supporters of Echo Park Dam—that there are several alternatives outside the park which would serve the same purposes (whether they are valid purposes or not) without invading any Park or Monument area. At least one alternative would supply water to the Central Utah Project—so that the State of Utah really has nothing to lose by this substitution—**if the supporters don't, in reality, want to get into the National Park System for other purposes once the bars are down.**

Testifying before a House Committee last year, Under-Secretary Tudor said: "In the final analysis, the increased loss of water by evaporation from the alternative sites is the fundamental issue upon which the Department has felt it necessary to give any consideration to the Echo Park Dam and Reservoir." During 1954, after prodding for several years, the Bureau and the Department of the Interior admitted that some of its original calculations with regard to evaporation were in error by as much as 600%; and when the figures were corrected (too late to come to the attention of the House Committee which was already taking action on the basis of the false figures) even Mr. Tudor had no defensable excuse to prefer Echo Park rather than an alternative.

e. The assertion that the local citizens were "promised" a dam at Echo Park when the Monument's park area was enlarged some years ago, is a deliberate misrepresentation of the facts. It is true that reservation was made for an anticipated dam in the enlarged park area; **but this site was specifically noted as being at "Brown's Park" which is many miles from Echo Park, near the edge of the monument area,** and would flood only one mile of canyon. Echo Park Dam would flood scores of square miles—and was NOT planned to provide irrigation. There is no reason to believe that those who oppose Echo Park Dam would oppose a Brown's Park Dam, if one should be under consideration (which it isn't) in view of the commitment made. It could not be considered an invasion of the Monument, since it would be interpreted as the fulfillment of an official promise.

f. **Opposition to Echo Park Dam has mounted as a result of the devious means used by its proponents to prove that it is "necessary," and to confuse the issue.** Many devices used have been so transparent as to simply cause irritation among thinking people, and to cast serious doubt and suspicion upon the entire project.

g. The most recent subterfuge has been the decision of the propagandists for the dam to rule out the name "Echo Park" and henceforth refer to the dam as the "Yampa-Lodore Unit." This is an obvious device (and a clever one) to convey the impression that the controversial Echo Park Dam is no longer part of the project. **This device will serve only to increase the determination of those who want to save the park. They will not let the public forget that Echo Park Dam by any other name is equally undesirable.**

McKay indicates that Echo Park Dam will provide three million people with water, which is a subterfuge. He says it is opposed by conservationists because "they say it would flood out the Dinosaur bones—which it won't"—and that is another subterfuge, since conservationists have never contended that any known bed of dinosaur remains will be affected. The contention that Echo Park Dam was "promised" is pure fiction. Now we have the effort to change the name and "hide" Echo Park—another device calculated to keep people from really looking into the facts. One cannot resist the temptation to ask "Why?"

h. Many people oppose Echo Park Dam because they oppose the entire Upper Colorado River Project. This group, led by members of the Hoover Commission, the Engineers Joint Council, and such writers as Raymond Moley, contends that **the entire project is badly planned, that it is not the best way to utilize their water, that there isn't the slightest chance that it can ever repay any important part of its cost, and that it is largely a "Pork Barrel Project" for purely political purposes.**

Many thinking people—in the East and West—object to the entire Upper Colorado River Project on the grounds that, as presently planned, it would cost American taxpayers as much as 15 billions—and we mean **FIFTEEN BILLIONS**—at a time when funds are needed elsewhere and could be put to better use —or saved in an effort to balance the budget. It has been estimated that the cost of Echo Park Dam and the "first phase" of the project would alone be enough to meet the deficit in the 1955 budget. *Last year, Congress was told the "first phase" of the project would cost 1.6 billions. This year, the cost is estimated at 1.1 billions for the same work. Does anybody know what happened?*

5. The Upper Colorado River Project is not new. It was originally planned many years ago, and pressure was put on several previous Administrations to put the matter before Congress. During the last years of the Roosevelt and Truman Administrations, propagandists for the Project kept urging the Interior Department to recommend it to Congress—but even those who felt most strongly in favor of dams generally could not see their way clear to recommending the Upper Colorado River Project. Oscar Chapman, then Secretary of the Interior, saw that much of the engineering and economics incorporated into the plan for Echo Park Dam were fallacious, and this, combined with his conviction that national parks should not be needlessly invaded, led him to recommend that the matter be more thoroughly studied before Congress be asked to act.

When the Upper Colorado propagandists saw that the Eisenhower Administration needed a reclamation project to prove it wasn't "against reclamation," they quickly steered the Department of Interior into the Upper Colorado Project. Under-Secretary Tudor was sent to the scene, supposedly to investigate, but before he had an opportunity seriously to investigate anything, the Department of the Interior, for reasons which have never been satisfactorily explained, moved ahead. Administration wheels immediately began to grind—without any further investigation, and without any effort to clarify the obvious errors of judgment, mathematics, and economics incorporated into the original plan.

6. Perhaps to further confuse the issue, at least FIVE bills to authorize the Upper Colorado Project, including Echo Park Dam, have been introduced in the present session of Congress. These bills are known in the Senate as S. 500 and in the House as H.R. 270, H.R. 2836, H.R. 3383, and H.R. 3384.

The opponents of Echo Park Dam represent only private citizens with vision but without vested interests, and have limited funds, supplied wholly by contributions from individuals who love the National Parks. They must depend for action wholly upon far-sighted American citizens to appeal to their Congressmen and Senators to vote against the bills authorizing the Upper Colorado River Project. Will you help?

WHAT YOU CAN DO:

1. **If you do not want to see national park areas turned over to the vested interests for private development;**

2. **If you do not want as much as 15 BILLIONS of your taxes invested in a highly doubtful development project—one which has been called unwise by competent and unprejudiced groups, and one which has obviously not been carefully planned, since even basic mathematics are admittedly in error; or**

3. **If you would like to see the Upper Colorado River Project delayed until Echo Park Dam is eliminated and until the highly doubtful economic and engineering questions can be resolved, then you should WRITE TO YOUR SENATORS AND YOUR CONGRESSMAN TODAY. TELL THEM TO VOTE AGAINST THE BILLS FOR AUTHORIZATION OF THE COLORADO RIVER PROJECT, WHICH INCLUDE ECHO PARK DAM, WHEN THEY COME UP FOR CONSIDERATION ON THE FLOOR OF CONGRESS.**

This is important. Do it now.

All members of the House should be addressed:
HOUSE OFFICE BLDG., WASHINGTON 25, D. C.

Senators should be addressed:

A TIMELY WARNING ABOUT UNNECESSARY DAMS

The conservationists who oppose Echo Park Dam do not necessarily oppose big dams in general, and the majority approve of them if they are necessary to provide the most practical solution to water control problems. However, there are certain liabilities in big dams that should be considered when vast and "perhaps questionable" projects are being planned. Here are a few points, quoted from "Big Dam Foolishness" by Elmer Peterson. Published by Devin-Adair ($3.50).

"Big Dams fight nature. They do not work with nature. Thus they are disruptive. They are disruptive of the water on which the soil depends. Each new dam, in this disruption, potentially requires that another be built to handle the upsetting caused by the first. And each and every one absolutely requires that, someday, another be built, because each and every one, as it fills with the inevitable silt, becomes gradually useless. It is a spreading cancer of dams that is the danger, each one nibbling away at the fertility of the land; each one taking men farther away from nature's demand that water be held, not in vast man-made pools, but on the land where it falls.

"... We find that far more water can be stored in the ground than in the greatest surface reservoirs. Most important of all, we find that the topsoil contains a stupendous complex and concourse of vital organic and inorganic substances upon which life depends, and that the washing away of these substances means 'Deserts on the March,' with sure death in their wake. We also see the most obvious object lesson in history.

"The death of many an empire—Babylonia, Carthage, Rome, Greece—is registered in the sedimentation of its rivers and canals, simultaneously with the erosion of its slopes. But our water policy leaders blandly ignore sedimentation or dismiss it briefly under the head of 'pollution' and concentrate their attention upon the crude methods of 60 centuries ago, which actually cause sedimentation instead of preventing it. That is, they concentrate upon the manipulation and trapping of muddy water—land-soup—in huge volume, oblivious to what history has to teach."

"Our potential enemy, Russia, has already tested out the technique and efficiency of dam-bombing.

"The tremendous magnifying of explosive power made possible by atomic fission, to replace TNT or other familiar explosives, makes the presence of dams a greater war-time menace than ever. There would be no necessity for the unique cumulative technique, calculated and accomplished by the RAF in Germany. One atomic bomb, even if it were not set off in contact with the dam, could do the job because of the incompressibility of water.

"The death-dealing nature of the explosion as such would be only a part of the menace, for the water, rushing from the broken dam, would be instantly contaminated by radio-activity from which there could be no escape."

March 17, 1955

Dear Ed,

Sorry we missed everywhere. You had a bad flight over - much worse than mine, which was bad. But apparently you did a fabulous job as always. I hear that three of the Smith TV's have been on and are wonderful. Do you think there is a book there? You will remember we talked about it.

Sorry the RO didn't work, but you weren't too sure that you wanted it, and I think I understand. The politics in France and Italy were quite something to look at, but you know more about it than I. I found Bill Downs doing a really good job in Rome and knowing everything that was going on. Tell me when you have a free moment. Congratulations, as I always give them to you, and all my best.

Blanche

P.S. By the way, my bouts with eight MP's were entertaining for me and the news of Bevan is probably more important than the public will admit.

New York,
U.S.A.

Dear Ed.,

When I left New York Friday 21st January I realised that you and I had not spoken about the Oppenheimer TV show that you thought you might put into a book and I radioed you. I have just now discovered from TWA that the radio was never sent. I hope you have decided in view of this and are working out the book for us with Bill Koshland of our office. I think really it is important to do it.

I left all instructions with production that if your proposal came through they were to go ahead on the basis of a $1.00 or $1.25 pamphlet size for a large distribution.

Nothing much new here; have seen Howard.

Yours, Blanche

Mrs. Alfred A. Knopf.

Dear Ed,

Your broadcasts get better and better, if that is possible. Yesterday's on Wolf Ladejinsky (?) was really moving. What can we do in the world we're living in? You care and I care, but so few people do. So now we have an eighty-fourth Congress, so the stock market is higher than ever, and you've had your very good roundup.

Well, I'm off to London at the end of the month. Can we meet before I go? I would like Eric to write a book for me. How can we work it? Dick Hottelet I suppose would too. You won't but something of these broadcasts I should put together - at least for my own happiness. Think that one over and if you won't, let's at least talk. You give me balance, which I lose day after day in my own work. All the best. Bless and a happy New Year.

Yours always,

Blanche -

Telephones: PLAZA 3-4761

501 Madison Avenue
NEW YORK (22), N.Y.

September 18, 1950

Dear Mr. Murrow,

As you know, Blanche is still in Europe, but I have hastened to read your seven Korean broadcasts which you sent over at her request. I had heard three of them on the air, and I am glad to say that they read as well as they listen. These are absolutely first rate, especially the eye-witness ones. There is no one who can touch you on this sort of thing.

The problem, of course, is bulk. If we had thirty or forty thousand words more of contemporary stuff to go along with these seven transcripts, I think it very likely that we'd have a book. But I can't quite see, now even less than when we last talked about it, reprinting the old broadcasts, wonderful though they were, just to make a bulky enough book. I know you sent these transcripts over because Blanche asked for them, and this does not necessarily imply that you yourself think there is a book here. As to that, I am sure that Blanche still feels and will continue to feel, as she wrote you on July 24th, that "If you write a book I want to publish it and have always wanted to."

Blanche will see all this material when she comes back, but meanwhile, if there is anything more you want me to do, or if you have tangible plans for a book about which I don't know, please let me know.

Cordially,

Harold Strauss

10th July, 1950

Dear Ed,

Before you go off to Korea it occurs to me that it would be a very good idea if you asked your secretary to send me transcripts of your Korean broadcasts as they come through. Perhaps these by themselves would make a short and important book; perhaps these, with part of the material that we have in the office, would make a book of some length that we both might like.

By the way I read Bill Costello's short article in The New Republic and thought it brilliant and am writing him at once. When you see him you may want to discuss it further.

It was charming seeing you the other evening. Please take care of yourself.

Bless you,

With my best,

Blanche

P.S. Proofs of Alistair Booke's A GENERATION ON TRIAL are going over to you before Friday.

10th July, 1950

Dear Mr. Costello,

Ed Murrow and I were talking about you the other night and about the possibilities of a book coming out now. I reread your letter of May 22nd and would now like to take up your offer to send us a definate outline, at the same time we would like to know the probable length of the manuscript and the delivery date.

You mention McCarthy twice in your letter, but I am sure that you will want to take quite a different approach now. American's are obviously more convinced of the importance of the Far East and your New Republic article takes the right approach to the background and recent developments.

We have heard your broadcasts off and on for several years and we think you can do just the right sort of book. Obviously the situation has made the whole project more exciting.

Looking forward to an early answer,

Yours sincerely,

Blanche W. Knopf

March 8, 1950

Dear Blanche:

I haven't read this, but it was written by a very able friend of mine in London. He asked if I would submit it to an American publisher. Naturally, I submit it to you first.

As ever yours,

Mrs. Blanche Knopf

New York (22)

Office of the Vice-President

July 22, 1949

Dear Ed,

Still I have not seen you and I won't be here after the tenth of August as I am going to Europe as per usual. How does the manuscript go and do you think there is a chance of my seeing it before I go off, or seeing the material that you have had typed so far. Can you give me a ring when you are in town and perhaps we can work out a meeting and see the outline of that preface.

With all my best,

Yours always,

Blanche

Dear Blanch:

Unfortunately, I had to cut the piece on THE PLAGUE because I mistimed the show, but I am glad you thought it acceptable. It was, as a matter of fact, the first time that I have mentioned a novel on the air.

Certainly we shall dine on Tuesday night. Let's check the weather on Tuesday morning.

As ever yours,

Mrs. Alfred A. Knopf

Office of the Vice-President

August 4, 1948.

Dear Ed,

That was a fine broadcast generally and what you said about THE PLAGUE is excellent and I believe that the Advertising Department will want to use it. I do not remember that you ever broadcasted about a novel before and when Camus comes here or you next go to France, you two must meet.

I look forward to seeing you next Tuesday night for dinner after your broadcast. If it is cool enough, let us dine at 24 West 55th, 8:15. If it is hot, perhaps we had better go out. I leave it to you.

Yours always,

Blanche

Office of the Vice-President

March 18, 1949

Dear Ed,

I think you have a splendid idea and hope that you will have the material collected by the time I return from California April 6th. The period from the annexation of Austria to some time next month when Churchill arrives is certainly important and your broadcasts during that time pooled together as you want them done should make a really splendid book. If you will put your material together I will go through it with one of the editors here as well if you like; I doubt that we will need to do much to it however. But this occurs to me, that a preface will probably be needed.

This is such good news that I sincerely hope that you will put it together in the next three or four weeks and when I return we will draw up a contract.

Please do not change your mind.

Yours,

Blanche

New York, N.Y.

Dear Mr. Murrow:

"Here It Now", Volume II, is the source of my knowledge of the Lilienthal quotation, excerpted on the cover of a greeting card I have prepared for friends. Therefore, I thought that you might find this use of it of interest.

The background of the card is this: I have recently moved from a position with the State of Michigan to one with the American Jewish Committee, here in Washington. From my residence I have this view of the Capitol, which to me, in my work, has a good deal of meaning. The Lilienthal quotation has remained in my mind ever since I heard it on your record some ten years ago. Lilienthal's finding of a common basis for democracy and religion seems appropriate to the holiday season and my new tie-in with the Capitol.

With continued good wishes for the success of your career, a career whose product has provided me with much thought, information and entertainment,

Sincerely,

Bob Greene

Robert J. Greene

January 7, 1960

Dear Mr. Greene:

Thank you for your letter of December 15th and for your enclosed greeting card.

Since Mr. Murrow is on a year's leave of absence and is traveling in Europe, I have forwarded your letter on to him there.

Very sincerely yours,

Gabrielle Wachsner
Secretary

Dear Ed:

I have thought a good deal further about the idea you described the other day at lunch, namely, that the Shah of Persia be invited to participate in a SMALL WORLD program. Your idea is very appealing. The Shah himself has a fine command of colloquial American, is photogenic, and quite relaxed in conversation so he would not be a difficult subject, from a technical point of view, I should think.

You made it plain that you had "commissioned" me to discuss the idea with His Majesty, and if it appealed to him, to assure him that you and CBS would make the necessary preliminary arrangements to get it under way.

But before I leave the country for Persia on February 21st, I would like to talk to you on the phone to make sure that in the meantime some very good reasons may not have occurred to you why the "commission" should not be a conditional one, or you may possibly have a different view of the entire project. Also I would need to have some idea of when, roughly, such a program would be scheduled; my suggestion is after the New Year period which is a period of a month following March 21st, in other words, some time in late April would seem to be the earliest that the Shah could sit before the camera, and probably the earliest that you could accomplish the other arrangements. If some big news event hits the place before then and you wanted to step up the schedule, I should think this could be done if it seemed important enough to do so.

As to other participants, since Mrs. Roosevelt will be out there while we are there in March, she seems a very good idea to me. You might think about the head of some other rapidly growing country, such as the new President of Mexico, as the third participant.

We are leaving for some work in Puerto Rico at the end of this week but expect to be back about February 17th. I will call you by phone on the 18th or 19th; we leave for Persia via London the evening of Saturday, February 21st.

Does your brother know of the invitation Iran is extending for tenders on its road construction program? He probably does, but if not, I suggest he or his Company communicate with the Commercial Attache of the American Embassy at Tehran, or directly with Plan Organization of Iran, Tehran, Iran.

With warm regards, (and to Janet)

Sincerely,

Dave

Dear Ed:

So glad we are going to lunch together (The Century, June 12, at 12:30 pm). Have asked our Executive Vice President, John Oliver, to join us (with Gordon) so he and your brother can meet. He has just returned from six weeks in Iran.

When Helen and I last visited you at Quaker Hill, I mentioned the beginnings of our activities on behalf of Iran in the re-development of what was the heartland of ancient Persia, the region from the head of the Persian Gulf northward - now known as the Khuzestan Region. Well, a lot has happened since then, and I'm glad of a chance to tell you something about it.

With warm regards,

Most cordially,

Dave

سازمان برنامه

TEHRAN Iran Nov. 28, 1956.

Dear Ed:

That was a pleasant surprise, hearing your voice in mid-ocean. Hope I shall be seeing you --I resist the obvious temptation to say "person-toperson"-- before too long.

Our work out here in the re-development of southwestern Iran--the center from which ancient Iran once ruled from the Nile and beyond to the Indus--is coming on amazingly, in spite of all the advise we had to expect nothing to be possible, in the way of action, in this country. It is quite a tale: some of our engineering parties, getting out of the mountains day after tommorrow, have been traversing quite unknown places on the map; the rivers we are preparing to put yokes on we find are magnificent, larger and more productive of water for irrigation and power than our air reconnaissance indicated. Today in our session with the Shah we accepted a new set of responsibilities, and are building an unusual group out here. But the political meaning , potentially, of our Khuzestan Region development, in view of Iran's unique position in the Middle East,

س ۹۷۹۴
۱۵۰۰و۱۰۰ب
۵-۱۴و۷م

is a fascinating possibility, since Iran is neither Arab nor without deep ties with its neighbors--and with oil, gas and water resources, and probably minerals (we'll be having searches for these going soon) it has the material resources and great natural intelligence and friendliness on which to build something, in time.

We left New York Oct. 24th; so a great deal has happened since we left. Our work in Italy, in the South and the Islands, is now begun, and we go back for a couple weeks more of that before coming back for Xmas with the children and grandchildren--and to gw greet Nancy's new baby expected about Xmas.

There are so many places wherew you and your co mprehension should go that I hesitate saying: put Iran on your list for a visit within the coming year--perhaps we can arrange to be here at the same time, but in any case put it on the If-possible list. XXXXXX

Helen sends her best to Janet and to you, with mine

Dave Lilienthal

November 16, 1955

My dear Ed:

Gordon and I are glad to have the dope on Transportation Consultants, and your brother Lacey's connection with it. As we run into transportation matters, we shall certainly keep this in mind.

Helen and I had quite a trip. Turkey, Greece, etc., but the most interesting (and grueling) was a month (and 5,000 auto miles) in the highways and by-ways of southern Italy and Sicily. The South Italy development program is one of the most unusual efforts of the kind I have ever seen, anywhere. It isn't that Italy is an "underdeveloped" country, God knows; more an overdeveloped country. But what they are trying to do to end the century-old sorrows of deepest poverty right smack in Europe is something to see.

Our new development-a-la-TVA outfit has made a good start, and we have some new things coming along, including one in the Middle East, where I shall be going before long, that will tickle your reporter's ear, I think.

I will be calling you for a lunch date, soon.

Best, as always,

Dave

David E. Lilienthal

Edward R. Murrow, Esq.

TRANSPORTATION CONSULTANTS, INC.

ENGINEERS AND ECONOMISTS

LACEY V. B. MURROW
1025 CONNECTICUT AVENUE N. W.
WASHINGTON 6, D. C.

Washington - 23 October 1955

ROBERT GALE BREENE
315 NEAL AVENUE
DAYTON 5, OHIO

My dear Brother:

Thank you for your very kind note of 17 October and the attachment which announces the formation of the Development and Resources Corporation with offices at 44 Wall Street, New York City. The names of Lazard Freres & Co., David E. Lilienthal and Gordon R. Clapp are well known to almost everyone and the scope of activities contemplated by this new firm would seem to have a high potential in foreign countries.

We have observed and in some cases participated in foreign work of a similar nature. Arthur D. Little and Company have a contract with I. C. A. on all phases of economic development in Egypt. Knappen-Tippetts-Abbett-McCarthy of New York have the same sort of commitment for Burma. The basic concept of this type of activity is sound. However, the results in several instances thus far have been disappointing. There is a tendency on the part of most firms engaged in this type of work to send out some bright young men from the Harvard Business School having no background of practical experience and no experience in working with the nationals of other countries. In Egypt, for example, they strayed off on such relatively minor considerations as increased poultry production and frozen meat packing plants, not realizing that the Arab will not eat frozen or canned meats.

It is perhaps to be expected that our viewpoint on foreign aid and planning for economic and industrial development might be somewhat prejudiced. After having had a look at several of these projects and active participation in Egypt, we are convinced that the greatest deterrent to economic development in the majority of foreign countries is the lack of adequate and economical transport. If transportation in the appropriate form by either air, water, highway or rail were provided, many of the developments that now occupy our planners' attention and concern would follow in a normal and orderly manner.

We have had little or no experience in the field of atomic energy production, although one of our young associates has a PhD. in nuclear physics. We believe ourselves qualified to handle any problems arising in the four fields of transport and to perform the engineering studies and surveys incident

thereto. At the present time we are retained by the American Automobile Association, the Atlantic Coast Line Railroad, and Oceanic Constructors, Inc., and we have performed professional engineering services for several other large organizations. From the very meagre information available to us at this time it would seem that we might be able to perform professional engineering services and offer other capabilities that probably will be required by the Development and Resources Corporation. In any event I would be glad of the opportunity to meet Mr. Lilienthal and Mr. Clapp and can of course come to New York any time at their and your convenience.

There are enclosed two copies of our small brochure, which might be of interest to the officers of the new corporation. I greatly appreciate your thinking of us in connection with the interesting possibilities of Mr. Lilienthal's new firm.

Sincerely,

Lacey

Mr. Edward R. Murrow
485 Madison Avenue

FUlton 5983 ..... 315 Neal Avenue
Dayton 5, Ohio

Cable Address: TCI, Washington, D. C.

TRANSPORTATION CONSULTANTS, INC., with offices in Washington, D. C. and Dayton, Ohio, are a group of engineers who have associated themselves for the purpose of undertaking special work in connection with major undertakings in the civil engineering field, but with particular emphasis on transportation problems.

A review of the following summaries of the professional histories of the staff and consulting board of this firm will reveal an outstanding record of high executive, as well as purely professional, experience in the development, design, construction and maintenance of highways, tunnels, bridges, railroads, terminal facilities, inland waterways, flood protection, ports, airfields and air transport facilities, large buildings, cantonments and factories. The combined experience of this group aggregates some 250 years of activity not only in engineering and building domestic and foreign projects, but also in instruction and the establishment of harmonious working relations with the nationals of other countries. They have had personal and responsible charge of expenditures, both public and private, totaling many billions of dollars.

The variety of fields and experience here represented qualifies this group to perform successfully complete consulting services on projects, surveys and studies of unusual magnitude and complexity.

Robert Gale Breene

B.S. in Mechanical Engineering, Purdue University; Graduate, Air Corps Engineering School, Command and General Staff School.

From 1917 through 1946, in active service with U. S. Army, being promoted through all ranks from Second Lieutenant to Major General. Retired with rank of Major General, 1946. During that period, responsible assignments involving multiple engineering duties included:

Officer in charge of installations, Materiel Division, Wright Field, Dayton, Ohio; Instructor, Logistics, Command and General Staff School, Fort Leavenworth, Kansas; G-4 Third Wing, Army Air Corps; Chief of Staff, Second Air Force, in charge of all engineering under command of the Air Force Commander; Director of Technical Services, Headquarters Army Air Forces.

1942-44, Organized and commanded Service of Supply, South Pacific Theater, during the entire period of active operations in that theater. This duty involved responsibility for all theater logistic problems, including movement of troops and supplies by water, highway, rail and air. Also commanded all engineer and construction forces assigned to building, maintaining and operating ports, railroads, highways and airfields.

1944-45, Deputy Commander Army Air Forces, Pacific Ocean Areas, this assignment including all Air Force engineering in this theater, operation design and construction of the air depots, supply and transportation of air force materiel and personnel.

Since 1946, consulting engineer and principal, Transportation Consultants, Inc., engaged in general civil and mechanical engineering studies and surveys for railroads, States, municipalities and large construction corporations.

Licensed Professional Engineer, Civil and Mechanical, State of Washington; Licensed Professional Engineer, Civil, State of Ohio.

Member, American Society of Civil Engineers and Tau Beta Pi.

Recipient of decorations and awards from United States and allied countries.

Charles E. Andrew

B.S. in Civil Engineering, University of Illinois.

1906-08, employed by Ralph Modjeske on the then largest and heaviest swing span in the world, crossing Willamette River at Portland, Oregon, for S.P.&S. Railroad.

City Engineer, St. Johns, Oregon — laid first concrete pavement west of Mississippi River.

Plant Engineer, Albina Engine and Machine Works, Portland, Oregon, in charge of design, construction and operation of complete shipbuilding facilities for steel freighters for Norwegian and United States Governments.

Successively bridge designer for U. S. Bureau of Public Roads; Bridge Engineer, State of Washington; Bridge Engineer, State of California.

1931-39, Principal Bridge Engineer of the *San Francisco-Oakland Bay Bridge*, in direct charge of design and construction. Largest bridge in the world, requiring the extension of many principles of bridge design. Its design and construction involved the deepest foundations ever built, the first major twin suspension bridge, the largest and heaviest cantilever span in the U.S. and the largest tunnel cross-section in the world. Design and construction of the entire project costing over $80,000,000 involved also one of the largest intercity rail transportation systems, with terminals, and one of the most modern signal systems in existence. Wrote Hoover Young report which was used as a basis for report to the President by the Hoover Young Commission and also as a basis for the final design and financial structure.

Design and construction of the bridge proceeded with rapidity and dispatch. Practically no changes or modifications were necessary in original designs and unusually small amount of contract claims were filed, all being settled without legal action. Some 28 contracts were timed and synchronized to such a degree that one of the fastest records of construction ever accomplished resulted, an average of nearly $2,000,000 being expended per month during the entire construction period.

From opening of bridge in November 1937 until March 1939, also in charge of operation and maintenance of bridge.

Chairman, Consulting Board, State of Washington, on the Lake Washington Bridge at Seattle and the Tacoma Narrows Bridge at Tacoma.

Lake Washington Bridge. Here a conventional bridge on piers was impractical due to its enormous cost. As a result, a floating structure of cellular reinforced pontoons end to end was designed and adopted. Such a design involved many original problems in bridge engineering and pontoon construction, particularly anchorage against wind and wave action. This

bridge, spanning the 8,000-foot west channel, has proved eminently successful. Its cost is approximately 1/5 of the cost of a bridge on piers. Its stability under actual wind velocities as high as 65 miles per hour has proved far more satisfactory than a suspension type and has shown less movement than the ordinary long span truss bridge. It is by far the largest floating bridge in the world and the first to be constructed wholly of reinforced concrete.

The entire project, including a twin bore tunnel 1,465 feet long, a truss bridge across the east channel, numerous crossing eliminations, the floating structure, roads, pavements and drainage, is 6½ miles long and cost approximately $9,000,000.

Tacoma Narrows Bridge. As it stands today, this is the third longest suspension bridge in the world, with a central span of 2,800 feet. Its construction involved extremely deep foundations constructed in water depths of 140 feet and tidal velocities as high as 9 miles per hour. Here the economical false bottom type of caisson was successfully constructed, being landed in 140 feet of swift water, which is the deepest landing depth yet accomplished.

Designed foundations for original Tacoma Narrows Bridge, superstructure having been designed by a separate firm of consulting engineers. This first superstructure failed under aerodynamic wind action in 1940. The piers were undamaged.

After this failure, was directed by Washington Toll Bridge Authority to assume full responsibility for both superstructure and foundations, and to develop a new design for the bridge. As Chairman of the Consulting Board and Principal Engineer, directed original research in aerodynamic studies and model tests for several years during the war in the solution of this problem, with the result that a second superstructure was designed on the original piers, incorporating several new features in suspension bridge design. The bridge has now been in service for more than 3 years and has been subjected to winds exceeding 75 miles per hour on several occasions without the slightest sign of oscillation.

Since completion of this bridge, engaged in developing designs on 3 proposed major structures for the Washington Toll Bridge Authority, including traffic studies and financing:

1. A series of bridges spanning Puget Sound. This project involves novel and unprecedented problems such as spanning waters varying from 650 to 850 feet in depth for long distances with a tidal range of more than 17 feet with deep foundation problems requiring floating structures, large suspension and cantilever bridges. Plans are now well developed and Army permits have been applied for. The project involves an estimated cost of $100,000,000.

2. Bridge across Hood Canal over 9,000 feet long and involving a combination of floating and cantilever bridges. This structure includes many of the problems of the Puget Sound Bridge. Plans are well developed and Army permits have been granted.

3. A second bridge across Lake Washington similar in many respects to the existing structure.

Author of many articles on bridges for the "Engineering News Record," the "Civil Engineer," the "Concrete Institute" and other professional publications. Member, American Society of Civil Engineers.

Richard Erwin Dougherty

Degree of Civil Engineer, Columbia University; College of City of New York. Instructor, Department of Civil Engineering, Columbia University; Special Lecturer on Concrete, Cooper Union.

For 49 years in service of the New York Central System, working from rodman and transitman to Vice President and Assistant to the President, including such experience as:

Resident Engineer in charge of construction Eastern District, comprising Hudson, Harlem and Putnam Divisions and New York Harbor; Designing Engineer, Buffalo and East; Engineering Assistant to Vice President in charge of Operation, including Ohio Central lines;

Assistant to the President, N.Y.C.S., and Senior Engineering Officer, 22 years. In addition to general assignments as presidential assistant, duties included supervision of all engineering activities and maintenance of way transactions, valuation, insurance, numerous problems requiring analysis, such as consolidations, coordinations, abandonments, joint facility contracts, etc.; also supervision over Grand Central Terminal real estate which, in addition to Grand Central Terminal concessions and office buildings, includes nine other office buildings, eight apartment houses and six hotels.

During World War II acted as a principal contact officer with the Army, Navy, Defense Plant Corporation and other governmental agencies in locating plants and industries. Also served as principal contact officer with the Transportation Corps of the Army in the organization of four railway battalions of the Military Railway Service. Architect-Engineer for the Holding and Reconsignment Station at Voorheesville, N. Y.

Chairman, Research Council, N.Y.C.S., for consideration of post war problems.

President, The Lakefront Dock and Railroad Terminal Company, for construction and operation of a coal and ore terminal on Lake Erie.

President, Niagara Junction Railway Company.

Chairman, Engineering Committee of railroad presidents to consider the Chicago terminal problem. Member and chairman, committees of Association of American Railroads studying various transportation problems. Chairman of the Executive and Operating Committees of the Associated Railroads of New York State (handling legislative questions). Chairman, Committee on Suburban Transit, Metropolitan New York.

Director, Hotel Waldorf-Astoria Corporation; Director, Great Eastern Fire Insurance Company, White Plains, N. Y.

Member, American Society of Civil Engineers since 1903 (President 1948; Past President and Member of the Board, 1949-50; Representative on United Engineering Trustees, Inc., 1945-48).

President, Engineers Joint Council, 1949 (American Society of Civil Engineers, American Institute of Mining and Metallurgical Engineers, American Society of Mechanical Engineers, American Institute of Electrical Engineers, American Institute of Chemical Engineers).

Member and official, American Institute of Consulting Engineers.

Registered Professional Engineer in New York and District of Columbia.

Member and past-Director, American Railway Engineering Ass'n; Member, New York State Society of Professional Engineers and Land Surveyors; Member and past-President, The Moles.

Advisor to Public Works Task Force under the Hoover Commission on Reorganization of the Executive Branch of the Government (1948). In 1949 appointed as one of the two personal representatives of the President of the United States as member of the Commission on Renovation of the Executive Mansion.

Member, Advisory Council for Science and Engineering, University of Notre Dame; Chairman, Building Plans Committee for new Columbia University Engineering Center.

Consulting Engineer to several major railroads and to the City of New York; Department of Public Works, State of New York; Corps of Engineers, U. S. Army; Roosevelt Field, Inc.; New York Metropolitan Rapid Transit Commission; Webb & Knapp, Inc., and Consultant to Seelye Stevenson Value & Knecht, New York City.

Active member of many civic organizations and committees.

Recipent of numerous honorary awards and citations, including Eggleston Medal and Citation for Distinguished Engineering and Achievement, by the Columbia Engineering School Alumni Association in 1945, and in 1950 The Member Award of The Moles for outstanding contribution to construction and for an exemplary career as a citizen, in conjunction with a similar non-member award to the Honorable Herbert Hoover.

Gibb Gilchrist

B.S. in Civil Engineering, University of Texas; Hon. D.Sc., Austin College; LL.D., Baylor University; LL.D., Southwestern University.

Santa Fe Railway, 3 years on railroad construction, 5 years as special assistant to the Chief Engineer.

Overseas service, U. S. Army, 1917-1919, discharged as a Captain of Engineers.

State Highway Engineer of Texas, 1924 and 1928-37, during which period more than 10,000 miles of improved all-weather roads and many major bridge structures were built; also responsible for maintenance and organization of all Highway Department functions.

Consulting Engineer, firm of Nagle, Witt, Rollins and Gilchrist, Dallas, Texas, specializing in design and construction of highways and bridges.

Dean of Engineering, The A. & M. College of Texas, which has accredited curricula in all principal branches of Engineering, 1937-44; Director, Texas A. & M. Engineering Experiment Station, same period. 1944-48, President, A. & M. College, its three academic branches, and head of five important agencies and services.

Chancellor of the Texas A. & M. System organized in 1948. As such was directing head of the A. & M. System of nine parts, each headed by a President or Director, as follows: A. & M. College of Texas; Prairie View A. & M. College (colored); Tarleton State College; Arlington State College; Agricultural Experiment Station; Agricultural Extension Service; Engineering Experiment Station; Engineering Extension Service, and Forest Service.

1953, Chancellor Emeritus: Research Engineer in Highways and Transportation (part time); also consulting civil engineer, particularly in highways and motor traffic.

Member, American Society of Civil Engineers; Chairman, Highway Executive Committee (1949). Member, Advisory Committee, engineering, science and management war training, U.S. Office of Education (1940-46). Member, Naval Advisory Educational Council, U.S. Navy (1942-45); Chairman, Texas Post War Planning Commission Conference, initiated and sponsored by the President of the United States in 1946. Delegate, by appointment of the Governor of Texas, to the White House Highway Safety Conference, 1953. Chairman, Engineering Committee, Texas Governor's Highway Safety Conference, 1950.

Past President, American Association of State Highway Officials.

Registered Professional Engineer, State of Texas; Tau Beta Pi; Phi Eta Sigma; Philosophical Society of Texas; Texas State Historical Association; Texas Society of Professional Engineers.

Research Engineer and Consultant, Faculty Exchange, College Station, Texas.

Charles Lacey Hall

Graduate, U.S. Military Academy; graduate, Engineer School; honor graduate, Army School of the Line; graduate, Staff College; graduate, War College.

For 40 years in active service with United States Corps of Engineers. Assignments included responsible charge for topographical work in the United States and abroad; Assistant to District Engineer, Washington, D.C., in charge of water supply of the District of Columbia; in charge of construction and maintenance of supply roads in Mexico and France.

Adjutant of a Railway Engineer Regiment, France; during Battles of St. Mihiel and Argonne in charge of the topographical operations of the 1st American Army.

District Engineer, Portland, Maine; Asst. District Engineer, Galveston, Texas, in charge of extensive fortification construction and the building of the Galveston seawall; District Engineer, Rock Island, Illinois; Assistant Professor of Engineering, U.S. Military Academy; District Engineer at Cincinnati, Ohio, covering 150 miles of the Ohio River.

Member, American Delegation, XVI International Congress of Navigation, Brussels, 1935.

District Engineer, New York and Puerto Rico, an assignment involving such disparate matters as plans for flood control in Puerto Rico and dredging the Ambrose Channel in New York; made first inspection under the Pan-American contract for air bases in Latin America; Acting Division Engineer, North Atlantic Division and Member, Board of Engineers for Rivers and Harbors; Division Engineer, Ohio River Division, in responsible charge of construction work costing one and a half billion dollars.

At end of World War II made basic report on rehabilitation of Philippine ports. Division Engineer, North Atlantic Division; Senior Member, Beach Erosion Board. Represented United States at first post-war meeting of Permanent Commission, International Congress of Navigation, Brussels.

Recipient of Distinguished Service Medal and other decorations and awards.

Life Member, American Society of Civil Engineers; Member and for 2 years Chairman, Executive Committee Waterways Division. Member, Permanent Section, International Congress of Navigation. After retirement, Chairman, American Delegation, XVIII International Congress of Navigation, Rome, 1953. Member, Am. Institute of Consulting Engineers.

Licensed Civil Engineer, New York, New Jersey and District of Columbia.

Author of numerous professional and technical studies and articles published by "Military Engineer," "Civil Engineering" and other professional publications.

Thomas Harris MacDonald

B.S. in Civil Engineering, Iowa State College.

For 15 years executive officer of Iowa Highway Commission.

For 34 years, executive and technical head of Bureau of Public Roads of the United States Government, first as Chief of Bureau, later as Commissioner of Public Roads. The Bureau, in cooperation with the State Highway Departments, administered the provisions of the Federal Aid highway legislation. As a joint operation with the highway departments, the Federal Aid primary and secondary road systems were selected, totaling 677,059 miles. Improvements of all types, from graded soil roads to the most modern multi-lane expressways reached 421,450 miles. The expenditures for constructure totaled $12,286,000,000 of which $6,917,000,000 were Federal funds.

The Bureau actively engaged in the promotion of highway improvements and in direct charge of highway construction in many other countries. Chief of the Bureau was responsible for choosing the form and personnel of the organization to carry on the projects in foreign countries and to give general supervision, spending some time in each country inspecting and consulting on the methods and problems of the work. Some of the more important projects included: The Inter American Highway, from Mexico south to Panama. Philippine Rehabilitation, a program of rebuilding roads and bridges, totalling $30,000,000 of U.S. funds plus amounts supplied by the Philippine Government. Mission to Turkey of highway technical personnel consisting of engineers and equipment experts to assist in planning and operating a major national program of highway improvement. Mission to Ethiopia of highway technical personnel to administer the expenditure of an International Bank loan. Mission to Liberia of highway technical personnel to administer an Export-Import Bank loan for highway improvements.

Member of Delegations representing the United States on a number of International Highway Congresses, including Argentina (Buenos Aires, 1925); Brazil (Rio de Janeiro, 1929); Italy (Milan and Rome, 1929); Netherlands (The Hague, 1938).

Presently Research Engineer, Texas Transportation Institute.

Registered Professional Engineer, State of Texas.

Member, Executive Committee, Highway Research Board; Member, Executive Committee, American Association of State Highway Officials; Honorary Member, Institute of Traffic Engineers; Honorary Member, Institute Municipal Engineers, London; Member Tau Beta Pi and Beta Theta Pi.

Recipient of French Legion of Honor and other decorations and awards.

Honorary Engineering Degrees: Iowa State College, Brooklyn Polytechnic, Beecroft Lecturer — 1945 (S.A.E.), Salzburg Lecturer — 1954 (University of Syracuse). Honorary Member, A.S.C.E.

Lacey V. B. Murrow

B.S., C.E. and M.S. degrees, Washington State College.

Successively Resident Engineer, Locating Engineer, Construction Engineer and District Engineer, Department of Highways, State of Washington, 1925-31. Registered Professional Engineer—Civil, Structural, Hydraulic and Land Surveying.

Director and Chief Engineer, State Department of Highways, and concurrently Member and Chief Engineer, Washington State Toll Bridge Authority, 1931-40. In responsible charge of location, construction, maintenance and operation of the State Highway System and of the Department's responsibilities in connection with the construction of and expenditures for county roads and city streets. President, Western Association of State Highway Officials; Member, Executive Committee, American Association of State Highway Officials.

United States Army Air Corps, command pilot, Captain to Colonel, with active service in the South Pacific, England, France, Italy, Africa, India, Burma and China, 1940-46.

Director of Transportation Research, Association of American Railroads, 1946-51.

Brigadier General, U. S. Air Force, duty in U. S., Japan and Korea, 1951-53.

Executive Director, Competitive Transportation Research, Association of American Railroads, 1953 to July, 1954. Supervised studies on operating practices and economic problems and policies of other forms of transport, including air, highway and water, to determine their competitive position with respect to rail transportation. These studies also included analyses of regulatory practices at national, state and local levels for all forms of transport.

July, 1954 to present, in charge of Washington office, Transportation Consultants, Inc.

Holds several decorations and awards from the U. S. and foreign countries.

Member, American Society of Civil Engineers, American Railway Engineering Association, National Defense Transportation Association; Life Member, Air Force Association; Member, Task Force on Water Resources and Power, Commission on Reorganization of the Executive Branch of the Government (Hoover Commission).

John H. Frederick

B.S. in Economics, Wharton School of Finance and Commerce, University of Pennsylvania; M.A. and Ph.D. in Econ., U. of Pennsylvania.

After honorable discharge from U. S. Army in 1919, in business in U. S. and West Indies. Instructor in Transportation, University of Pennsylvania, 1923-37. Managing Editor, "Electrical Wholesaling," trade journal, 1937-38.

Professor of Transportation and Industry, College of Business Administration, University of Texas, 1938-46. 1946 to present, University of Maryland, first as Prof. of Transportation and Foreign Trade, College of Business and Public Administration; since Sept. 1952 as Head of the Department of Business Organization.

Concurrently, held various consulting positions as follows:

1935-37, Chief of Section of U. S. Bureau of the Census dealing with distribution of manufacturers' sales; wrote 21 separate industry reports. 1946-49, Transportation Consultant to the House Committee on Interstate and Foreign Commerce, U. S. Congress, carrying on work of the National Transportation Inquiry of this Committee and writing reports. 1949-53, Consultant on Research and Education and after 1950 Deputy Director of Governmental Relations for the Transportation Ass'n of America. 1951-52, Economic Consultant to the Administrator of Defense Transport. 1952-present, Member, Advisory Council on Transportation to the Secretary of Commerce; member Exec. Comm. 1953-54. 1954, Consultant to Task Force on Water Resources and Power, Commission on Organization of the Executive Branch of the Government.

Also served as consultant on transportation and distribution matters to such organizations as: American Warehousemen's Ass'n; Distribution Engineering, Inc.; Braniff Airways; State of Texas before the I.C.C. on interterritorial freight rates; National Resources Planning Board; Southern Airlines; C. & O. Ry. Co.; U. S. Dep't of Justice; Cooperative Research Foundation; N. B., W. H., M. V. and Nantucket Steamship Authority, and the City Service Commission of Baltimore, Md.

In addition to several hundred articles published in trade and other journals, has published the following books: "Federal Regulation of Railway Securities" (1927); "Development of American Commerce" (1932); "Industrial Marketing" (1934); "Agricultural Markets" (1937); "Public Warehousing" (1940); "Commercial Air Transportation," now in 4th Edition; "Airport Management" (1949).

Member: American Economic Ass'n; Am. Soc. of Traffic and Transportation; Propeller Club of the U. S.; Am. Marketing Ass'n (National Director, 1942-43); Associated Traffic Clubs of America (Member Committee on Education and Research, 1952-present); American Society of Air Affairs (Fellow); Aviation Writers Ass'n; National Defense Transport Ass'n; Delta Sigma Pi; Beta Gamma Sigma; Phi Kappa Phi; Editorial Advisory Board "Journal of Air Law and Commerce."

In addition to the principals heretofore listed, Transportation Consultants, Inc. have available for assignment to special projects or studies where their services are required an engineer of national stature in the field of hydro-electric development, design and construction; specialists in railway maintenance, operation and signaling, and recognized economists in specialized fields of transportation management, research and analysis. There also are available complete design and drafting facilities and personnel, all of which permit the handling of projects of any magnitude from the development stages through construction engineering and management.

Transportation Consultants, Inc. are available for suitable domestic commitments; however, its members are also genuinely interested in foreign assignments. Most of them have worked with nationals of other countries throughout the world and have been active members of international engineering bodies.

Transportation Consultants, Inc. have working arrangements with highly qualified firms of architects and with other consulting engineering firms to cover projects requiring A&E type services and joint venture operations.

Lilienthal, David

June 6, 1955

Dear Dave:

You must think me a churlish bastard for not having previously answered your gracious note of May 3. I have been buried and I am just back from a week in England.

I would love to go out with you and see the Retrievers work, but I am afraid I just can't do it before the weather gets too hot for them to work well. Could we perhaps plan to go out sometime in the early fall. The prospect of possessing one of these beautiful animals is real exciting.

Do you have a day free for lunch in the next ten days.

As ever yours,

Mr. David E. Lilienthal
44 Wall Street
New York, New York

DAVID E. LILIENTHAL

11:03 P.M. Tuesday May 3/55

Ed:

That Texas Story was the most powerful thing you and Fred Friendly have done yet--and that covers a lot of territory. This is The Thunderer himself, but with a kind of vitality and validity that no other way of telling a story and teaching about the world has ever had. You really knocked me right off the piazza.

You care for good field dogs. As a distraction, would it interest you --and could you manage it with your schedule -- to go out to a wild part of Long Island and see some superb Golden Retrievers work--some of the best in the country. Belong to a friend of mine, and an admirer of yours. He never sells one of his dogs, but knowing you love to hunt and stumble through the outdoors with a gun, he would be pleasured to have you have one of his, now you have a farm and a place to kennel him. But aside from that, it would be a pleasant experience to see these magnificent critters. Let me know, and I'll work out the transport, etc. His name is George Murnane, and I think the world of him.

Saddened to learn about your Dad's death. My Dad died four years ago, just, and I still miss him a lot.

Warm greetings to you and Janet, as always

Dave

Edward R. Murrow.

December 2, 1954

Mr. Edward R. Murrow
Columbia Broadcasting Company
485 Madison Avenue
New York, New York

Dear Ed:

About the Colombia T.V.A., I enclose some material, as I said I would.

This includes: (1) my report to the President of Colombia (2) his remarks about the TVA idea in his inaugural address last August (3) decree chartering the new "autonomous" body, worked out when I was down there the second time, in October, which contains some interesting "Whereas" clauses, objectives, etc. (4) some illustrative newspaper stories from Colombia (5) letter of the President of November 15th, and an English translation, which indicates that this is ~~a~~ one-man's idea of a good will mission, rather than a professional engagement ("peso-a-year" man).

The Cauca Valley Authority Board is now functioning, engineering proposals are being studied; the Board of five, and their General Manager, very attractive non-political people, are considering a trip to TVA, in January.

I think this provides your files with the stuff I said I would send.

Best, as always,

Dave

David E. Lilienthal

P.S. The New York Times had a rather lengthy piece about this venture in its issue of last Monday, November 29th.

Ed: Is our tentative December 18th farmers' reunion date OK at your house?

RECOMMENDATION
on the
ESTABLISHMENT OF REGIONAL DEVELOPMENT AUTHORITIES
by the Republic of Colombia

An informal report
submitted, upon invitation of

THE PRESIDENT OF THE REPUBLIC
HIS EXCELLENCY GENERAL GUSTAVO ROJAS PINILLA

by

David E Lilienthal
Industrial Consultant
44 Wall Street
New York, N Y., U.S.A.

June 25th, 1954

LETTER OF TRANSMITTAL

Dear Mr. President:

In early January of this year the Ambassador of Colombia to the United States, His Excellency Eduardo Zuleta-Angel, invited me on your behalf to come to Colombia as the guest of the Republic for first-hand observation of some of your country's opportunities and problems in the area of economic development. There followed a formal letter of invitation from you which for convenience of reference, I attach herewith.

This visit, made in the company of my wife, was intensely interesting; the cordiality and thoughtfulness shown us by yourself and by all the many Colombians we met, and the indispensable assistance of the Colombian Minister-Counselor to the United States, Sr. Dr. Diego Suarez-Costa who accompanied us on our trip, are deeply appreciated.

When I conferred with you in Bogota, you requested that after I had studied the matter carefully, I prepare an informal and non-technical report, recording my impressions, and such preliminary recommendations as I wished to make. This I have done in the attached document.

The report is in three sections. The first (I) is devoted to general impressions; the second (II) is a specific, recommended course of action; the third (III) contains some of the reasoning that lies back of my proposal.

You will note that I recommend a program of regional development of Colombia's great natural resources, along TVA lines, beginning with an area that in my firm opinion is the most admirably suited for an immediate start, namely the Cauca Valley, and extending to other Colombian regions as promptly as appears feasible

This program can begin at once, dependent only upon securing cooperation and approval from three sources:

(1) Local and regional initiative by responsible citizens of the region or regions in question.

There was ample evidence, on my visit, that this essential initiative already exists on the part of the citizens of the Valle del Cauca for the launching of the early steps of such a program for that region. Comparable regional leadership may appear in other areas.

(2) The cooperation of the World Bank.

It is clear that the World Bank is in accord with the approach I here propose of a regional development authority or agency, and would be prepared to proceed to assist the Valle del Cauca, in concrete and practical ways, to further such a regional program.

(3) The approval of the National Government, and its cooperation in providing the necessary authorization and definition of responsibilities of the regional authority.

The course I recommend is described in this preliminary report only in the barest outline. The more specific details, however, have been given a good deal of thought. It would seem that they are more appropriately left to later stages in the consideration of my recommendation, should it appear to the Government of the Republic that there is sufficient merit in this proposal to warrant further exploration and the taking of the next steps toward translating these ideas into action.

May I once more convey to Your Excellency my thanks and those of my wife for the friendliness shown us, and to express my admiration for the spirit of progress I found in Colombia.

Respectfully,

David E. Lilienthal

44 Wall Street
New York, New York

Bogotá, 21 de enero de 1954.

Señor Doctor
DAVID LILIENTHAL
44 Wall Street, care Lazard Freres and Company
NEW YORK, N. Y.

Muy estimado Doctor Lilienthal:

Conocedor de su simpatía por mi país y de sus capacidades como orco, muy cordialmente lo invito para que en unión de su esposa visite a Colombia, como huéspedes de mi Gobierno.

Colombia, está actualmente en una etapa verdaderamente interesante y vigorosa de progreso en materia de transportes, planes de electrificación e irrigación, colonización, explotación de recursos forestales, etc. El país goza de paz y todos los hombres de empresa reciben con el mayor entusiasmo todo plan de fomento industrial, agrícola y técnico y su consejo en todos estos aspectos importantes lo consideran particularmente valioso.

Si a Ud. le parece conveniente, su visita puede durar un mes y por demás está manifestarle que los pasajes para usted y su señora así como los gastos de permanencia de ambos correrán por cuenta del Gobierno. Para este fín, puede communicarse con el Embajador de Colombia en Washington, Doctor Eduardo Zuleta Angel.

Personal y oficialmente para mí su visita será especialmente grata.

Muy cordialments,

E. Rojas Pinilla

Mr. President:

Prior to my three weeks in Colombia, and since my return, I studied many reports dealing with economic, engineering, geographic, hydraulic and agricultural aspects of Colombia. During my visit I had an unusual opportunity to see certain parts of the country, at close range, and the benefit of talks with many leading business and professional men, public officials (from the President of the Republic to traffic policemen) and average citizens in all walks of life, in factories, stores, markets, coffee and cattle farms, mines, banks and schools.

However, the comments and suggestions in this informal report are certainly not advanced in any way as those of an "expert" on the Republic of Colombia; they are offered as the observations and suggestions of a visitor.

My observation of Colombia has inevitably been strongly influenced by the long period during which I had responsibility for the policies and management of large public enterprises in the United States, and in particular, as head of the Tennessee Valley Authority (TVA). Indeed, I assume that it was largely because the methods developed by TVA had brought about the agricultural, industrial and technical advancement of a previously under-developed region that I was asked to visit Colombia and to record my observations and suggestions. It is not surprising, therefore, that the chief specific suggestion I make as a consequence of my visit is based upon the TVA experiment in the coodinated development of natural resources.

I

General Comments

My brief but intense "exposure" to Colombia - and Colombians - leaves me with the clear impression that this young nation has entered upon a great, historic era of growth and development.

To make more concrete what I have in mind, let me point to some of the specific things I found that many Colombians think the country wants and needs.

1. More and cheaper food.
2. More electric power, for factories, homes and farms.
3. More and better schools, hospitals, sanitation and water supply.
4. More controlled water for the irrigation of farming land.
5. Flood control, to make more land available for farming that is now inundated in times of high-water, or in swampy condition.
6. More pastures and cattle raising on the hillside slopes and as a consequence, more land available for intensive farming on valley land where now only cattle are raised.
7. More and better transportation, by highway, railroad, air and rivers, better sea and airports and railroad terminals.

To reach such goals as these is in considerable measure a function of public works or public programs.

That some (though by no means all) of the fundamental ingredients for such desired advance and development as this list represents appear to be at hand, I have little doubt.

A new day in Transportation

Colombia will soon possess a splendid system of modern highways, built under conditions of infinite difficulty of terrain. These highways will be capable of handling vast tonnages swiftly and at relatively low cost. For the first time in the more than four hundred years of Colombian history, the strategic population and production centers of the country will be effectively inter-connected by improved highways and joined to the outlets to the seas.

The effects of this fundamental fact will be far-reaching in changing the whole life of the country, provided that these highways are well maintained, from the very outset. I suggest strongly, however, that unless a program is worked out and adequate funds are provided for a strong and sustained system of maintenance of these highways, the expected benefits will not be realized. Experience shows that this is of the greatest importance.

Coffee prices: relation to Colombian development

Still another concrete reason for the rather sanguine view I hold concerning Colombia's future development can be told in a single word: coffee.

Fair and profitable coffee prices, on a satisfactory volume of production, can provide the abundant stream of dollars by which to hasten the physical transformation of Colombia in the next decade. Coffee at fair prices can supply a flow of great machines from the factories of the United States and Europe - the giant earth-movers and paving machines for vast highway construction, the compressors and electric-shovels for dams to control Colombian rivers and irrigate her lands, the water-wheels and steam turbines to quadruple her electric power supply, the mining machinery to develop her coal reserves, the dollars with which to send her young men for training in the technical schools, hospitals and factories of the United States, Britain, France and other countries.

All of the things that a sustained period of good coffee prices would - or could - do for Colombia and its development is, I am sure, obvious enough to Colombians.

Colombians are also aware of the grave injury that could be done to their country's development, if coffee prices should once more be depressed, at a time when the prices of imported commodities are at a high level; they have lived through a period of "ceiling prices" regulation of coffee in the United States, and know what it means. Colombians also have some idea of what political attacks and economic pressures against coffee consumption in the United States could do artifically to depress the level of income derived from the export of coffee to the United States, and

what injury this could do to the economic and political stability of their country.

But the coffee consumers of the United States and the public generally in my country, do not understand these things; they do not believe that prices even within the general range of current levels are justified. In fact, there is an unmistakable, steady tide of antagonistic consumer and political sentiment in the United States on this subject, that may at any time be translated into various forms of interference with the free exercise of the competitive natural forces of supply and demand in determining coffee prices.

This could endanger the rapid development of Colombia's resources and industries. It bears directly upon the feasibility of the specific proposal and recommendation I make later in this Report.

My own observation of the facts indicates to me that fair coffee prices are in the economic, political and humanitarian interest both of Colombia and of the United States - and by "fair prices" I mean those fixed in a free competitive market, rather than by arbitrary political pressures, boycotts or governmental "ceilings".

Based on a good many years' experience in studying American public opinion, it is my opinion that a true and persuasive case can be made that will appeal to the consuming American public, and to American public opinion. That case rests upon clear assurance that the proceeds of

purchases of coffee in the United States were being used to advance great constructive purposes of Colombia and Latin America. The program I recommend is one of that character, namely the development of natural resources, the provision of a more secure living for the people, the strengthening of the soil, improving the health and educational opportunities for the children, controlling floods, expanding irrigation and power supply, bringing some of the comforts of life to fellow citizens of our neighbors of the Western Hemisphere.

An extra cent a cup more for coffee, paid in a free uncoerced market, would be gladly paid and considered a low price for so real a contribution to more stable conditions in our neighboring countries to the south. For the American people know full well, housewives and heads of families and taxpayers alike, from costly experience, that to make it possible for Colombia and Latin America to progress in these constructive ways, is not only right, but that in our own self-interest it means the advance of freedom and democracy and a set-back to Communistic designs on this Hemisphere.

So if the proceeds are used for such a development program for several of the regions of Colombia as I here suggest, the chance, in my opinion, of winning American public opinion to the cause of fair and compensatory coffee prices as a long-term policy, is improved. Hence coffee prices are a matter directly relevant to this Report and to the great development of the standard of living of Colombians which it envisages.

There is still another argument which would make a great impression on American public opinion. The United States will benefit economically from good coffee prices, if the revenues therefrom are used in part for a development program. It would benefit by the large-scale purchase of goods and machinery from the United States as part of such a major development undertaking. Hardly a community in the United States would fail to feel the effects of orders of equipment, etc., from Colombia.

But United States coffee consumers and public opinion generally, would react very badly, in my opinion, if the proceeds of the higher coffee prices paid by them go for purposes that clearly are not constructive. Not even the most skillful presentation or propaganda would be effective to persuade us to acquiesce for long in a high level of coffee prices, over a sustained period, unless such purposes have such an appeal as a development program would provide.

Stability and the desire for progress

During my visit I thought I saw evidence of increasing social stability or equilibrium, a lessening of extremes of difference between various economic and political groups in the community.

If this admittedly casual observation is borne out by the facts and by subsequent events, it would, on the whole increase the stability of the country and therefore its prospects of sustaining a great economic development in the immediate future.

But perhaps the most important single favorable factor I observed is the strong and articulate desire, among Colombians, to further the development of the natural resources of land, water, minerals, forests - and above all - (through better education) the people who are, of course, the basic resource of any country. I found quite widespread among people of varying outlook, a recognition that modern technical advances - whether of machinery, or medicine, or agricultural science or of engineering - now made it possible for the people of Colombia to move forward relatively rapidly, if only such technical advances could be made more widely applicable to Colombian problems.

The feeling was expressed that in these days there is nothing hopeless or inevitable about disease, drudgery, lack of good food at prices within reach, lack of decent roads and houses, flooded lands and lack of irrigation, and similar handicaps; that these problems are difficult but no longer insurmountable.

The second Liberation

In considering the potential changes that may await Colombia in the coming decade, there comes to my mind, by way of analogy the outstanding change of the 19th Century, in South American and Colombian life: the work of one who is known as the Liberator. General Bolivar won a victory over colonial oppression and thereby opened the door of political independence and freedom.

The time may well be close at hand, indeed it may be here, for another epochal series of events in Colombian life - and through her, for all of South America, a kind of Second Liberation.

The weapons of this Liberator, however, will not be swords and cannon, nor will the price of this victory be exacted in the blood of Colombians, spilled for one's homeland on the field of battle. The arms of Liberation this time will be new highways and railroads, electrification, dams for irrigation and flood control and power, new schools and universities and hospitals, new and improved methods of raising coffee, sugar, cattle, rice. It may be said that the fruits of victory over ignorance and disease, over floodwaters, and soil erosion, and poor crops, can be as glorious as those won in the battles fought by Bolivar and his fellow patriots. The Colombians who lead their countrymen toward this 20th Century Liberation will surely be as highly honored and as long-remembered as those who, following Bolivar more than 100 years ago, offered their lives to win their country's independence.

Such a great forward surge in the physical development of a nation's resources as one can realistically envisage for Colombia in the next quarter century carries with it more than physical benefits alone. The very foundation of such a program can, in and of itself, serve as a center about which the whole people can unite and stand together, despite their economic or political differences.

With so much constructive and creative work to be done, and so much improvement for everyone at stake, such a program may help to bring the entire nation together on the essentials of certain concrete tasks that need doing.

Private business and public development inter-related

In spite of obvious difficulties and handicaps, one can, with reason, anticipate a period of quickened economic development in Colombia. Most of this expansion and growth will presumably be upon the initiative and with the capital and human energies of private business, such as small-scale farming or large sugar plantations, small and large retail stores, the building of factories and houses - and so on.

A substantial part of the development, however, must necessarily be in the form of public or governmental expenditures. I refer, of course, to such elements as highways, electrification, dams, river navigation and flood control improvements, railroads, seaport facility improvements, airports, public health and sanitary facilities, and agricultural and forestry experimentation. Some of these - such as electricity and railroads - are not necessarily public, but in Colombia they are predominately so, and seem likely to continue to be.

There are two aspects of most of such public expenditures for development that cannot be emphasized too strongly:

(1) They are among the foundation stones upon which private business rests.

The most outstanding illustration of this of which I have personal knowledge is the manifold increase in private business activity in the Tennessee Valley that, within a decade, followed upon public development in that region.

Colombia provides another such illustration: the vigorous impetus to private activity provided by the building of the new system of trunk highways.

(2) They are long-range and essentially permanent. Once built, good or bad, they are there for a long, long time.

A governmental policy concerning taxes, or import control, for example, can be changed overnight if it does not work out well. But mistakes or miscalculations or short-sightedness in the method of developing a river by dams, for example, must be borne by the country for many decades.

The history of the United States contains a number of instances of badly conceived public works, resulting in waste, human misery and destruction. For example: hundreds of millions of dollars and thousands of lives have been lost because of the construction of levees to control floods on the lower Mississippi River, when good engineering would have provided control of the tributaries, by storage dams. Some of the consequences of that error in

public works of many years ago continue to plague the United States today.

Colombia can profit by such mistakes and can avoid them by the use of modern technical advances.

The future well-being of Colombia depends to a considerable degree upon how the public works and development programs she institutes are carried on, upon the methods and techniques employed in bringing to the people the fullest benefits within the briefest period of time.

It is with this category of permanent public works or public program activities that the Tennessee Valley Authority (TVA) was largely engaged. And it is to a concrete demonstration in Colombia, of some of the managerial techniques developed by the TVA (and now copied or adapted in other parts of the United States and the world) that the proposal I make in Part II is directed.

II

Specific Recommendation

After careful study and reflection upon the opportunities that exist in Colombia for rapid and solid progress toward her goals of improved standards of life for her people, and after weighing the practical and technical obstacles and advantages of several possible courses, I have reached the following conclusion which I respectfully submit for your consideration:

From a practical and technical point of view, at this stage it seems to me the best prospect for rapidly advancing the agricultural, industrial and educational welfare of the entire Colombian people lies in the creation of a regional development corporation or agency to serve as a demonstration of the coordinated, efficient and modern development of natural resources of waters, land, forests and minerals, and of industrial and educational progress.

On the basis of my experience in these matters I have no hesitation in recommending that the first such regional authority should be in the Cauca Valley. It is in that Valley that the prospects appear to me to be the best for quickly and economically demonstrating certain basic management, engineering and agricultural methods and principles, and of achieving concrete results for the country. It is my judgment that for special physical, technical and economic reasons the Cauca Valley presents one of the most

solid and practical opportunities to be found anywhere for the carrying out of a pilot-plant or demonstration project. This undertaking will not only greatly benefit the people of the Valley but the whole of Colombia, and perhaps, by example and precept, the whole of Latin America.

Although I strongly recommend beginning in the Cauca Valley, I suggest that additional regional authorities, with comparable functions and objectives, should be set up, in other regions, wherever there exist the necessary local and regional initiative and the requisite local capital, technical manpower and other resources. While intensive programs of this kind cannot be started everywhere at the same time, the Cauca Valley development should encourage preparatory activity leading to the initiation by other regions of similar programs for their own region. In fact, as I indicate more fully below, this should be one of the important long-term national objectives of the Cauca Valley enterprise.

Among the important ingredients for a regional development undertaking of the kind I have in mind there are three that seem to me essential:

(1) Initiative in the region;

(2) The cooperation of the National Government;

(3) The cooperation and appropriate financial participation of the World Bank and of other financing agencies.

More specifically:

(1) The <u>initiative</u> for such a regional program must come from the region itself. Without such willingness

and ability to start things, nothing effective can be hoped for from my proposal.

A beginning in this direction already exists in the Cauca Valley, as I learned on my visit to Colombia. Comparable local or regional initiative may develop in other areas, particularly after a pattern for actually getting such a program under way regionally has been worked out by the Cauca Valley.

(2) Approval and cooperation of the Central Government.

It would be necessary for the National Government to authorize the creation of a regional development agency or public corporation, by special charter or its equivalent. This authority or agency would be analagous, in corporate status, to such public organizations in the United States as the New York Port Authority or the Tennessee Valley Authority or the London Port Authority in England. In proposing the creation of the TVA in 1933, President Franklin D. Roosevelt called upon the United States Congress to create (as it did) an autonomous but accountable body which he described as "a corporation clothed with the power of government but possessed of the flexibility and initiative of a private enterprise." (My italics)

This charter would establish the regional agency's status, powers and duties; its authority to raise funds in the capital markets or from the World Bank; to issue revenue or other bonds to be sold in local capital markets for local

currency costs; to utilize its own revenues, in whole or part, derived from sale of benefits, such as water for irrigation, reclaimed swamp lands, electric power, etc., or to use certain departmental tax revenues; to employ technical and managerial personnel to carry on and manage the public works under direction of a board of directors of Cauca Valley citizens and so on.

This program will unquestionably result in a need for the expansion not only of public services but also a need and opportunity for the expansion of private business: agriculture, large and small; industry, large and small; mining of coal and other minerals; processing of food, petroleum, etc., and so on. There will consequently be a need, in my opinion, for a specially chartered type of economic development corporation, or its equivalent.

Such a development corporation would serve to provide part of the needs for medium and long-term private capital, and as an inseparable part of its role to supplement available technical and managerial services necessary for this anticipated expansion of business activity. The funds for such a chartered development corporation would presumably be provided partly by Colombian capital (both banks and individual investors), from private capital sources outside Colombia, and as required, by credits from the World Bank or other public financing agencies. I have concrete suggestions to offer along these lines, but clearly this is a subject that, however vital to the objectives of a higher living

standard in Colombia, can be deferred for discussion at a later stage.

(3) Approval and cooperation of the International Bank for Reconstruction and Development (World Bank).

It is clear that the World Bank would be receptive to the proposal I am outlining, would be prepared to be of assistance in furthering the objectives of the proposal, and would be ready to provide assistance to the citizens committee of the Cauca Valley and to the Government of Colombia in working out the practical problems of getting the undertaking on its way.

As to a way to begin:

There are several possibilities. The one I recommend is that the group of leading individuals in the Cauca Valley with whom I consulted on my recent trip be given the opportunity to take the initiative to secure the necessary charter and other authority from the Central Government, and secure the cooperation of the World Bank and of private financial institutions if considered desirable. The Planning Council of the Valley (Consejo de Planeacion del Valle), made up of private citizens of standing, might be the nucleus from which such a representative citizen group in the Valley could be formed. This group, or an executive committee thereof, could thus become the first Board of Directors.

If some such idea should meet with general approval of the Central Government and the interested leading citizens of the Valley, a program of a series of concrete steps, leading to a special charter, methods of financing, discussions with the World Bank, employment of a nucleus of full-time employees, etc., could then be worked out.

-o-o-o-

III

The foregoing specific and concrete proposal rests upon a simple axiom - and a great deal of human experience.

That axiom is this: The standard of living of Colombia depends upon her natural resources: the land, the waters, the minerals and forests - and what her people are able to do with these resources; the problem of increasing this standard of living is largely one of improving the METHODS of developing and making use of these resources of nature.

For many years Colombia's development of her natural resources was carried on in piece-meal fashion; the same was true of the United States of America. By "piece-meal" I mean simply that there were no genuinely effective efforts toward co-ordination and balance between the separate governmental activities devoted to river development, power, irrigation, transport, and the like. Moreover, this piece-meal approach - in Colombia as in the United States - did not proceed with the guidance and the discipline which would be afforded by a comprehensive picture of the country's economy, its potential resources, its over-all needs. Such a comprehensive picture would permit of a rational and prudent schedule of priorities as between competing demands for the same funds and human energies, and of a kind of balance sheet of what the country as a whole could afford, and how and where its available funds and energies could most effectively be used.

In recent years Colombia has felt the need for such a study and report on the whole of its economy and its

opportunities; she has moved away from a piece-meal, project-by-project approach to her development. In 1949 Colombia requested the World Bank to set up a group of experts to make a preliminary study of her economy. The resulting Comprehensive Report was studied carefully by an Economic Development Committee made up of Colombians, whose recommendations then served as the basis for action taken by the Government to carry out certain of the Report's conclusions.

So that this new over-all approach to Colombia's development should have a continuous administrative basis, an Office of Planning was set up, as an aid to the President of the Republic, and is actively functioning. A number of specific projects have been completed, designed to enable Colombians to make better use of her resources; others are well under way; others are in the planning stages. Of those well under way the most significant would seem to be that which will give the country a modern and national transportation system of trunk highways and railroads. Recently, a study of the country's electricity needs, on a nation-wide basis, has been authorized and the preliminary engineering field work is now under way.

In the light of such facts as these, it does not seem an overstatement to say that as of mid-1954 Colombia, as a nation, has now adopted in principle, and has begun to put into operation, that practice of prudence and foresight which successful private businesses and individuals have followed, for which the word "planning" is as suitably

descriptive a term as any other.

My proposal presupposes a continuation, in full force and effect, of the national planning functions now residing in the central Government. The establishment of a regional agency simply provides machinery by which to focus effort on getting done those things that can most effectively be carried out on a regional or local rather than a national basis.

Under my recommendation the national Government would continue its present planning role of providing an over-all, balanced and national viewpoint, in judging the priorities to be assigned to projects for resource development and in advising on the availability of pesos, dollars, or credit for such projects, as well as on all other nation-wide policy or practical consierations.

In short, my suggestion of regional development is not in any way designed to weaken or dilute the effort of the Office of Planning; on the contrary, the proposal is intended to, and I believe would in fact, supplement the national planning effort.

The first step taken by Colombia toward comprehensive development having been taken, on a national basis, it should- I suggest - now be followed by a logical second step, on a regional basis. The second step should be designed and intended - as was the first step - to improve the methods of utilizing the economic resources of the country.

In considering this matter of method, I have kept before me certain premises and principles which are discussed below.

First:

The most effective way for all the regions of Colombia to learn the best methods of resource development is by observing actual concrete cases of such new methods. The best method of learning is by doing.

Accordingly, the regional agency should be a demonstration area, a kind of advanced practical university in the working out, and teaching (by example and precept) improved methods of the development of resources; later on, perhaps, the demonstration can be extended to other local and regional problems, such as public administration, education, sanitation, and the like.

It is contemplated, in my proposal, that men from all over Colombia would come to the "demonstration region" for observation of methods, and for training, which they can later apply in the development of their own regions.

In this way the region might serve, for Colombia, the function of "teaching by doing" that has been such a central feature of the TVA, in the United States.

Second:

In the decade or two of development work that lies ahead, Colombia wants the work done, to the greatest extent feasible, by Colombians: managers, engineers, agronomists, economists and accountants, geologists, etc., etc.

In the suggestions I have to offer I have kept this important point in the forefront. I look upon the regional agency as an important means of practical training of Colombian technical personnel, from all parts of the country, training which they can later put to use in other regions of Colombia.

As is well known, academic training, in the great technical and engineering universities of North America and Europe is not enough, of course, to qualify young Colombians to design, direct and manage large technical enterprises. An opportunity for practical experience, under the guidance of older heads, is essential.

That training is most effective, my experience has demonstrated, where young trainees and "interns" are in groups, where they can also learn from each other.

It is my thought, therefore, that the regional agency provide a nation-wide training area, not only in engineering, but in other related technical activities, in which administration and management should be included.

Third:

The demonstration region (or regions) should be areas where beneficial results can be achieved at the earliest possible moment.

To attain public support of a long-range effort, a "show-case" is needed. This requires, it seems to me, an area or region of Colombia where the conditions are ripe for relatively quick results.

It is well-known that the patience of the public is sometimes not its most outstanding characteristic. Accordingly, it is the part of prudence for a nation's leaders, when seeking to achieve a great program that inevitably requires a decade or more for fruition, to seek an opportunity to show results rather rapidly as to a part - a representative part - of the total undertaking.

This has led me to the conclusion that for a demonstration, in Colombia, of the techniques worked out in the TVA, a region or two should be selected where the results can be made plain most rapidly.

I have suggested that the first such regional development agency or authority be in the Valley of the upper Cauca River, which roughly approximates (but is not identical with) the political department of Valle del Cauca.

A principal reason for starting with the Cauca Valley is the existence in that region of local initiative for such a regional development on the part of a number of responsible regional leaders in business, professional and community circles.

But an equally important consideration for suggesting the region of the upper Cauca River Valley is my conviction that the prospects of early success, in that favorable situation, are most excellent. Moreover, it is a region where concentration of effort on improved methods of development will yield large returns for the Government and private

business and individuals, as compared with regions which are less well developed.

There is the further advantage, in beginning with an already relatively prosperous region. The results produced will attract the attention of other regions to the improved methods, and render more likely their adaptation to the needs of those other regions, than if a far more difficult region were the site of the initial regional demonstration.

The size of the Cauca Valley is another advantage it possesses. It is, relatively, a small region, and relatively homogeneous. This means it would be a far less costly and far more prudent place for a pilot-plant in which to make a demonstration of river control methods, for example, than a larger and more heterogeneous region. And yet it has a good many (though, of course, by no means all) of the problems of natural resources to be found in a number of other parts of Colombia.

While the Cauca Valley, according to my suggestion, would be the first demonstration-area, development work already in progress elsewhere would not be interrupted. Projects that are "ready to go" or urgently needed would not be affected.

Fourth:

I have framed the proposal with a thought to the continued cooperation of the World Bank, as one important source of loan-capital for Colombian development, and as a proven friend of Colombian progress.

The Bank acts upon the basis of projects presented in reports which must stand up under scrutiny for their financial and physical soundness. It must be selective since there is probably more demand for capital from the Bank, in South America and elsewhere, than the Bank could prudently satisfy.

A demonstration area such as I have suggested might have considerable advantage to Colombia, in improving and perfecting the method of presenting future loan-projects to the Bank, and to private financial institutions.

The functions and responsibilities of such a regional authority would, of course, have to be carefully defined, after discussion between regional leadership and the President and his official advisers. These functions would vary somewhat from region to region, depending upon the differing conditions of climate, terrain, available local leadership, financial resources, etc.

Only those intimately familiar with the opportunities and the needs of the Cauca Valley (or any particular region) and its traditions and laws could set down the full design for such a regional agency. Obviously I am not qualified; but I doubt not that a group of men could be assembled who would be qualified for this task.

Even a visitor without intimate knowledge of the Cauca Valley, however, can conjecture what some of these functions might be.

Certainly one function would be the development of the water resources of the upper Cauca River and its tributaries.

The development of that stream is inseparably inter-related to the land, and its most beneficial use. This inter-relation is one imposed by Nature; the regional agency should reflect this inter-relation, in its charter.

At times parts of the land of the Cauca Valley, I am informed, cannot be used effectively for agriculture because the river is out of its banks, the land flooded or swampy. At some seasons some of the Valley's land does not yield what it might because of lack of water; storage, control and direction of the river, by dams and by irrigation works could alleviate this.

The regional agency that has responsibility for the river and the land would also be concerned with electric power, since the river, controlled to prevent floods and promote irrigation, can also be a source of large amounts of electrical energy. The functions of a regional authority responsible for the river would presumably, therefore, extend to generation of the river's energy, subject to national policies.

But whatever the particular functions for which the Cauca Valley Authority might be given regional responsibility - whether the foregoing or some others - this much I think would be generally agreed: the most effective direction of natural resource activities of Government is not something

that can be done exclusively by National government. Local or regional governmental units, smaller than the nation as a whole, close to the problems of a particular river or valley, can add greatly to the effectiveness of such an effort.

One of the reasons and purposes for the setting up of a regional development agency for the Valley of the Cauca (and other regions which may subsequently sponsor, initiate and support such regional development schemes) is, of course, to benefit that region. This, in turn, would benefit the whole of Colombia.

But this is not what I have chiefly in mind.

My chief purpose relates to that part of the axiom with which Part III of this informal report began: that the best hope of increasing the standard of living of the people of Colombia is by the working out of better methods of handling the natural resources of the nation, upon which everyone's future prospects depend.

What I am suggesting, then, is that a particular region establish itself as a national demonstration or pilot-plant for the working out, step by step, and in concrete cases, of improved methods.

The whole nation, and its various regions, would derive benefit from the initial area's work, as a demonstration in methods and as a training-school for men from other regions. These national benefits would justify some support from the National Government, financially and otherwise, it seems to me.

(A discussion of the specific improved methods I have excluded from this preliminary memorandum; they could more appropriately be set out in subsequent discussion, when the specific design of a Colombian regional agency was under consideration.)

Initially, I would suggest, the demonstration should be confined to basic natural resources; chiefly the river and the land. But as time goes on, and the actual work is under way, the demonstration might well be broadened to include other local or regional problems, such as improved methods of local and regional public administration, local and regional sanitation and public health, local and regional transport, and so on..

The suggested Cauca Valley demonstration project will, in practice, differ markedly, as it should, from the TVA in the United States. But the basic TVA idea of a demonstration area is essentially the same: a place in which to work out improved methods, for the lessons the demonstration may bring to other areas of Colombia, and perhaps to the rest of Latin America, which may find this experiment of great interest, since it would be the first of its kind in South America.

Respectfully submitted,

David E. Lilienthal

Excerpts from Inaugural Address
by
Lt. General Gustavo Rojas Pinilla

To the Colombian Constitutional Assembly Upon
His Election to the Presidency of the Republic
on August 7th, 1954

"I do not want to finish this chapter on the technical approach to our agricultural production without making a special reference to the projects outlined by that eminent American, David Lilienthal, for the Cauca and Sinu valleys; his idea of taking advantage of advanced technical knowledge perfected in the Tennessee Valley, is what he himself describes as a 'pilot plant' of integrated development for those promising territories, an experiment of great worth not only to Colombia but to the whole Western Hemisphere.

His idea has all the backing of the Government which only awaits a more specific and detailed report and plan of its possibilities and consequences before starting the study of it.

For the Government and for the country it is a great honor and a great fortune to count upon the experience of one who has organized one of the most important undertakings of our age, such as the creation and administration of the afore-mentioned Tennessee Valley, the production of atomic energy and his keen interest in the development problems of our country.

Mr. Lilienthal can count upon the adequate backing and cooperation of all those Government organizations or national bodies which may be called upon to collaborate with him on this promising enterprise.

With international cooperation, its realization does not seem too difficult, and I feel sure that we shall reach our goal,

not only because world organizations, which have given us their help and their support, have followed with interest the development of our country, but because the above-mentioned project has a deep significance in the welfare and economic prosperity of other similar regions of the Western Hemisphere.

A natural consequence of this plan will call for the development of private industries in its various branches, adaptable to our environment, so as to give greater employment to our people and providing greater production for internal consumption therefore saving foreign exchange currencies.

The Government has therefore to assume the task of directing private initiative, not in a compulsory manner but through indirect stimulus, banking credit, facilities for the importation of capital, goods, and technical and commercial research, which will awaken and stimulate the interest of private capital and serve as a guide for the planning of its interests.

Much capital has been badly and unproductively invested because capital has ignored the infinite possibilities of modern manufacturing techniques and the purchasing capacity of markets or sources of raw materials. As an initial step the Government proposes to put out an issue of securities to be readily absorbed by the market, the profits of which will be earmarked for the importation of machinery and equipment for new industries and enlargement and improvement of existing plants."

CHARTER OF CAUCA VALLEY AUTHORITY, COLOMBIA, SOUTH AMERICA

Translation from the original in Spanish

DECREE No. 3110 of 1954

(October 22, 1954)

Which creates the Autonomous Regional Corporation of the Cauca, pursuant to Legislative Act. No. 5 of 1954. The President of the Republic of Colombia, pursuant to his legal powers and especially those conferred upon him by Legislative Act. No. 5 of 1954, and

WHEREAS:

First - It is the unequivocal policy of the present Government to work for the improvement of the conditions of life of the Colombian people, and to this end it desires to put into effect a development plan which will convert into reality the rapid improvement called for by the initiation on the country of the "Era of the Colombian Man".

Second - The Government considers that one of the most effective means for obtaining these objectives is the establishment of autonomous regional bodies with direct participation by the populace of the areas where these bodies shall operate, following the practices and methods of the TVA. The establishment of such autonomous bodies for the comprehensive development of various regions of the country has been recommended by outstanding public men like Dr. David Lilienthal, in his recent report, prepared at the initiative and request of the President of the Republic, as a means of fully utilizing the natural resources at our disposal;

Third - Dr. Lilienthal recommends that the first such autonomous Corporation be established in the area consisting of the drainage basin of the upper Cauca River and the adjacent watershed of the Pacific where, in view of the characteristics of the region, there are optimum conditions for increasing and improving in the shortest possible time the production of food and other essential products, so as to

contribute to lowering the cost of living, and which may serve as an instrument of experimentation and a demonstration project from which all the regions of the country will derive benefit.

Fourth - Legislative Act No. 5 of 1954 provides: "The Legislature is empowered to create public bodies, endowed with autonomous juridical personality, to provide public services, as may be especially determined; these bodies will be given powers to engage in the acts necessary for the fulfillment of their objectives, and their activities may extend to the entire national territory or to part of it". And said Legislative Act also provides: "Until the Constituent Assembly assumes legislative functions, the Government is fully authorized to exercise the powers granted in this Act to the Legislature".

DECREES:

Article 1. A public body is hereby created to be called the "Autonomous Regional Corporation of the Cauca" to promote the conservation and development of the territories substantially constituting the upper Cauca River drainage basin, the adjacent watershed of the Pacific and such other territories as may be related to or materially affected by the activities of the Autonomous Regional Corporation of the Cauca.

Article 2. The objectives which the Corporation shall pursue, within the territory of its jurisdiction, shall be the following:

a) To generate, transmit and distribute electric power.

b) To provide for the coordination of the region's electric power systems in the interests of economy and efficiency.

c) To control the course of rivers so as to prevent floods.

d) To utilize water resources for irrigation.

e) To reclaim and improve land by drainage or other means.

f) To regulate the utilization of water for public and industrial supply.

g) To protect waters against contamination.

h) To improve river courses in connection with their several uses.

i) To promote soil conservation and reforestation, and to regulate the exploitation of publicly-owned forest lands.

j) To encourage proper use of lands for agriculture and livestock.

k) To preserve flora and fauna.

l) To stimulate the development of mineral resources.

m) To encourage the improvement of communications and transportation systems.

Article 3. In order to carry out the objectives listed in the preceding Article, the Corporation shall

a) Act as an autonomous, decentralized and non-political body.

b) Apply modern methods of technology and business.

c) Carry out its activities in such a way that they will serve as a demonstration and training program for the region under its jurisdiction and for other regions of the country.

d) Seek to fulfill its objectives in such a way that the income from projects shall repay the initial investments and lead to the accumulation of funds to help finance the entire program. In case of liquidation, the liquid capital of the Corporation shall revert to the Nation and to the other public bodies that have made capital contributions to the Corporation, in proportion to the size of these contributions.

e) Orient its program so as to encourage private initiative and to create new opportunities for private participation in the development of the region.

f) Cooperate with National, Departmental and Municipal authorities, as well as with private persons, associations and private enterprises.

Article 4. The Corporation shall have the powers necessary to carry out its objectives as indicated below:

a) As an autonomous juridical entity, the Corporation may acquire and dispose of real estate and other property, borrow money domestically or abroad, lend money, guarantee its obligations by pledging its assets, and enter into contracts of all kinds to carry out it objectives.

b) The Corporation may receive donations and bequests and incorporate them into its capital.

c) The Corporation may manage, maintain, administer, develop and improve the properties and assets to which it has rights.

d) The Corporation may have recourse to the procedures of eminent domain when necessary to carry out its objectives.

e) The Corporation may determine which of its services should be reimbursed by the beneficiaries or users through the payment of assessment taxes or charges and may fix the manner in which such taxes or charges are to be fixed and collected. Assessment taxes shall be applied in accordance with the law; and the rates shall be submitted for the approval of the competent national bodies.

f) The Corporation may obtain directly technical and financial cooperation from the International Bank for Reconstruction and Development and from other national or international entities.

Article 5. The domicile of the Corporation shall be the city of Cali, where it will have its headquarters and administrative offices.

Article 6. For the administration of the Corporation, there is hereby created a Board of Directors, to be composed initially of the five members who now form, or those persons who may subsequently be appointed to replace the present members of, the Planning Committee of the Department of the Cauca Valley. This Board shall act until the final Charter of the Corporation is approved. The Board shall present the Charter to the President of the Republic for approval within six months from the date of this decree. This Charter shall define the manner of constituting future Boards of Directors. The Board shall elect its President and other officers and shall obtain the services of such local or foreign personnel as may be required to carry out its objectives.

The Board shall fix the compensation of its employees, define their duties and provide a system of organization to fix responsibility and promote efficiency. The members of the initial Board shall receive $50.00 (Pesos) per meeting, but in no case, regardless of the number of meetings, more than $400.00 (Pesos) per month. The Board may meet with no fewer than three members, and adopt decisions by majority vote of those present.

Article 7. Until the final Charter of the Corporation is adopted, the President of the Board of Directors shall be the legal representative of the Corporation in dealings with all officials, corporations, or other juridical or natural persons.

Article 8. The aforesaid Board of Directors shall have the following functions:

a) To prepare the Charter for the Corporation and submit it for the approval of the President of the Republic.

b) To study and submit for the approval of the Government the territorial limits within which it shall operate.

c) To prepare the initial development plan for the region after making a thorough analysis of existing reports and studies dealing with the improved utilization of the natural resources of the region.

d) To carry out such other studies, research and experiments as necessary to fulfill the objectives of the Corporation.

e) To prepare the budget of expenditures based on the income of the Corporation.

f) To prepare its rules of procedure.

Article 9. To initiate operation of the Corporation, five hundred thousand Pesos ($500,000) shall be allocated, to be provided in equal parts by the Nation and by the Department of the Valle del Cauca. To this end, the National Government shall establish the necessary budgetary appropriation, providing for the required special credits and budgetary transfers. In the same way, the Governor of the Valle del Cauca is authorized, without any further approval, to provide the amount necessary for the contribution of the Department, to include it in the departmental budget and to make the necessary budgetary transfers.

Article 10. The accounting of the Corporation shall be maintained in accordance with the legal procedures for private corporations. The auditing of the Corporation's accounts shall be done by a special auditor appointed by the President of the Republic, who shall fix his salary, to be paid by the Corporation. The functions of the special auditor shall be those fixed by Law 58 of 1931 for private corporations. The special auditor shall present to the President every six months a report on

the Corporation's accounts. The accounts of the Corporation shall be considered finally settled when approved by the special auditor.

Article 11. The properties needed for carrying out the objectives of the Corporation are hereby declared to be of public utility. When it becomes necessary to acquire a specific property, if it is not possible to obtain it by voluntary sale from its owner, the required declaration of necessity may be made by the National Government at the request of the Board of Directors established by this decree or of the Board which replaces it in accordance with the Charter of the Corporation. The demand for expropriation shall be presented by the legal representative of the Corporation and shall be handled by the Courts in accordance with the applicable laws.

Article 12. The National Government is hereby authorized to guarantee all credit operations of the Corporation, whenever in its judgment this may be indispensible and when general circumstances make it advisable.

Article 13. The Corporation shall have the rights of way established by law on public roads and private and public lands for the transmission of electric power and water for public service purposes.

Article 14. When the Corporation assumes its definite form, it shall acquire, in the name of the Nation, the right to regulate the allocation and distribution of public waters within the territory of its jurisdiction, in accordance with the pertinent laws. At the same time, it is understood that the Nation hereby grants to the Corporation rights to use the water power of the streams included within the territorial limits fixed for its activities.

Article 15. The plans adopted by the Corporation through its Board of Directors shall be considered definitive once approved by the National Planning Committee. Approval in this way of any plan or program of the Corporation shall constitute a determination that the works required for the execution of said plan or program are useful and beneficial, that they are deserving of the support and encouragement of all other public bodies, and that they are for all constitutional purposes included within national plans.

Article 16. Recourse may be had against the acts of the Corporation, or of any of its dependencies, to the Council of State, in accordance with the general standards indicated in Law 67 of 1941.

Article 17. This Decree is effective from the date of its issuance.

EL EXPERIMENTO LILLIENTHAL

Las bases para la realización en el Valle del Cauca del famoso plan, que más bien obedece a un soberbio experimento, por parte del científico David Lillienthal, han despertado, naturalmente, revuelo de apreciables dimensiones en todas las zonas de la economía nacional.

Las repercusiones de este proyecto, que obedece a lógicos racionamientos técnicos, absorben ya la inquietud de las gentes de trabajo, de los planificadores de las finanzas en Colombia. Por supuesto, no deja de observarse cierto malestar centralista en algunas expresiones particulares, sin duda empeñadas empresas utópicas para sus regiones respectivas.

El doctor Lillienthal, en concepto de sus cotérraneos, pertenece a una jurisdicción humana especial. Efectivamente, la metamorfósis sufrida por Tenneessee Vally, que antes fuera una extensa porción telúrica sin sistema nervioso, desprovista de todos los síntomas naturales de riquezas, es hoy una parcela de la cual depende, en gran parte, la economía de los Estados Unidos. Así, pues, el sabio de Illinois es toda una autoridad en la materia. Sus propósitos planificadores para nuestra comarca tienen todas las características de una proeza destinada a triunfar.

Sin embargo, debemos ser un poco más reales, menos exhuberantes en los vocablos, sin que ello, desde ningún aspecto, vaya a resultar en estremecimiento pesimista. Para todo experimento existen contingencias peligrosas. Y como en el caso del plan que va a experimentar aquí la alta mentalidad de Lillienthal, aún no se han hecho estudios preliminares ni a fondo, las circunstancias no han sido todavía, definitivamente, puntos de partida para afirmar que se ha triunfado.

Quien sabe si los estudios sobre irrigación, densidad de las lluvias, control de inundaciones, electrificación, calidad de las tierras, etc., vayan a ser favorables en la pura aceptación de la palabra. Ahí están, precisamente, las contingencias de peligro. Una vez puesto en vigencia el experimento, quien sabe si la demanda justifica la producción de las cosechas. Hay, desde luego, otras muchas probabilidades que no siempre pueden estar de acuerdo con la generosa e insospechada iniciativa.

Tánto el señor Lillienthal como sus asesores, son hombres de vasta experiencia en el tratamiento y en el contacto con climas definidos, como en Tenneessee. Aquí la situación del trópico ofrece perspectivas diferentes. En ninguna región de Colombia están demarcadas las estaciones con la precisión climatérica de las fechas exactas.

Bueno sería tener en cuenta lo anteriormente expuesto, para que el optimismo tropical no engendre aventuradas hipótesis.

De otra parte, conviene hacer notar que el alentador experimento, no solo tendrá la colaboración decidida e indispensable del Banco Mundial de Reconstrucción y Fomento, sino también la contribución natural de los gobiernos nacional y departamental. Los aportes de la nación y del Valle deberán ajustarse a una severidad irrevocable, toda vez que sin su exactitud vendría el desmoronamiento y los tropiezos sustanciales.

Así las cosas, el experimento de Mr. Lillienthal tiene, necesariamente, que constituír una empresa de envergadura sin antecedentes en América Latina. Pero ocurre que el afán de emulación sin fundamento de algunas secciones del país, ya se siente por insistentes campañas individualistas, con el eterno estribillo de que el Valle del Cauca es un filón de oro y por ésto mismo se basta por sí solo. Ello indica que aquí nada hay que hacerse. Equivocado criterio que en ningún caso se compadece con el proyecto de Lillienthal, porque si bien es cierto que nuestra parcela posee privilegios naturales que no se encuentran en ninguna otra región, las demás, por ello mismo, no estarían en capacidad de poner en marcha un experimento como el nuestro.

Aprobado el Plan Li

Mil Millones de Pesos se Invertir

Bogotá, octubre 11 (De nuestra oficina de redacción).— Un vocero autorizado informó esta tarde que durante el consejo de ministros que se reunió hoy desde las once de la mañana en la residencia de Melgar, presidido por el jefe del Estado se había aprobado el plan Lilienthal que supone la inversión de mil millones de pesos en el término de diez años y la creación de una corporación especial que se encargará de supervigilar los gastos y la realización de las obras, las cuales se iniciarán en el Valle del Cauca. Basado en esta afirmación el mismo portavoz agregó que en el curso de la presente semana el gobierno nacional expedirá el decreto respectivo y autorizará la iniciación de labores en el Valle del Cauca, con los empréstitos asegurados en el Banco Internacional de Reconstrucción y Fomento.

Como se sabe, al desde las once de la m tieron, invitados espe dor Garcés Giraldo y lienthal quienes con l dente Rojas sostuvier cia para acordar las b realización del plan norteamericano.

Muy poco ha logr reunión del consejo d cuerdo con los inform nos, el mayor tiemp se destinó al plan Lili bien se alcanzó a dis tes puntos:

Plan Lilienthal Para el Valle

se Invertirán en el Término de Diez Años

ción y Fomento.

Como se sabe, al consejo que se reunió desde las once de la mañana en Melgar, asistieron, invitados especialmente, el gobernador Garcés Giraldo y el científico David Lilienthal quienes con los ministros y el presidente Rojas sostuvieron una larga conferencia para acordar las bases definitivas para la realización del plan propuesto por el sabio norteamericano.

Muy poco ha logrado trascender sobre la reunión del consejo de ministros, pero de acuerdo con los informes responsables fidedignos, el mayor tiempo de las deliberaciones se destinó al plan Lilienthal, auncuando también se alcanzó a discutir sobre los siguientes puntos:

1º) Enmiendas al decreto sobre injuria y calumnia, sobre el cual se referirá seguramente el presidente Rojas en el discurso de Paz de Río.

2º) Creación del consejo económico.

3º) Posible modificación de la política tributaria sobre todo en lo relativo a la tributación que ha ocasionado liquidación de numerosas sociedades anónimas que contaban con un activo de cerca de doscientos millones de pesos.

4º) Creación de nuevos recursos para financiar los ensanches de Paz de Río.

Los ministros del gabinete ejecutivo regresarán mañana a Bogotá, acompañados del presidente Rojas, para el miércoles viajar a la inauguración de Paz de Río.

COLOMBIA

PRESIDENCIA DE LA REPUBLICA

PRIVADO

Bogotá, Noviembre 15 de 1954.

Señor Doctor
DAVID E. LILIENTHAL
44 Wall Street,
NEW YORK, N. Y.-

Muy estimado Dr. Lilienthal:

Debo expresar a Ud. nuevamente mis agradecimientos por su ayuda y recomendaciones encaminadas a poner en marcha un plan de desarrollo integral de los recursos naturales en la región del Cauca, siguiendo los métodos y las prácticas del TVA que usted orientó y dirigió con extraordinario éxito.

Mi Gobierno decidió aprovechar los importantes servicios ofrecidos por usted y creó la Corporación Autónoma Regional del Cauca en la que tendrá usted el carácter de Consejero del Presidente de la República.

El doctor Diego Garcés Giraldo, Gobernador del Departamento del Valle, me ha informado que usted desea prestar sus servicios sin remuneración alguna, estableciendo tan sólo una cifra nominal de un dollar por año como honorarios simbólicos. Soy el primero en agradecer su deseo de ayudar a los colombianos con ánimo altamente desinteresado y como buen vecino, no obstante el especial valor en que es apreciada su labor en todos los países.

Queda entendido que su vinculación a esta etapa inicial de la organización estará determinada por las circunstancias especiales de sus actuales compromisos, y que sólo dedicará usted al desarrollo del programa colombiano, el tiempo de que pueda disponer, sin menoscabo de sus personales intereses.

Cuando sea necesario que usted viaje a Colombia para consultas en relación con estos planes, me es grato manifestarle que usted y su señora vendrán como huéspedes del Gobierno Nacional y que la Corporación hará los arreglos del caso para que los gastos relacionados con el desempeño de su labor le sean cubiertos adecuadamente.

En reconocimiento de las erogaciones que usted ha tenido que hacer hasta la fecha, desde la preparación de su informe y en desarrollo de los pasos iniciales para la organización de la Corporación, que ascienden aproximadamente a la suma de tres mil quinientos dólares (US$3.500.oo), el Gobierno pagará a usted esta suma, que le ruego aceptar, de acuerdo con lo convenido entre usted y el doctor Diego Garcés Giraldo.

Es entendido que este arreglo amistoso y cordial entre nosotros, cubrirá un período de seis meses, que es el plazo que se calcula para la organización de la Corporación, en la importante etapa de su iniciación: pero es obvio que, cualquiera de nosotros podrá terminarlo en cualquier tiempo, a voluntad.

De usted muy cordialmente,

G. Rojas Pinilla

Translation

Bogota, November 15, 1954

Dr. David E. Lilienthal
44 Wall Street
New York, New York

My dear Dr. Lilienthal:

I must express to you anew my thanks for your help and your recommendations designed to put into operation a plan for comprehensive development of the natural resources of Colombia, following the methods and practices of the TVA, which you guided and directed with the extraordinary success recognized throughout the entire world.

My Government has decided to adopt your recommendations, and appreciates in its full value the opportunity to avail itself of the important services which, in response to our repeated requests, you have indicated you are prepared to offer as an adviser to the President of the Republic and as a consultant to the Autonomous Regional Corporation of the Cauca, which has just been officially created.

Dr. Diego Garces Giraldo, Governor of the Department of the Valle, has informed me that you wish to offer these important services without remuneration, proposing only the nominal sum of one dollar per year as a token figure. I am the first to recognize and to thank you for your desire to help the Colombians in a highly altruistic and humanitarian spirit and as a good neighbor, notwithstanding the great value placed upon your services, both in the United States and in all the countries of the world. This constitutes an additional proof of the noble sentiments that inspire you as a great American, which have earned for you the everlasting gratitude of your countrymen and now of Colombians.

It is understood that your connection with this initial phase of the organization, and the services that you are offering, will be determined by the special circumstances of your present commitments, and that you will devote to the work relating to the development of the Colombian program only the time that may be available to you without interfering with your personal affairs.

When it is necessary for you to travel to Colombia for consultations connected with these plans, it is a pleasure for me to state to you that you and your wife will be guests of the National Government.

For the expenditures you have had to date, since the preparation of your report and in developing the initial steps for the organization of the Corporation, which amount approximately to Three Thousand Five Hundred Dollars (U.S. $3,500), the Government will pay you this sum, which I beg you to accept in accordance with the Agreement between you and Dr. Diego Garces Giraldo.

It is my understanding that this friendly and cordial arrangement between us will cover a period of six months, which is the important initial period, anticipated for the organization of the Corporation but, naturally, either of us may at any time terminate the arrangement at will.

Very sincerely yours,
/s/ E. Rojas Pinilla

Lilienthal, Da

July 30, 1954

Dear Dave:

This is being dictated from my log house in the country. I hope you will forgive me for not having been in touch with you before this regarding your letter of April 28th.

I'm sorry we couldn't deal with TVA before we went off the air for the summer, but we now have active plans to do it in the Autumn. I had one conversation with Gordon Clapp and Larry Fly a week or so ago, and I shall hope to pick your brains about it when I get back in September.

As ever yours,

Mr. David E. Lilienthal

April 28, 1954

Edward R. Murrow, Esq.
C.B.S.
485 Madison Avenue
New York, New York

Dear Ed:

This letter is about a rather dramatic thing that is going on in the Tennessee Valley, of what I think is pretty considerable national importance, moreover it is an issue both sides of which can be presented through the filming of conversations, etc., of ordinary everyday people - something you and Fred Friendly have developed to a high art.

The particular issue is that between now and May 18th President Eisenhower will either reappoint Gordon R. Clapp as Chairman of TVA, or he will appoint someone else. Clapp's term expires on May 18th; another Member of the Board, Dr. Harry Curtis, is 71 years of age so, in effect, this may be a new head office for TVA.

I think I mentioned to you that the people down there consider the TVA something that they developed pretty much themselves and have strong feelings about it. On the other hand, there are critics of TVA, and a number of strong individuals in the Tennessee Valley who are very capable of presenting the other side.

So I would guess that this lends itself to your technique of interviews with farmers, housewives, businessmen, and the meetings of citizens that go on in the Valley whenever anything about TVA comes up that they get worked up about, and they certainly are worked up about the prospect of something adverse happening to their 20-year-old baby. Gordon Clapp himself is quite a personage and one who is almost completely unknown to the American public except through newspaper accounts.

I know that if your film crew wanted to undertake it, they could get plenty of cooperation from local people so it wouldn't be too difficult a chore in that respect. Also there is quite a library of film, as I understand, showing the way the Tennessee Valley looked in the early days of TVA and the rather blossoming effect it has today - particularly today, since the spring in the Valley is spectacularly lovely.

With warm personal regards, as always

Dave

Lilienthal, Dav

February 8, 1954

Dear Dave:

Thanks for sending me the note from Chief Wilson. He is really a top man to work for and so far has given me my head and stood behind me when the going was rough.

I am as ever grateful for your kind comments and regret only that we have so little opportunity of seeing each other. Perhaps we can remedy that when you return from Colombia. I am off to Berlin at the end of the week for a quick look through cameras at the Foreign Ministers Conference.

Sincerely yours,

Mr. David E. Lilienthal

Aluminum Company of America

I. W. WILSON
PRESIDENT

Pittsburgh 19, Pa.

December 31, 1953

Mr. David E. Lilienthal
44 Wall Street
New York, New York

Dear Dave:

As you can well imagine, we receive quite a few letters commenting upon the "SEE IT NOW" program presented by Ed Murrow and sponsored by Alcoa. These comments run the whole gamut from bitter criticism to high praise.

However, I can assure you that none of them has brought me the satisfaction that I obtained from your thoughtful letter of December 30th. We so heartily reciprocate in the feelings you express in your letter toward us that we place a high valuation on your opinion of our TV program and are gratified that you feel that it makes a real contribution to the public. Your letter is deeply appreciated.

Your many friends in Alcoa would wish to include their best wishes with mine that this new year and the succeeding ones will bring you health, happiness and prosperity.

Sincerely,

Chief

HANOVER 2-1200

December 30, 1953

I. W. Wilson, Esq.
President, Aluminum Company of America
Pittsburgh, Pennsylvania

Dear Chief:

It is a long time since I was dickering with Alcoa for miles and miles of conductor (and it is still there, and still mighty satisfactory) or working out that complicated deal for the Fontana dam site. Right then I acquired a lot of respect for Aluminum Company of America in general, and one Chief Wilson in particular.

But that respect for the quality and good sense of your Company has reached new heights lately. I refer to your sponsoring of the Ed Murrow TV show. (And I am saying this about a competitor, for I am proud to say, RCA is a consulting client of mine).

I have seen - and indulged in - a lot of institutional promotion and public relations in the last twenty years. I have never seen anything better than the way this show is handled, from the standpoint of the fellow who pays the bill, in this case Alcoa, the public point of view, or the interest of the audience. Murrow and Friendly and their field organization really know their business, and have brains and a sense of timing. But all this could be spoiled - as so often it is - if the spirit or "smell" of the whole thing were just a bit off, like an "only slightly" not-fresh egg. Each of you - Alcoa and its agency people and CBS-Murrow - make a balance that works, it seems to me.

I admit freely I'm not impartial. I have thought well of both Murrow and Alcoa for quite a long time. But impartial or not, I feel I ought to pay for the enjoyment of seeing good workmanship on TV, and since I don't buy much aluminum conductor nor many dam sites these days, this letter seemed the next best way of expressing that appreciation.

With cordial personal greetings, and best wishes of the season,

Sincerely,

David E. Lilienthal

October 2, 1953

Dear Dave:

Many thanks for your letter. I now know where to turn first in the Times on October 4.

Janet and I had a very pleasant summer, even though a good bit of work somehow got mixed up with the rest period.

The Berlin trip was very strenuous, but we really enjoyed it and felt it worthwhile.

We must get together again as soon as I can get settled down into some kind of routine. In the meantime, Janet joins me in sending affectionate greetings to you and Helen.

As ever,

Mr. David E. Lilienthal

September 30, 1953

Dear Ed:

Several years ago, when I was still cohabiting with the atom, you introduced me to a "radio executives" audience here, and I made a speech "agin" the secrecy obsession and for the need for public knowledge of what goes on, lest we "stumble - or be pushed - without knowing what we are doing, into some desperate finality."

The nuclear arms race is unhappily a lot farther along now than it was then. In the light of the announcements about the H-bomb, I have written a brief article on the present picture, and about how not to go about countering this latest chapter in that race; it appears in next Sunday's New York Times magazine (October 4).

I'm writing to call your attention to it, not of course because it has news value, but because you are one of the people I would most hope would find what I have to say worth turning over in your mind.

Helen and I do hope you and Janet got some good solid rest during the summer; your voice on the air certainly sounds vigorous and fresh and rested, despite that terrific Berlin story and its exertions.

Do hope we shall be seeing you again one of these days before long; in the meantime, affectionate greetings and esteem

As ever,

Dave

Excerpts from the Report of the Committee on the Marcellus Hartley Fund, National Academy of Sciences, recommending that the 1951 Public Welfare Medal be awarded to Mr. David E. Lilienthal:

The purpose of the award provided by the Marcellus Hartley Fund is to give recognition to individuals who have performed unusual public service through the application of the methods and techniques of science and technology. A portion of the recommendation of the committee is quoted below.

"Under his supervision, first as a director, and later as Chairman, of the Tennessee Valley Authority, a vast development project for the Tennessee Valley was initiated and carried into operation. Though there may be differences of opinion as to the political advisability of the Government undertaking such a project, there is no argument that the net result has been a tremendous technological achievement, that the availability of electric power has stimulated the growth of industry in the Valley (the Oak Ridge Atomic Energy Plant for example) and that this development has had a profound effect on the agriculture and on the standard of living of the people of that area. TVA represents an intricate interweaving of the technologies of water conservation, soil conservation, agricultural development and the generation and use of electric power.

"The problem presented to the Board of Consultants of the State Department in 1946 in drawing up the plan for international agreement on the control of atomic energy was certainly one of the most difficult and critical problems of modern times. Before feasible proposals could be drafted it was necessary for the members of this Board to become familiar with the basic science and technology of the atomic-energy field and become also familiar with the factors which stimulate the development of science and technology. On the basis of these principles the Board then attempted to draw up a plan which would win international acceptance and which would aim to reduce the chance that atomic energy would be used for purposes of war, without at the same time imposing controls which would prevent its development for purposes of peace. In looking back it can now be seen that the hope that this soundly conceived and far-sighted plan would be agreed to by the Soviet Union and its Satellites was doomed to disappointment. But this does not detract from the bold and brilliant thinking which went into the drafting of the plan, nor to the achievement of Mr. Lilienthal and others in bringing it into being and having it accepted as the official position of the United States Government, and later accepted by most of the Western nations.

"The Atomic Energy Act of 1946 created a wholly new type of Government Enterprise -- The Atomic Energy Commission. This Commission was charged with the task of taking over the military facilities which had been developed during the war and used for the development and manufacture of the atomic bomb, and to continue the operation of these facilities in the interests of national security and national defense. At the same time the Commission was instructed by the Law to proceed with the development of peaceful applications of atomic energy as a contribution to national welfare. The task of the Commission involved basic research and development in a large number of fields of science. It involved the development of new practices, techniques, and devices for the use of atomic energy, as well as the building of plants and factories for the production of materials required in the use of atomic energy for peaceful and war-time purposes. The vastness and complexity of the undertaking, and the difficulties faced in reconciling the

often conflicting interests of scientists, engineers, and the military, the unanticipated difficulty of the technological problems which arose are too well-known and too involved to be set forth here. It cannot be pretended that all these problems and difficulties have been solved, but it is clear that under the wise leadership of David Lilienthal as Chairman of the Atomic Energy Commission substantial progress was made under conditions made increasingly difficult by the deterioration of international relations, as well as by a frequently hostile political atmosphere in this country. For his wise and intelligent leadership in a critical enterprise during a critical period, the American people owe Mr. Lilienthal a debt of gratitude."

November 15, 1951

A PRIVATE CITIZEN LOOKS AT THE U.N.

Address of David E. Lilienthal
Pittsburgh Observation of United Nations Week
Carnegie Music Hall, October 24, 1951
Pittsburgh, Penna.

This is a day when we who are private citizens have our inning. This is our chance to say what we think about the U. N. and about war and peace. As one who was a public servant for almost twenty years I know that most public servants want to hear from the folks they are working for, to know what they are thinking, what their hopes are.

These local United Nations celebrations all over the land are a fine demonstration of a profound principle of democratic life. It is a principle that is just as alive and valid in international affairs as it is in national and local government. That principle is that the source of the strength and vigor and health of the United Nations is the people themselves, the people in their local communities, in their neighborhoods, in their churches, in their homes. Without the understanding, the criticism, the participation of the folks back home the United Nations is a tree without roots that will surely wither and die.

Pittsburgh is a singularly appropriate place for such a demonstration of grass roots democracy. Not long since, at an industrial conference held by the Corning Glass Works Dr. Charles Weidlein of the Mellon Institute told us the remarkable Pittsburgh story, told us how your recent civic improvements were sponsored by private citizens, organized by private citizens, carried through largely with the active participation of the citizenry of this fabulous center of American industry and education. This is democracy at its best. When something comparable to the Pittsburgh story takes place in the area of international relations, in the step-by-step development of the U. N., then peace and a golden future for the world will gradually become not a hope but an evolving reality.

What is it we are celebrating here? We are celebrating the establishment and the survival of the United Nations, as an institution for the promotion and preservation of peace and amity among the peoples of the world.

But what have we to celebrate? Is this "peace" that we see in the world today?

Your sons are fighting in Korea. Thousands of them are brought back home, dead, or wounded. American young men by the thousands are manning the defenses of Europe, my own son among them. There is fighting in Egypt and in Indo-China. In the subcontinent of India the soldiers of Pakistan and of India face each other in deadly anger. Ugly, violent things are going on in Iran. How then can we celebrate "peace"?

There are even more sobering facts than these to face up to.

Surely nothing could be plainer than this: The world lives from day to day on the very razor's edge of World War, of a war of annihilation between the Free

World and the Captive World. Both the Free World and the Captive World are engaged in an arms race, a desperate all-out arms race. As a consequence, what you and I produce is going largely into armies, into submarines and bombers, into airfields all over the world, into atomic bombs. Most of our huge tax payments are handed over to our military establishment. Our future income is mortgaged up to the hilt, for as long as you and I shall live, to pay for this great armament effort.

What is true of us is true as well of the tired people of Britain and France, and our other partners. The war-battered people of Russia are pouring most of their energies and their resources into the piling up of armies, air forces and atomic bombs.

And this arms race is not all. Spokesmen for the Free World and the spokesmen for the Communist World are flinging words of anger and contempt and bitterness at each other every day. Their words show but little faith that we can live together in the same world. Their words are of the kind that in other days would have been used only if the decision to go to war had already been made, the orders to march already given.

Now this is a somber picture. Does this mean that I think the United Nations is a failure, that our efforts to achieve peace and avoid the catastrophe of a World War through the U. N. have failed?

Not at all. For myself I have more faith in the U. N. today than ever before.

Moreover I happen to believe that the structure of our American foreign policy today, built upon the U. N. as its foundation, represents one of the finest examples of realistic and effective leadership in the history of modern statecraft.

I do indeed think there is something to celebrate tonight. I don't believe a gloomy view is justified.

It seems to me wrong to judge the progress of the U. N. and the prospects for peace almost solely on how things stand between us and the Russians. This is as grave a misapprehension as the earlier error we made: that if we Americans would disarm -- "bring the boys home" is what we called it after V-J Day -- then the Russians would behave.

Well, if a preoccupation with how we stand vis-a-vis the Russians at any particular time is not the way to judge the prospects for peace, or to judge the success of the United Nations as an instrument of peace, what is the way I think we should look at it? What other way is there?

The United Nations, as I see it, is not designed as a specific cure for war. We have tried such cures. In our own time the world has pinned its faith -- or in any case we Americans have put our faith -- in a whole series of such specific remedies. We tried pacificism, in various forms. By this I mean disarmament, backed up by promises contained in solemn treaties between nations. The Kellogg-Briand Pact, for example, was such a treaty to outlaw war -- a specific cure for war.

And then, after World War II many people thought peace had been achieved because we had defeated our enemies. That war can be eliminated by fighting a

war, is still the most widely believed of all the specific cures of war. This is a tragic illusion.

The purpose of our huge armament program is not to fight a war. It is to prevent one.

Now the United Nations is not like earlier efforts, a specific cure for anything, much less of war. It is not a formula, not so much a matter of organization, of vetoes and debate and resolutions. The dramatic televised Japanese treaty meeting at San Francisco recently did not represent the essence of the U. N. That is something broader, more affirmative than proceedings and debates in the General Assembly or the Security Council.

The U. N. is an expression of man's desire to eliminate the violence and destruction of war; but it is far more than that. It is a living expression of a feeling, widespread in the world, that in the 20th Century we have the greatest opportunity in all history slowly and painfully to build a world in which human beings can fulfill their destinies as the children of God.

This deeply felt sense of great opportunity accounts for much of the dissatisfaction and struggle and conflict -- and vitality -- in the world today.

Now it is upon this urge, upon this broad ethical and spiritual aspiration, that the U. N. rests. So also does democracy. In my opinion, then, the United Nations represents the democratic process, the democratic idea, on a world basis, applied to the world community.

The U. N. is not a formula, a dogma, a cure-all, a set of rules and regulations or treaties. It is a human process, the finest flower of the evolution of man in his relations to his fellow men. It is this same process, the process of adjustment and conciliation that is the heart of democracy. It is the process of open discussion, of persuasion, of listening to the other fellow's point of view and trying to understand it. It is leadership by example rather than by mere majority vote or by force or position. It is the recognizing of conflict and difference as the natural state of honest and free men. It is the process of resolving one conflict knowing full well that still another conflict lies ahead; adjusting opposing views knowing that still another and new problem will be created by the adjustment of the old. Democracy in world affairs, like democracy in Pittsburgh, is never-ending.

The U. N. then, in my view, stands squarely upon this democratic thesis. It therefore cannot expect to find perfect or complete or final answers. And above all, democracy -- exemplified by the United Nations -- does not rely only on the policeman or on the soldier, only upon the minister and priest, only upon the businessman or the diplomat, only upon force or upon faith -- but like democracy itself, relies on all of these together, each playing a part.

A few days ago I had a long visit with a very wise man, a pioneer in American business and a humanitarian who has profoundly affected the prospects for health of generations yet unborn. He talked about democracy. What makes American democracy so inspiring, he said, is that we are so everlastingly dissatisfied with it. Look at the great strides ahead we have made in living together, in racial relations, labor relations, respect for each other. But what do we hear?

Dissatisfaction, criticism, impatience, and complaints. That's the most heartening thing of all, he said -- that we are never satisfied; that we always keep trying to do better. That, he said, is the watermark of genuine democracy in this blessed country.

If, as I believe, the essence of the U. N. is that it is the democratic way on a world scale, then for similar reasons we can expect dissatisfaction and impatience with the U. N.'s accomplishments. But that dissatisfaction is in itself a sign of health, a sign that we are not once more depending upon specific cure-alls for war.

Peace is more than just the absence of fighting. Peace is a continuing process of striving, by a multiplicity of methods, to adjust the conflicts of men and nations. Peace is not something that is won, once and for all, any more than freedom can thus be won. Peace, like freedom, has to be earned day by day, by applying to the constantly changing conflicts of the human race what John Dewey called "the democratic methods of consultation, persuasion, negotiation, communication, cooperative intelligence..."

I would judge the success of the U. N. therefore by how well it exemplifies this educational process of democracy in world affairs. And by that yardstick it seems to me the United Nations measures up very well indeed.

The United Nations is the Free World's response to the universal longing for peace, just as democracy fills the universal longing of individuals to count for something. The U. N.'s record, judged by this standard, is impressive and heartening.

The U. N. has real achievements in the realm of persuasion and conciliation and adjustment of conflict, and in promoting self-government.

For example, the U. N. was successful, without force, in bringing about the withdrawal of Soviet troops from the territory of Iran, in 1946.

The U. N. Commission on Indonesia brought about a settlement between the Dutch and the Indonesians. In Greece the U. N. helped bring something like order to that still tortured country.

The U. N. Mediation Commission for Palestine ended the fighting between Jews and Arabs, after the British left that area; U. N. influence has kept sporadic outbursts of violence from spreading into full-scale warfare.

The U. N. has not resigned itself to futility. It has, for example, found a way, within the Charter, to curb Russian abuse of the Security Council veto. It is resisting and punishing the invaders of South Korea, a signal victory for morality and law, and its greatest test as an international body.

The U. N. has not been vindictive and negative, not just an agency of suppression. The outstanding example is the Japanese treaty, well described as an act of reconciliation and reconstruction.

The economic and political activities of the U. N. are affirmative. For example the World Bank, the Monetary Fund, the Trusteeship Council,

The U. N. has been concerned about human welfare in a positive and concrete way. The U. N. International Refugee Organization, for example, has found new homes and in other ways assisted 1,500,000 human beings cast out on the world as a consequence of the last War. The U. N.'s World Health Organization halted a terrible cholera epidemic, has reduced the ravages of malaria and helped to control it.

A recitation of these and many other specific accomplishments of the U. N. is clear evidence that we now have a vital international organization that operates in the world of reality. It will not and cannot solve all the world's troubles. But the U. N. is by no means a symbol of futility. It is not mere words. It is something solid and effective. As such it deserves the support and the prayers of the people of this country.

We DO have something to celebrate on this United Nations Day.

The first and chief concern of most Americans and of most people the world over is how to keep the universal tragedy of another World War from happening. I firmly believe that the growing over-all military strength of the free nations can help mightily to avert war, and that without this re-armament effort the prospects for peace would be slim indeed.

What is America's chief function, in the U. N., in its struggle for peace and amity among nations?

If war is averted the great hope for peace lies in America's assertion of world leadership in her special and historically unique role. That role is the demonstration, in concrete, workaday, and easily understood terms that a living democracy is the best way of satisfying the aspirations of man: his physical needs for food, shelter, education, health; his moral need for a sense of purpose; his spiritual need freely to worship his Maker.

What we are now moving toward is a program of action that goes beyond re-arming. It is a program that calls for the kind of accomplishments that have made America known the world over as a land of hopes fulfilled.

Our program of action -- as a nation and through the U. N. -- should not rest upon argument and ideological appeals, should not be only a matter of outvoting the Russians in the U. N. and out-arming them. The vitality of American leadership is best expressed in the things we DO that satisfy deeply felt needs. Our program for peace must therefore be concerned with such things as pastures and fields and forests, and how to make them yield greater benefits to men; rivers and how to make them work for people; disease, and how to control it. We should demonstrate how we organize and manage industry, large and small, and cooperative ventures.

Our leadership moreover should be based upon the principle we ourselves exemplify that productiveness is unlimited, a fundamental but little understood tenet of our American experience.

Accordingly we should provide the world with an example -- as I believe we are -- that assigns a minimum role to controls, to restrictions, allocations, directives, orders, and a maximum role to stimulating productivity of human and

material resources.

We can work our way to peace -- if our efforts to prevent a world-wide war succeed -- by reason of continued demonstrations of the unique virtues of a way of living in which freedom, not fear, prevails. For the ultimate issue we face is not one that we can win by military force. It is not one the Communists can win by force either.

We should be reassured by our military progress. But to be perfectly candid about it, it seems to me this growing military strength has set off a wave of glorification of weapons that is neither in the best American tradition nor in our own best interests.

I can't recall when we have heard more out-and-out jingoism in America than in the past two or three months. A jingo is a fellow who talks a lot about how strong he is, and how he will just pulverize his opponents. He stands around flexing his muscles, pounding his chest, and hinting about some razzle-dazzle he has up his sleeve, some push-button secret weapon. Hitler used to scream this kind of stuff about secret weapons, and his invincible Luftwaffe, and so on. It is appropriate enough from Hitler or Stalin, but it is painful to hear Americans talk that way.

If this is supposed to be psychological warfare it is pretty amateur stuff, this jingo talk, and so often it backfires on us. If it is designed to promise us a cheap, quick mechanical way to win a war it is misleading and mischievous. Sooner or later some one responsible for the hard military realities has to pull the rug out from under these statements, in plain sight of all the neighbors. Either as amateur psychological warfare or as a way of re-assuring the American people this sort of talk leaves much to be desired. And it can become a positive danger.

It is possible to talk ourselves into a world war. I don't think we are going to do this. But a continuation of jingoism, of preoccupation with weapons, is not going to help develop that sense of restraint and prudence that is essential in a democracy if we are to try to win our victory by preventing war rather than fighting one.

We are a peace-loving people. We need to build up our military strength and we're doing a fabulous job of it. To get us re-armed it is neither right nor necessary to try to scare the daylights out of the American people, or to make them war-like by jingo talk. It is a dangerous and an unbecoming course.

The future of the U. N. depends to a large degree on the future of the U. S. Our future depends upon our maintaining the quality of our moral leadership. We must keep ourselves fit for our great role.

Perhaps it was in order that we be prepared for this supremely difficult undertaking that America has so long been favored by Providence. The full purpose of the American Experiment may now be unfolding in the Dangerous Decade of the 1950's: this people's role in striving to avert catastrophe and to open the door of new and unbounded opportunity for the whole world.

DAVID E. LILIENTHAL SP

Topside, Vineyard Haven, Mass.
August 29, 1951.

Dear Ed:

Well, this is more like it!

I refer to the return of your voice to our living room.

Hope you had a decent change and rest this time. And that you skipped that long tiring hop to Yougosluvia or wherever. I know Janet and Casey must have enjoyed having a bit more of you than usual. We've had a good summer; I worked and commuted a good bit, but it wasn't strenuous. We've just taken an apartment at the Drake Hotel (440 Park Ave.) and will go back and forth to Washington this fall and winter, and except for trips will spend a good deal of the time in New York.

Our affection to all of you

Dave

PS We leave here September 4th.

July 12, 1951

Dear Dave:

Going back to your note of January 23; if I can't stand beside you in person, I am honored to stand beside Senator Norris.

Your piece on the session with Nehru was undoubtedly the best piece of writing you have done to date.

I assume you are now off to the vineyard but should you be passing this way, Janet and I would be greatly pleasured to have you spend as much time as possible with us. I shall be here until the end of July, after which time, as Mr. Luce's publications are wont to say, knows God I shall probably be going to Yugoslavia or some other improbable place. After all the old fashioned radio must manage somehow to compete with Colliers.

As ever yours,

E R Murrow

January 23, 1951.

Dear Ed:

Wonderful to talk with you this afternoon; I'm to do the recording tomorrow afternoon.

A "morale builder" story, just in case, what with a stubborn cold, you may want to know how part of your auditors feel about you. to wit:

When my secretary Mrs. Walden is out of the offices she switches onto "Courtesy Associates", a wonderful outfit who answer your telephone, "sorry his Secretary is out, can I take a message,etc." Wonderful gals, and quite a story back of the service, but that's neither here nor there.

Mrs. Walden returned from a brief absence, the Courtesy gal called to say: "Oh I'm SO glad you were out Mrs. Walden. I have just talked to Edward R.Murrow and I am so excited . . he talked just like he does on the radio." Finally she quited down sufficiently to transmit the message. I liked this story.

Take care of yourself, and let's hope we'll see each other soon after our return, about March 15th.

Best as always,

Dave

AMERICAN SECURITY BUILDING
WASHINGTON

January 23, 1951

Dear Ed:

The picture arrived, it was promptly framed, and now stands beside Senator Norris in my study. I am very proud of it and thank you so much.

On the basis of a sudden decision, but long in the brewing, Helen and I leave New York on February 2 on a flying trip to Pakistan, India, and back by Japan. There has been a great deal of cordiality about the whole thing, and though Lilienthal always picks the hard way and the hard time to do anything, it promises to be intensely interesting and not entirely hopeless. (By not "entirely hopeless" my formula is .001% hopeful out of 100%, which are sporting odds these days."

Should you come to Washington for a broadcast between now and February 2, or if we should get to New York ahead of time, it would be wonderful to have a visit with you before we go.

Warm regards,

Dave

April 30, 1950

Dear Mr. Schoenbrun:

Thank you so very much for your interest and help; Ed has shown me your letter of April 19th, and with his approval I'm answering directly.

The reservation at the Hotel Bellman sounds fine. Do I need to do anything more about that, myself, in order to make it firm?

As to the car, we shall follow your suggestion, and make reservations through AAA either in New york (as noted) or out of Washington if they can do it from here.

Regarding appointments with a variety of people in Paris and elsewhere in France, I'll await your list of suggestions, after which I'll write you at once; perhaps it would be better to hold up confirmation on the Monick date for May 31 until I have the list before me.

I shall not want a schedule for meeting people that will not permit some time to see some of the places in Paris which two Americans who have never before been there should see. But as I am used to pretty strenuous activity, I'm sure we can do both. Paul Hoffman has asked me to call on Harriman and others in the ECA office there, which of course I shall do. But I'd rather be with Frenchmen, actually. How much of a handicap, with such men as Monick for example, would you say it would be that I speak and understand no French whatever?

I have written Jean Monnet, whom I met here years ago, and have great respect for, but there has not as yet been time to hear from him in response. But as to his question in your postscript, no one so far as I know is "arranging" the trip through the Rhone, and indeed I'm not sure that this is the best place to go either to see the French countryside or its agricultural and water resource headway. So I should be glad to have both his guidance as to what I should try to see, and some help of the kind he suggests in understanding what I see.

Having listened to you often, I look forward keenly to meeting you and visiting about this and that.

Sincerely yours

Columbia Broadcasting System
Warner Building
Washington, D.C.
April 28, 1950

Dear Dave:

Herewith communications from the boys in London and Paris. You will notice that Schoenbrun raises certain questions regarding your plans. Maybe you would care to communicate with him directly or, alternatively, I'll pass on anything you want to tell him.

I hope to see you soon.

As ever yours,

SP

Come out & see our dogwood whenever the spirit of Spring moveth thee

C
O
P
Y

CBS
PARIS

April 19, 1950

Dear Ed:

I'm really thrilled at the prospect of meeting Mr. Lilienthal. This seems to be my lucky year for meeting people I've admired most of my life. Just a few days ago I spent the afternoon with Helen Keller and her companion Polly Thompson, two of the most remarkable women of our time.

For Mr. Lilienthal we have reserved a double room with bath at the Hotel Bellman 37 rue Francois Premier, Paris 8eme, telephone number: ELysees 62-51. This is a small, quiet, elegant hotel and very reasonable in price. They quoted 2500 francs a day at present. It might go up somewhat at the height of the tourist season, but it is about one third less than the other first rate hotels.

Jean Monnet said that he is most anxious to see Mr. Lilienthal. However he has been invited by the Canadian Government for their Fair on May 29th and probably he will not be in Paris when Mr. Lilienthal gets here. He thinks that he would be back in time to see him in England about mid-June. Could that be arranged? He would like to have Mr. Lilienthal's address so that he could send him a friendly note. Mr. Monnet also sends you his best personal regards and asks whether you will be in New York the first week in June. He will be visiting New York and Washington after Canada, and would like to see you in New York if you are free.

I have, as per your request, tipped off the Embassy and ECA about the Lilienthal visit, telling them that it was just a vacation trip, no razzle-dazzle or protocol expected: this to Lane Timmons, Deputy Chief ECA Mission to France, and the Ambassador.

I have also arranged a tentative appointment, for a talk or a meal--which ever Mr. Lilienthal prefers--with Emmanual Monick former governor of the Banque de France and now President of the Banque do Paris & Pay Bas. Date May 31st, confirmation requested. Mr. Monick, as you know, is one of the best financial brains of France. In a day or two I will forward a list of suggestions, for Mr. Lilienthal's approval, of labor leaders and industrialists whom he would like to see, and would appreciate knowing just how he would like his appointments made and what days.

As for a drive-yourself car I am told by the American Express Car Service that it can best be arranged by the AAA in New York. They use the same agents as the American Express in Paris, can arrange all the formalities of licences, plates and customs papers, and can make the car reservation from there. Their address is 25 Broad Street New York, unless they have moved already to their new offices at Rockefeller Center. They can arrange the whole trip for him, including the reservation for a dirve-yourself car in Britain. However if you prefer I can make the reservation here in Paris and send the contracts papers to New York.

With best regards to Jessie and John,

Faithfully yours,

/s/ David

P.S. Monnet would like to know who the French officials are who are arranging Lilienthal's Rhone Valley trip. He's afraid they are tourist office or administrative types who wont know about the Dam projects etc. He'd like to help by assigning one of his top industrial-projects experts from his 5-Year Plan Council.

OFFICE COMMUNICATION

Lilienthal

April 12, 1950

Dear Fellows,

This is purely personal. I have no hesitation in making the request although, as you will recall, I have made damn few similar ones in the last four years. The point is David Lilienthal and his wife are coming to Europe. I need not tell either one of you anything about his distinguished career as a servant of his country, but I do want to say that I have never met a man in public life whose actions and integrity commanded more of my admiration and respect. Here's the dope:

He is due to arrive on the Conte De Grasse, Le Havre, May 26.

May 26 to June 1: In Paris. (Dave; Could you recommend and make reservations...sizeable double bedroom will do; no suite required for that period.)

June 2-8: Touring the Rhone Valley. French officials are planning this one and will provide transportation so no special arrangements are required. (Dave; If Jean Monnet is in Paris, would you advise him of Lilienthal's plans? You might also tip off the ECA and Embassy.)

June 9 & 10: A quick look at Belgium and Holland. (Would it be possible to tee up a drive-yourself car for this period?)

June 11 to July 2: In Britain. The first week in London. (Howard; couldst make reservations for the first week of this period at the Connaught; also a drive-yourself for the second two weeks.) The Lilienthals plan to leave by boat on July 3 although this may be delayed a week or two.

In Paris, Dave, Lilienthal would like to see some T.U.C. leaders and a few industrialists.

In London, Howard, you know the people he ought to see, but I would think it ought to be somebody from the Coal Board, whoever is running the Colonial Development Board now, as well as people like Jeff Crowther, Rab Butler, Herbert Morrison and the rest.

Columbia Broadcasting System, Inc.

To

From

Station

OFFICE COMMUNICATION

Now my reasons for asking you to do this. Lilienthal is most anxious to travel as a private citizen and to avoid the usual embassy and foreign office razzle-dazzle. If his plans and appointments are pretty well set in advance, he has a good excuse for by-passing protocol. I am asking you to do it because you will find him not only full of information about this country, but a guy who will restore some of your faith in it, too.

Like always,

E.R.M.

February 8, 1950

Dear Dave:

First of all, my thanks for a most enjoyable day.

Secondly, I am--and most belatedly--sending you a half-dozen of the second volume of "I Can Hear It Faintly Somewhere". The purpose of this being that now that you have room to store them, you might care to put a couple aside for your grandchildren.

January 23, 1950

Dear Mr. Murrow:

Mr. Lilienthal, who is working at home today, asked me to send along this collection of editorials. He said they might have some relevance on one of the matters you and he discussed by phone. In particular, he pointed out the frequency with which a sentence in his resignation about one of his chief reasons for leaving the public service cropped up in or became the theme of the articles.

Sincerely yours,

Martha Jane Brown

Secretary to
David E. Lilienthal
Chairman

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York City

January 27, 1950

Dear Dave:

I am returning Mrs. Roosevelt's letter belatedly. If you do it, I'll listen.

I hope you pull out all the stops on the piece having to do with the airwaves. If you are in doubt as to where any bodies are buried I have got a Geiger counter that will uncover plenty skeletons.

The NBC matter does not progress; so far they ain't willing to talk dough and I'm a tough agent.

As ever yours,

SP

Mr. David E. Lilienthal
5126 Albermarle Street N. W.
Washington, D.C.

Captiva, Fla. Jan.16**1950

DAVID E. LILIENTHAL

Dear Ed:

The enclosed invitation to take part in Mrs. Roosevelt's new radio program over NBC may be relevant to your recent remark about NBC and a radio series etc. by yours truly. My guess is it would preclude it, but anyway I'm sending the letter along; please return when you get around to it. I haven't answered it yet; won't till I get back Thursday or Friday, and can see my schedule. My inclination is to do it.

We're pleased to hear from Janet that you will be down the first week-end in February in any event, and that we can have a dinner for you that Sunday.

The work of roughing out articles to be written during the next 18 or 20 months goes merrily on, and I'm already enjoying the prospect. In addition to the one that I hope will take Secrecy really apart, there is one well along on Government Monopoly and the Atom, which says our present way of developing this new technology may work in Russia but not here, and suggests that the McMahon Act be repealed, and why. I'm figuring on a series of two maybe three on international control of atomic weapons, a new-look, a kind of Acheson-Lilienthal Re-Visited. There are several in the ectoplasm stage <u>not</u> on the atom: the phony side of the Big and Little Business issue; why business men are so defensive, the hell that this raises, and some things to do about it. I even have done some outlining on the Air Waves and what has happened to Them, and what I think will happen. Well, Ed, this is what happens when I get two swims a day. Some one ought to hold my head under and save the country.

Best always

Dave

Edward R. Murrow Esq.

Captiva Island, Fla. Jan.14 --50

Dear Ed:

The Town Hall-Rollins thing over, Helen and I are here again for a few days breather before retunning for the final spurt. At Winter Park Miss Lockhart's introduction of me to the Forum placed the blame for my being there (after 3 successive declinations in as many years) squarely on Edward R. Murrow--true enough. Enjoyed the shin-dig, used it as a try-out on a "lecture" that will be heard again on the Circuit in March, and met the new Rollins President, one Paul Wagner.

Am planning a personal press conference for my last day on the job, Feb.15th (or possibly the day before). Have some things I want to say on the "up" side, about public service, to contrast with the usual doleful and sorry-for-myself tone of most departures. But chiefly, want to be able to describe what my "plans" are, for the future, if they are in shape at all for that. Assume the U.K. elections will find you covering them at first hand, so your plan to be in Washington in Feb. will be changed, in part at least. Eager for a talk with you prior to the 15th, if this can be managed. Of course if you and Janet do come to Wash. on schedule in early Feb. that will work fine; if not, please let me know and I'll try to get to N.Y. to see you.

In addition to teaching offers, etc. (some of them interesting enough for some years hence once my finances improve a bit) the things I'm considering most actively and want help on relate to two kinds of things: 1. Writing and speaking; 2. A look at various places in the world from the angle of TVA-type economic developments, and a study and reports on the likely effect of ec. development, on an intensive schedule, upon the cold and not so cold war -- the Murrow "half-war".

I've had some offers with law firms, Wash. and N.Y., and an office of my own for economic consultation and law-policy consultation would apparently produce quite a lot of money for John Snyder, some trace of which I would retain. I've pushed this into the background, though; don't like the appearance of it, for one thing.

On the writing angle, while I'm still talking to newspaper groups, the periodical thing seems best adapted to my ability to pro - duce. The Collier's offer I haven't discussed further with them--I mentioned it by phone with you. That I could write 12 articles in 2 years, without bearing down very hard, or tying me up, seems fairly clear, though I could be wrong. You said the Sat. Eve.Post would be a better river on which to sail, but so far their interest has been confined to getting hold of the article on ending the government atom monopoly and industrial secrecy. Haven't asked them, but I'd guess they wouldn't be nearly ~~quite~~ so interested in ~~enterprising about~~ getting me for a two year period as Ruppel. The Collier's proposal would be exclusive, but not prevent writing for Harper's--Atlantic-Foreign Affairs--that sort of thing. And I assume the articles from the trip to fur parts they'd expect to have exclusively. None of this excludes radio, or putting together another book.

The idea of TVA development in the relatively undeveloped regions--such as are still left to us--as the basis for a two year effort on my part I've given a lot of thought to. This would be entirely non-governmental and non-official; but the President has several times expressed great enthusiasm, and some specific suggestions of his own about it. Thinking particularly about Mexico, Brazil and perhaps Chile in the Western Hemisphere; India, parts of Indonesia and the Phillipines, and then South Africa and the Congo, perhaps also Greece

#3 Ed Murrow

the Tigris-Euphrates region. On one scale this could be just Helen David and I. Or it could be part of quite a project. I spoke to you briefly about a Floundation, established with funds from an old gal in Chicago, Mrs. Emmett Blaine, of the Reaper fortune-- Institute for World Government or something like that; trustees Stringfellow Barr, Scott Buchanan and Bob Hutchins. She has angeled all sorts of liberal and wallace-ish things, including Henry's campaign, and of course the World Government thesis at this juncture is also no recommendation. They are willing (actually are pushing hard) to turn over to me substantial funds from the Trust (they have $700,000 unexpended and no other ideas of how to spend it, and the old gal has a huge fortune as yet unspoken for, they say) If the money didn't have the above background, I would think that a very influential and useful job could be done, without tying me up to the exclusion of other things I want to do. I've been outlining the scope of such a look-see; it could be the spade-work form a policy and program for world ecnomic development that might possibly help get us off the tobaggon ride we're now on, all of us, and avoid a repitition of China in Southeast Asia. I had in mind something far more specific than a "Report", or an Anticipatory Alibi of why India and Indonesia etc. are off of us. I may be wrong in being troubled about the fact that the old gal might make me vulnerable, the funds are out of her hands, literally, of course, in the hands of the Trustees of the Foundation, who are willing they say to change the name and purpose of the Foundation etc. I also thought some of doing the job by transfer of funds to the F.D. Roosevelt Foundation, which wants me to become its head (that doesn't interest me much) since F.D.R. had so clearly in mind this world-wide TVA devel opt.

#4 E.R.M.

Well, I hope you'll give this some thought. Anything you can learn about the Blaine-Barr-Buchanan angle I'd appreciate and esp. how relevant it would be that they would provide the funds. It goes without much saying that they would not ask for any kind of committment about the results, or how the money was to be spent--full and complete discretion. I've been wrestling with this dream since 1942 and its hard, now I'm almost free, to let go of it.

So many people have spoken to me, or written, about the recording of the reply to McKellar. I'd guess that the Album has done very well; certainly hope so.

Anything new on the NBC folks--your note about them (and the sophomore letter from their representative in Wash) stirred my curiosity, to put it mildly.

I've told Leigh to go ahead signing me up for lectures for 5 weeks next Oct-November; the financial prospects were too much for my blood. Will do 3 weeks in March, opening the 1st, and a few in April, spend most of the time writing and seeing people till we go to the Vineyard for the summer.

Best wishes and affectionate greetings as ever

Dave

Edward R. Murrow Esq.

December 27, 1949

Dear Dave:

My spies tell me that the NBC boys are more serious about wanting you to manipulate a microphone than their juvenile correspondence would indicate. Do you wish me to brace them for a definite proposition?

As ever yours,

Mr. David E. Lilienthal
Atomic Energy Commission
Washington, D.C.

P.S. Meanwhile if you feel the urge to give tongue I will provide you with a microphone and a patient and tolerant audience. We get a standard fee of fifty bucks; no commission.

DAVID E. LILIENTHAL

Dear Ed:

Say why didn't you tell me about the Sateve-Post piece! Nice going!

Thought the enclosed better be before you — doesn't sound very hot.

Signed up with Leigh: he accepted the rejection-of-any engagement provision without a murmur — thanks.

Always sincerely

Dave

Waldorf
Wed night Dec 7/49

Ed:

I'm sending the Leigh contract, for the review and counsel of my "agent" and favorite guy; you recall saying you, and a friend whose name I disremember, would look it over.

We had a most amicable discourse, Leigh & I. He didn't enjoy the fee idea, but on this & everything else I could think of he said: I want to manage you, you bastard; write the ticket. He is tough but I think I'll get along fine with him.

I'll undertake to reach you by phone Thursday, after lunch, for comments; you

may not have had time by then, in which case I'll try to reach you from Wash, to which center of cin I return at 4 PM tommorrow.

He asked me to promise I'd not tell anyone except my mysterious Adviser that this isn't a 50-50 fee; so bear that in mind. He's dying of curiosity to know who I'm consulting — but keeping secrets is ~~see~~ my business — until, and I quote "the close of business on Dec 31".

My it was good to be with you + Janet + Casey

Faithfully
Dave

You'll pad hours for sure today = when are you
to submit to
humanity off?

December 10, 1949

Dear Mr. Keller:

Thank you for your letter of December 7.

I shall have to defer until a later date consideration of such matters as you cover in your letter for, as you can well imagine, I am terribly pressed just now getting things finished up here.

Sincerely yours,

David E. Lilienthal
Chairman

December 7, 1949

Mr. David E. Lilienthal
Chairman, Atomic Energy Commission
1901 Constitution Avenue
Washington 25, D. C.

Dear Mr. Lilienthal:

This refers to our telephone conversation and my letter of Thursday, December 1, concerning the possibility of your presenting a series of public affairs discussions on the National Broadcasting Company's radio and/or television networks after you leave government service on December 31, 1949.

I suggest that the proposed discussions might take the form of a 15 minute program once a week in which you might, for one thing, discuss current developments in the field of atomic energy and the interpretation and meaning of these developments to the public. As an example of a somewhat similar program, NBC now is broadcasting a weekly series, entitled "The U.N. Is My Beat," in which Clark M. Eichelberger discusses the United Nations and its activities. Mr. Eichelberger does not limit himself to presenting a chronological account of U.N. activities but also discusses issues, interviews personalities connected with the United Nations and otherwise covers a broad field of public service in his broadcasts.

I suggest that you prepare one or more 15 minute trial scripts which would cover twelve minutes of broadcast time, which provides the time necessary for the necessary introduction and close on the program. When you have prepared this script, or scripts, I will be glad to arrange for you to record the audition program or programs in the WRC studios in Washington. The recorded material and your script then would be sent to Mr. William F. Brooks, Vice President in charge of News and International Relations for NBC in New York. The recorded and written material then could form the basis for concrete discussion between you and Mr. Brooks about the necessary arrangements for the proposed series of programs.

I hope this proposal meets with your approval. I will be very glad to make the arrangements for you to make the audition recordings or to discuss any other details with you at any time convenient to you.

Sincerely,

/s/ C. M. Keller
Director
News and Special Events

December 1, 1949

Mr. David E. Lilienthal
Chairman, Atomic Energy Commission
1901 Constitution Avenue
Washington 25, D.C.

Dear Mr. Lilienthal:

Your recent letter to President Truman in which you resigned as Chairman of the Atomic Energy Commission stated that one of your reasons for returning to private life after your long career in Government service was to be able to engage in public discussion and public affairs.

I do not know what your plans may be for furthering this goal after you leave Government service on December 31, 1949. However, I wonder if you have given any thought to engaging in public discussion by means of radio or television broadcasting. Radio and television, as you know, are able to bring such discussions to many millions of listeners and viewers. In my opinion, they enable a speaker to achieve a greater impression with his message than is the case with any other information medium.

If you have given any consideration to entering the radio or television field, or if you may be interested in the future, the National Broadcasting Company requests the opportunity of discussing the subject with you before you make a decision or accept another commitment. I will be glad to arrange for an NBC representative to confer with you at any time which is convenient for you.

Sincerely,

/s/ C. M. Keller

Dear Mr. Lilienthal:

Now that you are free to discuss the Atomic Commission, would you consider a proposition to debate Fulton Lewis, jr. on the subject of whether or not the Commission has handled effectively all matters that were entrusted to them by the government?

Many of our clients would welcome the opportunity of hearing a public discussion by the most able member of the Commission and our well known commentator, Fulton Lewis, jr. I am sure that you both would produce a very lively time to the edification and education of the public.

Perhaps you would consider more than one such meeting; possibly ten or twenty. If so, I shall be glad to discuss the matter in detail as to terms, dates, places, etc.

Sincerely yours,

Lee Keedick

DAVID E. LILIENTHAL

Dear Ed:

Phoned to you Friday night --thinking Casey might be abed and "not available" to cheer you and Janet on the show that You weren't home but just wanted to say: night. Delightful. And to add that the Album arrived, and was played that evening, with even greater admiration for your skill and understanding of the communication-form you have pioneered and established. The lilienthal part pleased me a very great deal; I was slightly apprehensive, and would not have yielded to any other human being's assurances that what was a fearful experience could, later, be recorded in more or less cold blood, and still not seem contrived and stagey. The recording, the latter part esp. gave even me a feeling of warmth, without "speech-making". Your "narration" throughout, and the words you used, are excellent --noteworthy even for you. You ought to feel good about your year, my friend. Ever Yours

Dave

DAVID E. LILIENTHAL

P.S. The pheasant are beautiful, and will no doubt be as tasty as handsome.

Our children arrived and we've had as happy a Xmas as I can remember: all the old jokes and kiddings are as good as ever. Helen and I send our esteem and love to you both.

David

DAVID E. LILIENTHAL
statement before
Joint Congressional
Committee on Atomic
Energy, February 4th, 1947

Final Version

Recorded for "I Can Hear It Now" - Volume 2 - October 4, 1949

LILIENTHAL: This I do carry in my head, Senator. I'll do my best to make it clear. I believe, and I conceive, the Constitution of the United States to rest, as does religion, upon the fundamental proposition of the integrity of the individual and that all government and all private institutions must be designed to promote and protect and defend the integrity and the dignity of the individual, that this is the essential meaning of the Constitution and the Bill of Rights as it is essentially the meaning of religion. The fundamental tenet of Communism is that the state is an end in itself and that, therefore, the powers which the state exercises over the individual are without any ethical standard to limit them. That I deeply disbelieve. I deeply believe in the capacity of democracy to surmount any trials that may lie ahead, provided only that we practice it in our daily lives. And among the things that we must practice is this, - that while we seek fervently to ferret out the subversive and anti-democratic forces in the country we do not at the same time, by hysteria, by resort to innuendo, and smears, and other unfortunate tactics, besmirch the very cause that we believe in and cause a separation among our people, cause one group and one individual to hate another, based on mere attacks, mere unsubstantiated attacks upon their loyalty. This I deeply believe.

Recorded for album
10/4/49

DAVID E. LILIENTHAL
statement before
Joint Congressional
Committee on Atomic
Energy, February 4, 1947

LILIENTHAL: This I do carry in my head, Senator. I will do my best to make it clear. My convictions are not so much concerned with what I am against as what I am for; and that excludes a lot of things automatically. Traditionally, democracy has been an affirmative doctrine rather than merely a negative one. I believe — and I do so conceive the Constitution of the United States to rest upon, as does religion — the fundamental proposition of the integrity of the individual; and that all Government and all private institutions must be designed to promote and to protect and defend the integrity and dignity of the individual; that that is the essential meaning of the Constitution and the Bill of Rights, as it is essentially the meaning of religion.....One of the tenets of democracy that grow out of this central core of a belief that the individual comes first, that all men are the children of God and their personalities are therefore sacred, carries with it a great belief in civil liberties and their protection, and a repugnance to anyone who would steal from a human being that which is most precious to him — his good name; either by impugning things to him by insuendo or by insinuations.

(MORE)

And it is especially an unhappy circumstance that occasionally that is done in the name of democracy. This, I think, can tear our country apart and destroy it if we carry it further.....There are always witch hunters and people who will gladly defame and assassinate the character of others without responsibility.....I will be very glad to be lynched if, in the process of that lynching, this lesson about what our history means is learned and what the history of the common law means in terms of protection of the individual citizen against irresponsible charges of witch-hunters

8:04 Pm

Dear Ed:

Helen and I have just heard your broadcast. If you and Janet were here, your feet stretched out before the fire (a beauty, as only an ancient apple tree fire can be, especially if you cut the old gent up yourself) there are many things about the past three years I would love to regurgitate and chew over with you. For this past week (part of which I spent in Washington) has kinda added up figures on the adding machine -- the keys had been punched down quite a bit ago, and now the machine arm is swung and the addition shows up. This week's occurrences themselves are so melodramatic in the way they happened as to be too corny to believe. Some day I hope we can chew it over.

About the "recording", when approached on this before I've declined, having some reservations, because of this and that. I still have some of those reservations; but I am fairly sure that the careful way you would have this done, andyour understanding of why I am reluctant about it, would take care of them very well. I could discuss this with your representative, or if you have the time of course I'd enjoy talking with you. I'll be back pretty pronto now, perhaps (though I appreciated the "deserved vacation" reemark tonight) before October 4 which is when I planned. I may be in New York October 3 in connection with my book, and might manage it that day. I asked Mr. Canfield to send you an advance copy; at that time I didn't know today's announcement was going to make some of the things therein written (some of them, re Congress, so belligerently) quite so timely.

Helen sends her love to you and Janet and Casey as do I ; and I remain as ever

Faithfully

Dave

Edward R. Murrow Esq.

September 14, 1949

Mr. David E. Lilienthal
The Allen house
R. F. D. #1
Vineyard Haven, Mass.

Dear Dave:

I am just coasting now that I know you aren't listening. When you return to this world of scurry and scamper, I shall screw the pop valve down and make an effort.

Any chance of your stopping by Quaker Hill on your way back to work? We would love to have you.

Without ary damned apology for intruding upon your vacation, I send you the enclosed, with which you may be familiar. We are working on another album of recordings covering the period from the end of the war to date. These words were not recorded. They must be included in the album. I want to lay it on your conscience to record this as soon as your holiday is ended. We will do it in your home, in your office, in your automobile, or anywhere else. I would even carry the recording gear on my back to any point that you may designate.

Janet and Casey charge me to send you both their very best regards.

As ever yours,

from David Lilienthal

The Allen house
RFD#1 Vineyard Haven Mass
Sept 2--49

Dear Ed:

You sounded crisp as the first autumn morning, night before last when we heard your broadcast, the first we'd heard since your return from your holiday; so we're hoping this means you got a good change and rest and refreshment. Besides, your auditorial on the 10th anniversary of the onset of the War was one of your very best, in content, my style (so especially designed to the listening process, not-like so many of your contemporaries- written for the eye and then declaimed from the script) and in timing-as-you-speak. This latter has special reference to the long spacing (that is, long relative to your customary pacing) between some of the very short heard-phrases (sentences they would be in another and older medium)

But good as it was, be damned if I listen to you again for some time, for you are counter-stream to my main purpose and function in life at the moment, that is: to dawdle, fritter, laze, be dopey, vegetablish, to-hell-with-it-ish. We got here 2 weeks ago tomorrow; most of the time I've had "terminal" work to do, delegations with anxious frowns and wearing tightly drawn neckties so out of keeping with our oil-lamp and oil-stove existence here. They all promise to drop me from their life as of today; we hope to be here until about Oct 1. . . . Affectionate greetings from Helen and from me

as ever

June 16, 1949

Dear Dave:

You will, I am sure, understand why I haven't bothered you. This is merely a note to say that your stature increaseth daily, and my admiration for your handling of this affair does likewise. Some of my mail would, as they say in the South, pleasure you greatly

I venture it not as a personal but as a professional opinion that the developments so far--in spite of what it has cost you, have been beneficial for the body politic.

I send you my best salute.

As ever yours,

Mr. David E. Lilienthal
R.F.D. #2
Rockville, Maryland

May 24, 1949

Dear Ed:

It is a great gift you have, the ability to sum up and clarify a confused issue in a few inspired words. Your broadcast of last night was an example of that.

I have a question that I think you might find interesting, and if you do think so, might find someone who could ask it. I don't mean I want you to be the someone, don't misunderstand me. But it would seem to me (I speak as an "informed" taxpayer, now!) that it might be pertinent to ask what the congressional Atomic Energy committe has been doing these many months, to become curious about the attendance at committee meetings, now that many of these men have become so publicly alarmed. I hppe that the minutes, or rather that the attendance rolls of those committee meetings are not classified. I know the answers, of course -- two and three, and rarely the same two or three in succession.

It looks this morning as if they were going to throw the book at Dave. Well, at least we won't have to speculate much longer about whether he is to continue in public service. That can be checked off.

My best to Janet and Casey.

Sincerely

Helen Lilienthal

at home May 19, 1949

DAVID E. LILIENTHAL

Dear Ed:

Your analysis of the fight I'm in at the moment, on tonight's broadcast, put new heart into me. It has been rough--and with the planted time bomb of the 4 gram jitters going off right in the middle of it, and other such scheduled now doubt--but there really is a principle involved, and I think one or two of the Senators this morning began to see it.

My first talk, after appointment to this job, was impromptu, to a gathering of correspondents here. I said: any men named to this job, with all the emotion and mystery and fears surrounding it, must understand that they are expendable--they can't last long, and that is just part of the job. So---don't forget I may be looking for some ideas of how to live sans atom any day now! But I'll be ridin' him cowboy till then.

This Yuranium Yumps, over the 1/7 ounce is something. After 4 hours of listening to big strong Members and Senators trembling I said: If you fellows issue that kind of a statement over the reported discrepancy in accounts of 4 grams of uranium oxide, how do you think the country will behave by your example when Russian has a stockpile of weapons." The statement was changed; no further argument. Quite a life.

As ever Dave

rockville md rfd#5 April 30--49

Personal

My dear Ed:

Naturally, I was delighted to read of the Peabody award. More was involved--far more--than the satisfaction of seeing a friend get his just deserts. Without being too impersonal (a reprehensible trait, and not I hope one I'm guilty of too frequently) I thought this award re-assuring, in a deep sense. Your reporting and your comments are not deliberately sensational, or theatrical or escapist. They aren't pollyannish; and they don't appeal to the fascination for catastrophe that is also a sign of an unhealthy public mind. You assume that the men and women of America are adults, most of the time, and that you are responsible to them and not to Hooper or to your personal ambitions or axes or vanity or prejudices. (And if you have none of these latter things, in normal dosages, you are less attractive a human being than I'm under the impression you are.) Well--in short, the award confirms a high opinion of your audience and your audience's sense of values. And since that audience is very large and their opinions are far more important than those of any public official (or aggregation thereof) the award is deeply re-assuring.

I was asked, formally, yesterday, to name the man I thought had contributed most to "the public service" during the past year; this was part of the American University's selection of one to receive their annual award for public service. In putting down your name, I answered their question

ed murrow #2 4-30-49

"why this nomination" in two sentences about the central importance of informed democracy--and your place in keeping it informed--that was another way of saying what I've just said about the Peabody award and one Edward R. Murrow.

You would have enjoyed the trip to Washington (State of) from which I returned last Tuesday. Talked to 7000 students at W.S.C., at Pullman, and had a wonderful time. In the huge gym, with the sunlight on them, and all of us in a fine mood. When I included among the reasons for my joy in being out there, looking at them, my admiration for one of their graduates, whom i regarded as probably "the most modern and civilized man of my generation" they greeted your name with a lusty round of applause and rustling that was good to hear. Had a terrific time at Hanford, and at Seattle, where I put in one day that tops all of mine up to this point for a round of activities, not excluding a speech to the best "cross-section" I've ever seen assembled, a speech at night at Meaney Hall to an audience so responsive as to approximate a lively conversation; and recording two half-hour radio conversations, one with Grange leaders and one with 5 newsmen, a kind of meet the press, and then radio-interview stuff with 3 stations. It was foolishness to try all this (to which add a breakfast conference, a luncheon meeting, a dinner at Dr. Allen's, and a reception that lasted till 1 A.M.) but at least it was fun, refreshing, and showed there's nothing wrong with my stamina, yet--with birthday number 50 ahead in July.

Best to Janet and Casey. Hope we'll see you soon.

As ever, faithfully, Dave

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON 25, D. C.

February 12, 1949

Miss Joan Platoff
Secretary to Ed Murrow
Columbia Broadcasting System
485 Madison Avenue
New York 22, New York

Dear Miss Platoff:

Thanks so much for sending us the transcript of the January 31st broadcast.

Would you, by any chance, still have the copy which Mr. Lilienthal used the night of the broadcast? Don't go to a lot of trouble in looking for it but if you should have it available we would like to have it for our files since Mr. Lilienthal has a mania (well, almost!!) for saving all drafts of his speeches, broadcasts, etc. But as I say--don't worry about it if you don't have it.

Give my regards to that nice boss of yours.

Sincerely yours,

Martha Jane Brown

Secretary to
David E. Lilienthal

Ed: This is the Lehigh thing I referred to. Sure we boys did enjoy our visit with you & Janet Davis

UNITED STATES

FOR RELEASE AT 2:30 P.M. (EST)
SUNDAY, FEBRUARY 6, 1949

Commencement Address
by David E. Lilienthal, Chairman,
United States Atomic Energy Commission,
to be delivered at Lehigh University,
Bethlehem, Pennsylvania, 2:30 P.M., February 6, 1949

SCIENCE AND THE SPIRIT OF MAN

We meet today upon a campus famous the world over for the men Lehigh has trained, for the additions to knowledge Lehigh has made and has nourished. Wherever science and engineering are known and respected, Lehigh and her teachers and graduates are known and are respected.

Science and technology were once matters that concerned only those with special technical knowledge; today they are front page news, affecting men's daily lives and daily decisions. Whether millions of human beings shall go hungry or be fed, shall suffer disease or enjoy good health, be condemned to drudgery or use machines to relieve their toil -- more and more such human questions are determined by modern technology. Even more than this: technology and the machine have become central figures in the perilous struggle to safeguard the free spirit of man and to establish a peace that is a true peace.

This was made plain by the President in his Inaugural Address a fortnight or so ago, an address directed to the people of the whole world.

(more)

"We must", the President declared, "embark on a bold new program for making the benefits of our scientific advances and industrial progress available for the improvement and growth of under-developed areas.... More than half the people of the world are living in conditions approaching misery.... For the first time in history humanity possesses the knowledge and the skill to relieve the suffering of these people." He continued, "The United States is pre-eminent among the nations in the development of industrial and scientific techniques. I believe that we should make available to peace-loving peoples the benefits of our store of technical knowledge in order to help them realize their aspirations for a better life." Such a program as this "can greatly increase the industrial activity in other nations and can raise substantially their standards of living." "Democracy alone," the President said, in a challenge to other systems of the left and right basically in conflict with our own, "Democracy alone can supply the vitalizing force" to overcome the "ancient enemies--hunger, misery and despair."

Thus did the American people once more assert and strengthen their historic role of maintaining the offensive in the ceaseless contest for men's minds and loyalties, with the most potent weapon ever devised, a weapon that makes the atomic bomb seem a firecracker by comparison: an idea. That idea is this: that technology applied for human welfare can bring not only material well-being but can also nourish the free spirit of man.

The towering place of the machine, of science and the technical skills that create the machine, are among the dominant facts of the turbulent times

(more)

in which we live. The President's "new bold program," the activities in our atomic laboratories, the new advances in medicine, in the production of food by scientific methods, in the design of new scientific weapons of vast destructiveness -- these and many other instances can be cited of the predominant position of science and engineering today. And from such facts the great issue of our lifetime emerges. It is an issue with which you and I and all the peoples of the world will be at grips, day in and day out, for the rest of our lives. It is this:

> Are machines and science to be used to degrade man and destroy him, or are they to be used to augment the dignity and nobility of humankind? How can men use science and the machine to further the well-being of all men and the flowering of the human spirit?

From this issue no one who lives today can escape. It reaches into the lives of every one of us, old and young, rich and poor, you who graduate today and you who are freshmen. It concerns the housewife, the librarian, the chemist; it must be faced by the clergyman, the professor and the physician no less than by the businessman and public official. For this is the kind of world we live in -- the world of the machine -- and this is the struggle of our time.

Standing always at the elbow of each delegate at the United Nations Security Council meetings, always present at the conference tables of this troubled world is this same issue: how is technology to be used? Cross the seas and the shadow of this question has preceded you -- to the valley

(more)

of China's Yangtze River, to the rising factories of Bombay, to the oil fields of Iran, the tractor-powered wheat farms of the Ukraine. Geography and language differ, but the question and the struggle are everywhere in essence the same.

Men ask themselves: Is our advancing technology good? Is the ever more important machine good? Or are they evil?

To some people modern technology is plainly evil. To them the more gadgets the more unpalatable is life. The more things we produce, the faster we can travel, the more complex the machines we invent the nearer--they assert--we move to the edge of a bottomless pit. They ask: "Is not scientific warfare the inevitable fruit of technology? Are not ever more devastating atomic bombs the ultimate proof that modern applied science is a curse, an unmitigated blight?" Even great figures are heard to say: "Let us cease learning more of the world, let scientists declare a moratorium in their ceaseless prying into Nature's secrets." They are homesick for that simpler life, before the days when man produced so much and knew so much. They want to flee. But where and how? They cannot say. They cry out against science and the machine and call them evil; but their voices are the voices of despair and defeat.

There are others of our contemporaries who have an almost opposite view of the machine. You will find them all over the world. What they say is exuberant and uncritical. "Of course technology is good," they say, "for it produces more and more things; and isn't production the answer to everything?" They are usually skeptical of God, but they openly worship the machine.

(more)

"Of course the machine is good," they say. "When assembly lines cut costs, when production curves are upward or when Five-Year Plans are fulfilled -- those are the important things; let's not agonize over the effect of the machine on the freedom of men."

Technology, they seem to say, is good as an end in itself. If the spirit of man balks, if the yearning to be human increases cost of production or requires coercion -- well, man must be redesigned to fit the assembly line, not the assembly line revised for man. The supertechnologists of the world are quite prepared to recreate man in the image of the machine.

I venture to say that neither of these views -- of the defeatist or the technolator -- will appeal to most Americans.

The machine and technology are neither good nor evil in themselves. They are good only when man uses them for good. They are evil only if he puts them to evil purposes.

The machine can, of course, be so used as to degrade and enslave man. It can be used to exhaust the land and with it the human dignity of those who live on the land; it can poison the air, foul the streams, devastate the forests, and thereby doom men and women and children to the spiritual degradation of great poverty. But it can also open wider -- and it has so opened -- the doors of human opportunity; it can nourish the spirit of men. Technology can be used to eliminate filth and congestion and disease; to strengthen the soil; to conserve the forests; to humanize man's environment.

The machine can be so used as to make men free as they have never been free before.

(more)

We have a choice -- that it seems to me is the shining and hopeful fact. If we are wise enough, if we follow our democratic precepts, we can control and direct technology and the machine and make them serve for good.

I believe in the great potentialities for well-being of the machine and technology; and though they do hold a real threat of enslavement and frustration for the human spirit, I believe those dangers can be averted. I believe that through the methods of democracy the world of technology holds out the greatest opportunity in all history for the development of the individual, according to his own talents, aspirations, and willingness to shoulder the responsibilities of a free man. I believe men can make themselves free. Men can direct technology so that it can carry mankind toward the fulfillment of the greatest promise for human life and the human spirit in all history.

But this result is by no means inevitable. It is equally possible that technology may yield a harvest of bitter fruit.

More huge cyclotrons and nuclear research reactors are not enough. More fine laboratories, more extensive projects in physical and social research are not enough. More <u>use</u> of technology, more factories, more gadgets, whether in this country or in the undeveloped reaches of Africa and Asia and South America is not enough. Those who encourage a contrary belief are playing a dangerous game or are quite blind to the realities.

I say to you that unless the applications of research and technology are consciously related to a central purpose of human welfare, unless technology is defined and directed by those who believe in people and in democratic

(more)

and ethical ends and means, it could be that the more research money we spend the further we miss the mark. It is like driving in an automobile that is going in the wrong direction; the faster and faster you drive the farther away from your destination you will be.

The guiding of technical activity is safe, in terms of the human spirit,only when it is in the hands of those, in private business and in public agencies, who have faith in the individual human being. It is only safe when it is carried on by methods that are in furtherance of that faith, and methods that insure accountability to the people for the results.

This is not always the case with modern technology. There are times when these matters are controlled by men who lack a faith in people. People, to them, are only a "market." They are a market to whom to sell new gadgets; a labor market with which to make the gadgets; a political market to be cajoled and organized and voted and coerced. Technical development under such direction will not further freedom or will do so only by accident, by sheer coincidence.

We know what amazing things applied research can do to increase the destructive powers of Armies and Navies and Air Forces--our own, or a potential enemy's. But we still must ask: What can technology do to nourish and strengthen the human spirit? What can technology do to safeguard and strengthen men's freedom?

That modern man can completely change his environment is a matter of common observation. Perhaps as widely known an illustration in other parts of the world is afforded by the development in the Tennessee Valley.

(more)

In a single decade the face of a region larger than England was substantially altered, a region comprising parts of seven Southern states. The great Tennessee River has been changed: more than a score of huge dams make it do what men tell it to do. The farming land is changed -- millions of acres -- and the forests and woodlands. New factories, large and small, barges on the new river channel, and yards building ships; fields once dead and hideous with gullies now fruitful and green to the sun, secure with pastures and meadows; electric pumps in farmyards; new local and regional libraries; state parks and county health facilities -- these and many other changes make it a new Valley today. The job of development is not done, of course -- such a task never is -- but it is well on the way. It is one more demonstration that modern technical tools and managerial skills can control Nature and change the physical setting of our life in almost any way we choose -- there is the point -- in whatever way we as a people choose.

These changes in that Valley -- these physical changes -- strike the eye. They are unmistakable evidence of what can be done. Equally impressive are the evidences of increased production of farm and factory, of rising individual income among people who have suffered under shockingly sparse incomes. But most important of all the changes is the change in the spirit of the Valley's people. One of Alabama's younger leaders described it in these words: "We can write of great dams...of the building of home-grown industry and of electricity at last coming to the farms of thousands of farm people in the Valley. Yet the significant advances have been made in the thinking of a people. They are no longer afraid. They have caught the vision of their own powers. They can stand now and talk out in meeting..." And they do!

(more)

The real significance to many observers of what has taken place in the Valley of the Tennessee is this: This American experiment has fortified confidence that men need not be chained to the wheel of technology. If their purpose is firm and clear, and if they insist upon ways and means to make that purpose effective, man can use the machine in the interest of human welfare and the human spirit.

A great many men and women from foreign countries have come to study the TVA. They have come from more than 50 countries, and in particular from the technically undeveloped regions of the world, and from areas in which unsparing and unwise exploitation threatens their natural resources with utter exhaustion. These visitors have not only seen new life come to a dying soil; they have also seen how a new hope and faith return to people living on that soil, have seen men's pride and their human dignity strengthened as their soil was strengthened. They have not only seen the once wasted energies of a great river turned into electricity but they have also seen the way that electricity has put an end to degrading drudgery in tens of thousands of homes. They have seen businessmen, farmers, laborers -- all kinds of men and women -- joining together to apply the lessons of science and technology to the building of their region, and in the very act of joining together for that common purpose have seen many of them become better neighbors, kinder and more generous and more cooperative human beings.

These hundreds of foreign visitors see with particular clarity that the new Tennessee Valley speaks in a tongue that is universal among men, a language of things close to the everyday lives of people: soil, forests,

(more)

factories, minerals, rivers. No English interpreter is needed when a Chinese or a Hindu or a Peruvian sees these products of a working technology, sees a series of working dams, or a hillside pasture brought back to life by phosphate and lime and an understanding of soils. For it is not really Fontana Dam on a North Carolina stream or a farm in Kentucky that he sees, but a river, a valley, a farm in China or India or Peru.

Because it is an illustration with which I am familiar, I have pointed to the Tennessee Valley as one bit of American evidence that it can be done, that men can use science and technology in the interest of the human spirit. It does not make the demonstration less relevant that only a beginning has been made in that Valley, that the people of the Valley realize what a long, long way there is yet to travel. And it should surely not be necessary to utter the warning that no one should regard the TVA, or any other one effort in this direction as a single way out. The paths are many, and TVA is but one of the many moving toward the same goal.

We have a choice. We can choose deliberately and consciously whether the machine or man comes first. But that choice will not be exercised on a single occasion, surrounded by spectacle and drama. We will move from decision to decision, from issue to issue, and as I said to you at the outset, you and I and all of us will be in the midst of this struggle for the rest of our days.

We cannot master the machine in the interest of the human spirit unless we have a faith in people. This is the foundation of everything. The rock upon which all these efforts rest must be a deep and abiding faith in

(more)

human beings, which is a faith in the supreme worth of life. The machine can only add to the dignity and integrity of human existence if it is deliberately used in furtherance of such faith in people. It is the purpose for which the machine is used, and particularly the methods pursued in carrying out that purpose that determine whether technology is likely to further human well-being or to threaten it.

Let me restate: We do have a choice. On the one hand, it is clear that science in the hands of those seeking arbitrary power over men can make us slaves -- well-fed perhaps, but more pathetic for that fact. On the other hand, it is plain that men can use technology and the machine to further human freedom and the development of human personality.

How the machine shall be used will be determined by choices made by the people. But those choices are genuine choices only if the people make them with a knowledge of the facts, with a knowledge of the alternatives that are open to them. The means whereby the people make their decisions depends upon a sacred and inviolable process -- the dissemination of knowledge.

One such recent choice was the decision of the American people, through their elected representatives, in favor of civilian as distinguished from military direction of the scientific and technical development of atomic energy. After months of hearings and extended public discussion, Congress decided that although atomic energy is of central importance to the national defense, it also holds such broad implications for our health, agriculture, industry, education -- in short our whole way of life -- that it must be fitted into the democratic scheme of civilian self-government.

(more)

That was an important decision. But many other questions concerning atomic energy are before this country today, and many more will arise in the months and years ahead.

These questions concern every last one of us. They include such questions as these: What kind of Army, Navy and Air Force do we now require, in the light of these new discoveries? What are safe and what are unsafe methods of international control of atomic energy to prevent its use as a surprise weapon? How extensively should the American people support medical research in this field, and similarly research in nutrition and in increasing the production of food by novel methods opened up by these new developments? What should be the place of private corporations in this brand-new technology, an industry that unlike anything the world has ever seen before was a giant at birth, and wholly government-owned? How do the people see to it that our universities and research institutions shall remain free of Government or military control when it is necessary that such vast sums for research and development be provided to them by the Federal treasury? How can the people see to it that narrow politics and pork barrel methods are kept strictly out of this huge scientific, industrial and educational enterprise? How can we maintain essential secrecy without drying up the very well-springs of scientific and technical advance, which flourishes not in secrecy but in openness and free discussion?

The questions are manifold. The answers, the decisions, will affect directly the future well-being of the 145 million stockholders in this atomic enterprise, that is the people of the United States. They will indeed affect every human being on the globe.

(more)

Those decisions to be genuine democratic decisions require facts in the hands of the people. Indeed facts and the dissemination of knowledge are the very foundation of self-government, are the very foundation of any effort to direct technology toward the protection of the free spirit of man.

Because of its military aspects and the present unhappy international situation, it is not possible to make the whole atomic energy field subject to public scrutiny. But as we on the Commission have studied the matter, we have found that much of what is going on in this strange new enterprise can with safety be publicly reported and publicly discussed. One such report was issued last Monday. More reports, ranging from an Atomic Primer to an Atomic Weapons' Effects Handbook, are in preparation.

Wide dissemination of facts and broad public discussion in this field must continue and must increase. For unless the people have the essential facts about atomic energy they cannot act wisely nor can they act democratically.

It is well that we recall our basic tenet: that this democracy of ours is founded upon a faith in the judgment of the people as a whole. It is founded upon a belief that when the people are informed -- honestly and clearly informed -- their conscience and their common sense can be relied upon to carry us safely through any crisis. The direction of applied science and the machine by the judgment and conscience of the people as a whole requires that we be an informed people.

Faith in the people must have as its corollaries faith in the facts, faith in the power of knowledge, faith in the free flow of ideas, and hence faith in education and the processes of education. These are the very pillars of our free society.

2/1/49

December 28, 1948

Dear Dave:

I cannot let the day pass without offering you my best salute on the opinion re Frank Graham. It was an act of courage and justice in a world where there is little of either to be found. The least surprising thing I have encountered in a long while was your reaction to my piece of December 16th. I think it was Thoreau who said: "It takes two men to speak the truth--one to speak it, the other to hear it".

I am eagerly looking forward to spending as much time with you as you can spare during January, for in the words of the old hymn, "I am standing sore in need of help", and being a dog of an unbeliever, I think I am probably more likely to get it from you than the "omnipotent boss".

As ever yours,

The Honorable David E. Lilienthal
Chairman, Atomic Energy Commission
Washington, D.C.

Dec 21/48

DAVID E. LILIENTHAL

Dear Ed:

I didn't get to hear you on Dec 16 but I've just read the — do they call it "rescript" — and it makes sense. What we've been hammering at for a year does need more explicitness — and with public opinion and understanding where it

DAVID E. LILIENTHAL

now is — a considerable advance — and a better Congressional picture we now have the ball. What I said about raw materials, in Denver, on Dec 17, previously secret, should be followed by equally explicit things — and with luck & support it will.

DAVID E. LILIENTHAL

So keep on telling me off when I get in the "rights" —

And I'm looking forward to seeing you, in January.

As ever
Dave

P.S. Did you see our opinion on Frank Graham re "associations"? I enclose copy.

C O P Y

MEMORANDUM OF DECISION
REGARDING DR. F. P. GRAHAM

The Commission has under consideration the question of the security clearance of Dr. Frank Porter Graham for access to restricted data under the Atomic Energy Act of 1946.

Since 1930 Dr. Graham has been President of the University of North Carolina. In addition, he has a record of distinguished public service, which includes service as a member of the National Defense Mediation Board during 1941-1942, as a member of the National War Labor Board during 1942-1945, and as a member of the Maritime War Emergency Board during 1942-1946.

The question of Dr. Graham's security clearance arises because he is President of the Oak Ridge Institute of Nuclear Studies, a non-profit organization of southern universities established to assure broad regional participation in the atomic energy educational and training activities centered at Oak Ridge, Tenn. The Institute carries on its work under a cost-reimbursement contract with the Atomic Energy Commission, and much of this work is conducted on a wholly unclassified basis. However, the President and the Board of Directors of the Institute require occasional access to certain general information of a classified nature if they are to provide effective leadership and guidance in the development of the Institute's programs.

Under the Atomic Energy Act of 1946, security clearance is to be based on a Commission determination that "permitting such person to have access to restricted data will not endanger the common defense or security", and each case is considered in the light of a Federal Bureau of Investigation report on the individual's "character, associations, and loyalty".

The five members of the Commission have examined with care the security file relating to Dr. Graham. They are fully satisfied that Dr. Graham is a man of upright character and thorough-going loyalty to the United States. His career as a leading educator and prominent public figure in the South has, it appears, been marked by controversy, engendered in part by his active role in championing freedom of speech and other basic civil or economic rights.

In the course of his vigorous advocacy of the principles in which he believes, Dr. Graham has allied himself, by sponsorship or participation, with large numbers of people and organizations all over the country. In this way he has been associated at times with individuals or organizations influenced by motives or views of Communist derivation. These associations, which in substance are described in various published material, are all referred to in the security file.

"Associations" of course have a probative value in determining whether an individual is a good or bad security risk. But it must be recognized that it is the man himself the Commission is actually concerned with, that the associations are only evidentiary, and that common sense must be exercised in judging their significance. It does not appear that Dr. Graham ever associated with any such individuals or organizations for improper purposes; on the contrary, the specific purposes for which he had these associations were in keeping with American traditions and principles. Moreover, from the entire record it is clear in Dr. Graham's case that such associations have neither impaired his integrity and independence, nor aroused in him the slightest sympathy for Communism or other anti-democratic or subversive doctrines. His record on controversial issues has made this abundantly clear, and his course of conduct during the past two decades leaves no doubt as to his opposition to Communism and his attachment to the principles of the Constitution.

All five members of the Commission agree with the conclusion of the General Manager that, in the words of the Atomic Energy Act of 1946, it "will not endanger the common defense or security" for Dr. Graham to be given security clearance, and that it is very much to the advantage of the country that Dr. Graham continue his participation in the atomic energy program. Our long range success in the field of atomic energy depends in large part on our ability to attract into the program men of character and vision with a wide variety of talents and viewpoints.

THE CITIZEN AS PUBLIC SERVANT

Every individual has a philosophy. Sometimes it is explicit and articulate; more often it is not, but it is there nonetheless.

Similarly every generation has a philosophy, a theme, a major premise.

When my generation sat where you graduates of '48 sit today, we, as a generation, had a rather definite philosophy. This guiding general principle of those of us who in the Twenties were at about the age and time of life you are today, can be summed up in this phrase:

"Take care of Number One."

The idea was a simple one; it was almost universally accepted; it seemed eminently sensible. If everyone devoted himself to his own success, to his own advancement, if everyone took care of Number One, and concentrated on that -- why obviously the sum total of the successes of all the Number Ones would be prosperity and happiness all around, an end to poverty, in brief a golden era.

(more)

Taking care of Number One, the philosophy of my generation, was not however confined to individuals, and the careers of individuals. It applied to groups. If farmers looked out for their own interests, if organized labor and industrial management did the same for their respective interests, if physicians and lawyers and bankers and bond salesmen and ship-builders and merchants -- each looked out for Number One then all the Number Ones would be looked out for.

The same philosophy dominated international relations of the Twenties. Since we felt this was a good philosophy for individuals and for groups, naturally it was a sound idea among nations too. If the United States concentrated on advancing the welfare of the United States, and if Germany did the same, and Britain the same, and France and Russia and all the other nations, then by the philosophy of "Look out for Number One," by each nation paying strict attention to its own business, the sum total would be prosperity and peace for all.

The idea seemed sound; it was what we then liked to call "just plain common sense." We had made the simple discovery that not only was poverty unnecessary but so was war. To make sure of it, all the Number Ones who were each going to look out for himself, got together and signed an eloquent piece of paper agreeing that there would be no more wars.

(more)

For a time the idea worked wonderfully well. A great many of us, just out of college and professional school or just beginning in business looked out for Number One, and found it surprisingly profitable. It was, by and large, a time of easy earning and free spending. We did not know then, as we do now, that in a time of rising prices, of inflating values, you really have to be very dumb indeed to fail to make money. So, in our naivete, we attributed this easy success to our own great talents for money-making, and to the fine education in self-advancement we had received, and for which we had been awarded diplomas from the universities of the land.

Nations found the idea worked well, too. We protected our own industries by high tariffs, and other nations took measures they deemed appropriate to take care of their prosperity. Taxes were low, and the budget was balanced. What need was there for expensive armies and navies, since we had a piece of paper that said, officially, that war had been outlawed? With every interest watching out for its own pickings, the President could take a long nap every afternoon, and Congress a rest several months out of every term.

But to say that Taking Care of Number One <u>did not work</u> is a masterpiece of understatement. Judged by the implacable and merciless test of results -- a prostrating depression followed by a terrible war -- it was soon made clear that the philosophy of

(more)

my generation was somehow, tragically in error.

Each man took care of himself, but the sum total of all this self-reliance was that the devil not only took the hindmost but the foremost and those in between. Each nation tended to its own affairs, but the net result was not the end of war, but the greatest war of all time.

The art of self-government, the whole process of Government that had seemed so irrelevant, so inconsequential to us who thought we had found the golden way, became suddenly the center of our greatest concern. A business depression of great severity brought us all to the brink of collapse. Many of our leading citizens, who had theretofore never given a thought to Government except as a minor irritation, gave up their business to devote themselves entirely to Government, in order to pull us out of this havoc. Later they put their own interests aside to work in Government, in order to help win a war, a war their own sons were fighting.

Some of our generation, thinking it over later, felt that it might have been better if they had concerned themselves with Government sooner, before the day came when they saw so many people's life-savings go down the drain. They wondered if it wouldn't have been smarter to have come to Washington, or to have concerned themselves more with the kind of men chosen to go to Washington, before a war was on, while there was still time perhaps to do something to prevent war, than to have put off their interest

(more)

in Government until that day when they walked down that long, long station corridor to see their sons off to military training camp, to wish them bon voyage on their journey to possible mutilation and death in some far-off jungle or beach.

Yes, we, your fathers and your grandfathers have done some sober thinking since the good old days of the Twenties when we worshipped at the altar of Personal Success.

There is sound precedent -- a great deal of it, and very impressive it is too -- for a commencement speaker to commend to the young graduates, that they follow in the philosophy of the speaker's own generation. I must depart from that precedent today. I can't honestly recommend "Take care of Number One" as a philosophy for your generation.

Why was it wrong? Well, the explanations are various. There are some who would say the philosophy was doomed to fail because it contravenes the moral law, since it embodies the glorification of self; that its failure was foretold by the teachings of the Old and the New Testaments. But there is no need for such speculations, not this afternoon at least. I certainly cannot commend that philosophy to you, whatever the reasons. For its results alone are sufficient to mark it a failure, not worthy of repetition as a major premise for your own individual lives, or as a principle of our national life, or as a principle of international relations.

(more)

No, I cannot commend to your generation the philosophy of my own. What I propose in its stead I can compress in this phrase:

"Be an active, living part of your times."

Do a good job and attain success in your chosen field; yes, definitely. Be self-reliant, yes. But self-sufficient, self-centered, self-loving -- no, not that. Become an active part of your time -- this I propose as the best, though clearly a most difficult, alternative to the idea of each man withdrawing into the shell of self-preoccupation, of concern solely about his own success.

I speak of "your times." What kind of times will yours be? And what do I mean by being an active, living part of that time?

I can best suggest what I have in mind by quoting to you the remarks of two men.

First I quote from Warren Gamaliel Harding, 28th President of the United States, who, I think it is fair to say, exemplified to a degree the central philosophy of the generation of the Twenties, a generation that with infinite appropriateness made him and his associates our corporeal and symbolic leaders.

This is what President Harding is reported to have said: "Government, after all, is a simple thing."

Next I quote the comment of Dr. Albert Einstein, whose brain has comprehended abstractions and arabesques of the intellect quite beyond most of us: "Politics" the great mathematician said,

(more)

meaning I take it the whole art of government, "Politics is more difficult than physics." And for physics I think we may substitute science, all science.

There you have it. The times, of which I urge you to be an active living part, will be chiefly occupied, indeed "dominated" is not too strong a word, with these two: physics and politics, or more accurately science and government.

First, as to the role of science in the drama of your time.

The assertion that science (taken together with the technologies based on physical science) is a dominant fact with which your generation must reckon is surely one that requires little elaboration, certainly not to you who only three years ago read the astounding headlines of Hiroshima and Nagasaki, and only a few weeks ago the accounts of man-made cosmic rays and of multi-billion volt atom-smashers. One need but refer to atomic science (to mention but one branch) and how that science has spurred progress in the search for the cause of disease, how it is helping to throw light on the ancient mysteries of growth in plants and in animals, the way it is opening fresh fields in industry in the development of quite new materials and metals. One need but point to the probability that in your life-time there will be created new sources of energy that may shape the future of the undeveloped continents of the world. These and other developments and opportunities in various sectors of science are almost as fresh and new as the diplomas you carry away with you this day.

(more)

What do I mean when I urge you to play an active part in science? I do not, of course, suggest that the members of your generation must all adopt science and engineering as a life's work. What I do urge is that, as an educated citizen, that is to say a privileged citizen, you keep informed of the essentials, of the basic facts. For it is chiefly upon the lay citizen, informed about science but not its practitioner, that the country must depend in determining the use to which science is put, in resolving the many public policy questions that scientific discoveries constantly force upon us.

Science itself, of course, is neither good for mankind nor is it evil; it is, in itself, neither beneficent or destructive. How its findings are used -- whether for good or for ill -- these are matters largely for the good judgment, in human affairs, of all citizens, scientists and non-scientists; but they should be informed citizens.

You need not, of course, have the detailed knowledge that the professional scientist must have. But in the field of atomic sciences, as one example, you should know the elementary principles and the basic concepts, and the progress of their development. You should have a knowledge of the methods and principles of scientific inquiry, and how that method differs from the method of the politician or administrator or executive, skilled in the arts of government or of business.

(more)

For all of you who have had a course in the fundamentals of any of the physical sciences -- and most of you have -- this will not be difficult, particularly in view of the improvement now taking place in scientific journalism for lay readers.

The quickened pace of scientific discovery and development will touch and affect all manner of issues of concern to you, some of them matters of life and death. These will be issues bearing upon the security of the nation, upon the state of mind of your communities (ranging from blind fear and panic to calm and prudent judgment) issues of health, of investment opportunities, of what we need by way of armies, navies and air forces -- this list could be extended indefinitely in length and variety.

So whether you are going into business or the law or journalism or farming or any of a number of lines of work, I urge that you become a living part of that vital fact of your times that is covered by the term "science."

I said, a few moments ago, that Government and Science would, in my opinion, be the two towering facts of your generation and I have spoken briefly of science.

Let me state more precisely what I mean when I urge you to be active in Government. Do I mean what we call "good citizenship," that is keeping informed on public questions by reading and listening to the radio and attending forums, by remembering to vote, and

(more)

never neglecting to put the wastepaper neatly at the curb during Clean-Up-Your-Town week? Yes, of course. But that won't be enough, not for what you are going to encounter in the Fifties of this century.

Well, surely I don't mean that every man and woman to whom this country has given the high privilege of a college education, and who has the qualifications, should actually spend a part of his life in some form of public service!

That is exactly what I am proposing.

In the next three decades I urge that every educated person who is qualified to do so, plan definitely to set aside a number of years for the rendering of service in the legislative, or executive branches of his local, state or federal government, and that as nearly as possible this be full-time service.

I am proposing a widespread rotation of the not-too-pleasant duties of the public service. And I do not mean merely part-time or "dollar-a-year" service alone. Nor in my opinion will it meet the situation to put this public service off until you are of retirement age.

I propose that, out of the best and most productive years of your life you should carve out a segment in which you put your private career aside to serve your community and your country, and thereby to serve your children, your neighbors, your fellow men, and the cause of freedom.

(more)

Today our concept of what constitutes a decent society, our deepest moral convictions, our ideas of self-government, these are all the targets of the fury of extremism, of fanaticism, both abroad and at home. The threat to our institutions is not one that military force can remove or from which it alone can protect us. Nor is it a crisis of a few months' or a few years' duration; we face, I fear, a decade, more probably a generation, of continued tension, a period in which one pressure will follow another, a period in which alarms and excursions alternate with "sweet talk" of peace and of normalcy, of easy solutions that will cost us almost nothing -- cost us nothing but the whole of our moral principles and the heart of our liberties.

This period will not only call for steadfastness and faith, but for great skills in self-government, great judgment and open-mindedness in the development of public policies, and creativeness in all the arts of Government. In these circumstances we must summon all of our talents for citizenship, for self-government, for public service as we chart our course through these dark waters.

By whom will the public services be manned? By mediocrity and by hacks? Or by our very ablest citizens? I say it must be the latter, and it is for that reason I have made this proposal of a citizens' universal public service.

(more)

In the Twenties, in the era of Common Sense, Government was something way off yonder, something really quite unimportant. We were well content to permit people we thought not quite respectable or not quite good enough for the competitive struggle, to run Government.

In those days the sort of proposal I have just made would have sounded quite mad. Our own careers were what counted. Why in the world should anyone break into his career to associate with a bunch of politicos in the city council, or the state legislature, or in Congress? We would have asked, in some indignation: What sense does it make for a fine physician to bother with veterans' hospitals, or a distinguished scientist or engineer to bother trying to give special quality to a government research laboratory, or a rising young business executive to bring modern ideas of management into public works? That just wouldn't have made sense.

Well, we were sensible, all right, we of the Twenties. Government wasn't important, we thought, and by the time we found out that we were wrong, it was pretty late, very late indeed.

I urge your generation not to drift into the same error. I say to you that there is no one in this country, however talented, however well-trained, however ambiticus, who can safely adopt the attitude toward local or federal Government, in all its many ramifications, that we of the Twenties adopted. Upon the ability and

(more)

integrity and judgment of men and women in Government -- whether they be mediocre and mere political hacks and windbags, or whether they be superior, well-trained and independent -- upon them too many grave decisions depend these days to permit anyone to assert that his career is too important to be bothered by the irrelevance of Government service.

And we all remember with pride that in the early formative years of the Republic, full time public service, though at least as distasteful as today, was not thought beneath the talents or the dignity of the ablest and most successful of men. By any measure Mr. Washington and Mr. Jefferson were not the least able citizens of the Commonwealth of Virginia.

The maintenance of peace -- or atomic warfare? Is that important to you as an individual? To your children?

Business stability -- or depression? Is that important: I mean important to you?

Sensible taxation and fiscal policies -- or the kind that bankrupt us? Important?

World trade-- or a contracting economic isolation? Scientific progress, outdistancing the world, or the hamstringing of scientific enterprise? Public education on a flourishing basis, or in a state of collapse?

(more)

Are these things important to you? To your families?

They are indeed. And by and large most of these questions are determined, the course laid out, by men in the public service. They had better be the best men and women we have, since these are among the most important questions we have.

I hope I have made it clear that I'm not urging that everyone pursue public service, in some form, as a life career. Not at all. As a matter of fact, I am inclined to think that the idea of public service as a life-time career has certain severe limitations, judged by present-day public needs.

What I urge is a fluid kind of citizen-service, in which men and women move from private life into public service for a period of years, and then back to private life. Thus there will be an almost ideal situation, as I see it, in this: On their return to private life, we will have private citizens experienced in first-hand knowledge of public affairs and of the special difficulties that beset the public servant; we will have public servants whose judgment will be enriched by recent experience in the day-to-day problems of private affairs. The careers of the Founder of the University of Virginia, and of its present distinguished President and Chancellor are illustrations of what I have in mind.

Such a plan has a number of advantages to the country. The proposal also has in it an element of common fairness.

(more)

It seems only right to me that the grim and disagreeable tasks that so often are the lot of the responsible public servant should not be exacted of him for an indefinite period, but should be rotated among all who have an equal stake in these grave issues.

There are these days many gloomy predictions about the future, sometimes profoundly gloomy. It is, indeed, not uncommon to hear responsible and well-informed men foretell mankind's suicide, predict a cataclysm that will bring the end of our civilization in the not distant future.

I do not share this gloom, nor these forebodings of utter catastrophe. Of course, no man in his right mind can minimize the hazards of the gathering storm, or fail to see that troubled days and years lie ahead. I am sure there is no time to waste. But I have confidence that the philosophy of "Take Care of Number One" has so clearly been demonstrated a tragic failure that it will not be embraced again in your generation; that despite occasional (and quite human) relapses from time to time we will not again be led down that road. More than that, I believe there is a good chance that we shall more and more apply in our daily affairs and public policies the moral precepts and ethical standards mankind over thousands of years has learned, with such pain, may not be lightly ignored nor disregarded. I firmly believe that your generation intends to be and will become an active living part of your times.

Mr. David E. Lilienthal
Unites States Atomic Energy
Commission
Washington, D. C.

Dear Dave:

Many thanks for your note and for your kind invitation to dine. Janet will not be coming to Washington next week, but I will be delighted to join you and Helen on Thursday evening, May 27th.

I'm looking forward to seeing you both.

As ever yours,

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON

May 17, 1948

Special Del

Dear Ed:

I am going to be in New York a couple of days this week--some urgent business and an informal talk at the Council on Foreign Relations.

Since, as I recall, you expect to be in Washington next week perhaps we can put off our visit until then but Helen wants me to find out as promptly as I can whether you and Janet will have dinner with us one day during your stay. We can make it any day but just to start the ball rolling may I suggest Thursday evening, May 27.* Because of your broadcast we will ask you to dine in town with us.

Sincerely,

Dave

David E. Lilienthal

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON 25, D. C.

February 13, 1948

Dear Ed:

I hated like mischief to wire you that I could not manage the Overseas Press speech but after looking over what I know is ahead in the next few weeks (to say nothing of the things that come up that can't be foreseen) it just didn't seem humanly possible. It would have provided a great opportunity.

Helen and I enjoyed being in your home and visiting with you and Janet more than we can say. The chance to meet Lady Reading was a great treat. What a gal she is!

I am hoping to see Russell Davenport again shortly.

I thought your broadcast on the markets, etc. the other evening one of the very best you have done--and on a very difficult subject. You manage to give things a sharp point without any trace of the pontifical or dogmatic that drives most people away from even the most relevant and important issues of their lives. You sound more like the fellow you meet on the street who has given a subject some thought and persuades you by tracing his own mental processes rather than the all-wise "expert" from whom most of us shy off. It is the most difficult thing in the world to do--that kind of simple, relaxed but penetrating analysis. It is the thing, of course, that gave Roosevelt his hold on the country.

Sincerely yours,

Dave

DEL

P.S. And last night on russophobia as a substitute for public discussion was another beaut. D

COLUMBIA BROADCASTING SYSTEM, INC.
485 MADISON AVENUE
NEW YORK 22, N. Y.

February 9, 1948

The Honorable David E. Lilienthal
Chairman
Atomic Energy Commission
Washington, D.C.

Dear Dave:

Herewith our suggestions for what we think will add up to a fine address and a good reason for your breaking bread with the Overseas Press Club at its annual dinner on Tuesday, March 16th.

The dinner, held at the Waldorf Astoria, draws in the bulk of OPC's 650 members from all over the country and some 650 guests, distinguished citizens from every major field of industry, education, science etc., with the main emphasis on those who operate the instruments for the dissemination of news.

Having in mind your earnest plea for the necessity of public understanding of atomic energy made at the Radio Executives Club last Thursday, and your recent address in Chicago, which sketched in broad strokes the bright potential of intelligent use and understanding of atomic energy, we suggest, in effect, that you talk about your charge in hard comparative terms understandable to the layman.

To repeat—for Daly bent your ear at great length in this matter—the hard comparative term is the TVA. The TVA meant power. What did its arrival bring to the community and mean to its inhabitants in terms of better living, greater opportunity and emancipation of body and spirit? This goes all the way from more and better food to better health; to a better breed of youngsters because they're better fed, have better medical care, have more educational and informational contacts with the world and its doings through radio;

E. R. M.
F. 1155

COLUMBIA BROADCASTING SYSTEM, INC.
485 MADISON AVENUE
NEW YORK 22, N. Y.

The Honorable David E. Lilienthal February 9, 1948

because, with the advent of power and its economic effects, they have their heads up, hope for tomorrow, and a chance for the knowledge to sustain the present. In sum, here is what TVA and Power did to, and for, the area and people it serves.

Atomic energy, too, means, fundamentally, Power. Here is the bright promise of what it can do for the area and people it can serve—all the globe and all its populations. Its telling will lie in a reprise of your Chicago address. Specific terms can do nothing but create great interest and win wide distribution—such terms of reference as your Chicago statement that atomic energy in the field of agriculture can make hunger disappear from the globe perhaps in a decade; that within a decade you hope to have harnessed atomic power, on a pilot basis, to the operation of refrigators and washing machines, etc. Enclosed is a clipping from The Christian Science Monitor of February 3rd which speaks of a power development in the combustion engine as becoming available to the public in five to ten years. Surely then, when you speak of the promise of atomic energy in terms of a decade, it is as though you spoke of tomorrow.

We will avoid further detail, for this note gets over long, and I think what is laid down here will refresh your mind on other details of the talks you have had with both of us.

One last reminder. Daly spoke of relating your quest for public interest in atomic energy to the recent drive to establish the Damon Runyon Cancer Fund. This drive tapped a well-spring of generosity and interest because cancer is something we all live with, fear, and hate. Yet, cancer is only one of the bitter enemies of society that atomic energy is already seeking to destroy. Also you will remember that we suggested that your peroration might be that TVA has shown what can happen when men use Power intelligently, the promise of atomic energy already is that it can do as much more as its equation of power exceeds that of electricity, and the choice rests at every hearth and fireside. Bombs or benefits—we must take our choice and back it up.

Daly bespoke our need for getting invitations out immediately. May we have your acceptance (they said in unison) by Wednesday?

Sincerely yours,

E. R. M.

FOR RELEASE UPON DELIVERY OF
ADDRESS, 12:30 P.M., EST,
THURSDAY, FEBRUARY 5, 1948

ATOMIC ENERGY -- WHERE DO WE STAND TODAY?

An address by David E. Lilienthal, Chairman
United States Atomic Energy Commission,
before the Radio Executives Club, Grand Ballroom, Hotel Roosevelt, New York, New York,
Thursday, February 5, 1948, 12:30 P.M.

The topic I have chosen to discuss, "Atomic Energy--Where Do We Stand Today?" may give you the impression that I intend to tell you how many atomic bombs this country has, and where they are; or the progress in use of atomic energy for the treatment of disease; or how the new super-cyclotron has split and shattered the nucleus of such a common substance as lead.

But I have something quite different in mind. I shall talk with you chiefly about people.

For people are the most important fact about atomic energy. What goes on in people's minds -- and in their hearts -- is even more important in determining the fateful future than what goes on in atomic energy laboratories and vast production centers.

The theme of what I shall say to you is this: The people must know; the people as a whole must come to understand the essentials of this new world into the outer reaches of which science has brought us so suddenly.

We must not, we dare not, enter upon this new era of human life if the very facts that set our time off from any that preceded it are, in their essentials,

(more)

not widely known. For men generally to be in the dark as to the nature of the fundamental structure and forces of the atom -- and of the evil and the great good this knowledge can bring -- would be for us to live in a world in which we are, in elementary knowledge, quite blind and unseeing. It would be almost as if we did not know that fire is hot, that water is wet; as if we did not know there are seasons and gravity and magnetism and electricity.

I am persuaded that the people are increasingly determined to find out, to learn about these things. Some of the obstructions in their path are being exposed as myths. For example the widely circulated piece of nonsense that atomic science in its entirety is a military secret is about exploded. The well-cultivated fiction that atomic energy is a bomb and nothing else, that it has no humanitarian and practical uses -- this too is being understood for what it is, a bit of pure moonshine. The myth that the essentials are too technical, are "over people's heads" is giving way to the truth.

The mischievous notion that people are such utter dopes that they are not and can not be made interested in the atom -- though every cell of their bodies and everything they eat and touch is made up of atoms -- this notion does persist, but it is taking a beating in those communities where the people are setting out to find out about what makes the physical world tick.

What is happening in the country, at the grass-roots, is an encouraging and heartening story.

The people, in their home towns and neighborhoods, in their churches, and schools, in their service clubs and farm organizations and local professional societies, the people are on their way.

(more)

They have, it is true, made only a beginning, and there are difficulties to be overcome. Some of these difficulties in creating wider interest and understanding the radio industry (with the press, the periodicals and the films) could help mightly to overcome. You of the radio, if you are willing to pitch in with your great skill and your vast facilities -- you can give a great and perhaps decisive impetus to this effort by the people to understand the atomic world.

I said that the important thing about atomic energy is people, what goes on in people's minds, how well the people understand the broad outlines of this "knowledge so new" to man that with it "he can become a new man". I do not mean any special kind of people -- scientists or generals or public officials. By people I certainly do not mean leaders only. No, when I speak of what goes on in people's minds about atomic energy I simply mean people as they come, as you find them up and down the country, the people in the drug stores and art galleries and churches and bars and banks and union halls, the people who go to the ball games and horse shows, the people, in short, who listen by the tens of millions to the radio programs for which you are responsible.

For me to discuss people and what people think is appropriate before a radio industry audience. For people are your business, you who own and manage the radio industry, you who get in the revenue and direct the programs and analyze the news and do all the other things that have persuaded the families of this country to put in their homes more radio sets by far than there are in all the rest of the world put together. It is your business and your responsibility to know what it is that will hold the interest of millions upon millions of people, from hour to hour and day to day;

(more)

and not only to entertain -- a very important function indeed -- but to inform, to stimulate and to inspire.

The energy within the atom has been released and put to use. This event, dreamed of, speculated about for centuries, has actually taken place, and on a large dramatic scale. Something has happened that has quite fundamentally changed the world.

The river of time has abruptly altered its course. You and I and all men now alive have actually seen this happen.

In the drama now unfolding there is no one -- not a single one of us -- who is a mere spectator, no one who is just listening in. There is no one who can turn a knob and tune himself out; no one who can just pick up and leave if he is bored, or horrified, or is more interested in his private affairs. You and I are all in this, we are all players, participants in that future chain of events that these epochal discoveries have set off.

The world looks the same. Radio City and Fifth Avenue and all the familiar sights of our world look the same. But they are not the same. They are not the same, because of this culmination of new knowledge about Nature and matter and about force and destruction that we call "atomic energy."

Now I began by saying that it is of great importance what people in our country and elsewhere think about atomic energy.

But it is wrong to assume, off hand, that this is self-evident. Actually, what difference does it make? What does it matter what the people think about this admittedly startling series of scientific discoveries about the fundamentals of life?

In the case of other great discoveries and events, it didn't make a great deal of difference, one way or the other. It is a notorious fact

(more)

that on very few occasions did people understand the significance of great events at the time they occurred, nor for a long time thereafter, for that matter.

There is a classic story about this very thing. Some forty-odd years ago there were two young fellows, who ran a bicycle repair shop in Dayton, Ohio. Gadgets interested them. They read in the paper that a fellow by the name of Otto Lilienthal had broken his neck trying to fly by jumping off hills in a pair of wings. This gave the bicycle boys a hair-brained idea. They thought that if they mounted a motor on a pair of wings they could make the darned thing fly. They took their contraption to the sand dunes of the North Carolina coast. One day their sister in Dayton got a telegram reading: "First sustained flight today. 59 seconds. Very happy. Home by Christmas." Signed, Orville and Wilbur. She rushed to the local newspaper office with this great news. The next day in the Personals column there appeared the following headline:

POPULAR LOCAL BICYCLE MERCHANTS
EXPECTED HOME FOR HOLIDAYS

As I say, in the past other great changes have taken place and have not been well understood, most of them have not even been widely known, at the time. The voyage of Columbus marked a sharp turn in events, affecting every human life from that time forward. But apparently Columbus himself did not understand what he had found. The discovery of fire, the invention of the wheel, of gunpowder, of steam as a source of energy, Farraday's discovery of electro-magnetic induction (or electricity, as we say), the discovery by Hertz of radio wave propagation -- what people thought about these events at the time was mighty little, and what they thought was largely wrong. Then why

(more)

should we expect atomic energy to follow any different course? Why can't we go about our business and not fret about understanding atomic energy in its essentials, what with all the other things there are to understand -- from just how a zipper works, or how to meet the crisis when it doesn't work, to the facts about the Marshall Plan? Isn't it enough if the scientists and engineers know what they are doing, and keep at it? As for the rest of mankind, well, suppose we do ignore the whole thing, or miss the point; suppose we do think that the real news is that those up and coming Wright boys will be home for Christmas, or that a new route to India has been found rather than a new world. If it didn't matter what people thought before what is there about this particular discovery that makes it different?

The answer is found in the circumstances that set off this discovery and its effects on human life from any that have gone before.

The first and most important circumstance is time. There was no long time interval between the discovery of the controlled release of the fantastic energies within the atom, and the large-scale application of that knowledge. The very first atomic bomb, though just the beginning, became almost overnight the most successful and potent weapon of all time. It was almost as if the Wright brothers in their first attempt at Kitty Hawk had flown smack across the Atlantic Ocean, or as if Marconi instead of tinkering with a spark gap started off the first crack out of the box with a 1948 television network complete with coaxial cable links.

The second circumstance that sets the event of atomic energy off from all previous new beginnings by man is this: the very first application of this knowledge was in the form of a weapon, but a weapon so utterly revolutionary

(more)

and devastating that it shook all existing ideas of warfare and international relations. Even before it had been improved -- and on top of a mesa in the mountains of New Mexico we are improving it -- the very first product at once affected the lives of every being on the globe, and almost every institution to which men have somehow adjusted themselves and grown accustomed, including the idea of nations, and of balance of power, and of how wars may be prevented, fought and begun.

There is a third circumstance about atomic energy that makes it different not only in degree but I rather think in kind, among the great ideas and events of history. Atomic energy presents the two-sidedness of knowledge-- good and evil -- in the most dramatic way possible. Indeed it may be said to symbolize the two-sidedness of knowledge, and the choice men must make. It is difficult to recall any discovery or any idea in all of mankind's history in which the choice between the beneficial uses of knowledge and the destructive uses of the same knowledge is presented on such a heroic scale, and with such umistakable clarity.

The development of our knowledge of this fundamental force for the improvement of the lot of men everywhere holds out promise of benefits that stir the imagination. And these are not merely remote hopes. This same knowledge that has put a cloud of fear and uncertainty over the future, is the means of searching out some of life's most baffling secrets. In laboratories and hospitals quite near us today they are aiding dramatically in research that may uncover the cause of dread diseases and aid in their cure, and in the alleviation of human suffering. Benefits to the health of millions, increased food and better nutrition and vast new sources of energy -- these we may look

forward to with confidence as a consequence of knowledge of the atom. And it was this knowledge that made the Bomb.

Now of course almost all knowledge has such a two-sided aspect; all knowledge can be used for good or for evil. The closest modern parallel is probably radio itself. Radio has been used and is being used to develop and strengthen freedom, and all that is good and humane and creative. But radio was also used to inflame the minds and poison the hearts of the German people, and thereby to crush European civilization.

Atomic energy, the new-found land of the atom, is beyond our ordinary human experience. There is little now to which we who are laymen can immediately relate this extraordinary phenomenon. But given time -- a generation or so -- gradually to get used to the idea, we would come to understand it, and make good sense of it.

But we were not given time.

We do not have time today. That is the crux of the matter.

You recall the circumstances. Radio broadcasts around the globe told mankind that a single bomb had destroyed an entire city. That single bomb had the power of 40,000,000 pounds of TNT. There followed a most remarkable horrow build-up. The effect -- though this was not the purpose -- was to make the mysterious and the horrible even more mysterious and even more horrible. We were to be frightened into our salvation. We were told that we must have world government and have it at once -- within a definite and implacable time schedule of a few years -- or we were goners. Our own special vulnerability to atomic warfare was told and re-told in a way that was correct but fearsome in the extreme. Maps of the New York City were published showing in detail

(more)

just what ghastly horrors would occur if an atomic bomb no more powerful than those already used was dropped in the Hudson River or above the Roosevelt Hotel -- accounts that were scientifically correct, but harrowing. We were reminded that these bombs need not be dropped by air armadas, that could be intercepted, but might be smuggled in, in parts, or easily concealed in the cargo of a tramp steamer moving innocently up the Hudson or into the Golden Gate. Such bombs, we were told, could poison the air and all plant life, and used in numbers render areas of the earth uninhabitable for decades.

Nothing quite like the effect of this upon the human mind has happened before, in the case of a new idea or discovery; certainly not on such a scale. And the most important factor has been TIME. There has simply not been an adequate or decent interval of time between the advent of the discovery and its application in a manner that affects most of our institutions.

Usually we've had a generation or even a century or two to adjust ourselves to the new and incomprehensible. This jump has been the biggest one we have ever been called upon to make, in our thinking. For example, after 50 years of continuous development the destructive power of explosives was about doubled. Atomic energy multiplied the power of the highest explosive previously known not by 2 times but by 17,000,000 times -- and this occurred virtually overnight. Similarly as to the release of energies for peaceful uses. In the atomic furnace at Oak Ridge the energy we are releasing from the splitting of the fissionable atoms of a pound of uranium is greater than from the burning of a pound of coal, but greater by tens of millions of times.

These are all big jumps for the human mind to adjust to overnight.

(more)

And then to top all the difficulties, this new discovery comes at a time of bitterness and unhappiness in the world, and a state of international distrust such as has rarely existed before in time of peace.

I certainly need not labor this fact.

We shall need good steady judgment and cool heads in the coming years. Public thinking that is dominated by great fear, by phantasy, or by indifference to one of the central facts of our century provides a sorry foundation for the strains we may find it necessary to withstand, and the hard decisions and courses of action that may inhere in this extraordinary situation.

(more)

Anyone experienced in human affairs recognizes fear as a dangerous state of mind. To those who have given little thought to such matters, it might have seemed a good idea to scare the world into being good, or at least sensible. But fear is brother to panic. Fear is an unreliable ally, it can never be depended upon to produce good. One result of intense fear may be panic, but another is likely to be phantasy, a dream-world. For men can stand great fear only so long. The sturdier ones look around for something specific they can do to overcome the cause of their fear. But most people unable long to endure fear, turn to unreality. Things that are disturbing just don't exist. Other more pleasant objects are substituted. People who insist upon talking about unpleasant facts, and after a while facts of any kind, are condemned or avoided.

If not fear, then what?

Our answer is: understanding, comprehension, knowledge.

Now this is a big order. But it is by no means an impossible one. Even the fact that there is not as much time for understanding to develop among people generally, even this time factor does not present impossible difficulties. For we have today some offsetting advantages.

Never before in man's whole history did we have at hand such magic to aid in the communication of ideas and of information: the radio and television; our newspapers and magazines, both now at a peak of quality, usefulness and reliability unequaled in our history; the motion pictures with their infinite potentialities; our amazing network of formal educational agencies—schools in every hamlet, colleges and universities by the thousands, with the greatest enrollment of men and women in higher education ever known;

(more)

the churches, and lay churchmen's organizations; the thousands of local societies and service clubs and Forums and libraries in every town and city. What forces for stimulating understanding we have in such as these!

The radio is a medium so new, so pervasive, so potentially helpful in this crisis that it is nothing less than providential that it should be ready at this hour when the world needs desperately to shorten the time necessary for the dissemination of knowledge and understanding. Here is this great instrument, manned by a corps of talent capable not only of entertaining and stimulating but of finding ways as yet undiscovered--but discoverable--of inspiring man's interest and aiding his comprehension of knowledge that holds our common destiny.

The magnificent performance of radio during the war in promoting public understanding and individual action essential to the winning of that war shows clearly that the radio industry can do an heroic job in the public interest.

Your industry is in a sense trustee of a natural resource--the broadcast frequencies. This, in the public mind, makes it all the more reasonable to expect and to demand that radio play an important part in the task of stimulating interest in and communicating facts about a subject so vital to all men everywhere.

You are the people by and large who decide just what it is your fellow countrymen will have a chance to learn over the air. The tens of millions of homes of this country can receive broadcasts about atomic energy only if you choose to transmit them--and this is quite a responsibility; it is not a responsibility that is remote and vague, and I'm not

(more)

going to exhort you about it. But it is my duty simply to say to you that public knowledge and understanding of atomic energy involves your own security, your own profits, your own future. There is nothing remote or academic about this.

This theme I have chosen to discuss with you is not sensational. No big headlines in it. It can't compete with colorful talk about "push-button warfare" or spies or crystal-ball stuff about atomic pie in the sky by and by. It is not a spectacular theme, and it is part of my job and that of my colleagues not to be spectacular.

But can the atom be made interesting? Many people think so— interesting and in many aspects deeply heartening and hopeful, and dramatic too.

What is in people's minds today, about atomic energy is important. But what may be in their minds next year at this time, or two or three years hence, when tensions may have increased, when steady judgment may be essential, depends upon what we do in the meantime.

What may be in people's minds a year or two hence depends largely on leadership in each community; it depends upon how successful the press, the radio and education generally will be in inspiring people to think about atomic energy, and to appreciate the force of the facts about it.

As people become more and more convinced that they must know about this new critter, the atom, and what it holds for evil and for good, this is going to happen: people are going to become less patient with explanations that informing the public is not part of the business of radio or

(more)

the press or the periodicals. This may be especially resented in the case of radio, since it is an industry that in this country makes use of a natural resource of the whole people. People will become particularly impatient--impatient is a weaker word than I think might be justified--they will be particularly impatient as more and more of them come to understand the following fact--at least I believe it to be a fact:

> that the principal and perhaps the only solid hope for preventing the use of atomic energy for destruction on a scale that has not yet been disclosed is for peoples everywhere to come to understand the atomic world; and to understand thereby the opportunities that lie before us to put this knowledge to uses beneficent and humane.

A vacuum of knowledge about the atom will be filled; of that we may be sure. As time goes on it may be filled by utter indifference. This would be tragic and disastrous for a people to whom some of our well-intentioned compatriots orate sweet-nothings about peace being had if we wish for it hard enough. Or that vacuum of lack of knowledge may be filled by deep unreasoning fear and panic. The vacuum may be filled by phantasy, by illusions. Neither panic nor phantasy provides the basis for a world of peace and security.

(more)

But whether the vacuum is filled by indifference, or panic or wishful nonsense--the vacuum of public knowledge will be filled.

If people have knowledge and understanding they may or may not be happier as individuals.

But the country will be safer.

The peace of the world will be more secure.

We will be less likely to be taken in by sweet talk, or scared by shadows, or stumble--or be pushed--without knowing what we are doing, into some desperate finality.

An informed and understanding people will take the facts as they come, not reject them because some of them may not be pretty. We will, with familiarity with this subject, set out to live with the facts of life, begin to take them into our thinking, into our everyday vocabulary.

We will then begin to form common sense judgments, not only as individuals, but as neighborhoods, as communities, as a people. There are no supermen, no all-wise to solve these problems for us. There is no substitute, no good substitute, for the common sense judgment of a whole people.

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON 25, D. C.

January 30, 1948

Dear Ed:

I am terribly grateful to you for your willingness (as transmitted through your secretary) to take a look at this speech. I am particularly anxious to have your candid views on the references to radio--particularly those that are critical--which I have marked on page 4 and from page 24 to the end of the speech.

I promised to have this in final form by 11:30 Monday morning; hence if you can call me by phone, reversing the charges please, either on Saturday or Sunday or Monday morning it would be a great help. You can reach me through the AEC operator (EXecutive-1616) though I shall be at home. In case there is any trouble my phone number at home, which is unlisted, is OLympia-8939.

Mrs. Lilienthal and I are looking forward to dining with you and going to the theatre Thursday evening.

Sincerely yours,

Dave

David E. Lilienthal
Chairman

Mr. Edward R. Murrow

For Ed Murrow

SECOND DRAFT

RADIO EXECUTIVES CLUB

The topic I have chosen to discuss, "Atomic Energy--Where Do We Stand Today?" may give you the impression that I intend to tell you how many atomic bombs this country has, and where; or what progress there has been in world-wide explorations for uranium ore, or how the new super-cyclotron at Berkeley has split and shattered the atom of such common elements as lead and tin.

But I have something quite different in mind. I shall talk with you chiefly about people.

For people are the most important fact about atomic energy. What goes on in people's minds -- and in their hearts -- is even more important in determining the fateful future,

than what goes on in atomic energy laboratories and vast production centers.

And this importance of people and people's understanding is the theme of what I shall say to you of the broadcasting industry today. It is the theme of what in various ways I have been saying to the country in the months since last April. namely: The people must know. The people as a whole must come to understand the essentials of this new world into the outer reaches of which science has brought us so suddenly. We must not, indeed we dare not enter upon this new era of human life if the very facts that set our time off from any that proceeded it are not known by the people, in their simply essentials. For the people generally to be in the dark as to the nature of the

fundamental structure and forces of the atom -- and of the good and evil this knowledge can bring -- would be for us to live in a world in which we are, in elementary knowledge, quite blind and unseeing. It would be almost as if we did not know that fire is hot, that water is wet, as if we did not know there are seasons, and air waves and gravity and magnetism and electricity. I myself am persuaded that the people are increasingly determined to find out, to learn about these things. Some of the myths that obstruct their path are being given the heave-ho. For example, the fairy tale that ~~this~~ atomic science in its entirety is ~~all~~ a military secret -- a widely circulated piece of nonsense -- is about exploded. The equally absurd myth that the essentials are too technical, are "over people's heads," is beginning to be exploded. The mischievous fiction that people are such dopes that they aren't interested in the atom -- though every cell of their

body and everything they eat and touch is made up of atoms -- this notion persists, but it is taking a beating at the grass roots, in those communities where the people are setting out to find out about what makes the physical world tick. And what is happening in the country, at the grass-roots is an encouraging and heartening story. The people, in their home towns and neighborhoods, in their churches, and schools, in their farm organizations and local societies are on their way. It is only a beginning, and there are difficulties. Some of these difficulties the radio industry could help overcome. You ~~Before~~ people of radio, if you will ~~can get you to~~ pitch in, with your ingenuity and your facilities -- you can give a great impetus to this ~~in this~~ extensive effort by the people to understand the ~~to find out what goes on in the~~ atomic world.

I said that the important thing about atomic energy is people, what goes on in people's minds, how well the people understand the broad outlines of this "knowledge so new" to man that with it "he can become a new man" . I do not mean any particular kind of people -- scientists or generals or public officials. By people I certainly do not mean leaders only. No, when I speak of what goes on in people's minds about atomic energy I simply means people as they come, as you find them up and down the streets and in the drug-stores and art galleries and churches and bars and banks and union halls, the people who read the best sellers, the newspapers and comic books, who go to the ball games and horse shows, the people in short who listen by the tens of millions to the radio programs for which you

are responsible.

To discuss people and what people think is appropriate before a radio industry audience. For people are your business, you who own and manage the radio industry, those of you who get in the revenue and direct the programs the scripts and analyze the news and do all the other things that have induced the people of this country to put in their homes more radio receivers than there are bath tubs or furnaces or telephones -- more radio sets in one country than in all the rest of the world put together. It is your business to know what it is that will hold the interest of millions upon millions of people, from hour to hour and day to day; and not only to entertain -- a very important function indeed -- but to inform and to stimulate.

The energy within the atom has been released and put to use. This event, dreamed of, speculated about for centuries, has actually taken place, and on a large dramatic scale. Something has happened that has quite unalterably and fundamentally changed the world. ¶ The river of time has abruptly altered its course. You and I and all men now alive have actually seen this happen, ~~in our time~~. In the drama now unfolding there is no one who is a mere ~~no no~~ spectator, ~~those~~ who can just pick up and leave if they are bored or horrified. We are all actors, all participants in the chain of events that these epochal discoveries have set off.

no one who is just listening in. There is no one who can turn a knob + turn himself out no free

The world looks the same. Radio City and New York Harbor and Fifth Avenue and all the familiar sights of our world look the same.

But they are not the same. They are not the same, because of this culmination of new knowledge about Nature and matter and about force and destruction that we call "atomic energy."

Now I began by saying that it is of great importance what people in our country and elsewhere think about atomic energy.

But it is wrong to assume, off hand that this is self-evident. Actually, what difference does it make? What does it matter what the people think about this admittedly startling series of scientific discoveries about the fundamentals of life?

It hasn't made a great deal of difference, one way or the other, In the case of other great discoveries and events, It is a notorious fact of history that on very few occasions did people understand

the significance of events at the time they occurred, nor for a long time thereafter, for that matter.

There is a classic story about this very thing. Some forty-odd years ago there were two young fellows, brothers, who ran a bicycle repair shop in Dayton, Ohio. Gadgets interested them. They read in the paper that a fellow by the name of Otto Lilienthal had broken his neck trying to fly by jumping off hills in a contrivance that looked like a pair of wings. This gave the bicycle boys a hair-brained idea. They thought that if they mounted a gasoline motor on a pair of wings they could make the thing leave the ground and stay off the ground, with them in it. ~~The dopes thought they could fly!~~ They saved their money, and in mid-December 1903

took their contraption to the sand dunes at Kitty Hawk on the North Carolina coast. One day their sister in Dayton got a telegram reading "First sustained flight today. 59 seconds. Very happy. Home by Christmas." Signed Orville and Wilbur. She was jubilant, and rushed to the local newspaper office with this great news. The next day in the Personals column there appeared the following headline:

POPULAR LOCAL BICYCLE MERCHANTS
EXPECTED
HOME FOR HOLIDAYS

As I say, other great changes than atomic energy that have taken place in the past have not been well understood, most of them have not even been widely known, at the time. The voyage of Columbus marked a sharp turn in events, affecting every human life from that time forward. But apparently Columbus himself

did not understand what he had found. The discovery of fire, the invention of the wheel, of gunpowder, of steam as a source of energy, Farraday's discovery of electro-magnetic induction -- or electricity, as we say -- what people thought about these events at the time was mighty little, and what they thought was largely wrong. Then why should we expect atomic energy to follow any different course? Why can't we go about our business and not fret about understanding atomic energy in its essentials, what with all the other things there are to understand -- ~~jx~~ from just how a zipper works to the facts about the Marshall Plan? Isn't it enough if the scientists and engineers know what they are doing, and keep at it? As for the rest of mankind, well, suppose we do ignore

the whole thing, or miss the point; suppose we do think that the real news is that those up and coming Wright boys will be home for ~~XXXX~~ Christmas, or that a new route to India has been found rather than a new world. It didn't matter what people thought before; what is there about this particular discovery that makes it different?

The answer is not easy to state.

But essentially the answer is found in circumstances that set off this discovery and its effects on human life, from any that have gone before.

First and most important is concerned with with time. There was no long time interval between the discovery of the controlled release of the fantastic energies within the atom, and the large-scale application of that knowledge. The very first atomic

bomb, though just the beginning, became at one stride by all odds the most successful and potent weapon of all time. It was almost as if the Wright brothers in their first attempt at Kitty Hawk had flown smack across the Atlantic Ocean, or as if James Watt, instead of fooling with steam in a tea-kettle, started off the first crack out of the box with a Baldwin locomotive.

The second circumstance that sets the event of atomic energy off from all previous new beginnings by man is this: the very first application of this knowledge was in the form of a weapon, but a weapon so utterly revolutionary and devastating that it shook all existing ideas of warfare and international relations. Even before it had been improved -- and on top of a mesa in the mountains of New Mexico

we are improving it -- the very first product at once affected the lives of every being on the globe, and almost every institution to which men have somehow adjusted themselves and grown accustomed, including the idea of nations, and of balance of power, and how wars may be prevented, fought and begun.

There is a third circumstance about atomic energy that makes it different not only in degree but I rather think in kind, among the great ideas and events of history. Atomic Energy presents the two-sidedness of knowledge--good and evil-- in the most dramatic way possible. Indeed it may be said to symbolize the two-sidedness of knowledge, and the choice men must make. It is difficult to recall any discovery or any idea in all of mankind's history in which the choice between the beneficial

uses of knowledge and the destructive uses of the same knowledge is presented on such a heroic scale, and with such unmistakable clarity. The development of our knowledge of this fundamental force for the improvement of the lot of men everywhere holds out promise of benefits that stir the most sluggish imagination. And these are not merely remote hopes. This same knowledge that has put a cloud of fear and uncertainty over the future, is the means of searching out some of life's most baffling secrets; in laboratories quite near us today they are aiding in the study of growth, and thereby they may well uncover the cause of dread diseases and aid in their cure, and in the alleviation of human suffering. Benefits to the health of millions, increased food and better nutrition and vast new sources of energy --

these we may look forward to with confidence as a consequence of knowledge of the atom. And it was this knowledge that made the Bomb.

Now of course almost all knowledge ~~xxxxxx~~ has such a two-sided aspect; all knowledge can be used for good or for evil. The closest modern parallel is probably radio itself. Radio has been used and is being used to develop and strengthen freedom, and all that is good and humane and creative in our culture. But radio was also used to inflame the minds and poison the hearts of the German people, and thereby to crush and it may well be to kill European civilization.

Atomic energy, the new-found land of the atom, is beyond our ordinary human experience.

There is little now to which we who are laymen can immediately relate this extraordinary phenomon. But given time -- a generation or so -- gradually to get used to the idea, we would come to understand it.

But we were not given time.

We do not have a generation of time, ~~today.~~ That is the crux of the matter.

You recall the circumstances. Our radio told us one day that a single bomb that could be carried in a plane had destroyed an entire city. That single bomb had the power of 40,000,000 pounds of TNT. Then followed one of the most remarkable horror build-ups of all time. The effect -- whatever the purpose -- was to make the mysterious and the horrible even more mysterious and even more horrible.

We were to be frightened into our salvation. We were told that we must have world government and have it at once -- within a definite and implacable time schedule of a few years -- or we were goners. Our own vulnerability to atomic warfare was told and re-told in a way that was correct but fearsome in the extreme. Maps of New York City were published showing in detail just what ghastly horrors would occur if an atomic bomb no more powerful than those already used was dropped in the Hudson River or above the Plaza Hotel -- accounts that were scientifically correct, but harrowing almost beyond endurance. These bombs were such, we were reminded, that they need not be dropped by air armadas, that might be intercepted, but might be smuggled in, in parts, or secreted in the

cargo of a tramp steamer moving innocently up the Hudson [redacted] or into the Golden Gate. The radioactive death rays from such bombs, we were told, could poison the air and all plant life, and in numbers render large areas of the earth uninhabitable for decades; even change our descendants into creatures hardly recognizable as human.

Nothing quite like the effect of this upon the human mind has happened before, in the case of a new idea or discovery; certainly not on such a scale. And the most important factor has been TIME. There has simply not been an adequate or decent interval of time between the advent of the discovery and its application in a manner that changes and affects most of our

institutions. Usually we've had a generation or even a century or two to adjust ourselves to the new and incomprehensible. This jump has been the biggest one we have ever been called upon to make, in our thinking. For example, the increase in the destructive power of TNT over early versions of gunpowder was a multiplication of a few fold, perhaps twenty ~~[illegible]~~ and it took place over a period of centuries. The jump in destructive power between atomic energy and the previously most powerful sustance was ~~[illegible]~~. Similarly as to the release of energies for peaceful uses. In the atomic furnace at Oak Ridge the energies we are releasing from the splitting of the atoms of a pound of uranium is greater than the energies that result from the burning of a pound of coal.

~~the public~~ ~~[illegible]~~ ~~this~~ ~~[illegible]~~ ~~[illegible]~~ ~~[illegible]~~

But not twice as much or ten times as much -- tens of millions of times as much -- a factor no one can understand off hand

These are all big jumps for the human mind to adjust to overnight.

And then to top all the difficulties, this new discovery comes at a time of bitterness and unhappiness in the world, and a state of international antagonism and distrust such as has rarely existed before except in time of a shooting war.

I certainly need not labor this fact.

We shall need good steady judgment and cool heads in the coming years. Public thinking that is dominated by fear, phantasy or indifference to one of the central facts of our decade provides a

sorry foundation for the strains we may find it necessary to withstand, and the hard decisions and courses of action that may inhere in this extraordinary situation.

Anyone experienced in human affairs recognizes fear as a dangerous state of mind. To those who have given little thought to such matters, it might have seemed a good idea to scare the world into being good, ~~"good" in this case being the adaptation of some form of world government.~~ But fear is brother to panic. Fear is an unreliable ally, it can never be depended upon to produce good. One of the results of great fear is panic, but another is likely to be phantasy, a dream-world. For men can stand great

fear only so long. The sturdier ones look around for something ~~useful~~ specific they can do to overcome ~~defeat~~ the ~~object~~ cause of their fear. But most people unable long to endure fear, turn to unreality. Things that are disturbing just don't exist. Other more pleasant objects are substituted. ~~Facts are swept under the rug~~. People who insist upon talking about unpleasant facts, and after a while facts of any kind, are condemned or avoided. ~~A dream world takes the place of reality.~~

There are chapters in recent history that tell us what happens to whole peoples who run away from reality.

If not fear, then what?

Our answer is: understanding, comprehension, knowledge.

This is a big order. But it is by no means an impossible one. Even the fact that there is not as much time for knowledge to grow, for understanding to develop among people generally, even this time factor does not present impossible difficulties. For we have today some offsetting advantages.

Never before in man's whole history did we have at hand such magic to aid in the communication of ideas and of information: the radio and ~~more than 60 million sets in this country;~~ television; the ~~services~~ of our newspapers, and magazines, both now at a peak of quality, usefulness and reliability unequalled ~~never before equalled~~ in our history; our amazing network of formal educational agencies--schools

in every hamlet, colleges and universities by the thousands, ~~hundreds~~, with the greatest enrollment of men and women in higher education ever known; the churches, and lay churchmen's organizations; the thousands of local societies and service clubs and forums and libraries in every town and city. What forces for ~~developing~~ stimulating an awareness + developing understanding we have in such as ~~all~~ these!

The radio is a medium so new, so pervasive, so potentially helpful in this crisis that it ~~might almost seem that its invention and wide development was timed by some strange circumstance so it would be~~ is nothing less than providential ~~that~~ it is ready at this hour when the world needs desperately to ~~telescope and~~ shorten the time necessary for the dissemination of knowledge and understanding. Here is this great instrument manned by a corps of talent capable not only of entertaining and stimulating but of finding ways as yet undiscovered--but discoverable--

of inspiring men's interest and comprehension of a subject so close to our common destiny. ¶ The magnificent performance of radio during the war in promoting public understanding and individual action essential to the winning of that war shows clearly that the radio industry can do a heroic job in the public interest. The fact ~~that you are,~~ Your industry is in a sense, trustee of a natural resource--the broadcast frequencies. This, in the public mind, makes it all the more reasonable to ~~anticipate~~ expect that radio will ~~take its place with older forms of the communication of facts and of~~ play an important part in the task of stimulating interest ~~in this vital~~ in and communicating facts about ~~so vital a~~ subject so vital to all men everywhere. ~~This is not a spectacular~~ theme I have chosen to discuss with you is not sensational. No big headlines in it. Can't compete with colorful talk about "push-button warfare" or spies or dream-stuff about pie in the sky by and by. It is not a sensational theme; And it is part of my job <u>not</u> to be ~~spectacular~~ sensational.

¶ As you see, the

But can ~~Can~~ the atom be made interesting to the people? Lots of people think so. Just how is a matter of opinion. I have heard it suggested ~~A radio executive is quoted as saying in some~~

see page - 27 -

~~imitation Jonathan,~~ that if we could get Bob Hope to talk about atomic energy that would do it. This may have been intended as sarcasm, or seriously, I don't know which. But I don't regard even this as out of the question; ~~for~~ in any case Mr. Hope ~~is an intelligent and able man, and so are his sponsors, and it also happens that he~~ and his sponsors and their advertising agency are all in the same ~~boat~~ boat with the rest of us, ~~neither.~~

I grant that this theme of understanding the world we now live in is not side-splitting, and it may not at first blush seem dramatic--though I do recall the use of the radio at a time of desperate panic in this country, in March of 1933, as the indispensible factor in quickly restoring this people to confidence in themselves. And that seemed dramatic to most of us.

What is in people's minds today, about atomic energy is important. But what <u>may be in</u>

their minds next year at this time, or two or three years hence, when tensions may have increased, when steady judgment may be essential, depends upon what we do in the meantime. What may be in people's minds a year or two hence depends on leadership in each community; it depends upon leadership ~~among the educational forces of the country and among the media of communication.~~ how successful that is in inspiring people to think about atomic energy, and to appreciate the force of the facts about it. ¶ As people become more and more convinced that they must know about this new critter, the atom, and what it holds for good and for evil, this is going to happen: people are going to become less patient with explanations that stimulate the story to an interest in the public ~~in~~ to informing themselves is not part of the business of radio or the press or the periodicals. This may ~~possibly~~ be especially resented in the case of radio, since it is an industry that in this country makes use of a natural resource of the whole people. People ~~They~~ will become particularly impatient--

impatient is a weaker word than I think might be justified--they will be particularly impatient as more and more of them come

see page - 29 -

to understand the following fact--at least I believe it to be a fact:

> that the principal and perhaps the only solid hope for preventing the use of atomic energy for destruction on a scale that has not yet been disclosed is for peoples everywhere to come to understand the atomic world; and to understand thereby the opportunities that lie before us to put this knowledge to uses beneficent and humane.

A vacuum of knowledge about the atom will be filled; of that we may be sure.

As time goes on it may be filled by utter indifference. This would be tragic and disastrous

for a people to whom some of our well-intentioned compatriots orate sweet-nothings about peace being had if we wish for it hard enough. Or that vacuum of lack of knowledge may be filled by deep unreasoning fear and panic. The vacuum may be filled by phantasy, by illusions. But whether the vacuum is filled by indifference, or panic, or wishful nonsense--the vacuum of public knowledge will be filled. If people have knowledge and understanding they may or may not be happier as individuals. I don't know. But the country will be safer; the peace of the world will be more secure; we will be less likely to be taken in by sweet talk; we will be less likely to be skeptical and unbelieving of everything. With understanding we will take the facts as they come, not reject them because some of them may not be pretty. We will, with familiarity with this subject,

neither panic nor phantasy provides the basis for peace + security

set out to live with the facts of life, begin to take them into our thinking, into our everyday vocabulary--and this is more important than may seem. We will begin to form common sense judgments, not only as individuals, but as neighborhoods, as communities, as a people. There are no supermen, no all-wise to solve these problems for us. There is no substitute, no good substitute, for the common sense judgment of a whole people.

DAVID LILIENTHAL
ATOMIC ENERGY COMMISSION
WASHINGTON

WILL BE AT CARLTON HOTEL ALL NEXT WEEK AND TWOULD QUOTE PLEASURE UNQUOTE

ME TO SEE YOU IF YOU HAVETEN MINUTES TO SPARE

ED MURROW

Rockville, Md. RFD#2
January 4, 1948.

DAVID E. LILIENTHAL

Dear Ed:

Feel badly about the Radio Executives Club engagement; trying my best to figure something out, but with Congress back (and how) and many urgent fires to be put out, not easy. Still rocky with the flu after-effect.

Hard to believe that it is almost a year since we visited at my office when I asked your counsel about staying on this post, if I should be confirmed. Reminded of this by finding in my mail a reprint of my reply to Senator McKellar's question about my "views on communistic doctrine"--a reprint put out the other day by a St.Louis bank, for heaven's sake. And shocked to note that this was February 4th, 1947--almost a year ago.

I like to think--as I am sometimes told by well-wishers--that Feb. 4, 1947 marked the high tide of smearing and scare-methods, that the trend since then has been slowly back to American common sense; that for the Herald Trib and Bert Andrews to go after the State Department on arbitrary panic methods of "eliminating" suspected employes is one of many evidences of that return to sense. I would like to believe this. As the Marshall Plan debate opens, it becomes important to remember that the reasons for supporting the Plan are almost as important as getting it through; those reasons, as I tried to say a year ago, are more concerned with what we are for than merely what we are against.

DAVID E. LILIENTHAL

Best wishes to you, always

Sincerely

Dave

Edward R. Murrow

New York City

DAVID E. LILIENTHAL

Rockville, Md. RFD #5
January 3, 8 P.M.

Dear Ed:

That was a mighty good one tonight: as my Dad would say "un--uzer-al good". When it comes to teaching the alphabet of democracy --and its arithmetic, about which so little is known, my friend -- you are in a wonderful bit of terrain; and do you miss a chance? Not so as I have noticed.

I'm taking off for several days at Oak Ridge; but Miss Brown is trying to snag you for a luncheon or other spot for me for next week; and Helen is writing Janet.

Always, my best

Dave

Mr. Edward R. Murrow

December 31, 1947

Dear Dave:

I am deeply distressed to hear that you are ill, and hope that you will soon be back on your feet.

Thanks for the kind words about my piece on your Farm Bureau speech. The credit is all yours because the words were yours. You will be amused to know that I received one wire from an irate middle westerner saying why did I quote Lilienthal? didn't I know that the Jesuits had been teaching that sort of thing for hundreds of years?

I shall probably be coming down for the opening of Congress and will hope to see you then. Meanwhile, may your strength increase during the coming year.

As ever yours,

The Honorable David E. Lilienthal
Atomic Energy Commission
Washington, D.C.

E. R. M.
F. 1155

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON

December 27, 1947.

My dear Ed:

The evening you broadcast your comment upon my Farm Bureau speech I was on the train returning to Washington. But I have since seen the script, and was and am enormously pleased and heartened by it. Your words of comment and quotation reach more people, by a factor I suppose of a thousand, perhaps more, than a speech of mine would. More important still, your audience is in a frame of mind that a radio audience listening to a speech almost never is.

This is being written at home, where I've been in bed for a week with a sharp attack of flu; it looks now as if I'd be directed to defer all speeches and travel and extra chores for some weeks, till I get right, which will probably mean I shan't be able to make the Radio Executives Club on January 8. I haven't had the nerve to raise the question yet.

We were enchanted with Casey!

Sincerely

Dave

Mr. Edward R. Murrow

Sunday October 26--47
Rockville Md RR#2

DAVID E. LILIENTHAL

Well met at Waldorf.

Dear Ed:

You said something the other night on the 'phone -- something generous-- about a "platform", for things that needed saying. I am "busting out" with something that seems to me very important, in a brief speech on the Herald-Tribune Forum Tuesday night, the 28d. It is a kind of bridge between the discussion of America and the following day's discussion of the reconstruction of Europe--called it "The Strength of America". It may not be appropriate for your broadcast, but as I put the finishing touches on the darn thing today, and see how to the roots of me these ideas go, I thought this was something I should let you know of, anyway. I speak Tues.night and leave Wed. AM at 9:30 so there doesn't appear to be a chance to see you this trip. Faithfully yours Dave

FOR RELEASE UPON DELIVERY

ATOMIC ENERGY IS YOUR BUSINESS

Address by David E. Lilienthal
Chairman, United States Atomic Energy Commission
Before a Community Public Meeting
Sponsored by the Civic Organizations of
Crawfordsville, Indiana
Monday Evening, September 22, 1947
on the Campus of Wabash College
(For Broadcast CBS Network
9 p.m. C.S.T., Monday, September 22)

There is a growing tendency in some quarters to act as if atomic energy were none of the American public's business.

It isn't said in just those words, of course. It is put more discreetly. It is said that the subject is too "technical" for public discussion -- or that "national security" requires that the public be kept in the dark, even on discussions of broad policy -- or that the steps that need to be considered are such strong meat that all these matters must be withheld from the public. It is said, in support of this practice, that it was followed successfully in wartime, and hence should be continued today.

In my opinion this is plain nonsense, and dangerous nonsense, dangerous to cherished American institutions and for that reason dangerous to genuine national security. And if I sound belligerent it is because on this issue I am in a fighting mood. I have come back home to Indiana to say so, as emphatically as I can.

(more)

I say to you that atomic energy and scientific discoveries have not and need not change the fundamental principles of democracy, which rest upon faith in the ultimate wisdom of the people, when they have been truthfully and clearly informed of the essential facts. This principle and this faith form the basis of the law establishing the civilian Atomic Energy Commission. If the people of this country want that principle and that policy to be made effective -- the policy that it is they who decide their future and their fate -- that is the policy that will prevail.

I propose tonight to suggest a specific program whereby here in Crawfordsville and in all other American communities the people on their own can set about to learn the essential facts about atomic energy. I make this proposal so that in the months and crucial years ahead it can continue to be said as it has in the past that the glory of the American system is that the common sense judgment of the people as a whole determines the course of the Republic.

What do you think of when you think of atomic energy? The chances are that you think only of the atomic bomb. This is natural enough. You have been fed a publicity diet of almost nothing else but horror stories since the blast at Hiroshima two years ago. Some people are warning you to get ready to move into caves. Others are actually proposing, as a defense measure, that we prepare to turn the life of the country over to military control; and other such proposals are being urged. It is a tribute to the American people's horse sense that they have kept their shirts on through all of this. You are troubled, of course, concerned, uneasy -- and you should be. The atomic weapon is real. I live with it, day and night, and I assure you that however fantastic it is plenty real. But scaring the daylights out of everyone so no one can think, inducing hysteria and unreasoning fear -- this is not going to get us anywhere -- anywhere we want to go.

(more)

Now it is perfectly true that atomic energy produces a weapon of unimaginably destructive power. It is true that this nation's Atomic Energy Commission is today designing, developing and producing such weapons. As required by law we fully intend to maintain American preeminence in these weapons until effective international safeguards are in force. It is true that our present monopoly in the production of such weapons will not last indefinitely, and that in time other nations on their own can produce such bombs. It is true that a war in which such bombs were used in numbers would be a catastrophe of unendurable violence to civilization. It is for these reasons that in the United Nations this and other nations have made and continue to make efforts to place atomic weapons under international controls -- workable, foolproof controls -- efforts which are thus far not successful.

No one -- least of all your speaker -- underestimates the importance of atomic energy as a weapon, as a weapon that has shaken previous military and diplomatic concepts to their foundations. These facts are just as important to you right here along the peaceful shaded streets of Crawfordsville, Indiana, as they are to anyone in Washington, or London or Paris or Moscow.

But it is equally important to understand that atomic energy and atomic bombs are not synonymous. To continue to think so as most people do is a major fallacy, a fallacy that will make more difficult our efforts to eliminate atomic energy as a weapon of war, a fallacy that may keep us from the beneficial fruits of this great discovery.

The weapon is the first demonstration of the use of atomic energy, and a very dramatic one it is indeed. But what we have here actually is not simply a weapon. Here is newly acquired knowledge of great and universal forces comparable to the forces of gravity and the forces of electric charges and of magnetism.

(more)

I suppose there is nothing of a physical nature that is more friendly to man, or more necessary to his well-being than the sun. From the sun you and I get every bit of our energy, the -- chemical energy -- energy that gives life and sustains life, the energy that builds skyscrapers, and churches, that writes poems and symphonies. The sun is the friend of man. In its rays is the magic stuff of life itself.

As familiar as all of this is to every one of us, it is very close to the subject of atomic energy. For the life-giving sun is itself a huge atomic energy factory. The energy the sun pours forth -- that energy has its origin in a process within the sun by which there is released for our benefit the forces within the atomic nucleus, within the atom of the familiar substance known as hydrogen. The sun, I repeat, is an atomic energy plant.

The forces, then, within the atom are not new. Far from it. Without the atomic energy released by the sun, this country would be a lifeless crater.

What <u>is</u> new is this: that in our day, our generation, knowledge has so increased, that we are now actually on the long road to understanding atomic energy and making it serve men's needs.

These atomic forces are still not well understood by even the most learned scientists. But here are two towering facts of greatest importance to every living human being the world over:

First: Mankind has probably learned more in the past thirty years about atomic forces than in all the preceeding centuries.

Second: Within the next few years -- a decade perhaps -- we should be in a position to unlock new knowledge about life and matter so great that wholly new concepts of human life will follow in the wake of this new knowledge.

Just as the sun is fundamental to human life, so are the forces within the atom. It is our fortune, yours and mine, and that of our children, to live

(more)

in that fragment of historical time when knowledge of the very cornerstone and foundation of life may be opened to human understanding.

Let me repeat: atomic science and atomic bombs are not synonymous. That is why I have spoken to you about the sun. The atomic bomb is just one manifestation of atomic energy; the energy in the rays of the sun is another. One is destructive, the other benign and a source of life and strength.

I had another purpose in beginning with the sun. I wanted to make plain that what we are dealing with in the forces of the atomic nucleus are fundamental, basic, and have an effect on everyone's life, as do the nuclear transformations within the sun. Atomic energy is not just another new gadget, nor just a new weapon, however powerful and devastating. We are dealing with forces as fundamental to your life as the force of the sun, the forces of gravity, the forces of magnetism.

Such new knowledge inevitably brings changes. These are changes that will affect you and yours, in your life here in this community. Some of these changes are in process at this moment. Thus the atomic weapon has changed the relations between nations and the problem of the maintenance of peace -- and nothing could be closer to your life and that of your children than that. Atomic energy has already brought changes in the treatment of human suffering, and is at this moment adding to knowledge to be used in fighting cancer, heart ailments, and many other diseases.

Radioactive materials from the Commission's plant at Oak Ridge are throwing a clear light upon some of the oldest mysteries of life. For example, how does a stalk of growing corn use the rays of the sun to manufacture its products into energy-giving food substances? How does a plant absorb fertilizer from the soil, and just what happens within the plant? Much progress has already been made through the availability of these radioactive tracers. It is fair to say that the entire investment in the atomic energy project -- now nearly

(more)

two and a half billion dollars -- may be more than repaid by the benefits to agriculture and to human nutrition alone. Atomic treatment of familiar metals, and new knowledge of little known metals opens up great prospects in industry. At Commission laboratories work proceeds so that some day the energy released by the splitting of the atoms of uranium and plutonium, will provide a new source of electricity and heat. New professions for your young people, new hope for the afflicted, new understanding of how science can serve for peace -- these are among the items on the agenda of the present and immediate future.

But these things -- and many others I might mention -- are but a beginning. The door of knowledge is but barely opened. No one can predict just what changes will come of knowledge that goes to the root of all things physical. For bear in mind that every living being is composed of atoms, and the nuclear forces we are talking about are within each of these atoms. Remember too that every bit of matter, this desk, the walls of this chapel, the mountains and the seas are likewise composed of atoms and their nuclei. We are therefore throwing light upon the very nature of the structure of the world we live in. What is important to understand is not just what the precise effect of knowledge of these basic forces will be -- which is necessarily speculative -- but rather that important changes will come -- which is as certain as anything in this world can be.

The primitive man who first beheld fire was probably terrified by this strange and destructive force he knew so little about. He could not predict that fire would change the life of every mortal from that early day to this, nor could he possibly know that the forces that he saw lay waste the forest and consume his enemies would someday be accepted as one of the most friendly and helpful forces at man's command.

(more)

What should concern us, it seems to me, is not that changes are coming. Americans have always taken change in their stride; indeed generally speaking we thrive on it.

What we should be concerned about, and what we should make sure of is that the changes shall be fitted into the American way of doing things, that those changes shall not be so imposed upon us that individual freedom is impaired. We must make sure that the American people will have a say-so, and a decisive say-so, in the adjustments these discoveries will bring in community life, in our agricultural, educational, industrial and military institutions. You must make dead sure that your public servants in all branches of your Government, civil and military, legislative and executive, all understand clearly that atomic energy is your business, the people's business.

Now I must warn you that this will not be easy. But it is vitally important to you here in this community and all other communities, large and small, that you keep the decisions, the broad decisions in your hands. For science and technical matters will become more and more important, important in determining peace and security, important in industry and jobs, in health, in farming, in education, in community affairs here in Crawfordsville and in thousands of cities and towns and villages all through the country. More and more things of your daily life, and in the factory and school and farm will be affected by the discoveries and applications of science. Atomic science will stimulate a whole new world of other discoveries: this is already happening and it will continue. And it can be made pretty much to the good -- good for you here in your town, good for peace and decency and human freedom. But you must not at your peril let these new technical advances get out of your power to control and direct. I warn you that this must not happen or the essence of the American scheme of things will be lost.

(more)

It comes down to this, the whole problem of atomic energy, and of all the great scientific discoveries it is bound to bring -- it comes down to this:

First: We must persist until we find ways whereby mankind will not make use of these discoveries for destructive and evil ends;

Second: (and closely related to the first) We must find ways of encouraging and stimulating the application of these discoveries and new ones to come, to things that are beneficial and helpful to mankind and to the best of human aspirations.

To what use will we put this great new ever-growing knowledge? There is the real question -- to what purpose, to what ends will atomic energy and the fruits of scientific discovery be put?

My friends of Crawfordsville, my fellow citizens of all the peace-loving communities of the wide world, here is the challenge of our time.

These are not scientific matters. What this vast problem requires is not technical judgment, but rather the human experience and good sense of the natural leaders of opinion within the thousands of communities of the country. There has never been any good substitute for the all-around common sense of an informed lay public. That is just what is needed here.

But you can be barred from a decisive voice in these issues about atomic science, issues so close to your life and your future. You can be kept out by your own default -- by failing to inform yourselves, so that you will not be able to be effective in the making of the great decisions on the problems that atomic science presents for determination.

There are many reasons why you need to know and understand the basic facts of atomic energy. But none is more pressing than this: that it is those basic facts that determine whether a particular proposal for international control is workable, one that in the language of Secretary Marshall last Wednesday will

(more)

"remove the specter of a war of annihilation"; or whether the facts of atomic energy show that a particular proposal is ineffective and indeed a "fraud on the peoples of the world". It is the facts and an understanding of those facts that determined the American proposal, the Baruch plan, now carried forward by Mr. Frederick Osborn, a proposal which the representatives of ~~the~~ ten nations have approved.

Now just what is it that you can do about becoming informed, right here in Crawfordsville, and in Galesburg and in Sioux City, in Hartford and Yipsilanti and Fresno and all the other communities of the country?

Bear in mind, what is needed is not knowledge and judgment about scientific or engineering matters -- you don't have that and couldn't take the time to acquire it of course. The technical forces associated with the Atomic Energy Commission can do that, and are doing a good job of it, and one you will be proud of. The quality of that job is being constantly checked by independent advisory boards of distinguished scientists. But the kind of judgment that I am talking about is of quite a different sort -- for example, a sense of what things people will accept as right and sensible and workable. What is needed is sense about human relations, about standards of fairness, about principles of self-government and of self-education. These judgments turn on the weight to be given to concern for the individual as compared to concern for the state. The issues call for the kind of over-all judgment that is summed up when your neighbor says: "That makes sense to me."

Nothing could weaken the security of our country in the atomic field more quickly, nor more surely slow up research in cancer control, say, than to permit science and scientists to be kicked around by the organized forces of ignorance and demagoguery, and petty politics. You don't have to have scientific training to sense that this would be bad, bad for you, bad for Crawfordsville, bad for the country. This sort of thing is a real danger to our scientific

(more)

progress, for as the old Hoosier saying has it, "There are some men who would play peanut politics with the multiplication table and the Ten Commandments." There is only one real protection against the harm selfish and ignorant and fanatical men can do and that is an informed public.

There are many other broad issues where your judgment will be essential, and your interest vital. These might include such matters as the proposals for international control of atomic weapons; the conditions under which the present Government monopoly in this field can safely be changed to private competitive production; the share of the national budget that should be devoted to scientific research; the adequacy of protection against health hazards from radioactive materials in the air and on the ground; the proper relation of civilian direction to the military, in this field; what kind and size of navy, army and air force we need in the light of developments in scientific warfare; what sense the proposals make that we go underground; the workability of decentralization of cities as a defense measure; how rapidly atomic fuel may supplement coal, oil and water power as a source of electricity; the wisdom and workability of censorship of the press and radio as a means of maintaining secrecy in this field, under peacetime conditions. Such a list of policy issues could be extended almost indefinitely.

You need to watch your public servants, to keep an eye on us, whether in the Executive Branch, the military, or in Congress. And to do so effectively your views and judgments must be based upon some knowledge of the background of facts.

How can you acquire sufficient information to make you effective? I have some suggestions to offer along this line.

As to <u>what</u> you should know, remember that the information you need to have is not secret technical information. Nor is it highly complicated. The essentials of atomic energy even on the scientific side, are actually not difficult, not nearly as difficult as those who would like to keep the decisions

(More)

to themselves would lead you to believe.

For what technical information you need try your nearby colleges or your local high schools -- and if their science teachers don't know enough about the subject to be able to explain it simply to the average layman, then you know there is something wrong with the teaching going on around you -- and that is worth something in itself. As for the public issues, there too the colleges and the schools can assemble and boil down the relevant facts for the use of your civic organizations.

In providing information about atomic energy the United States Atomic Energy Commission has a responsibility, imposed by law. It is our hope that it can be discharged with good sense and restraint. A considerable area of technical and other information must and will be kept secret under present conditions, and elaborate precautions are being taken to this end. The Commission must provide some guidance on such matters, of course, and will from time to time be prepared to release new information that can be made public without prejudice to security. But by and large, the sources of information on public issues are already open. Much of the information has already been published.

The problem is chiefly one of getting non-secret information into a form for your consideration that will be clear, interesting, and without bias. And for this you can properly expect great things of the press of the United States, the radio and the magazines. These, together with motion pictures, constitute one of the greatest educational forces in human history. There has never been anything like it. The press, the radio and the magazines are competent to take the body of knowledge that exists and with their great skills of presentation make this subject clear and alive for every school child, and every grown-up in your community and all the communities of America. In our great pictorial magazines the country has an unique asset for the presenting of information in graphic form. Similarly with other magazines --- those addressed to groups of which you now

(more)

have local entities here in your town --- the national magazine of the Elks, the Rotarians, the American Legion and the other organizations in your community.

It is important that the facts and analysis of policies should come to you from a variety of sources, not from only one, and above all that they should not come solely from official sources. This variety gives you a chance to check one version against another, and draw your own conclusions.

Such help as this from the outside is necessary, and can be very useful. But try to keep this as close to home as possible, when you come to your analysis and your discussion of these things. Don't be content to take ideas that have been pre-digested for you at some distant place. Put this on the programs of your Chamber of Commerce, the Boy Scouts and Girl Scouts, the unions, the Parent-Teachers Association, Rotary, Kiwanis, Lions and similar organizations, the League of Women Voters, your Montgomery County Farm Bureau and 4-H Clubs, the local veterans organizations, the business and professional women's organization, the bar association and county medical society -- and so on. These are your organizations. You can speak your mind in your own town.

You don't need a brand new organization for this purpose. Make use of the many fine civic, fraternal, educational, professional, and religious organizations you now have in your community.

Don't make this a crusade, a "drive", full of ardor and zing for a couple of weeks and then it's all over. This is not a "campaign." This subject will be with you for a long time, so take it in your stride, as part of your community responsibilities.

What I am proposing here tonight -- and will continue to urge -- is not that you or any other community start a new organization, and certainly not that this be regarded as a "movement". My hope is that the people of the country will come to be familiar with this new realm of facts and ideas that are so important to us all. I can see the time not long off when the terms Geiger

(more)

counter, radioisotope, the Baruch plan, alpha particles, neutron absorption, nuclear reactor -- these will become just as much a part of common speech and common understanding as carburetor, X-ray, high octane, short-circuit, and frequency modulation have become in other fields.

What I propose will mean some work. No doubt of that. Most of you are already about as busy as you can be, and those of you who are looked up to as leaders in your community are usually quite burdened with chores beyond your own business and home. Some of this will require reading, discussion, meetings, added to everything else you have.

Let me say this: Look upon this task of becoming familiar with the essentials of atomic energy as an obligation directly to your children -- and if there are grandchildren, to your grandchildren; or to those nice likeable youngsters next door. This is at least as direct a way of doing your duty to your children as the sacrifices you make without hesitation to get them an education, or the right diet and good doctors. If schemers or fools or rascals or hysterical stuffed shirts get this thing out of your hands -- it may then be too late to find out what it is all about. Do this for your children.

Anyway, that idea helps me on my own job; that idea, and the feeling I have deep in me that God the Father of us all did not make man in His image and endow him with capacity to learn nature's secrets in order that man use that knowledge to destroy the human race.

The American people, talking these things over in all the Crawfordsvilles of this broad land, will get a feel for this subject, an understanding of the essentials of this new force that may make the difference between calamity and progress. I believe the American people, thinking it over together in their home towns, and having it on their hearts, will work this thing out and make good sense of it. For in the conscience and the judgment of the people lies the strength of democracy.

September 30, 1947

Dear Dave:

You will remember that we discussed some time ago, the possibility of your talking at the Radio Executives Club Luncheon. I I undertook to suggest alternate dates to you about the time; here they are:

December 3rd
January 8th
January 22nd

In terms of securing the best possible audience, I think December 3rd will be the best date.

Any time you feel like talking on the radio again please let me know.

As ever yours,

Mr. David E. Lilienthal
Atomic Energy Commission
Washington, D.C.

American Broadcasting Company, Inc.
30 ROCKEFELLER PLAZA · CIRCLE 7-5700
NEW YORK 20, N. Y.

September 24 1947

Mr Edward R Murrow
Columbia Broadcasting System
485 Madison Avenue
New York New York

Dear Ed:

Bill Hedges advises that the following dates are open for the Radio Executives Club luncheons:

December 3rd
January 8th
January 22nd

The December 3rd lunch could be held in the ballroom of the Roosevelt Hotel jointly with the Advertising Club of New York, which would appear to make that the most attractive date.

Will you please let me know if Lilienthal is interested?

Many thanks for this help.

Sincerely

Bob

UNITED STATES ATOMIC ENERGY COMMISSION

LETTER

FROM THE

CHAIRMAN AND MEMBERS OF THE UNITED STATES ATOMIC ENERGY COMMISSION

TRANSMITTING

PURSUANT TO LAW THE THIRD SEMIANNUAL REPORT OF THE UNITED STATES ATOMIC ENERGY COMMISSION

Ed: from Dave.

FEBRUARY 2, 1948.—Referred to the Joint Committee on Atomic Energy and ordered to be printed, with an illustration

UNITED STATES
GOVERNMENT PRINTING OFFICE
71068 WASHINGTON : 1948

LETTER OF SUBMITTAL

The honorable the PRESIDENT PRO TEMPORE OF THE SENATE OF THE UNITED STATES:

The honorable the SPEAKER OF THE HOUSE OF REPRESENTATIVES OF THE UNITED STATES:

SIRS: We have the honor to submit herewith the third semiannual report of the United States Atomic Energy Commission, as required by the Atomic Energy Act of 1946.

There are a number of important phases of the atomic energy program which for reasons of national security cannot be presented in a public report of this character. These are discussed with the Joint Committee on Atomic Energy, which was authorized by the Congress to receive information on all activities of the Commission.

Respectfully,

UNITED STATES ATOMIC ENERGY COMMISSION.
ROBERT F. BACHER.
SUMNER T. PIKE.
LEWIS L. STRAUSS.
WILLIAM W. WAYMACK.
DAVID E. LILIENTHAL, *Chairman*.

THIRD SEMIANNUAL REPORT TO THE CONGRESS BY THE UNITED STATES ATOMIC ENERGY COMMISSION

Section I—The First Year—A Summary

In its first report to the Congress a year ago, within the month of the transfer of the United States atomic energy program from military to civilian management, the Atomic Energy Commission outlined its organizational policies and general operating plan. In July 1947 the second semiannual report to the Congress reviewed the status of preparations for the long-term program envisioned in the Atomic Energy Act of 1946, and reported briefly on the program for expansion of the project to maintain and improve the Nation's position in the field of nuclear development.

The Commission, in its third open report to the Congress, is able to report that this program is under way. The following pages are a summary of the first year of operation under legislative authority of a project of government in which the American people have invested heavily of their funds and their hopes.

Through the Joint Committee on Atomic Energy, the Atomic Energy Act provides the means for informing the Congress of those matters the open discussion of which might be prejudicial to the security of the United States. In this public report, however, we have attempted to provide sufficient unclassified information to enable the Congress and the people of the United States to appraise in general the management and progress of the Nation's atomic energy business.

During 1947 there was definite progress toward the repair of those areas of administrative and physical erosion which resulted from the period of national uncertainty following the cessation of hostilities of World War II. While a number of specific steps have been taken to establish the program on a sound, permanent basis of operation, in both physical plant and organization, it would be incorrect to assume that the project will become static either in facilities or in general activity for many years to come.

The paramount objective of "assuring the common defense and security," as defined in the Atomic Energy Act, required a major program of development at the Los Alamos Scientific Laboratory, where the weapons program is concentrated. An over-all plan was completed during the year and a number of important steps taken toward its fulfillment, including the construction of service and technical facilities, improvement and standardization of design of weapon components, development work on new designs, and the beginning of an extensive program of stabilizing production operations.

The work of the laboratory progressed to a point permitting field tests of indicated laboratory results at a proving ground established on Eniwetok Atoll in the South Pacific.

The production of fissionable materials was maintained throughout the year. A general program for the expansion of capacity was started along four main lines:

1. Through development of new sources of raw materials.
2. Through improvement of processes for the reduction of ores and the preparation of feed materials for the Commission's plants.
3. Through renovation and expansion of existing facilities for the production of fissionable materials, and advances in operating techniques.
4. Through the development of the nuclear reactor for more efficient utilization of the available fissionable material.

A major program of expansion and improvement of the Hanford plant for plutonium production was started in the fall of the year.

Research, both applied and fundamental, was reorganized and expanded. Increased emphasis in applied, or programmatic, research was placed on the work leading to an assured maximum supply of fissionable materials. With respect to fundamental, or basic, research, a plan and policy was adopted to obtain the greatest possible effort toward restoring the level of fundamental knowledge and replacing and increasing the flow of basic information which in years past came to the United States from a healthy science abroad.

While quantitative measurements of a research program are wholly inadequate, the Commission had more than 100 research contracts or subcontracts in effect during 1947 and inaugurated a $90,000,000 plan for the provision of new research facilities. The major accomplishment in the field of research during 1947, however, was the consolidation of programmatic research projects aimed at urgent objectives and the establishment of a research policy designed to utilize the full scientific potential of the Nation.

The continued production of radioisotopes at the Clinton National Laboratory made possible a Nation-wide program of tracer research in medicine, agriculture, biology, metallurgy, and industrial processing. The Commission does not report on the work done by the many agencies using this important research tool. These agencies are required to publish the results of this work, and some of the most significant advances in human welfare may result from the work done in nearly 300 public and private institutions which last year received more than 1,800 shipments of radioisotopes.

The Commission established a Division of Biology and Medicine to direct the work done in Commission facilities in this field and to effect the proper coordination with the work of other agencies. By year's end, the Division had completed an industrial hygiene survey and laid plans for still further improvement in health protective measures; developed a program for the training of scientists and technicians in medical, biological, and health physics fields; arranged for the operation of two medical and biological training centers to be established by the Commission; and completed plans for the Commission's support of cancer research.

The security of the project has been strengthened. Physical security measures include the establishment of special guard forces, installation of new facilities and equipment, and more adequate controls of classified materials. The Federal Bureau of Investigation has completed more than 40,000 personnel investigations [1] of "char-

[1] Full background investigation.

acter, associations, and loyalty," as required by the act. To insure adequate review of decisions based on evaluation by the Commission of investigative reports, a Personnel Security Review Board headed by former Supreme Court Justice Owen J. Roberts, was appointed.

The dissemination of scientific and technological data necessary to the growth of American science was continued under the system of declassification established early in 1946. A technical information service for the Commission and contractor organizations was established, and public information service was provided to supply information requested by press, radio, pictorial media, and citizen groups. The availability of security guidance to these media has been helpful in maintaining the security of information.

In appraising the United States atomic energy program, it should be recognized that the basic structure is determined by the location and characteristics of the physical plant built during the war to accomplish the single objective of developing and producing a weapon in the shortest possible time, and by the plans and programs initiated by the Manhattan project prior to the passage of the Atomic Energy Act of 1946, including the establishment of the Knolls Atomic Power Laboratory and the broad National Laboratories program.

Section II—Raw Materials

The Commission established in October a Division of Raw Materials to plan and carry out the exploration, procurement, and processing program in this field. A group of eight well-known mining men was appointed as an Advisory Committee on Mining and Exploration. Members are:

Donald H. McLaughlin, president, Homestake Mining Co., Lead, S. Dak., chairman.

G. Temple Bridgman, consulting engineer, San Francisco, Calif.

Everette L. DeGolyer, petroleum geologist, DeGolyer & McNaughton, Dallas, Tex.

Anton Gray, geologist, Kennecott Copper Co., New York, N. Y.

Wilber Judson, vice president and director, Texas Gulf Sulphur Co., New York, N. Y.

Robert E. McConnell, trustee, McConnell Foundation, New York, N. Y.

Fred Searls, Jr., president, Newmont Mining Corp., New York, N. Y.

Clyde Williams, director, Battelle Memorial Institute, Columbus, Ohio.

The staff of the Raw Materials Division, composed of mining engineers, geologists, and metallurgists, has recently been recruited.

The supplies of source material used in the atomic energy program to date have come predominantly from certain foreign countries whose uranium deposits are richer than any in the United States. No production of uranium from the United States other than the recovery of byproduct uranium from the vanadium industry of the Colorado Plateau was feasible during the war period. In the field of raw materials, however, as in other fields, the Commission now must plan for the indefinite future in which the requirements of national defense and of peacetime industrial applications of atomic energy will bring unpredictable demands for uranium ores.

One of the objectives of the Division of Raw Materials is to determine the extent of the uranium resources of the United States. A solution to the problem of assuring adequate supplies of fissionable materials is not confined to the discovery and development of ore reserves. Equally important objectives are improvement in the ore refining and recovery processes, development of reactors that will more efficiently utilize the fissionable material with which they are fueled, and the development of processes to utilize uranium contained in materials which now go from the various stages in the process to storage. Intensive research is directed toward each of these goals.

Research is also being directed toward the development of new radiation detection instruments and field prospecting techniques.

DOMESTIC RESOURCES

The first appraisal of domestic reserves of uranium ores was undertaken during the war by the Manhattan Engineer District, which carried on a program of exploration in many parts of the United States.

In addition to exploration, the program included purchase and refining of residue products from current operations of vanadium-ore mills as well as of waste tailings which had accumulated. These were treated for the recovery of their uranium content. In that period vanadium-ore mills were operating at Durango, Uravan, and Naturita, Colo., and Monticello, Utah. Following the war, the Government-owned facilities for treating tailings in residues from these mills were dismantled by the Manhattan Engineer District, and Government-owned plants for processing vanadium ores were declared surplus. Privately owned plants in this area also curtailed or suspended operations. The only operations at the present time are those sustained by Government purchases of vanadium and uranium.

As a result of the Manhattan Engineer District program, deposits of very low-grade ore were discovered. These are now being studied from the point of view of developing methods for the recovery of their uranium content. Their utilization, however, depends upon the solution of difficult and complex research and industrial problems, which for security reasons cannot be described in detail. Exploration for additional deposits is continuing.

The Commission believes new reserves of source materials can best be developed by competitive private industry, under the stimulus of profits, and the means of accomplishing this are under study.

In general it will be Commission policy to purchase ores for its program from private sources and limit direct Government production as far as possible. It is desirable, however, for the Commission itself to carry on certain activities for the purpose of determining the most efficient methods of ore extraction and beneficiation. The Commission recently purchased the vanadium plant at Monticello, Utah, from War Assets Administration and plans to put these facilities into operation after necessary repairs and alterations have been made and an ore stock pile has been accumulated. Consideration will be given to operating or encouraging the operation of other plants in the area.

The scope and extent of the ore-buying program to be recommended will be determined after a survey and full consideration of the entire raw-materials picture. The survey is actively under way. It should be emphasized that mine operators should not make commitments for

supplying ore to the Commission except on the basis of definite contracts or publicly announced purchase schedules.

A raw-materials office has been opened at Grand Junction, Colo., where a new office building will be constructed.

Section III—Production

FISSIONABLE MATERIALS

Production operations are by far the major portion of the total United States atomic-energy program, accounting for about 70 percent of construction expenditures and about 80 percent of operating expenditures. A public report of the Commission's work, however, can reflect only those phases of the production effort which do not reveal operating information.

The year's record of production work is reflected in activities throughout the project, including specific research assignments to the laboratories, improvements in operating techniques, higher standards of quality of materials produced, and construction of new production facilities which take into account both new developments and the deterioration and obsolescence of plants and equipment. While restrictions on information as to production operations are wholly justified and will be maintained, it is clear that effective security really depends upon technological advancement and production achievement.

Processing of source materials

All processing of source materials done at the point of extraction from the earth is under the direction of the Commission's Division of Raw Materials. All subsequent steps, through the reduction to metal and the preparation of feed materials, the separation of fissionable isotopes, production of fissionable materials in reactors, the separation of radioactive materials, and the manufacture of components of weapons are production operations. This work takes place at a number of locations and is coordinated through the Division of Production.

Experience gained in the processing of source materials in the plants of the contractors handling this work has been reflected in both improved quality of product and increased efficiency. The program is demanding an ever-increasing output of feed materials, but unit costs to the Government have been reduced.

The organization for the feed-materials preparation is designed to maintain current production at maximum levels and to insure as far as possible against future contingencies which might reduce the flow of materials to feed isotope separation plants and production reactors. In addition, certain residue materials potentially valuable for other purposes are stored for possible additional processing.

Production of fissionable materials

Immediately prior to the transfer of the properties to the Commission, the Manhattan project began the reduction of operations at the Oak Ridge electromagnetic plant for the separation of fissionable isotope of uranium, U–235, and initiated a program of increased production at the gaseous diffusion plant at Oak Ridge. While much of the production equipment in the electromagnetic plant is maintained in stand-by condition, its powerful magnets and research facilities are used for limited production and process-improvement purposes.

Plutonium is produced by the transmutation of uranium metal in the reactors at Hanford, where facilities are being substantially ex-

71068—48——2

panded, taking into account both new developments and the normal deterioration and obsolescence of this type of facility. The plant additions at Hanford, with necessary residential, administrative, service, technical, and production auxiliaries constitute one of the largest construction programs ever undertaken by the Government in peacetime.

The General Electric Co., contract operator of the Hanford Works, also has the prime contract for the construction program, which will require a greater expenditure of funds than the original building of the plant. The prime contractor has mobilized a strong technical and construction group and under some difficulty has organized the procurement of the many nonstandard items of equipment needed in the plant. Assembly of materials is now under way. Under a carefully planned schedule of work, a construction camp to house some 15,000 workers and their families is nearing completion. Special development work is going on in a number of laboratories, industrial plants, and Government installations.

Quality control

Since the materials used, at every stage of the production process, must be of a purity never before achieved outside the laboratory, an elaborate system of quality control and specification testing is necessary. Every factory supplying materials must maintain testing facilities and constantly analyze the product. The more difficult tests are performed in laboratories of the Commission, the National Bureau of Standards, or in cooperating universities.

A great variety of new instruments has been developed for these purposes and for the detection of radiation, many of which are now proving useful in other kinds of industries and laboratories. To insure a continuing supply for the Commission's work and for others, the manufacture of these instruments is being licensed to commercial firms wherever security considerations will permit.

WEAPON PRODUCTION

The atomic weapons produced during the war were literally laboratory products, experimental devices not only designed but also largely fabricated and assembled by the distinguished scientists who conceived them, in the mesa-top laboratory, at Los Alamos, N. Mex. And with the ending of the war there came an inevitable interval of readjustment during which weapon development was carried on under very difficult conditions. It became clear that for the longer-term operation it was necessary to establish a much broader base for production operations and take steps to insure against "bottlenecking" at any stage.

During its first year, therefore, the Commission's weapon program was directed toward furthering this project, converting the productive system from the unit fabrication of a laboratory device to a different scale of weapon production. This conversion necessitated basic changes in organization and planning for production, handling, and utilization of weapons, with these primary objectives:

Expansion of production facilities, to effect a continuous flow of component parts.

Development of new designs, stemming partly from work done during the war.

Improvement and standardization in the design of component parts.

Standardization of procedures—and provision of standard instructions—for storage and handling.

Progress is being made toward all of these objectives. The continued development of production facilities is being executed in accordance with an over-all plan. In the procurement phases of this work, the assistance of the Army and Navy has been of the highest order. Preliminary plans of the Manhattan project were incorporated in the weapon stabilization program.

PRODUCTION OF ISOTOPES

Artificial radioactive isotopes were first manufactured in cyclotrons, in minute quantities and at very great expense. Now, as a result of the development of atomic energy, there are more than a hundred kinds available for research work, and in adequate quantities—more than adquate, in fact, in view of the number of technicians qualified to use them. Radioisotopes for off-project distribution are produced in the reactor at Clinton National Laboratory, Oak Ridge.

The stable isotopes are separated from their brother atoms in the great magnetic machines built during the war at Oak Ridge to extract the fissionable U–235 isotope from common uranium. The radioactive isotopes are manufactured by irradiation of materials in nuclear reactors constructed for the production of fissionable plutonium or for research. Thus, isotopes are byproducts of the manufacture of the atomic bomb.

But although byproducts, isotopes are generally regarded as the most valuable new research tool since the invention of the microscope. If the development of atomic energy had produced nothing else, its cost would undoubtedly have been balanced within a few years by the gains in knowledge that the Nation is making with isotopes—gains that are already becoming tangible in medicine, chemistry, industry, and agriculture.

The Commission considers it to be of vital importance to make isotopes available to all qualified users in quantities as large as can be profitably used, in variety as great as can be developed, and at the lowest possible cost.

Nearly 2,000 shipments of radioactive isotopes have been made from the Commission's Isotopes Division at Oak Ridge since August 1946, more than 1,600 of them within the past year. Close to 100 different kinds are available. Production and distribution methods have been brought to the point where it is certain that all reasonable future demands can be met. Costs are being reduced rapidly and, for most types, are now well within the range that the average laboratory can afford to pay.

The Commission provides advice on the utilization of radioactive isotopes, together with film badges and other safety equipment, and hopes soon to expand this service to the point where all inexperienced prospective users are instructed in the most productive and safest research techniques.

In September 1947 the President, in a message to the International Cancer Research Congress at St. Louis, announced a program of

foreign distribution of isotopes by the Commission. Twenty varieties, particularly those most important for biological and medical research, are now being made available in limited quantities to foreign laboratories and medical-research groups, upon prior agreement by the recipients to make 6-month reports to the Commission on results obtained and freely permit publication of such results; to use the isotopes only for purposes stated in the original requests; and to permit qualified scientists of all nations to visit their institutions and freely obtain information about the work, in accordance with the best scientific tradition. By the year's end, 20 shipments had been made to foreign users in Argentina, Australia, Denmark, and the United Kingdom. To date, as the result of requests received, the Commission has approved future distribution to Belgium, Canada, Cuba, France, Ireland, Italy, the Netherlands, New Zealand, Peru, Sweden, and the Union of South Africa.

Intensive development work in the Oak Ridge electromagnetic separation plant made possible the recent announcement of the availability of more than 100 types of stable (nonradioactive) isotopes for distribution in the United States, and some 200 shipments were made in 1947.

Liaison is maintained with the National Bureau of Standards on radioactivity standards and safety, the United States Department of Agriculture and State agricultural experiment stations on agricultural utilization, the National Research Council on cancer research, and the medical agencies of the armed forces.

A new Committee on Isotope Distribution was named to advise the Commission's Isotopes Division on the most productive and safest distribution, particularly where therapeutic treatment was planned. Members of this advisory committee are:

Dr. G. Failla, of the Columbia University Medical School; chairman.
Dr. H. A. Barker, plant nutrition, University of California, Berkeley, Calif.
Dr. Henry Borsook, department of biochemistry, California Institute of Technology, Pasadena, Calif.
Dr. Robley D. Evans, Massachusetts Institute of Technology.
Dr. Hymer L. Friedell, Lakeside Hospital, Western Reserve University, Cleveland, Ohio.
Dr. J. G. Hamilton, University of California, Berkeley.
Dr. Joseph W. Kennedy, Washington University (St. Louis).
Dr. Robert F. Mehl, Carnegie Institute of Technology.
Dr. Paul C. Aebersold, Chief, Isotopes Division, AEC, Oak Ridge.
Dr. Austin M. Brues, Argonne National Laboratory, Chicago.
Dr. A. H. Holland, Jr., medical adviser, AEC, Oak Ridge.
Dr. L. N. Nims, acting head of department of biology, Brookhaven National Laboratory, Patchogue, Long Island, N. Y.

Details of the distribution and utilization of isotopes are included in appendix 4.

Section IV.—Research and Development

Since submission of its last report to Congress, the Commission has made progress toward reorganization of the atomic energy research program. Recognizing that aggressive and almost contin-

uously changing research, both applied and basic, is vital to the national defense and welfare, the Commission has established a program in accordance with the following major requirements:

1. Concentration of immediately available facilities and personnel on the most urgent problems. This has required selective planning in programmatic or applied research and extensive direction of applied research activities under way at the time of the transfer of the properties.
2. Adequate support and stimulation of fundamental, or basic, research in order to restore the levels of fundamental research activity reduced seriously since the period before the war.
3. Maximum utilization of the national research potential: Governmental, academic, and industrial.
4. Provision for expanding the supply of qualified research personnel.

Within the policy framework, the Commission has directed its current research program in the physical sciences toward increased production and more efficient utilization of fissionable materials and the development of military and nonmilitary applications of atomic energy. Medical and biological research, including health physics, is covered in a separate section of the report.

PROGRAMMATIC RESEARCH

This research report covers the principal areas of research operations in both programmatic (or applied) research and basic research. Under the former is included a discussion of new reactors and of the outlook for useful power from nuclear energy.

Raw materials

A raw-materials research program was designed to assist in the exploration for ore deposits by the most modern methods, improve the efficiency of recovery methods for treating ores, and develop methods capable of beneficiating very low-grade ores. In this work, the Commission has the active assistance of the United States Geological Survey and other Government agencies, private contractors, and educational institutions. Exploration research includes geological investigations to determine the origin of various ore deposits and radiometric experimental work to develop improved methods and instruments for exploration and laboratory analytical procedures. The development work includes the operation of plants adjacent to the ore sources, one of which is now working in the Colorado Plateau region on the extraction of uranium from the low-grade carnotite ores there available.

Feed materials

Intensive research continues in the field of processing of source materials. Changing and tightening of specifications for the feed materials used in reactors requires unceasing study of the properties of the materials involved, the methods and efficiencies of refinement and processing, and the means of improving quality of the final fuel product.

Fissionable material separation

One of the largest and most important phases of research in chemistry and chemical engineering is that directed toward the development

of improved methods for fissionable material separation and purification. Current emphasis is on the development of improved methods of plutonium separation, and on a system for the recovery of fuel materials from reactors now in the design stage.

Weapons research

Problems relating to atomic weapons research and development are dealt with mainly at the Commission's laboratory at Los Alamos.

The Commission's principal goal in this field is the scientific and engineering perfection of improved designs. The past year has seen definite progress toward this goal.

During 1946, a year in which the country abruptly reoriented itself following the end of the war, it was inevitable that much of the technical talent assembled during the war should depart from weapons work. Some of this talent again became available for the work in 1947.

An over-all long-range weapons research program has now been rounded out. Specific projects that had been interrupted are again directed toward tangible ends, and new projects have been instituted. The Los Alamos Scientific Laboratory has been restabilized and has regained an effective scientific "tone." It is the Commission's intention that this laboratory shall be operated in the spirit of a permanent research center. Building construction is now under way to that end.

Proving ground.—Thorough testing of weapons and components under simulated operation conditions is necessary to improved design.

The procurement of materials and the installation of facilities, instrumentation, and other equipment are well under way at Eniwetok Atoll, site of the proving ground mentioned in the Commission's second report to Congress. The purpose of this proving ground will be the testing of atomic weapons from time to time as part of the program of improvement. The scientific and technical operations of the proving ground will provide new fundamental data and a broader understanding of the phenomena of nuclear fission, for peaceful as well as military application of atomic energy.

The major part of the construction program has been undertaken for the Commission by the armed forces. Full security restrictions of the act are in force, and only participating official observers are permitted. Public warning has recently been issued against the entry by nonparticipating individuals into a specified area surrounding the test location. The Security Council of the United Nations has been informed by the United States Department of State, which also officially notified representatives of other nations.

Reactors

1. *General.*—The research and development on nuclear chain reactors is shaped by three primary considerations:

(*a*) Requirements of the Military Establishment.
(*b*) Reactors for research and development purposes.
(*c*) Special and large scale industrial applications.

The work aimed at providing reactors for these purposes does not separate, nor will operation necessarily be independent, even though the reasons for and principal objective of each may be quite distinct.

The requirements of the Military Establishment involve reactors to provide fissionable materials and reactors for military power requirements.

Industrial applications of reactors may be for the large-scale generation of electrical power, for the production of high-temperature-process heat, and for special purposes such as remote stationary power installations or for the irradiation of materials.

At present, reactors under development may combine purposes serving several of the ultimate objectives outlined above. This report on reactor research covers for the most part work on problems common to all reactors, regardless of purpose or, if not common to all reactors, problems which must be answered before specialized applications may be realized.

2. *Working materials.*—The working materials in the construction of reactors fall into six principal categories:

1. Fuel elements.
2. Moderators required to slow the neutrons in reactors utilizing neutrons of low energy.
3. Coolants, required to remove the heat generated by fission within the pile.
4. Structural materials, which form the supporting framework of the reactor, or pile.
5. Shielding, required to confine the intense radiation.
6. Auxiliaries, such as pipes, valves, blowers, pumps, instruments and controls, feeding and removal mechanisms, protective casings for feed materials, and others.

These items cover the engineering problems in the design and construction of piles. The specifications for all of the materials to be used cover: Neutron absorption characteristics; resistance to corrosion; chemical and physical stability under high temperature and intense radiation; and workability into shapes which will withstand high internal and external pressures of liquids or gases, and other stresses.

Sufficient research progress has been made on a number of these problems to permit the design of medium high-temperature reactors using various coolants and with several variations in the moderator. These reactors may be operated at temperatures high enough to produce power on an experimental basis. One of such should be in operation by the end of 1950, and perhaps earlier.

3. *Reactors for military use.*—Studies of reactors for military power requirements are presently carried out by the Department of the Air Forces and by the Department of the Navy. The Commission is cooperating with these programs.

4. *Research and development reactors.*—Many of the problems encountered in finding the working materials for the construction of reactors involve the use of reactors themselves in testing and developing such working materials and auxiliary equipment. In addition to the reactors at Hanford, the Commission has available two reactors at Los Alamos, two at Argonne National Laboratory, and one at Oak Ridge.

These reactors are excellent for the various purposes for which they are used: To produce plutonium, to produce isotopes, and for research. No one of them produces usable power and no one of them operates at a high temperature. The "fast" reactor at Los Alamos uses plutonium as its nuclear fuel. The others are uranium reactors, operating at relatively low temperature.

Construction was started this year on a uranium, graphite-moderated, air-cooled reactor for research purposes at Brookhaven National Laboratory. This will provide much-needed research facilities in the Northeastern United States. Basically similar to the existing reactor at Clinton National Laboratory, the new Brookhaven reactor will be somewhat more powerful. It should be in operation within a year.

Argonne National Laboratory has completed the design and is nearly ready to start construction of an important new type of reactor. It may be operated at temperatures sufficiently high to make possible production of useful power.

A special type of reactor is under design at the Knolls Atomic Power Laboratory operated for the Commission by the General Electric Co. at Schenectady. This reactor will be similar in purpose to the new Argonne reactor but will be of different design. The new Knolls reactor will provide further information on coolants and will permit special studies of both components and power production.

Clinton National Laboratory at Oak Ridge has carried to an advanced stage the design of a high-flux reactor for general research and development purposes. The specification calls for a neutron intensity far greater than those now available and will include provisions for testing reactor components at high temperatures. It will be a most important research and development tool for the entire reactor program, and will be constructed at Argonne National Laboratory.

General power reactors have been studied at Clinton National Laboratory for many months. The primary objectives of this work is to survey the possible usefulness of a wide range of reactors and components. The studies completed thus far constitute an important store of knowledge of the power problem, and particularly of components and auxiliaries.

5. *"Breeding"*.—Underlying the entire field of atomic energy today, or, more specifically, the utilization of nuclear energy through the chain reaction process, is the problem of the availability of fissionable materials. This availability depends not only on the actual stores in the earth's surface, but on the time and energy consumed in obtaining them in quantities sufficient to permit full-scale development of atomic energy. These are limiting factors which it is believed can be removed only by an intensive long-range scientific and engineering effort.

In this discussion of research on the reactor program, it should be kept in mind that intensive research is going on in the field of reduction and processing of ores for the feed materials upon which reactors depend. Solution to the problem of assuring adequate supplies of fissionable materials may lie in one or more of several directions: (1) Discovery of new deposits of ores; (2) improvement in the recovery processes; (3) development of new recovery processes for different types of source material, and (4) development of the nuclear reactor for more efficient utilization of the available fissionable material.

Research is under way in each of these fields. One important line of work in the direction of improved reactors is aimed at development of a "breeder" type of reactor. This is a nuclear chain reactor which over a period of time will actually create more fissionable material than is put into the reactor as fuel to sustain the reaction.

The word "fuel," when used in this connection, denotes the fissionable material put into the reactor as a source of energy and the source of neutrons on which the fission process depends. The material which is put into the reactor for conversion or transmutation into fissionable material is known as fertile material. The fuel is consumed through fission, which at the same time may create new fissionable material from the fertile material, as a result of the absorption of neutrons by the fertile material. If more fissionable material is thus produced than is consumed, there would be a net gain of fissionable material, or a "breeding" of the fuel.

The significance of the breeder type of reactor is directly related to questions of the stores of uranium and thorium in the earth's surface and the problems of their recovery and use, whether economic, political, or technological. Both the military and industrial potential of atomic energy justify the effort to solve the problems of "breeding."

The process of the accumulation of fuel through operation of a breeder-type reactor may be likened to the compounding of interest on money. In this analogy, the reactor is a bank. The initial stock of fuel can be compared to the capital which the depositor puts into a savings account. That capital—in this case fissionable material—is put to work producing power. But at the same time, additional fissionable material (interest on the capital) is accumulating and therefore increasing the original capital, just as compound interest increases the depositor's capital in savings account.

6. *Power.*—Because of the relationship between the rate of reproduction of fuel in a breeder and the power of the reactor, the development of breeders and of reactors for power will go hand in hand. There is, in effect, a complete interlocking of the scientific and engineering problems of the breeder and the power reactor, with both heavily influenced by our ability at any given time to procure, recover, and process efficiently and with reasonable economy the required fuels.

The generation of significant amounts of useful power from nuclear energy depends upon no single factor of availability or utilization of fissionable materials, but upon a complex pattern of developments in the fields of exploration and processing of raw materials, reactor working materials, chemical separation systems, and reactor design and operating techniques. The development work to be done in these fields and the periods of time required to produce usable amounts of new fuel through "breeding," introduce a time factor measured in years into any discussion as to when nuclear energy can make a significant contribution to the supply of power now available from other sources.

It was with these facts in mind that the Chairman of the Commission expressed the Commission's views on these prospects in an address before the Detroit Economic Club on October 6, stating that "the first commercially practical atomic power plant is not just around the corner, not around two corners," and that a common estimate of the time schedule for the development of nuclear power "is from 8 to 10 years to overcome the technical difficulties and have a useful, practical demonstration plant in operation."

A reasoned view of the prospects for significant amounts of useful power from nuclear energy—at least for limited practical applica-

71068—48——3

tions—is an encouraging one. But the timetable extends through two decades.

In a recent paper discussing the scientific and engineering problems of power, the General Advisory Committee said:

> Assuming even a most favorable and rapid technical development along these lines a word of caution is needed as to time scale. We do not see how it would be possible under the most favorable circumstances to have any considerable portion of the present power supply of the world derived from nuclear fuel before the expiration of 20 years.

BASIC RESEARCH

Future developments in atomic energy will depend on new knowledge—not only new knowledge of nuclear forces and general nuclear behavior, but new knowledge in all of the supporting sciences: Chemistry, metallurgy, physics, health physics, biology, etc. This knowledge will be the product of basic research, which at the same time will provide opportunities for the training of scientists and technicians.

Basic research is carried on in AEC facilities as well as in other Government and university laboratories. AEC laboratories conduct all basic research involving reactors and other fundamental studies required to give balance to the program.

Arrangements are being made with the Office of Naval Research for joint sponsorship of a wide range of basic research in a program which will insure efficient utilization of facilities, personnel, and results.

Basic research was expanded during 1947 in the fields of physics, chemistry, and metallurgy. Much of this work is being done in Commission facilities where reactors are available, and includes studies of nuclear properties of elements important to reactor, weapon, and other work; the chemistry of the transuranic elements and of radioactive materials; and the metallurgy of both fuel elements and reactor working materials.

Basic studies of the interaction of elementary particles are being done chiefly through the use of particle accelerators.

The principal facilities where basic work is under way are:

Argonne National Laboratory, Chicago, Ill.
Batelle Memorial Institute, Columbus, Ohio.
Brookhaven National Laboratory, Patchogue, Long Island, N. Y.
Clinton National Laboratory, Oak Ridge, Tenn.
Columbia University, New York, N. Y.
Iowa State College, Ames, Iowa.
Massachusetts Institute of Technology, Cambridge, Mass.
Radiation laboratory, University of California, Berkeley, Calif.
United States Bureau of Standards, Washington, D. C.

Nuclear reactions investigated in cyclotrons

The operation under contract with the Commission of the 184-inch cyclotron at the radiation laboratory, University of California, has provided a source of alpha particles and deuterons with which to investigate nuclear structure. So-called "spallation" or splintering reactions, have been observed, in which as many as 15 primary particles have been ejected from the nucleus of a single heavy element subjected to bombardment.

Fission can also be induced in certain heavy nuclei by high energy alpha particles and deuterons, and has been observed in bismuth, lead, thallium, platinum, and tantalum.

The cyclotron has indicated the existence of the so-called "exchange forces" operating between protons and neutrons in the atomic nucleus and has thus made a step toward answering the question of what holds the nuclear particles together.

Linear accelerator

A new linear accelerator designed for accelerating protons, was built at the University of California and operated to produce protons with an energy of 32,000,000 electron volts.

Research reactors

New radioactive substances and concentrated beams of neutrons are produced in the Commission's experimental nuclear reactors now available to the research workers at Oak Ridge, Los Alamos, and Chicago. Such reactor products are now indispensable to the fundamental investigation of materials. Other new experimental reactors—especially, the one now under construction at the AEC Brookhaven Laboratory—will still further expand the area of basic research which can be carried out with neutron beams.

Trans-uranic elements

While physicists explore the interior of the atom, chemists in many of the Commission's laboratories are studying its behavior as a whole—how the newly created elements combine with, and react upon, the materials that are already understood. To utilize new materials, or to make new use of familiar materials, understanding of their chemical behavior is essential. All of the "trans-uranic elements," such as neptunium, plutonium, americium, and curium hitherto nonexistent upon earth, are still largely mysteries.

Rare earths

The rare earth elements, a group comprising those from atomic No. 57 (lanthanum) through atomic No. 71 (lutecium), have long been practically unavailable for physical and chemical research except as mixtures of the group. Separation of individual rare earth elements is extremely difficult because of their chemical similarity.

The development of special methods for chemical separations of radioactive isotopes has led to the successful application of these methods to the problem of rare-earth separation, and as a result, the individual differences in these elements can now be systematically explored and both their physical and chemical properties determined.

Synthesis of organic compounds labeled with carbon–14

Radioactive carbon-14 has been available for the last year to laboratories in this country through the Isotopes Division of the Commission. It is now available also for foreign distribution. Since carbon is an element contained in all organic compounds, its chemical behavior plays an exceedingly important role in all plant and animal processes and in all synthetic organic chemical researches.

To be useful, however, the carbon atom must be incorporated, or synthesized, into a molecule so constituted that it will undergo the organic reactions under study. To aid research in the application of carbon-14 to such problems, many organic "intermediates" or basic compounds more suitable as starting materials have been synthesized in Commission laboratories, and these compounds are being used to

study many biological problems and to investigate the exceedingly important plant process of photosynthesis. It is expected that several such compounds will be available soon for distribution. One, methanol, is currently being distributed.

Publications

One measure of the contribution to basic research during the past year in laboratories working under the auspices of the Commission is the volume of publications and reports which have been issued. The subjects covered embrace many of the fields of interest in the Nation's atomic energy program excepting only those aspects of atomic energy research that cannot be discussed publicly at the present time.

Current work is covered for the most part in nearly 3,000 reports in the fields of chemistry, physics, metallurgy, biology and health, and others.

Section V—Biology and Medicine

During its first year of operation, the Commission—while encouraging and assisting wherever possible the research work already in progress and undertaking such work in its own laboratories—laid the groundwork for a Nation-wide program of biological and medical research and education. The major steps taken were:

1. *Appointment of a Medical Board of Review, composed of seven experienced scientists in the field of biological and medical research.*

In June 1947 the Commission requested the President of the National Academy of Sciences to nominate a panel of qualified advisers to review the medical and biological aspects of the program. This Medical Board of Review recommended the continuance and expansion of research and training in the various fields, appointment of a permanent advisory group, and establishment of a broad training program.

2. *Appointment of a permanent Advisory Committee for Biology and Medicine.*

This committee, appointed in September 1947 is composed of seven distinguished scientists in the various medical and biological fields and convenes at monthly intervals at the various installations in an unusually active advisory capacity. The committee is composed of the following members:

Dr. Alan Gregg, director for medical sciences, Rockefeller Foundation, New York City; chairman.

Dr. G. W. Beadle, division of biology, California Institute of Technology, Pasadena, Calif.

Dr. Detlev W. Bronk, director of the Johnson Research Foundation, University of Pennsylvania.

Dr. Ernest W. Goodpasture, dean of the school of medicine and professor of pathology, Vanderbilt University.

Dr. Baird Hastings, professor of biochemistry, Harvard Medical School.

Dr. E. C. Stakman, chief, division of plant pathology and botany, University of Minnesota.

Dr. Joseph T. Wearn, dean of the school of medicine, Western Reserve University.

3. *Establishment within the Commission's Washington headquarters of a Division of Biology and Medicine.*

The Division will correlate the medical and biological research programs related to atomic energy in the Commission's, in other Government, and in private laboratories; initiate needed investigations and review all contracts entered into and allocations of funds for research; and direct for the Commission its health physics work and industrial hygiene activities.

4. *Arrangement with the National Research Council for joint sponsorship of the Council's Committee on Atomic Casualties, which will make a long-range study of the effects of atomic bombing on Japanese survivors in Hiroshima and Nagasaki.*

The study of the actual effects—immediate and long-term—of exposure of human beings to an atomic bomb is one of our most important sources of information for the future. Besides the effects on general physiological functions, the relations of genetics and cancer are primary concerns. The president directed the National Research Council to undertake this study and authorized the cooperation of Government agencies.

5. *Maximum development of the production and distribution of isotopes for medical and biological investigations and the appointment of a Committee on Isotopes Distribution composed of experts in the field.*

Radioactive isotopes continued to hold the center stage in medical and biological research. With these tools, for example, new methods of treating heart dropsy were developed and encouraging results were obtained in various disorders of the blood. (See sec. III, Production.)

6. *Support of research through the administrative organization of the Office of Naval Research.*

7. *Planning of a fellowship program for the training of personnel for atomic energy work in medical and biological fields.* (See sec. VII, Training and Information.)

8. *Formulation of a cancer program, in accordance with the policy of assisting established medical research to explore the application of atomic energy to the various aspects of cancer treatment.*

The Commission's cancer program, developed in 1947, includes special assistance for cancer research at such institutions as the New York Memorial Hospital, Harvard University, and the University of California; the development in the Commission's laboratories of radioactive materials for cancer treatment; and the provision of beds for selected cancer patients in hospitals at the Clinton, Brookhaven, and Los Alamos Laboratories, and elsewhere.

9. *Authorization of funds for building and equipping a medical and biological training and research center at the University of Rochester, Rochester, N. Y.*

These new facilities will permit the extension of the medical and biological research program conducted for the Government at this institution and particularly of the work now being done under contract with the Commission, centering around the medical and biochemical aspects of radioactive substances and processes.

THE MEDICAL AND BIOLOGICAL RESEARCH PROGRAM

The Commission through 1947 had research contracts with the University of California, Columbia University, Harvard University,

the Massachusetts Institute of Technology, and the University of Rochester, providing for research not only on the biological effects of radiations and radioactive materials but also in the utilization of isotopes for the investigation of life processes in plants and animals. A great many other institutions in all parts of the country conducted similar work.

At various of the Commission's own installations, intensive work was carried out in these fields—at the Clinton National Laboratory, studies on the effects of atomic energy on hereditary traits and other biological phenomena, and at the Argonne National Laboratory, extensive toxicologic studies on the various products of fission of the nucleus. This latter study revealed new methods of producing tumors experimentally and thereby provided new avenues in cancer research. At Los Alamos, N. Mex., several drugs and vitamins were made radioactive and studied in the human body, and methods of treatment of radiation sickness were evaluated. The Brookhaven National Laboratory started to investigate the relation of atomic energy to cancer and to carry out basic research.

The initial task of the Commission in 1947, and specifically of its Division of Biology and Medicine and the Advisory Committee, was to inventory the research and educational work now going on in this field, select the areas where the effort should be stimulated, and take positive action—by assistance through contracts, participation in the work of other institutions, the construction of facilities, and the establishment of laboratories—to enlarge and coordinate the national program. This work continues.

INDUSTRIAL HEALTH

Unprecedented safety measures have been developed to meet the equally unprecedented hazards to health involved in the atomic energy production process—from the novel respirators used for uranium work to the remote control "fingers" used by the Los Alamos operator who views his work through television.

Many of the materials that must be handled are organically poisonous, aside from any danger of radiation. Protective measures must be based upon an understanding of why the materials are toxic and a determination of tolerance standards. These investigations were carried out during 1947 at a score of universities and medical institutions and Government and industrial laboratories, and have resulted in more effective utilization of protective clothing, respirators, dust-removing systems, cleaning methods, and analytical techniques for the continuous testing for danger.

Investigations of the effects of radiations on living things are still so new and tentative that they have the character of a search after fundamental knowledge. But the application of health physics cannot wait the results of this search; therefore, the safety measures adopted against radiation are now largely of the kind that can be instituted without the guidance of well-established standards. The policy has been to take no chances. A small fraction of what is calculated to be the minimum safe tolerance dose has been the limit for workers. Shielding—of reactors, particle accelerators, and radioactive materials—has been designed with ample safety factors.

The Commission's Offices of Directed Operations maintain medical divisions to coordinate safety operations in contractor's plants. A

remarkable safety record has been achieved in 1947 throughout the Commission's organization. (See sec. IX, Organization and Administration.)

Section VI—Engineering and Construction

The construction and engineering work required during the early years of the peacetime development of atomic energy represents a very large proportion of the total development expenditure in the current phase of the program. The work has accelerated rapidly. In early 1947 there were broad program determinations and detailed planning. Actual new construction got under way in the summer of 1947.

Production plants and facilities are taking by far the largest share of construction effort in this stage. Indirectly, production requirements are the occasion for a substantial share of the extensive construction of housing and community facilities.

CONSTRUCTION NOW UNDER WAY

Production facilities

A large share of all construction undertaken in 1947 was at Hanford in preparation for the building of production facilities in the period immediately ahead. A construction camp to accommodate 15,000 men was nearly complete by the year's end. Progress of this project was greatly accelerated by the acquisition, through the War Assets Administration, of a completely equipped Navy hospital with 65 buildings, barracks, and various types of service equipment, which was moved to the camp site in North Richland.

Also at Hanford, new storage facilities for process materials were completed in 1947, and additional facilities went into an advanced design stage. A great variety of preparatory alteration and construction of operating and maintenance facilities—office buildings, machine and carpenter shops, warehouses, and other service structures—was continually in progress through the year.

Construction of research facilities

Nearest to completion of major research facilities is the new metallurgy building on the campus of Iowa State College at Ames, one of the Commission's most important research and development centers for metallurgy. The laboratory, fully equipped to apply the new techniques in this field, and for the study of production processes of uranium and thorium, was started during the year and is now about half complete. The property on which it stands has been leased by the State of Iowa to the Federal Government for 99 years. Another project brought close to completion during 1947 was a developmental laboratory at Miamisburg, Ohio.

In the radiation laboratory of the University of California at Berkeley, a new synchrotron is under construction in a recently completed special building.

At the Commission's Knolls Atomic Power Laboratory at Schenectady, a $15,000,000 construction program, begun in August 1947, is 10 percent complete. A 70,000-square-foot building in Schenectady, acquired from the War Department, was converted to the use of laboratories, shops, and offices previously crowded into inadequate space in the General Electric plant.

Construction of housing and community facilities

The Government community at Los Alamos, which now has a permanent population of nearly 8,000, was built during the war in an isolated and physically confined area, a piece at a time, as needed to meet the urgent and secret demands of the weapon program. Living conditions, as a result, are far below the standard acceptable, on a long-term basis, to the scientists and other workers and their families who must now make their homes at the critically important project; and furthermore, maintenance costs of the hastily constructed community are abnormally high. During 1947, therefore, an emergency program of community renovation was pushed with all possible speed. A generating plant, sewage-disposal system, and several markets, shops, and warehouses were completed, and roads and street additions are well under way. Other town buildings and stores were about half completed. About 550 permanent houses were finished, and another group of 113 living units in houses and apartments was about one-quarter done. Installation of an improved water system was undertaken. Additionally, a great deal of remodeling and renovating of existing facilities was accomplished during 1947.

At Oak Ridge, population 35,000, a construction program to provide immediately needed public works, safety installations, and school facilities was about 60 percent complete at the close of the year.

At Hanford, a $14,000,000 permanent housing project was about one-fifth completed.

ENGINEERING AND PLANNING

Engineering and design of facilities to be constructed in the expanding program of 1948 went ahead in 1947 under more than a score of major contracts. Most of these plans were developed to the stage where actual construction would soon begin.

Planning of production facilities

Engineering work at Hanford involves every kind of planning required in the preparation for a construction project that is big by any peacetime—or wartime—standards, and expansion of the town into a good-sized city. Contracts were let for the enlargement of electric power and telephone facilities; plans were completed on projected railroad and highway connections, both of which will bridge the Yakima River to reach the project. Heavy construction equipment sufficient to meet 80 percent of future needs was obtained from other Government agencies. About $5,000,000 worth of building materials and equipment was obtained from the War Assets Administration and about $11,000,000 worth from the Army, Navy, and Department of the Interior. The Pasco Army Depot was obtained by transfer from the War Department to provide space for receiving and storage of construction materials.

Los Alamos is the center of an expanded production program, which will require the expenditure of more than $23,000,000 during the next fiscal year.

Planning of research facilities

Plans were well advanced in 1947 for full-scale construction—to get under way in 1948—on the two new National Laboratory establishments that the Commission will build: Argonne, in Du Page County

outside Chicago; Brookhaven, on the site of the former Camp Upton at Patchogue, Long Island. Contracts for the construction of both laboratories were let, and design was carried to an advanced stage.

At Brookhaven, ground was broken in August 1947 for the construction of the experimental reactor that will make the laboratory a center of nuclear physics research in the Northeast. Design of the reactor was completed, and construction begun. Design of laboratory buildings was completed.

The contract for the design and construction of the Argonne National Laboratory, was let in May 1947 to the University of Chicago, which in turn entered into subcontracts for architectural, engineering, construction, and management services. Actual construction is scheduled to begin in the spring of 1948, and the entire installation is scheduled for completion in 1950.

Planning of housing and community facilities

Community development at the Government atomic energy production and research center at Oak Ridge involves long-term planning for an efficient and livable city of 35,000 people or more. The Commission in 1947 started the preparation of a master plan to provide for city development on a sound and economical basis. The plan has four phases: The preparation of maps showing geographical and environmental features of the area and present utilization; analysis of present utilization; development of plans for improved utilization, prepared with full attention to the functional relationships of each land-use area to the others and the most advantageous location of housing, community, school, and all other permanent facilities; and finally, the development with Government authorities of definitive plans covering zoning, transport, utilities, recreational features, and other necessities of city government.

Similar long-range studies were started at Hanford and Los Alamos. A 114-bed community hospital, for Los Alamos, was approved by the Federal Bureau of Hospitalization; plans and specifications will be entirely completed by May 1948. The hospital will have a wing set aside for medical research, where selected cancer patients will be provided with care and treatment without charge, as part of one of the Commission's cancer research programs.

Section VII—Training and Information

TRAINING

An inseparable part of the Commission's responsibility for the development of atomic energy relates to the training of men who will do the work. During 1947 a fellowship program was developed in the Division of Biology and Medicine, designed to train qualified persons for careers in the medical and biological aspects of atomic energy. The Commission will finance the program and establish the operating policies and training goals to be met. Actual administration, including selection of candidates, will be undertaken by the National Research Council of the National Academy of Sciences, which has had broad experience in the administration of fellowship programs. The AEC has budgeted approximately $1,000,000 for the first year.

71068—48——4

Fellowships

The initial fellowships will be distributed among three broad classes of candidates:

Doctors of medicine.

Doctors of philosophy in the biological sciences.

Bachelors of science and of arts, who will receive training in health physics and related subjects.

Post-doctoral fellowships will extend for a period of 2 years, with annual stipends, depending upon marital status, commensurate with other fellowship programs. Graduate training in health physics will extend for a period of 1 year or longer depending upon the qualifications of the candidate and his need or desire for additional training.

It is anticipated that fellows trained under the program will become leaders in future development of medical and biological education in the atomic energy field. An opportunity to utilize their training at AEC research and production centers will be offered, although the fellows will not be committed to such work. Insofar as possible, they will be afforded an opportunity to elect the type of training desired and the means by which it will be obtained, and will have a certain amount of latitude in selecting the universities or laboratories at which their studies will be pursued.

Selection of institutions will depend in part upon geographical location and in part upon availability of adequate educational and physical facilities. Special consideration will be given institutions in which it is possible to integrate medical and biological training with physics, chemistry, and mathematics. Since conditions allowing this combination are limited, special facilities are being provided at the Commission's regional laboratories and at certain universities. However, fellowship training will not be limited to these institutions. Fellows may receive all or part of their training at other laboratories, universities, hospitals, or foundations having necessary facilities.

Results of work carried out by a fellow will be available to the public through approved scientific channels, without restriction, except as may be required for reasons of security.

A similar plan for research fellowships in the physical sciences is under development.

Other training

The three national laboratories at Chicago, Oak Ridge, and Patchogue, Long Island, with their total of 52 associated universities are important training as well as research centers. The broad base of participation in atomic energy research by academic institutions is in itself important from an educational standpoint. All of the research programs at educational institutions are training programs as well.

THE NATIONAL LABORATORIES

The Commission has three national laboratories, established to provide a common ground for teamwork in research and training between the Nation's private educational institutions and the Government.

In section 1, under the title of "Purpose," the Atomic Energy Act of 1946 makes the Commission responsible for:

> A program of assisting and fostering private research and development to encourage maximum scientific progress; and * * *

A program of federally conducted research and development to assure the Government of adequate scientific and technical accomplishment. * * *

To some extent this objective, of scientific and technical advancement, is being pursued individually by the universities and the Government, but there is an unmistakable need also for large-scale continuance of the cooperative effort that proved so enormously fruitful in wartime. The universities have—and must have—the major share of scarce scientific manpower today; the students essential to tomorrow's progress; and the tradition of effective fundamental research and education. The Commission has a Nation-wide program directed toward the ends specified in the act, and the facilities and the tremendously expensive equipment—reactors and particle accelerators, for instance—that must be used. Obviously, both groups of resources must be used if the program is to produce the greatest results.

The National Laboratory program was developed during 1947 to combine these sources of strength; at the three laboratories, at Chicago, Oak Ridge, and Patchogue, Long Island, a total of 52 universities and institutions are cooperating in scientific research and education. (See appendix 3 for names of cooperating institutions.)

Argonne National Laboratory is successor to the Metallurgical Laboratory established early in the war for atomic energy development at the University of Chicago, where the first operating nuclear reactor was built. It is still operated for the Commission by the university; and 29 participating Midwest institutions are represented on the Council. Argonne is today the center for the Commission's reactor development program and all the research and development accessory to it—reactor theory and design, study, and development of necessary materials and components, and general coordination of the Nationwide effort. It has two operating reactors and extensive facilities for the use of its 10 divisions: Biology, chemistry, health physics, instrument research and development, mass spectroscopy and crystal structure, medical, metallurgy, experimental physics, theoretical physics, and reactor research and development. A good deal of fundamental research is conducted in most of these divisions. The laboratory, now scattered over the campus of the University of Chicago, is to be consolidated at a single Government site. Land is being acquired in Du Page County, and designs are under way.

The *Clinton National Laboratory* at Oak Ridge is an outgrowth of the huge wartime development of the production of fissionable materials at this location. Laboratory facilities include more than a hundred buildings equipped with a great variety of specialized equipment and an experimental reactor. In addition to much work in physics, metallurgy, and biology, the laboratory serves as a center for the Commission's Nation-wide program of chemical and chemical engineering research, both basic and programmatic, with emphasis upon industrial applications. From this laboratory, the Commission's Isotopes Division distributes to all parts of the country and abroad the experimental isotopes produced in its reactor and in the electromagnetic separation plant located at Oak Ridge.

Cooperating with the Clinton National Laboratory are 14 southern universities, combined, under charter from the State of Tennessee, into the Oak Ridge Institute of Nuclear Studies, under contract to the Commission for extensive research and training. The institute has developed several programs. The graduate training program

permits selected graduate students from various universities to complete their thesis research by work done at Oak Ridge; during the 1947 fall semester 198 students registered for courses in chemistry, chemical engineering, mathematics, physics, and zoology. A supplementary graduate training program enables regular employees of the local operating contractors to continue work while studying subjects required for their theses at Oak Ridge instead of going elsewhere. The school of nuclear science of the institute provides advanced study at the post-doctorate level in special problems related to nuclear reactor development. The research participation program will make it possible for scientific staff members of educational institutions to take part in the research programs of the operating contractors. Also, the institute will conduct a special school in radioactive tracer techniques, beginning in the summer of 1948.

Brookhaven National Laboratory at Patchogue, Long Island, was established to enlist the scientific cooperation of the great educational institutions of the Northeast. It is operated by Associated Universities, Inc., a corporation formed by nine universities of the region, and is being provided with a full range of laboratory equipment, sufficient to supply the needs of advanced work in the atomic energy aspects of physics, chemistry, biology, and medicine, including a nuclear reactor and a number of particle accelerators. A staff of about 140 scientists from universities, industrial research laboratories, and other institutions was appointed to the laboratory; and in addition about 180 consultants agreed to assist the work. Conferences on subjects connected with the research are regularly held and were attended during 1947 by close to 1,000 scientists.

A major purpose of the laboratory is to provide exceptional facilities to young scientists for training in nuclear research. Although Brookhaven neither awards degrees nor grants academic credit, selected graduate students are permitted to carry out their doctorate investigations, using its special facilities.

PUBLIC AND TECHNICAL INFORMATION

Directly supporting not only the research and training activities of the Commission's facilities, but also the work of educational and industrial institutions throughout the country, is the provision of technical information on work done in the atomic energy program.

The Commission established late in 1947 a unified Public and Technical Information Service to insure, in accordance with the Atomic Energy Act, adequate control and dissemination of the information that is the lifeblood of scientific and engineering progress—and of public understanding of that progress and its implications. The Public and Technical Information Service combines five interdependent functions relating to the control and dissemination of information:

1. Preparation, reproduction, and controlled distribution within the project of classified reports to personnel requiring such information.
2. Declassification through analysis by qualified scientific reviewers of material which then becomes available for public use.
3. Editing, preparation, and reproduction of technical information materials, including indices, abstracts, project reports, and declassified papers.

4. Security guidance service—aid to publishers, editors, reporters, broadcasters, leaders of citizen groups, or others issuing material relating to atomic energy—in order to prevent compromise of restricted data; and assistance to contractors of the Commission and other agencies of Government to safeguard restricted data.

5. Public information service—assisting representatives of the press, radio, picture services, citizen and trade organizations, and educational agencies, in obtaining the full range of declassified and unclassified data currently available from the national atomic energy program.

Declassification of information

The declassification system developed under the Manhattan District and continued under the Atomic Energy Commission during 1947 received some 1,200 documents for declassification. Of those, the 120 scientists and engineers serving as reviewers recommended declassification and general release of over 1,000, after the making of necessary changes and deletions. A number of these declassified documents have been published in scientific and technical journals and have also been made available to the public through the Office of Technical Services of the United States Department of Commerce.

In order to insure uniform application of declassification policies with respect to information shared by the United Kingdom, Canada, and the United States, as a result of their combined wartime efforts, and in the interests of maintaining maximum security of information, the Commission arranged a 3-day conference between representatives of the atomic energy agencies of the three nations in November 1947. The conference was concerned with the application of uniform declassification policies for atomic energy information. Discussions were limited to technical data held jointly by the participating nations as a result of their cooperation during the war. Canada and the United Kingdom now use the Declassification Guide developed in the United States and made available to them in April of 1946.

Technical information

Congress in the Atomic Energy Act recognized that—

> the dissemination of scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free exchange of ideas and criticisms which is essential to scientific progress.

The system for providing information to the scientific and technical community, both inside and outside the Commission and its contractors' organizations, developed extensively during the year.

Of prime importance in this program is the distribution of restricted data originating within the atomic energy project to those within the project who have need of such information and are authorized to receive it. In 1947, an average of 50 copies each of 3,000 such classified reports were distributed in accordance with distribution lists carefully compiled. Each laboratory received those categories of information it needed for the successful accomplishment of its program. In addition to this routine distribution, 34,000 individual copies of such reports were distributed to laboratories requiring them, after careful screening to insure that no unnecessary distribution of restricted information resulted.

To insure that project laboratories have access to all information in the field of atomic energy which originates outside the atomic energy project, a continuing Guide to Published Research on Atomic Energy and allied fields was prepared in the Technical Information Service by assembling abstracts in this field from all of the published abstract journals. During the year, 2,223 such abstracts were assembled and circulated throughout the Commission's contractor groups.

In order to make certain that all project scientists have access to the information contained in the Research and Development Reports prepared at each laboratory, the Technical Information Service prepares abstracts of each of these reports that can be circulated to all project laboratories; 507 such abstracts were prepared and incorporated in the Abstracts of Research and Development Reports which was issued monthly during the year. This publication is classified Secret.

To furnish adequate reference service for the mass of information contained in the 18,000 individual classified research and development reports deposited in the Commission's libraries, an extensive card index system was developed by the Technical Information Branch; 906,000 index cards were prepared and distributed in the past year.

Over the past year also, nearly 1,700 individual declassified documents were distributed, including those declassified prior to January 1947. So that the information contained in these documents would be of maximum usefulness to the scientific community, the documents were reproduced and distributed to project laboratories, Government agencies, and 150 depositories of the Library of Congress, and were made available to the public through the Office of Technical Services of the Department of Commerce. Nearly 162,000 copies of these documents were distributed.

A program was instituted to make the information in these declassified documents more readily accessible through abstracts, 700 of which have now been prepared for the same distribution as the documents themselves.

Much progress was made toward completion of the National Nuclear Energy Series, a 110-volume compilation of scientific treatises based primarily on research in the field of atomic energy conducted under Government auspices. By the year's end, material for six volumes had been declassified and prepared for reproduction and public sale. An additional 20 classified volumes are ready for reproduction and distribution within the project. The Commission entered into a contract with Columbia University to handle the publication of the series, and it is expected that a publisher will be announced shortly. The first issuance of the National Nuclear Energy Series will be known as the Manhattan Project Technical Section, covering work done under the Manhattan project. Approximately half of the total number of volumes are expected to be declassifiable and available for public use and will aggregate approximately 25,000 pages.

Public information

In response to the very great public interest in and concern with the progress of the Nation's atomic energy development program, the media of public communication and information during 1947 continually devoted large amounts of space and time to reporting all that could be reported on the program, explaining the basic nature of atomic

energy, and counseling readers and listeners on public policy toward control and use of this new force. At the Commission's offices in Washington and the five Offices of Directed Operations, there was a mounting volume of demand by reporters, editors, broadcasters, picture men, and leaders of citizen groups, for information from the Commission and for guidance on the security aspects of information on atomic energy obtained elsewhere.

To meet this demand the Commission authorized a small public information staff—four professional employees in Washington and one at each of the five Offices of Directed Operations. Through the declassification system this staff obtained for all who asked such service—writers, publishers, periodicals, newspapers, broadcasters, citizen groups—judgment on whether copy proposed for publication contained restricted data. The volume of requests for such service grew steadily. It was—and is—evident that the public communications media of the Nation desire overwhelmingly to avoid harm to the national defense and security through publication of restricted data. There is a heavy continuing demand for security guidance service in Washington and at the Offices of Directed Operations.

Security guidance service constituted only a part of the public information requests handled by the Commission's offices. An even larger volume of requests called for positive information, declassified or unclassified, to be used as news, in radio broadcasts, in books, pamphlets, periodicals, or talks by a great range of people. Additionally, the Commission issued at its Washington office 75 statements for press and radio giving the facts about new developments in the national atomic energy development program. Through such public releases the Commission is able to discharge to some small extent the public accountability which rests upon all Government agencies and which is especially important in the case of an agency under heavy security restrictions.

The public demand for information direct from Commissioners and staff members through talks upon numerous occasions was far greater than could be satisfied, and only a small fraction of the requests could be filled.

It is the Commission's hope that the contractor organizations and the associated universities and colleges will redouble their efforts to provide speakers, visual materials, etc., to help satisfy this intense and extensive public demand for basic information on atomic energy and the progress of the national program for its development. The Commission's own activities in this field were small in 1947 and will be on a limited scale in the future. This educational need can and should be met by the press, the radio, the schools and colleges, and the organized groups of the country.

The extent and the urgency of the demand for both security guidance and positive information service from the publishing group in the United States was indicated by three developments of the last quarter of the year: (1) The appointment by the American Society of Newspaper Editors of a special committee on atomic energy to develop recommendations for editors and for the Commission on how to give fullest service to readers on atomic energy development and at the same time to avoid breaches of security; (2) the appointment of a special committee on atomic energy by the American Textbook Publishers' Institute to speed the development of textbooks dealing

with this field; (3) the appointment of a special committee by the Association of Secondary School Principals to develop a broad program for school and community education in the fundamentals of atomic energy development and control through a project called "Operation atomic vision."

The membership of these three groups is as follows:

American Society of Newspaper Editors Committee on Atomic Energy Information

Gideon Seymour. executive editor, Minneapolis Star-Journal and Tribune, chairman.
W. S. Gilmore, editor in chief, Detroit News.
B. M. McKelway, editor, Washington Star.
Paul C. Smith, editor-manager, San Francisco Chronicle.
C. G. Wellington, managing editor, Kansas City Star.
Laurence L. Winship, managing editor, Boston Globe.

American Textbook Publishers Institute Special Committee on Atomic Energy

Lee Eighton, Harcourt, Brace & Co., Inc.
Charles Griffith, Silver Burdette Co.
Henry McCurdy, Macmillan.
Lloyd W. King, American Textbook Publishers Institute, executive secretary.

Association of Secondary-School Principals Advisory Committee on "Operation Atomic Vision"

Kenneth Benne, Teachers College, Columbia University, New York, N. Y.; member of the department of adult education of the National Education Association.
Claude V. Courter, superintendent of schools, Cincinnati, Ohio; member of the American Association of School Administrators.
Stanley E. Dimond, director, Citizenship Education Study, Detroit Public Schools, Detroit, Mich.; member of the National Council for Social Studies.
Paul E. Elicker, executive secretary, National Association of Secondary-School Principals, Washington, D. C.
Will French, professor of education, Teachers College, Columbia University, New York, N. Y.; chairman, committee on curriculum planning and development, National Association of Secondary-School Principals.
George L. Glasheen, executive director, National Committee on Atomic Information, Washington, D. C.
Harold C. Hand, professor of education, University of Illinois, Urbana, Ill.; member of the Association for Supervision and Curriculum Development.
J. Dan Hull, Chief, Secondary School Instructional Problems, Division of Secondary Education, United States Office of Education, Washington, D. C.; member, committee on curriculum planning and development, National Association of Secondary-School Principals.

Philip Johnson, specialist in science, Division of Secondary Education United States Office of Education, Washington, D. C.

Morris Meister, principal, Bronx High School of Science, New York, N. Y.; member of the National Science Teachers Association.

Morse Salisbury, Director, Public and Technical Information Service, United States Atomic Energy Commission, Washington, D. C.

The Commission or members of its staff have met with each of the three groups and have started to develop programs of service to reporters and editors, writers and publishers, schools, and—through them—to pupils and the public. Specific requests for service in the way of security guidance and information will be forthcoming shortly from these groups. These are organized manifestations of the public desire for facts and for aid in reporting what may be reported about the goals and the progress of the Nation's atomic energy development program.

Section VIII—Security

Soon after taking office, the Commission enlisted the services of Rear Adm. Sidney W. Souers, USNR, former Deputy Chief of Naval Intelligence and first head of the United States Central Intelligence Group, and of Frank J. Wilson, former Chief of the United States Secret Service, as special consultants to assist in a survey of the long-term security problem. Meanwhile, the security system of the Manhattan project remained in effect.

As a result of the study, the Commission established in its staff headquarters an Office of Security and Intelligence to direct all of the security activities of its program. The Office maintains close liaison with the Central Intelligence Agency, the Federal Bureau of Investigation, and other security and intelligence agencies of the Government, as well as with the staff of the Congressional Joint Committee on Atomic Energy.

Following its establishment, the new Office took many significant measures to insure the security control of plant, personnel, documents, and information in addition to the establishment of standards, policies, and procedures.

The policy and procedures with respect to administrative review of personnel clearance decisions were developed to a point where by the year's end a five-member Personnel Security Review Board, composed of prominent citizens, was being established, to make recommendations to the Commission for further definition and codification of standards and criteria used in determining ineligibility for employment by the Commission and its contractors and to provide for administrative review.

Members of the Board are:

Owen J. Roberts, former Associate Justice of the United States Supreme Court, Chairman.

Dr. Karl T. Compton, president, Massachusetts Institute of Technology.

Hon. Joseph C. Grew, diplomat and former Under Secretary of State.

George M. Humphrey, president, M. A. Hanna Co.

H. W. Prentis, Jr., president, Armstrong Cork Co.

Security staffs of the Managers of Directed Operations made 844 detailed inspections and surveys during 1947. The scope of this

report does not permit a detailed presentation of physical security improvement resulting from these surveys. However, all major and many lesser facilities were improved in this respect. Protective devices to provide adequate mechanical safeguards were installed and, pending the completion of the construction program, an expanded guard force was created to maintain optimum levels of plant protection.

In building a guard force of 3,100 men, a high level of personnel standards and indoctrination was set and is being maintained; as an example, at Los Alamos, out of 14,000 applicants for guard duty, only 1,000 were able to qualify. Further, in connection with the development of guard forces, emergency defense plans were made for all major facilities. For this purpose close liaison was maintained with the National Military Establishment.

An integrated survey system was established to provide a regular coverage of facility surveys. A Headquarters Inspection and Survey Unit was formed to advise the Commission in achieving an effective and consistent security policy and to assist the Managers of Directed Operations in the accomplishment of that end. The unit operates independently in checking the status of security in the field, consulting with the Offices of Directed Operations and recommending to the Commission revisions and supplementations in security policies, standards, and procedures.

Preparation of a set of maps, for all key Atomic Energy Commission installations, was begun. These maps show all standard natural and cultural features and graphically stress physical security aspects.

All Commission employees are given full background investigation.

In order to protect restricted data and at the same time allow maximum progress in construction at the Commission's installations, access to restricted work is allowed to as few cleared construction workers as possible, the security and construction plans being so integrated as to provide for classified work being started only after the nonclassified construction has been completed. Considerable progress was made in 1947 in reducing the number of construction workers who have access to restricted work.

In connection with the information control and security education program, a Classification and Document Control Board was set up to establish criteria for the classification of restricted data, to supervise procedures involved in the accounting for classified documents, and to define such areas of Commission information and activity as should be free from security restrictions. Field units were set up by the Managers to work closely with the Board.

There was no complete inventory of classified documents available when the atomic energy program was transferred to Commission management. The task of inventorying such documents was begun in July 1947. The magnitude of the inventory may be illustrated by an operational and statistical outline. In the highest category of classified data over 25,000 documents were identified and are in the process of inventory. Technical and scientific reports totaling over 450,000 are also in the process of a detailed inventory and were about 75 percent complete by the end of the year. Part of the problem involved in inventorying documents is the several million less highly classified papers, which must be scanned in various repositories, to separate the two named groups of material from other less highly classified documents being studied, and to set up an improved system

for handling and accounting for documents. One location has more than 25,000 linear feet of files in which 20 percent of the material is estimated to be classified.

In the security education activities, vigorous efforts were made to indoctrinate all personnel having access to restricted data with a full knowledge of their duties and responsibilities. At regular meetings, local security officers achieved, through personal contact, the cooperation of plant and laboratory personnel in understanding and executing the requirements of security. Security kits containing training material and copies of Security Education Outline, a guide to the procedures involved in security, were distributed to all Managers of Directed Operations.

Ten thousand copies of a general manager's instruction, "Responsibility for Security," were also distributed. This document describes precisely the personal obligations of all Commission and contractor personnel for security obligations. It defines the responsibilities of administrative officers—the Director of the Office of Security and Intelligence, the Managers of Directed Operations, and the heads of Washington divisions and offices.

Section IX—Organization and Administration

By Executive order, the AEC assumed responsibility from the Manhattan Engineer District of the War Department for the organization and administration of the atomic energy program on January 1, 1947. During the past year a large amount of Commission and staff time has been devoted to the establishment of the basic structure of the organization, to the recruitment and selection of principal members of the staff, and to the necessary assignments of responsibility and essential procedures for effective administration. The military authorities were extremely helpful in facilitating the administrative transition to civilian operations provided for by the Atomic Energy Act. This work is now essentially complete.

PRESENT ORGANIZATION OF THE COMMISSION

Policy review and formulation

The five-man Commission established under the Atomic Energy Act acts as a policy formulation body. The five Commissioners meet with the several bodies established by the act—namely the Congressional Joint Committee on Atomic Energy, the General Advisory Committee and the Military Liaison Committee. In addition, the Commission and the General Manager have sought the advice of several other groups on specific policy and administrative problems.

General Advisory Committee.—The members of the General Advisory Committee have made themselves continuously available to the Commission and staff in handling a wide range of scientific and technical matters. In addition to many meetings of subcommittees and special surveys by individual members, the full committee met formally eight times during the year for a total of 20 days.

The members are:

Dr. J. Robert Oppenheimer, director of the Institute for Advanced Study, Princeton, N. J., chairman.

Dr. James B. Conant, president of Harvard University.

Dr. Lee A DuBridge, president of California Institute of Technology.
Dr. Enrico Fermi, professor of physics at the Institute for Nuclear Studies, University of Chicago.
Dr. I. I. Rabi, chairman of the department of physics, Columbia University.
Hartley Rowe, vice president and chief engineer of the United Fruit Co.
Dr. Glenn T. Seaborg, professor of chemistry at the University of California.
Dr. Cyril S. Smith, director of the Institute for the Study of Metals, University of Chicago.
Hood Worthington, Carothers Research Laboratory, E. I. du Pont de Nemours & Co., Inc.

The value of an advisory group of this type cannot be overemphasized in the management of an enterprise which frequently is operating in almost unexplored areas of science and industrial technology. Not only has the General Advisory Committee assisted in the solution of specific problems, it has provided a most helpful evaluation service in the reorientation of research and development programs. As a result of its own surveys and studies, the Committee has recommended specific projects and made suggestions to strengthen the program at several points. The membership of the Committee, of course, insures the most competent appraisal of those phases of the United States atomic-energy program which, under the act, are reviewed by the General Advisory Committee.

Joint Committee on Atomic Energy.—The Joint Committee on Atomic Energy is the medium established by law whereby the Commission reports fully on its activities on a current and continuing basis, including the reporting of secret matters. The joint committee, working closely with the Commission, has assisted materially in making progress toward reconciling the requirements of maintaining the secrecy of information and at the same time assuring the necessary accountability of the Commission to the Congress.

Members of the joint committee and the Commission have discussed many matters relating to the Commission's activities in both formal and informal meetings. Representatives of other agencies of the Government such as the State Department and the National Military Establishment have also participated in some of these meetings.

The Commission has also informed the joint committee of its activities by means of many letters, memoranda, and written reports. Furthermore, the Commission's staff is in almost daily contact with the staff of the joint committee, and members of the joint committee and of the committee staff have visited the major installations of the Commission throughout the country.

Members of the committee are:

Senator Bourke B. Hickenlooper (Iowa), chairman.
Representative W. Sterling Cole (New York), vice chairman.
Senator Arthur H. Vandenberg (Michigan).
Senator Eugene D. Millikin (Colorado).
Senator William F. Knowland (California).
Senator John W. Bricker (Ohio).
Senator Brien McMahon (Connecticut).
Senator Richard B. Russell (Georgia).

Senator Edwin C. Johnson (Colorado).
Senator Tom Connally (Texas).
Representative Charles H. Elston (Ohio).
Representative Carl Hinshaw (California).
Representative James E. Van Zandt (Pennsylvania).
Representative James T. Patterson (Connecticut).
Representative Lyndon Johnson (Texas).
Representative Carl T. Durham (North Carolina).
Representative Chet Holifield (California).
Representative Melvin Price (Illinois).

Military Liaison Committee.—The Commission meets regularly with the Military Liaison Committee on alternate Wednesdays and oftener when required, and the staffs of both work closely together. The Committee is housed in the Commission's headquarters. Twenty-two formal joint conferences were held during the year, 14 of these since July 1, 1947, and there were numerous staff and informal conferences. Working relationships were maintained with the armed services at various levels in Washington and in the field and were much broader than the activities involved in establishing and meeting military requirements.

The mutual interests of the Commission and the services extend throughout the broadest range of subjects: Security of information and facilities, production, procurement, construction of facilities, biology and medicine, certain field operations, intelligence, support of basic research, appropriations and other fiscal matters, export controls, mobilization planning, and participation of industry in the atomic energy program. Organizing for effective relations with the Military Establishment in these many fields—relations which recognized the responsibilities, explicit and implied, of the Commission and the services—was a major objective of the Commission during 1947, and progress toward this objective has been substantial, in a year which was a formative period for the Commission and a period of reorganization for the services.

Differences arising in initial presentation of matters considered jointly have thus far been resolved by discussion and thorough analysis by the members and staffs of the Military Liaison Committee and the Commission. Of the wide range of matters relating to the entire atomic energy program that have been discussed with the Military Liaison Committee, no case has yet arisen where it has been necessary to refer any disagreement to the President for decision as provided for in section 2 (c) of the Atomic Energy Act.

Members of the Committee are:

Lt. Gen. Lewis H. Brereton, United States Air Force, Chairman.
Lt. Gen. Leslie R. Groves, United States Army.
Col. John H. Hinds, United States Army.
Rear Adm. Thorvald A. Solberg, United States Navy.
Rear Adm. Ralph A. Ofstie, United States Navy.
Rear Adm. William S. Parsons, United States Navy.

Organization

The General Manager is responsible to the Commission for the effective functioning of the organization. The small Washington office is essentially a staff organization concerned largely with the development and evaluation of programs and policies. The opera-

tions of the Commission are carried on by private and governmental research, construction, and production contractors under the direction of five decentralized Offices of Directed Operations headed by managers.

The Washington organization includes the four statutory program divisions: Engineering, Military Application, Production, and Research. To round out the organization necessary to cover the extensive spread of program responsibility and to assure the Commission of highly skilled specialized talents, two divisions have been added and partially staffed during the past 6 months: The Division of Biology and Medicine and the Division of Raw Materials. Directors of the six divisions function as the technical program staff and are empowered to advise managers and contractors on the technical phases of their operations directly on behalf of the General Manager and the Commission. A program Council, made up of the General Manager, the directors of the six divisions, and the Assistant General Manager, assures full consideration of all aspects of the highly complex technical problems which require joint judgment of the Commission and staff.

Responsibility for the development of managerial policies, standards, and service rests with seven offices established by the Commission: Administrative Operations, Budgets, Comptroller, General Counsel, Organization and Personnel, Public and Technical Information Service, and Security and Intelligence.

Operating responsibility except in the field of raw materials is decentralized to the five Offices of Directed Operations established at Chicago, Hanford, New York, Oak Ridge, and Santa Fe (Los Alamos). Three of these Offices of Directed Operations were established, and managers appointed, during the past 6 months.

The positions of directors of the divisions and offices and the managers of the five operating establishments, as well as most other principal positions, are currently filled with experienced personnel.

DEVELOPMENT OF PROGRAM AND ADMINISTRATIVE POLICY

The scope of governmental direction of the atomic energy program and the new problems associated with its administration in times of peace demand creation of sound base-line policies in a number of complex fields. During the past year, and more particularly during the past 6 months, the Commission and the General Manager have established a variety of temporary or permanent advisory bodies of unusually competent experts to examine operations and needs of the program. These advisory bodies have made reports of their findings and recommendations, all of which are currently under consideration or have been acted upon by the Commission.

Advisory Committee for Biology and Medicine

The Commission established a permanent Advisory Committee for Biology and Medicine on September 12, 1947, after its program and needs had been examined by a temporary Medical Board of Review. The permanent Committee is charged with the continuing study of the basic policies of the Commission in the medical, biological, and health physics aspects of the atomic energy program. The members of the committee are among the leading medical and biological scientists of the country. (Their names are listed in sec. V, Biology and Medicine.)

Advisory Committee for Exploration and Mining

The importance of the discovery, development, and procurement of raw materials required in the Commission's program led to the appointment of an Advisory Committee for Exploration and Mining to assist the newly established Division of Raw Materials in this work. The committee was charged with the responsibility of studying the Commission's present program and advising on questions of exploration and development with a view toward integrating and coordinating present programs and policies. (Membership is listed in sec. II, Raw Materials.)

Patent Administration and Patent Advisory Panel

The Atomic Energy Act contains provisions relating to inventions and discoveries which were adopted by the Congress in view of the special patent problems in the atomic energy field. Thus, under the act, patent rights to inventions will not be conferred to the extent that the inventions are used in the production of fissionable material or in the utilization of fissionable material or atomic energy for a military weapon; at the same time the Commission is authorized to make awards to such inventors. In addition, the Commission is authorized under certain circumstances to declare a patent to be affected with the public interest and to license its use in the atomic energy program subject to the payment of a reasonable royalty fee.

To assure that the administration of the patent provisions of the act does not restrict free operation of business or interfere with incentive, the Commission during the first month of its operation appointed a Patent Advisory Panel to study and report on these phases of its activities. The panel now has five members:

William H. Davis, chairman of the Patent Survey Committee, Department of Commerce.

John A. Dienner, former president of the American Patent Law Association.

Casper W. Ooms, until recently United States Commissioner of Patents.

Hector M. Holmes, of Boston, Mass.

H. Thomas Austern, of Washington, D. C.

The initial report of the Patent Panel was submitted to the Commission in September 1947. The panel concluded that the impact of the patent provisions of the act upon the patent system and upon the normal process of industry had been made as small as possible consistent with the needs of common defense and security and the other purposes of the Atomic Energy Act. The panel also concluded that the practice of the Commission in this field is to avoid any unnecessary interference with the normal functioning of the patent system. The panel found evidence of general satisfaction on the part of the Commission's contractors with the fairness with which the patent provisions in contracts had been negotiated and administered, and was of the opinion that the types of patent clauses employed appeared to be generally satisfactory.

The panel is continuing to serve as an advisory board to the Commission on patent matters. Following the submission of its initial report, it undertook to consider proposed regulations to govern proceedings which will be heard before the Patent Compensation Board to be established under section 11 (e) of the Atomic Energy

Act. Such regulations are expected to be ready for publication in the near future.

By the end of 1947, there had been docketed by the Patents Branch of the Commission's Office of General Counsel (and by its predecessor in the Manhattan District) more than 6,500 records of inventions covering scores of different technical classes. Filing of a patent application was recommended in 2,375 cases, and most of these already have been filed. Over 11,500 project technical reports and 6,600 notebooks have been examined for evidences of inventions.

Industrial Advisory Group

More than 3,000 contractors, subcontractors, and suppliers are already taking part in the atomic energy program. Many more must be induced to participate—for unless the initiative, technical skill, and managerial ability of American business are brought to bear with maximum effect on the problems of atomic energy development, the people of the United States will not realize full benefits from this new field of endeavor. It is the policy of the Commission, subject to congressional supervision as provided by the act, to move away from the present Government monopoly provided by law as rapidly as feasible, having in mind the paramount consideration of the national security. The Industrial Advisory Group will explore opportunities for increased individual participation for profit and methods of developing incentives for industry to get into the field. The objectives are to:

1. Utilize fully the Nation's industrial research and development capacity.
2. Keep the industries directly concerned fully informed as to the developments in their fields within security limitations.
3. Insure the opportunity for technical training in atomic energy of as large a part of American industry as possible in order to prepare the industrial community for the job it must do if America is to continue to be strong in atomic energy development.

An interim Industrial Advisory Group was appointed and began its task of getting the necessary background acquaintance with the project in October 1947. In the following 3 months the members, fully cleared for access to secret data necessary for their deliberations and recommendations, visited all major Commission installations involving potential industrial applications, consulted with present and potential AEC contractors, and started preparing their first report to the Commission. This report will offer recommendations as to the permanent advisory groups needed in the field of industrial participation in the atomic energy program.

The members are:

James W. Parker, president and general manager, Detroit Edison Co., Detroit, Mich.

Oliver E. Buckley, president, Bell Telephone Laboratories, New York City.

Donald F. Carpenter, vice president, Remington Arms Co., Bridgeport, Conn.

Bruce K. Brown, vice president, Standard Oil Co. of Indiana, Chicago, Ill.

Gustav Egloff, director of research, Universal Oil Products Co., Chicago, Ill.
Paul D. Foote, executive vice president, Gulf Research & Development Co., Pittsburgh, Pa.
Gabriel O. Wessenauer, manager of power, Tennessee Valley Authority, Chattanooga, Tenn.
Robert E. Wilson, chairman of board, Standard Oil Co. of Indiana, Chicago, Ill.
Isaac Harter, executive vice president and director, the Babcock & Wilcox Tube Co., Barberton, Ohio.
Jerome C. Hunsaker, chairman, National Advisory Committee for Aeronautics.

Safety and Industrial Health Advisory Board

The safety and health protection record of the Manhattan Engineer District and the Commission has been excellent, as measured by the standard indices in this field. During the first 10 months of 1947, the frequency of accidents among Commission and contractor personnel was 4.91 persons injured for each million man-hours worked, a rate more than 50 percent below the 1946 national average for all industries. The fire loss record was even better by comparison. In all of the plants operating in the refinement and processing of source materials for the Commission, the accident frequency rate was only half that of the nonferrous metals industry as a whole.

But the deterioration of wartime structures, equipment, and facilities; the problems arising from expanded operation; and the difficulty of fitting the work of the Commission into a normal peacetime economy have led the Commission to seek the independent judgment and recommendations of competent and experienced analysts in these vitally important aspects of its operations. Accordingly, the Commission, in consultation with the National Safety Council, secured the services of such a group to constitute its Safety and Industrial Health Advisory Board. The Board made an extensive survey of AEC and contractor practices and problems of safety and industrial health. Members are:

Sidney J. Williams, assistant to the president, National Safety Council, Chicago, Ill., chairman.
Horatio Bond, chief engineer, National Fire Protection Association, Boston, Mass.
Dr. Philip Drinker, Harvard School of Public Health, Boston, Mass.
Robert H. Albisser, safety director, Merck & Co., Inc., Rahway, N. J.
William F. Brown, safety director, Consolidated Edison Co. of New York, New York City.
Bernard R. Caldwell, deputy chief of police, Los Angeles, Calif.
Dr. Abel Wolman, head, department of sanitary engineering, Johns Hopkins University, Baltimore, Md.
Arthur E. Gorman, sanitary engineer, Office of the Housing Expediter, Washington, D. C.
Herbert M. Parker, assistant superintendent, medical department, General Electric Co., Hanford, Wash.
Dr. Hymer L. Friedell, director, department of radiology, University Hospitals of Cleveland, Cleveland, Ohio.

Richard Fondiller, president, Woodward & Fondiller, New York, N. Y.

Jack J. Smick, associate actuary, Woodward & Fondiller, New York, N. Y.

Advisory Board on Relationships of the Atomic Energy Commission with its contractors

This temporary five-man board was established in February 1947. It conducted a thorough investigation of Commission-contractor relationships, particularly in the field of research, and made numerous valuable suggestions for establishing more effective working relationships with the contractors. Members were:

Dr. John R. Loofbourow, professor of biology of the Massachusetts Institute of Technology; chairman.

Dr. John W. Hinckley, director of the patent management division of the Research Corp., New York, N. Y.

Dr. Ronald H. Robnett, professor of business administration of the Massachusetts Institute of Technology.

Alfonso Tammaro, Atomic Energy Commission.

Committee on Scientific Personnel

The full support and active participation of scientists and workers in scientific laboratories now engaged, or potentially equipped to engage, in atomic energy work is of vital importance to the Commission. Recognizing certain handicaps including those which derive from the necessity for security practices, which are new to the pursuit of scientific inquiry in peacetime, the Commission felt the need for a fresh consideration of the special problems of this very important group. A Committee on Scientific Personnel was therefore established in May 1947 to examine the problem. The committee after a canvass of practices, standards, and attitudes of scientists and administrators of scientific laboratories completed its work and reported to the Commission in October 1947. Valuable recommendations for guide-line policies were made with respect to: Classification of employees; salaries; promotion and salary control; interchange of employees between institutions; tenure and retirement; consultant policies; vacations and sick leave; hazard pay and insurance; organization.

These recommendations, combined with staff appraisal and recommendations for putting them into practice, are now before the Commission. (Membership was listed in the second report to the Congress, and is repeated in this report in appendix 2.)

ADMINISTRATIVE DEVELOPMENTS

Accounting and finance

Two significant steps have been taken during the past 6 months to provide the Commission with essential facts necessary for the creation of financial policy and the development of more effective accounting procedures, for its industrial and scientific—rather than typical governmental—operations.

An analysis of obligations and expenditures for production, research, construction, town management, and administrative functions for the fiscal year 1947 and through November of 1947 has been completed

and will provide the basis for the development of a system of accounts on accepted industrial and cost-accounting principles.

Five of the Nation's leading public-accounting firms were employed to review the accounting for five prime contracts, covering a cross section of Commission operations. Their reports, which are now being submitted, will assist the Commission in clarifying certain aspects of its relationships with industrial contractors.

Personnel

The Commission's dual policy of working through contractors for construction, production, research, and other operations, and of decentralizing all supervision of contract operations to the five Offices of Directed Operations, is reflected in the distribution of personnel associated with the project. There are approximately 500 employees in the Washington office, including the military personnel in the Division of Military Applications. Almost 10 times this number, or approximately 4,800 employees, are located in the operational centers. Approximately 10 times the total number of Government employees—about 55,000 persons—are employed by contractors at AEC installations.

During the Commission's first year of operation, Government employees were decreased by approximately 1,100 while contractor employees increased by about 14,000. The increase in contractor employment reflects increased scope of operations and would have been greater if not offset by considerable savings in manpower from increased efficiency in certain operations, particularly at Oak Ridge.

Labor relations

Continuing efforts have been made to evolve a labor-relations policy which would provide an essential framework within which contractor-employee relations may operate. At present the wartime arrangement with the National Labor Relations Board, whereby the Board will not certify labor organizations as representatives of employees of processing and research contractors other than at Oak Ridge, continues.

Requests for recognition were renewed during the period, however, by the International Association of Machinists (independent) at Argonne National Laboratory and by the Metal Trades Department of the AFL at Hanford. New requests for recognition were made of the contractors by Building Service Employees International Union, AFL, and International Brotherhood of Teamsters, Chauffers, Warehousemen and Helpers, AFL, at Argonne National Laboratory. Action on all of these requests was deferred. But a new agreement was entered into at Hanford between the principal construction contractor and the Building Trades Department of the AFL for construction work at that location.

At Oak Ridge, another NLRB election was held at the gaseous diffusion plant which was again won by the United Chemical Workers, CIO. Following the election, successful collective bargaining negotiations between the Carbide & Carbon Chemicals Corp. and the UCW resulted in a new 18-month contract effective December 10, 1947, the date of expiration of the previous contract. A vote of the local union membership authorizing the union officers to call a strike in the event negotiations were unsuccessful was taken the day after

demands were presented to the contractor, but in view of agreement and the signing of a new contract 7 days later no strike resulted.

The Commission is working closely with the Joint Committee on Atomic Energy in considering how best to assure that work stoppages will not occur at AEC installations.

Regulation of special materials and facilities

In November the Commission issued a regulation governing the export of facilities and equipment for the production of fissionable materials. In preparing for this action, the Commission solicited the advice of the manufacturers of the equipment to be controlled in a series of industry meetings and invited a representative group to sit with the Commission's staff as an interim Equipment Advisory Board transmitting the industry's views on regulation and related matters. The Commission made it clear that in the administration of the regulation it will be the policy to interfere as little as possible in the conduct of normal business activities and, so far as is practical, to design licenses to fit the normal business requirements of the licensee.

The new regulation strengthened existing controls on the export of equipment adapted for use in atomic energy research and production work. Other controls, including the use of the powers of the Department of Commerce under the Export Control Act of 1940, continued. The regulation provided effective control over the export of two specific classes of equipment:

Class I includes any facility capable of producing any fissionable material; e. g., nuclear reactors, cyclotrons, or other particle accelerators.

Class II includes component parts or equipment suitable for service as component parts of a class I facility; e. g., radiation detection equipment, mass spectrometers and component parts, high vacuum equipment.

Other equipment may be added to this list from time to time as the need arises.

Under the new regulation a specific license issued by the Commission is required of persons intending to manufacture or produce for export any facilities for the production of fissionable material, to transfer or acquire such facilities for export, and to export such facilities from the United States. Also incorporated in the regulation is a general license issued for manufacture, production, transfer, and acquisition of such equipment within the United States.

Administration of the Commission's earlier regulation, issued in May 1947 for the control of source materials, has been assisted by the wholehearted cooperation of industry. All essential industrial uses of uranium and thorium are being provided for.

Services

Engineering plans were completed for new telephone facilities between the five Offices of Directed Operations and the Washington office to meet increased needs of speedy communication and to effect savings in staff time devoted to coordination of the whole program. A new crypto-teletype system was installed between Washington and field installations to provide the highest obtainable degree of security for the automatic encoding and decoding of messages. Radio facilities were also installed for emergency communication with aircraft in the vicinity of the Commission's restricted areas and with guard and patrol motor vehicles.

United States Atomic Energy Commission, Principal Staff and Managers of Offices of Directed Operations

General Manager	Carroll L. Wilson.
Assistant General Manager	Fletcher C. Waller.
Assistant to the General Manager	John A. Derry.
Special Assistant to the General Manager	Richard O. Niehoff.
Secretary to the Commission	Roy B. Snapp.
General Counsel	Adrian Fisher.
Associate General Counsel	Joseph Volpe, Jr.
Managers of Offices of Directed Operations:	
Chicago, Ill	A. Tammaro.
Hanford, Wash	Carleton Shugg.
New York, N. Y	W. E. Kelley.
Oak Ridge, Tenn	John C. Franklin.
Santa Fe (Los Alamos), N. Mex	Carroll L. Tyler.
Director, Division of Research	James B. Fisk.
Director, Division of Production	Walter J. Williams.
Director, Division of Engineering	Roger S. Warner, Jr.
Director, Division of Military Application	Brig. Gen. James McCormack, Jr.
Director, Division of Biology and Medicine	Dr. Shields Warren.
Director, Division of Raw Materials	John K. Gustafson.
Director, Office of Administrative Operations	Malcolm E. Pitts.
Director, Office of Budgets	Paul W. Ager.
Director, Office of Comptroller	Paul M. Green.
Director, Office of Organization and Personnel.	Donald E. Bostock, Acting.
Director, Public and Technical Information Service.	Morse Salisbury.
Director, Office of Security and Intelligence	Rear Adm. John E. Gingrich, USN.

APPENDIX 2

MEMBERSHIP OF COMMITTEES—STATUTORY COMMITTEES

Joint Committee on Atomic Energy

Senator Bourke B. Hickenlooper (Iowa), chairman.
Representative W. Sterling Cole (New York), vice chairman.
Senator Arthur H. Vandenberg (Michigan).
Senator Eugene D. Millikin (Colorado).
Senator William F. Knowland (California).
Senator John W. Bricker (Ohio).
Senator Brien McMahon (Connecticut).
Senator Richard B. Russell (Georgia).
Senator Edwin C. Johnson (Colorado).
Senator Tom Connally (Texas)
Representative Charles H. Elston (Ohio).
Representative Carl Hinshaw (California).
Representative James E. Van Zandt (Pennsylvania).
Representative James T. Patterson (Connecticut).
Representative Lyndon A. Johnson (Texas).
Representative Carl T. Durham (North Carolina).
Representative Chet Holifield (California).
Representative Melvin Price (Illinois).

Military Liaison Committee

Lt. Gen. Lewis H. Brereton, United States Air Force, chairman.
Lt. Gen. Leslie R. Groves, United States Army.
Col. John H. Hinds, United States Army.
Rear Adm. Thorvald A. Solberg, United States Navy.
Rear Adm. Ralph A. Ofstie, United States Navy.
Rear Adm. William S. Parsons, United States Navy.

General Advisory Committee

Dr. J. Robert Oppenheimer, director of the Institute for Advanced Study, Princeton, N. J.; chairman.
Dr. James B. Conant, president of Harvard University.
Dr. Lee A. DuBridge, president of California Institute of Technology.
Dr. Enrico Fermi, professor of physics at the Institute for Nuclear Studies, University of Chicago.
Dr. I. I. Rabi, chairman of the department of physics, Columbia University.
Hartley Rowe, vice president and chief engineer of the United Fruit Co.
Dr. Glenn T. Seaborg, professor of chemistry at the University of California.
Dr. Cyril S. Smith, director of the Institute for the Study of Metals, University of Chicago.
Hood Worthington, E. I. du Pont de Nemours & Co., Inc.

PERMANENT ADVISORY BODIES APPOINTED BY THE COMMISSION

Advisory Committee on Biology and Medicine

Dr. Alan Gregg, director for medical sciences, Rockefeller Foundation; chairman.
Dr. G. W. Beadle, division of biology, California Institute of Technology.
Dr. Detlev W. Bronk, director of the Johnson Research Foundation, University of Pennsylvania.
Dr. Ernest W. Goodpasture, dean of the school of medicine and professor of pathology, Vanderbilt University.
Dr. Baird Hastings, professor of biochemistry, Harvard Medical School.
Dr. E. C. Stakman, chief, division of plant pathology and botany, University of Minnesota.
Dr. Joseph T. Wearn, dean of the school of medicine, Western Reserve University.

Advisory Committee for Exploration and Mining

Dr. Donald H. McLaughlin, president Homestake Mining Co., Lead, S. Dak.; chairman.
G. Temple Bridgman, consulting engineer, San Francisco, Calif.
Everette L. DeGolyer, petroleum geologist, DeGolyer & McNaughton, Dallas, Tex.
Dr. Anton Gray, geologist, Kennecott Copper Co., New York, N. Y.
Wilbur Judson, vice president and director, Texas Gulf Sulphur Co., New York, N. Y.
Robert E. McConnell, McConnell Foundation, New York, N. Y.
Fred Searls, Jr., president, Newmont Mining Corp., New York, N. Y.
Clyde Williams, director, Battelle Memorial Institute, Columbus, Ohio.

Advisory Committee on Isotope Distribution

Dr. G. Failla, of the Columbia University Medical School; chairman.
Dr. H. A. Barker, plant nutrition, University of California, Berkeley.
Dr. Henry Borsook, department of biochemistry, California Institute of Technology.
Dr. Robley D. Evans, Massachusetts Institute of Technology.
Dr. Hymer L. Friedell, Lakeside Hospital, Western Reserve University.
Dr. J. G. Hamilton, University of California.
Dr. Joseph W. Kennedy, Washington University (St. Louis).
Dr. Robert F. Mehl, Carnegie Institute of Technology.
Dr. Paul C. Aebersold, Chief, Isotopes Division, AEC, Oak Ridge.
Dr. Austin M. Brues, Argonne National Laboratory, AEC, Chicago.
Dr. A. H. Holland, Jr., medical adviser, AEC, Oak Ridge.
Dr. L. N. Nims, acting head of department of biology, Brookhaven National Laboratory, AEC, Patchogue, Long Island.

Patent Advisory Panel

William H. Davis, chairman of the Patent Survey Committee, United States Department of Commerce.

John A. Dienner, former president of the American Patent Law Association.
Hector M. Holmes, Boston, Mass.
Casper W. Ooms, until recently United States Commissioner of Patents.
H. Thomas Austern, Washington, D. C.

TEMPORARY ADVISORY BODIES APPOINTED BY THE COMMISSION

Advisory Board on Contractual Relationships (reported finally to the Commission in December 1947)

Dr. John R. Loofbourow, professor of biology of the Massachusetts Institute of Technology; chairman.
Dr. John W. Hinckley, director of the patent management division of the Research Corp., New York, N. Y.
Dr. Ronald H. Robnett, professor of business administration of the Massachusetts Institute of Technology.
Alfonso Tammaro, Atomic Energy Commission.

Industrial Advisory Group

James W. Parker, president and general manager, Detroit Edison Co., Detroit, Mich.
Oliver E. Buckley, president, Bell Telephone Laboratories, New York, N. Y.
Donald F. Carpenter, vice president, Remington Arms Co., Bridgeport, Conn.
Bruce K. Brown, vice president, Standard Oil Co. of Indiana, Chicago, Ill.
Gustav Egloff, director of research, Universal Oil Products Co., Chicago, Ill.
Paul D. Foote, executive vice president, Gulf Research & Development Co., Pittsburgh, Pa.
Gabriel O. Wessenauer, manager of power, Tennessee Valley Authority, Chattanooga, Tenn.
Robert E. Wilson, chairman of board, Standard Oil Co. of Indiana, Chicago, Ill.
Isaac Harter, executive vice president and director, the Babcock & Wilcox Tube Co., Barberton, Ohio.
Jerome C. Hunsaker, Chairman, National Advisory Committee for Aeronautics.

Medical Board of Review (reported to the Commission in July 1947)

Dr. Robert F. Loeb, Lambert professor of medicine, Columbia University; chairman.
Dr. Detlev W. Bronk, director, Johnson Research Foundation, University of Pennsylvania, and Chairman, National Research Council.
Dr. Wallace O. Fenn, professor of physiology, University of Rochester School of Medicine and Dentistry.
Dr. Herbert S. Gasser, director, Rockefeller Institute for Medical Research.

Dr. Ernest W. Goodpasture, dean of the school of medicine and professor of pathology, Vanderbilt University.
Dr. Alan Gregg, director for medical sciences, Rockefeller Foundation.
Dr. A. Baird Hastings, professor of biological chemistry, Harvard Medical School.

Safety and Industrial Health Advisory Board

Sidney J. Williams, assistant to the president, National Safety Council; chairman.
Horatio Bond, chief engineer, National Fire Protection Association.
Dr. Philip Drinker, Harvard School of Public Health.
Robert H. Albisser, safety director, Merck & Co., Inc., Rahway, N. J.
William F. Brown, Safety director, Consolidated Edison Co. of New York.
Bernard R. Caldwell, deputy chief of police, Los Angeles, Calif.
Dr. Abel Wolman, head, department of sanitary engineering, Johns Hopkins University.
Arthur E. Gorman, sanitary engineer, Office of the Housing Expediter, Washington, D. C.
Herbert M. Parker, assistant superintendent, medical department, General Electric Co., Hanford, Wash.
Dr. Hymer L. Friedell, director, department of radiology, University Hospitals of Cleveland, Ohio.
Richard Fondiller, president, Woodward & Fondiller, New York, N. Y.
Jack J. Smick, associate actuary, Woodward & Fondiller, New York, N. Y.

Committee on Scientific Personnel (reported to the Commission in October 1947)

Dr. F. W. Loomis, professor of physics at the University of Illinois, chairman.
M. P. Carpenter, executive manager of the Whiting Laboratories of the Standard Oil Co. of Indiana.
Dr. Farrington Daniels, chairman of the board of governors of the Argonne National Laboratory, AEC.
L. D. Geiger, Iowa area manager of the Atomic Energy Commission.
W. A. Hamor, associate director of the Mellon Institute.
W. B. Harrell, business manager of the University of Chicago.

APPENDIX 3

United States Atomic Energy Commission, National Laboratories

ARGONNE NATIONAL LABORATORY

Chicago, Ill.

Contractor operator: The University of Chicago. Participating institutions—members of the Council:

Battelle Memorial Institute
Carnegie Institute of Technology

April 30 1965

ARCHIBALD MacLEISH UPHILL FARM CONWAY, MASSACHUSETTS

Dear Janet:

Glory is no comfort, I know. Sometimes it only makes the grief harder to bear by throwing such a blaze of light around it. But this is a very particular kind of glory. What stands out is not the fame but the man — and how fine a man, how human a man. We are all enhanced in thinking of him — all proud to have known him — all the better for his being. Ada and I have been thinking of you day by day through this long, painful time, wishing we could somehow reach you with our affection. But nothing could have reached you there where you had to be alone. Now we can send you only our deep and enduring admiration. What a gift is a great wife: more greater. And he knew it.

Dear Janet — will you take our love, too, with all the others?

Archie

Archibald MacLeish

October 28, 1960

Dear Archie:

This is a belated note to say my thanks for your graciousness in offering to arrange what would have been a delightful weekend when the Yales play the Harvards. Janet, Casey, and I are all disappointed, but we shall be coming to Boston occasionally to see our young man and hope to get a glimpse of you.

As ever yours,

Mr. Archibald MacLeish
Uphill Farm
Conway, Massachusetts

New York City

19th
Leave for Quincy!

Dear Ed:

The Yale-Harvard Game is November 19th and the Master of Leverett House would be delighted to put you both up. The one question remaining is whether you are really serious about wanting to come. The plan, if you can arrange it, would be something like this: you would come up on Friday in time to dine with Ada and me at the Somerset Club and we would then make our way back to the Master's Lodgings where some of the lads in the house, together with some members of the faculty would drop in for a little casual talk - ladies included. In other words, you would not have to sing for your supper but merely meet a few pleasant people and talk a bit - which has never been a burden for you or for those who talk with you. Let me know how you feel about this so that I can proceed to put in for the necessary tickets. Would your son be coming in from Milton and would he like me to get him a ticket also and would he like to bring somebody along with him?

A.MACL:aj

Yours ever,

Archie

ARCHIBALD MacLEISH WIDENER W. HARVARD UNIVERSITY

January 16, 1952

Mr. Edward R. Murrow
485 Madison Avenue
New York 22, New York

Dear Ed:

Your letter of January 9 gave me the deepest possible pleasure. Thank you for wanting to write it - and then for doing it.

As for The Horse, it was presented by the B.B.C. on their Home Program day before yesterday. I have as yet no word of the production or the response, but I know they had put together a cast they were proud of.

For the life of me I can't understand the CBS reaction, for the play is certainly as good as The Fall of the City and I think a good deal better. I am afraid it means something not about my play but about the direction in which radio is going and that saddens me. I wish you were still in a position to influence such things, though I know what heartaches go with it. However, I can counterbalance all that by rejoicing, as so many other Americans do, that you are where you are.

Yours ever,

Archibald MacLeish

A MacL/mvs

MacLeish, Archibald

January 9, 1952

Dear Archie:

A new year is upon us and for some reason, I wish to send you my best salute and deepest personal affection. I wish also to say that I had a fleeting moment of almost wishing that I were back as an executive of this company in order that your horse might have had a fair run. When next you come down to this "stable", will you not give me an opportunity to buy you a lunch.

As ever yours,

Mr. Archibald MacLeish
Widner W.
Harvard University
Cambridge 38, Mass.

ARCHIBALD MACLEISH WIDENER W. HARVARD UNIVERSITY

October 15

Mr. M. See attached

23

Dear Ed:

Correction.

If my guess is right - that no one at CBS burns to ride my horse - could I trouble you to send it along to Harold Freedman, Hotel Volney, 23 East 74th St.? He has some ideas for it which sound very interesting to me. And if your secretary could drop me a line to say it has gone I'd be more than ever in your debt

yours as ever

Archie

Ed Murrow Esq.

Mr. Meighan's office had already sent it off to Mr. MacL.
DM

ARCHIBALD MACLEISH WIDENER W. HARVARD UNIVERSITY

October 10

Dear Ed:

I gather my HORSE is up in the pine lot somewhere. I don't want you to feel you have to keep sending the boys out after him. Unless somebody there wants to drive him badly - badly - there's no use harnessing him up at all.

You know the history of this business in my mind. Fifteen years ago I thought radio offered a superb stage for verse - for the verse play - because it liberates the imagination wholly and completely. I still think so but few people in radio have ever agreed. I not only still think so - I think also that radio might well wish, at the present moment, to exploit its few advantages over TV. But that's just one man's opinion. The point is that I don't want you to feel you have to push on this if there is no enthusiasm. And I gather there is none. If I'm right just send the lad back. I'll hope for better luck in England. And I'm deeply and as always in your debt.

affectionately

Archie

CBS RADIO

MacLeish, Archibald
(Not in Griffin Index)

A Division of Columbia Broadcasting System, Inc.

485 MADISON AVENUE, NEW YORK 22, NEW YORK · PLAZA 5-2000

Howard S. Meighan
President

October 9, 1951

Dear Mr. MacLeish:

Ed Murrow, on your behalf, asked us to consider your play "The Trojan Horse" for broadcasting over CBS.

My associates and I have read the play with great interest and pondered its use.

As I am sure you will appreciate, it is most difficult to appraise this most unusual radio project except in relative terms. And on this basis, we have somewhat regretfully concluded that it is not feasible for us to contemplate this sort of thing at this time.

We still remember with enormous pride, our association with "The Fall of the City." We appreciate most sincerely the opportunity of studying the script and I am genuinely sorry that our conclusion must be negative.

Sincerely yours,

Mr. Archibald MacLeish
Widner W

SEND THE HORSE TO ME MY FRIEND TWOULD PLEASURE ME GREATLY TO SEE THAT IT GETS CAREFUL AND IMMEDIATE ATTENTION. I AM SURE CONCURRENT BBC NEGOTIATIONS WOULD NOT BE EMBARRASSING. REGARDS AND LOVE TO YOU BOTH.

ED MURROW

ALD MACLEISH, UPHILL FARM CONWAY, MASSACHUSETTS

September 5,1951

Dear Ed:

The troubling with having friends is that they keep bothering you. Forgive me. I know this letter shouldn't go to you but its you I think of when I think of CBS..

I have finished a new verse play for radio called The Trojan Horse - a play about the classic situation but with long shadows which fall forward into our time.

I don't know whether CBS is still interested in that kind of thing and I don't want to send it down unless it could go to someone who would be.

And I have a further question. BBC has expressed a lively sight-unseen interest which may or may not materialize. If CBS <u>might</u> be interested would it matter whether or not I were also in negotiation with BBC?

Ada and I listen to you on this hill top with admiration and something more - a kind of desperate relief after the rest of the voices. You and Elmer and then ..... well where are you? Its a terrifying thought if you judge the health of the Republic by those cynical or cowardly or evil words.

yours as ever

Archie

New York, New York

Costello.

January 15, 1959

Dear Brother Bill:

I am not sure I can be of much help to you on the Dewey-Nixon business. My relations with Nixon are non-existent, and, while Dewey and I are neighbours and friends, we have a sort of arms-length relationship when it comes to politics. I, too, have heard that Dewey has transferred his affections to Rockefeller, but I don't know this of my own knowledge. I do know that during the 1952 campaign, Dewey practically held Nixon's hand by the telephone during the crisis over his personal fund. I can also tell you, although I certainly would not want to be quoted on this, that, up to a few weeks before the election, Dewey did not think Rockefeller could win.

If I can ferret out anything in the course of next weekend or so, I will make you a signal.

I think the year-end show suffered from too much rehearsal, too much production and, in general, too little spontaneity. My love to your family.

As ever yours,

ERM:skh

Mr. William Costello

William Costello

Counsellor on International Affairs

Cable: Coscounsel

Investment Building, Washington 5, D. C., STerling 3-7079

January 12, 1959

Dear Brother Ed:

As you are aware (from the call to you by Viking Press), I am working on something about Nixon that could be called either a long profile or a short book. It's a hell of a thing to try to do along with broadcasting, but I'm sweating it out.

One of the best-kept secrets about him is his relationship with Tom Dewey. I have heard reports that the two have met with some degree of regularity ever since 1952. Other reports say Dewey is now ready to transfer his political affections to his less controversial boy in Albany. At the same time, Joe Martin publicly accuses Nixon and Dewey of having pulled the intrigue against his leadership.

I know you have no time to write anything about your knowledge of this labyrinth, but I'd be most grateful if you could dictate a short memo, covering the Nixon-Dewey relationship (if any), and any anecdotes from your own experience. Failing that, I'll try to cometo New YOrk this spring for a talkfest, about that and other things.

Incidentally, I am grateful too for your fortitude in lying so valiantly on my behalf to Viking.

cheerio.....Bill

By the way, I thought you looked less whipped than in other years on the year-end show -- the which, by the way, suffers for want of a new format.

Sending this to your apartment because even personal mail to your office seems to get lost.

Moley, Raymond

May 11, 1956

Dear Raymond Moley:

My real concern was whether you really felt on the basis of knowledge that the piece on the Vice Presidency was distorted or inaccurate. I am venturing to send you the printed text where you will note the only reference to Mr. Nixon is an altogether favorable quotation from President Eisenhower.

My letter was prompted more out of respect than anger, and I certainly agree with you that no useful purpose is served by fellow laborers in this not always fruitful vineyard engaging in public debate or controversy.

Thanks again for writing as you did.

Sincerely yours,

Mr. Raymond Moley
152 West 42 Street

April 30, 1956

Dear Mr. Murrow:

Some years ago in what, as I remember, was a broadcast, you stated as fact an incorrect account of my official relations with Secretary Hull and my resignation from the government in 1933. That incorrect account had been vigorously exploited by my enemies at the time and was injurious to me and embarrassing to my friends. I wrote to you a correct account of the record.

In return you wrote that you regretted the account you had given and that you would take occasion to correct your interpretation of that bit of history. I was very happy to have your letter and wrote in my book of memory at the time that you had done the fair thing with a fellow laborer in the thorny field of public comment. Whether a correction was made did not particularly concern me then or now. I was glad to take the will for the deed.

Since on that occasion you clearly manifested a spirit of fairness, I hasten to reply in kind to your letter of the 28th.

What I said concerning your broadcast on the Vice Presidency was not in the text of the written speech which I made on that occasion. It was ad libbed, in the course of a political speech before a political group.

While the account given by your colleague is not verbatim correct, I did use the word "lied," and I regret it. It was not the expression commonly used to describe what I contended at the time was a selection of facts which failed to give a balanced picture of the Vice Presidency. I should have been more careful in my characterization of the general tenor of the broadcast. It was also out of my own character to mention libel.

I very sincerely regret my choice of words, which, I may add, were selected in a meeting in which feelings ran pretty high.

I am inclined to believe as a practical matter that, considering the limited circulation of my remarks concerning your broadcast, which were not reported in any of the published accounts of the speech, to bring the matter now to a much wider audience would not be helpful. However, in some way I shall presently take occasion publicly to amend any impression that my choice of words on that occasion might create.

I shall be happy to have your reaction to this suggestion.

Very sincerely,

Mr. Edward R. Murrow

April 25, 1956

Dear Mr. Moley:

A colleague of mine in Los Angeles quotes you as having said recently on a public occasion: "More recently the anti-Nixon campaign has taken another slant. It began with a grievous and reprehensible distortion of history in a program on the Vice Presidency by Ed Murrow. If Murrow wants to sue me for libel, he can. Murrow lied. You would have thought that the Vice President is a good for nothing, or a drunkard. It was an attempt to destroy Dick Nixon." I am wondering whether the above quotation is accurate.

I am wondering, too, whether you would care to look at the script or the film; because if you would, I will be very glad to provide you with either or both. If you can find a single mistake in fact in that program, I will be both willing and eager to make a public retraction; if you can't, maybe you would consider similar action.

Normally, critical comment is expected and, indeed, welcome. I don't mind being called a liar, but it would be helpful to know wherein I lied. Would you care to enlighten me, or am I to conclude that your view is that I am merely a liar by instinct, and that you will not confer upon me the sacrament of proof.

Sincerely yours,

Mr. Raymond Moley

LOS ANGELES BUREAU

April 19, 1956

Dear Mr. Murrow,

The vagaries of the business took me yesterday noon to a rightwing festival in honor of Raymond Moley. His claim to authority because of his past errors reminds me of the ex-Communists who write and lecture for money. They brag of having been completely wrong a few years ago, but use that very fact in claiming they are completely right today.

That's beside the point, of course, I blame it on gas pains lingering on from the luncheon. I don't know whether you follow the comments of people like Moley - Newsweek but he threw the high hard one at you and I took notes.

Speaking of the Vice President, he said: "More recently the anti-Nixon campaign has taken another slant. It began with a grievous and reprehensible distortion of history in a program on the Vice Presidency by Ed Murrow. If Murrow wants to sue me for libel, he can. Murrow lied. You would have thought that the Vice President is a good for nothing, or a drunkard. It was an attempt to destroy Dick Nixon."

As I said, I don't know whether you care, but more than a thousand people heard those remarks and the newspapers today carried them in part.

With great admiration,

Bill Stout

3-C-27 (not included in the Griffin Index) Nixon, R.

NIXON

The New York Times - September 6, 1955 - By Russell Baker (9/5/55)

Denver: Then, the Vice President gave this interpretation of what he suggested had been Senator Joseph R. McCarthy's fatal error.

There was, he said, a political adage to the effect that "you must not strike a king unless you kill him."

"Politically," he said, "you could say you must not strike a leader unless you destroy him. I think that our political history shows that when you have a great issue and an individual decides to take on the top man, if he wins out on the issue he gains in popularity, but when you make a frontal assault on somebody bigger, you'd better be sure you win. If you lose, you're through."

3-C-27

September 18, 1952

IN THE MIDST OF THE CAMPAIGN CAME WHAT NIXON LATER DESCRIBED AS THE MOST SCARRING PERSONAL CRISIS OF HIS LIFE. IT BEGAN WITH A HEADLINE, "SECRET NIXON FUND", IN THE NEW YORK POST.

This is the story, so far as we have it, of what may come to be called "The Affair Nixon". Today a Los Angeles tax attorney, Dana C. Smith, confirmed that he was a member of a group of Californians that had provided more than sixteen thousand dollars /THE LATER CORRECTED FIGURE WAS EIGHTEEN THOUSAND DOLLARS/ in the last two years toward defraying the expenses of Senator Richard M. Nixon, the Republican candidate for Vice President. Smith said this money was not provided for Nixon's personal use; it was to help the senator pay for such things as Christmas cards, telephone calls, stamps, travel and radio recordings. Attorney Smith said the fund was to help Nixon do a "selling job in behalf of private enterprise," was designed to keep him free from the pressure of special interests and that no one who contributed to the fund had ever asked for personal favors. Mr. Smith said the money wasn't paid directly to Nixon. He, Smith, just paid some of Nixon's bills and, in a few "minor instances", reimbursed the senator for a few things he had to pay in Washington.

When first informed of this disclosure Senator Nixon declined to comment. Later, he said the money was used to handle postage, travel expenses, the cost of printing speeches and documents, and to enable him to hire extra clerical help. He said the money was used to take care of political expenses "which I believe should not be charged to the Federal Government." And he said, "As an alternative I might have

used free government transportation, or might have put my wife on the federal payroll, as did the Democratic nominee for Vice President." Nixon also said he hadn't been accepting law fees on the side while sitting as a member of Congress.

The chairman of the Democratic National Committee, Stephen A. Mitchell, called upon General Eisenhower to demand the resignation of Senator Nixon because he had accepted this money from the California group. Mitchell said Eisenhower should demand that Nixon get out, or Eisenhower should admit the statement that he would rather not be elected President than to be elected by the help of those who have lost their sense of public morals is just plain campaign hogwash. Mitchell said, "By no standard of public morals, or of private morals, can such conduct be condoned or explained away."

The original story of the Nixon subsidy was broken by The New York Post. Confirmation and explanation have now been offered by the tax attorney who handled the fund and by Senator Nixon. A senator's salary is twelve thousand, five hundred dollars a year, plus a yearly tax-free expense account of two thousand, five hundred dollars. The essential facts in this situation are not in dispute. The public and private morals and ethics are.

The Murrow invasion - and capture - of Israel

D-Day for the Murrow invasion of Israel was set for Monday 30th January; H-Hour was 22:00 hours when he stepped off the plane at Lydda Airport. Within fifteen minutes, he was on his way to Jerusalem and, after a clean-up at the King David Hotel, he was off to a midnight meeting with some of Israel's top officials to ask the kind of tough questions that would get him quickly to the core of the current Israel-Arab problem. At 2:30 a.m. he was deposited at the door of his hotel, and five and a half hours later, he was standing in front of two cameras with U.N. Truce Chief of Staff General Burns, on the bleak, sun-less strip of no-man's land between Israel and Jordan, just beyond the Mandelbaum Gate, a familiar mike in his hand, uttering the opening line of his next "See It Now" television programme "This is Ed Murrow, talking to you from a no-man's land in the Middle East"....

That's how it began - and that's how it went on for the next ten days, a thorough coverage at breakneck speed of the life and mood, the fears and hopes of the people of Israel. The result will form half of the ninety minute show which CBS will present at 8:30 p.m. on March 13th, an unprecedented length for a television documentary. The other forty-five minutes will be devoted to Egypt. Howard K. Smith, CBS Bureau Chief in Europe, headed the team that covered the Egyptian side.

"An essay in transportation" is how Ed Murrow put the purpose of his programme, designed to point up for American viewers the current pattern of Israel-Egyptian tension. "I'd like to use cameras and microphoes to show intelligent Americans what they would see for themselves given the opportunity of this trip to the Middle East. And perhaps a little more, enabling them to meet some folk, both high and humble, they might not themselves have had a chance of seeing...."

But he was talking in understatement. For the real standard he set himself

was the capture of an intangible - how to transmit to the American public the delicate intricacy of the strands that make up the design for living of another people - for the simple truth, like life, is never simple; and how to get all the colours of the rainbow on his palette - for black and white are hardly the sole ingredients of the middle Eastern - or any other -picture. No one whom he met in Israel can be sure that he succeeded. But all are quite certain that no one has ever tried so hard, or taken such pains, to discover truth.

To be fair, Murrow's physical invasion of Israel was something of a walk-over. His name was not strange to Israeli ears. Not that the country enjoys - if that is the word -television as yet. But newsstands brim with American papers and periodicals, and much was therefore known of some of his more outstanding "See It Now" programmes, notably the Oppenheimer and Nehru interviews, and the documentaries on McCarthy, South Africa and Farm Surplus. And there are thousands of today's Israelis, who emigrated from Europe, who recall Ed Murrow's broadcasts from blitz-torn London during the war, with their familiar "This Is London...".

And so the welcome he got as he stepped from the plane was not the frigid, impersonal, diplomatic reception accorded to the general run of V.I.P's but the warm greeting of a people who admire competence and honesty.

His technical team, serving as a kind of advance landing party, had hit the Israel beach-head five days earlier and managed to land equipment. Marty Barnett and Leo Rossi each headed a film unit, aided by Dave Blumgart, Larry Gianneschi and Robert Clemens. Marty operated a Wall single system camera and Leo an Akely. Cameras and sound and lighting equipment weighed one ton.

The more important sequences and all the major interviews were filmed with both cameras, so as not to disturb the interview by stopping to reload. And both teams shot a ratio of nearly twenty to one to ensure perfection. For the forty-five minute Israel part of the programme, the teams filmed 80,000 feet - nearly

fifteen hours of screening time. Neither Hollywood nor newsreel nor any other television programme reaches so high a ratio of shooting. It is costly but it gives results.

The seventh member of the party reached Israel two days before Murrow. This was Fred Friendly, burly co-editor of the "See It Now" programme, who bustled through the next forty-eight hours on a personal reconaissance of people and places to devise, as Chief of Operations, a feasible plan for his General. It is true to say that Israel isn't quite the same after Fred's visit. With his departure, Israelis aver that Israel is the most peaceful place in the world.

First hint of the Friendly touch came with his plan of a skirmish before the arrival of the Chief - an attack on Israel's parliament, called the Knesset, since there was unlikely to be an opportunity of tackling this body during Murrow's crowded schedule. Fred remained unbothered by the fact that no comprehensive film coverage had ever been made of the Knesset in session. On the contrary, this served as a sharpened spur. And while frantic Government officials were despatched to placate the Speaker, trucks rolled up with cameras, sound and lighting equipment. These were installed shortly before the session opened, with disturbance only to two opposition members who entered the Chamber to find their seats occupied by Leo Rossi's Akley. Fears harboured during the filming operation that this may well mean the end of parliamentary democracy in Israel proved groundless. Question time passed off without a hitch, discussion flowed smoothly, and members emerged from the ordeal with sufficient strength to celebrate, that very evening, the Knesset's seventh birthday. By this time, Fred was on his way to the airport to meet Ed. Janet Murrow followed shortly after.

Ed's interview with General Burns at 8 o'clock next morning took place in no-man's land exactly mid-way between Jordan-held Old Jerusalem and Israel-held New Jerusalem. Rain which had greeted Fred's arrival stopped when Ed reached

town, and kept off throughout his entire stay. The cameras were in position when Ed and the General reached Mandelbaum Gate - Leo and Marty had started setting up at 6 a.m.. Mandelbaum Gate, the frontier post on Israel's side of Jerusalem, is an adventure in semantics. It has been so widely mentioned in the world press that popular imagination conceives it as something at least as majestic as Berlin;s Brandenburg Tor. It is in fact a tumble-down ruin, shattered by Arab Legion twenty-five pounders during Israel's War of Independence. It belonged, before hostilities, to a Dr. Mandelbaum.

With cameras whirring while Ed talked to the General, Arab Legionaires popped their heads out of one building while Israeli soldiers watched from another. Marty's camera did a pan shot which took in the guards from both sides - surely the first time that rival troops, in their own positions, have been captured in the same shot.

Next assignment was the campus of the new Hebrew University that is being built at the western outskirts of the city. The original buildings of the University are on Mount Scopus. This is in Israel hands. But access to it lies through Jordan held territory, and this is denied to students. They study at present in improvised lecture rooms, but a new University is now being constructed in a beautiful valley near the western entrance to the city. It is characteristic of the Murrow technique that coverage of this cultural institution was achieved not through the President or one of the professors but by interviewing one of the building workers on the site. He was a Russian immigrant who had fled from Moscow shortly after the revolution. Today he is one of Israel's aristocrats - a man who works with his hands. He speaks with pride of the numerous buildings of Israel he has helped to construct. He spoke not only of the architectural grandeur of the new edifice but of the spirit of this centre of learning. "Here is the new physics laboratory, and here the department of history. The buildings are used as fast as eanh is completed. You can't go in

there - that's the new botanical hall, and there's a lecture on at the moment. Finished only last week, it's now in full working use, from 8 in the morning to 8 at night." Ed got a glimpse before he left of a model of what the completed university will look like in five years time. He promised to come back and see it on the ground.....

Next stop was the south. A border settlement near the Gaza strip. Word had come through that rain had turned the fields there into hip-high mud, and rubber boots were desirable. And so the convoy, two trucks and three cars, parked outside Jerusalem's most elegant shoe-store while one by one the teams filed in, and emerged looking like sons of the soil.

"Go South" say the words of a popular Israeli song, and south went Murrow, leaving the winding Wadi Sureik where Samson courted Delilah, and heading for the barren desert lands of the Negev. But land that was barren five years ago was now green with barley and clover, fruit of Israel's giant irrigation plan to bring water from the abundant north to nourish the arid south.

At the northernmost point of the Gaza strip, an Israel Defence Forces escort awaited the Murrow party to take them to the border settlement. For the track then leaves the tarmacadamed road and runs parallel, and close to, the border, and while Murrow sought no protection, the Israel Government was taking no chances. Men and vehicles have been mined and shop up on this very track with grim frequency during the last two years.

Half an hour later the teams arrived at Nahal Oz, without incident. Nahal Oz is the Hebrew for Stream of Strength. It is an agricultural cooperative farm, called a Kibbutz, in which an entire community own and work the land in common, putting into the common pool their labour power and their idealism - and there's a good deal of that - and receiving from the community the satisfaction of their basic wants - food, clothing, shelter, group social living, and the right to serve. It is exactly five hundred yards from the Egyptian border, opposite the

Egyptian held town of Gaza. The frontier is a furrow. The kibbutz is surrounded by a barbed wire fence, ringed with floodlights that expose would-be infiltrators at night, and dotted with entrenched look-out positions and watchtowers which are manned day and night. The young Israeli farmers, men and women, move around with rifle slung automatically over their shoulder, followers of the biblical injunction in this land of the Bible "With one hand on the plough, the other on the sword."

It was to Nahal Oz that Ed Murrow came to capture the mood of life on the frontier. While the crews were busy transferring equipment from truck to tractor, to navigate the mud - the report had been no overstatement - Ed and Fred floundered towards the most forward look-out post, and just beyond the frontier espied the Egyptian positions facing them. They returned gingerly to the settlement as dusk fell and the lights came on. Waiting for them was Uri - a twenty-year old Israeli born golden-haired farmer. Like most of his fellow members of the kibbutz, Uri had been born and brought up in urban surroudings - his father is a successful merchant in Tel-Aviv - who had responded to the call of pioneering and come south to farm and defend the frontier. His English was not polished but understandable. Ed decided to interview him on camera. But he was on duty that night, on guard in one of the watchtowers. "Very well," said Ed, "we'll interview you at your post - if you won't mind." And that's where the interview took place.

Setting up the equipment was not so easy. Powerful lights were needed for this night exterior. The only electricity available was that run off the kibbutz generator, and it wasn't certain whether it would carry the required load. At one point Fred was murmuring about cutting off the kibbutz lights for the duration of the interview, but the combined skills of Dave Blumgart and Larry Gianneschi and the kibbutz electrician succeeded in extracting enough power to illumine both Ed and Uri without plunging the rest of the community in darkness.

Ploughing through mud, they ran a cable several hundred yards from the nearest point to the tower, adding lamp to lamp while Leo Rossi, (looking incidentally like Harry Truman), stood poised on the tower, checking his light meter, eyes screwed like some modern Diogenes in myopic search for truth, exclaiming at intervals "more light, more light."

Cameras and lamps in position, Ed, trailing his microphone, scrambled up the rickety stairs to the platform of the tower where Uri stood on guard. Another watchman took over duty while Uri answered Ed's questions - ranging from life in the kibbutz to what Uri thinks about when he keeps watch on the frontier. The interview lasted an hour. After five minutes, despite the lights and the lenses, it was clear that Uri had forgotten that he was on camera, and without self-consciousness, with frankness and freedom, chatted to the American commentator. At times, this fresh, happy-faced twenty-year-old Jewish farmer sounded like an ancient monk talking to a novice, as he tried to explain why he and his fellow members had spurned the cafes, movies and lights of the city to come and farm in this lonely and dangerous outpost. This is what gave them a basic sense of satisfaction - reviving an ancient but neglected land and defending it against attack. This is what enabled him to stare back, unflinching, at what he saw in his shaving mirror each morning. Not that there was melodrama in the way he spoke. Only in the implications in what he said. He was as free from emotional overtones as an All-American on the practice field. "What do I think about when I'm on guard? I think "Why do I have to do this? I'd much rather be in bed. And I'm sure that the Egyptian on guard on the other side of the frontier feels the same. I wish we could talk it over together. But so long as there's political tension, and so long as we're attacked, someone's got to guard the frontier, and I and my young friends feel that those 'someones' ought to be us. That's why we're here."

It was long past midnight when the party left to sleep what remained of the

night at a new bungalow hotel near the Mediterranean at Ashkalon, of the biblical "Tell it not in Gath, tell it not in the streets of Ashkalon, lest the daughters of the Phillistines rejoice...". But the party was back the next morning, to cover the daily living sequences in a border settlement, the armed tractor driver who has to be careful, when ploughing near the frontier, to turn inside and not across the line; the young men and women at work and at rest; the children playing near the concrete anti-sniping wall that shields their kindergarten; the bomb-proof shelters; the peaceful cattle oblivious of their proximity to danger....

At midday, Ed broke off with one of the camera units to cover a border patrol. Listening in to a pre-patrol briefing, Ed asked these Israeli soldiers where they had come from. Replies ranged from Iraq to Yugoslavia, Morocco to Rumania, Poland to Israel born. All of course spoke Hebrew. Vehicles got stuck in the mud and they dismounted, continuing their patrol on foot. Ed followed as they moved along the border and then had to leave. There was much to be covered. While Fred stayed with the team that was continuing the coverage of Nahal Oz, Ed proceeded northwards to Heletz, scene of Israel's cuccessful oil strike some months ago. He managed, in his disarming way, to elicit from the standard clam-like lips of the local oil experts, facts about current production and future prospects which are not normally divulged. He left impressed with Israel's future oil hopes.

Rendezvous point for the two teams that evening was Beersheba, capital of the Negev. The party had an hour in which to wash and eat and they were whisked off to a new rural farming village three quarters of an hour away, which had recently been settled by new immigrants from Kurdistan. They were being taught music and dancing. Their instructor was the young Israeli composer who had authored "Tzena, Tzena." In a wooden hut in the heart of the desert, the young boys and girls sang the new songs of Israel and the old songs of their old

country, and danced the folk dances of their new land.

It was a tired party that slept that night in the unseasonably frigid rooms of the Beersheba hotel.

And early next morning they were on the job, covering this desert town which had developed in seven years from a population of 300 to 23,000, with modern apartment houses, buildings, factories, a large hospital, schools and the largest cinema-cum-congress hall in the country. It was a Thursday morning, weekly market day for the surrounding Arab bedouin, who flocked to the city with their camels and donkeys to enjoy the finest sport in the Middle East -- bargaining. For sale were carpets and saddle bags, chicken and eggs, hand-woven fabrics and ornamented belts, silver-mounted daggers and Negev herbs - and even their camels if the price was right. Leo was lucky enough to get a shot of a couple of camel-mounted bedouin riding across a nearby crest with a large newly constructed flour mill in the background.

At midday the party left to cover the potash works at the Dead Sea. They took the new road, a remarkable piece of engineering, which winds and descends in gentle curves from 1200 feet above to 1200 feet below sea level. Here, at the southern end of the sultry lake, lies Sdom - of the illfated biblical Sodom and Gemorrah. It is marked today by a huge plant engaged in extracting potash from what is probably the richest treasure of salts in the world. For the Jordan flows into the Dead Sea and there is no outlet. Evaporation is so rapid in the heat that the salt content of what remains continually rises. No swimmer can drown in this inland sea, for it takes more than a single person's power to thrust his head under water. You just float. The surrounding terrain looks like moon country, rough, bleak mounds and crags, the colour of parchment, still and lifeless in the winter heat. But there is about it a rugged beauty and a grandeur made majestic by the background blue of the calm water. For some miles along the edge of the lake the cliffs are of pure salt. It is a tribute to Ed's

reputation of honesty that no one described a salt-block near the track at 'Lot's wife.' From a high platform of the plant, near the giant separators, overlooking the salt-pans in the sea, Ed did a general commentary on the modern extraction of potash, magnesium and other chemicals which are exported to earn precious foreign exchange for the young State.

That night, too, was spent in Beersheba, for next morning, Murrow was to interview Israel's Prime Minister, David Ben Gurion, in his desert pioneer settlement, Sde Boker, to which he had retreated two years ago and where he still likes to spend his weekends and free moments.

The two crews left at 6 a.m. and when Ed arrived, cameras were already set up outside the Prime Minister's three-room wooden hut. Nature was kind. The sun shone and the desert wind had not yet begun to howl. (It started five minutes after the interview ended). Ed was introduced to Ben Gurion, they chatted for a few moments just to get accustomed to each other, sat down, and within a minute, the cameras started rolling. Murrow makes it a point not to discuss or rehearse his questions before the interview. Everything is done "on camera." The result is spontaneity on the television screen. And the nature and manner of the questioning are such as to put the interviewee at ease. The Ben Gurion interview lasted an hour. Observers present who have listened in to numerous interviews with the Prime Minister affirm that never before has he offered so rich a fare of fact and philosophy. He spoke freely and with great candour about the problems that beset the State, what he is doing, what he proposes to do and what he feels others should do. He told Ed, on camera and very much on the record, that he was prepared to sit down with Nasser and any other Arab leader "tomorrow, any place, at any time, to discuss peace and negotiate a peace treaty." He burked no question, evaded no issue. He replied fully to everything he was asked. The result must surely be the most comprehensive film record to date of the feelings, thoughts and ideas of the Prime Minister of Israel.

The interview over, Ben Gurion returned to his hut, while Ed and Fred wandered round the settlement securing additional background shots. This completed, Ed thought he would just slip over to the hut to say a final goodbye to the Premier. He knocked. There was no reply. He knocked again. Again no reply. He then opened the door, and walked in. Opposite the outer door was the kitchen. It was open. Standing by the sink stood the Prime Minister of Israel, engaged in washing a plate beneath a thin trickle of water that flowed reluctantly from the faucet. They bade each other 'Shalom' - the Hebrew greeting that means "peace" - and Ed returned to the car. He told Fred what he had just seen. Someone nearby suggested filming the scene of Ben Gurion in the kitchen. "Not on your life" said Ed, "no-one would believe it. They'd think it had been staged."

The party headed northwards to spend the night in Tel Aviv, the teeming, lively city on the Mediterranean and the largest city in Israel. It was their first evening of relaxation, and they spent it at a party given by young members of the Chamber theatre, a bright and talented group, whose outstanding recent successes have been Shaw's St. Joan and Shakespeare's As You Like It. Highspots of the evening were Israeli folk songs and Negro spirituals sung by a trio to a guitar accompaniment, a puppet show, and some highly diverting theatrical caricatures by a brilliantly talented pantomimist, Shai Ofir. It was 2:30 a.m. when the party got to bed. And by eight, they were on the road to an Arab village near the Jordan border.

This was Tira, a few hundred yards from the frontier and opposite the Jordan held city of Qalqiliah. It lies about 25 miles northeast of Tel Aviv. The party was received by the Arab mayor, in flowing robes and head-dress, and the Arab superintendent of schools who served as interpreter. They were taken up a hill to inspect the new reservoir which the Government had built and which meant, for the first time, a faucet in every Arab kitchen. Someone observed

that this meant the passing of that centuries-old gracious sight - Arab women walking with slender grace from the well, a pitcher on their heads. But the women themselves who did the carrying were not at all reluctant to exchange the arduous romanticism for the boon of water on tap inside the house. The piping in of water to this village also meant green fields and abundant crops. Their standard of life had never been higher.

From coverage of water, Ed was taken to see the schools - including a high school built in the last couple of years. It was the first time the Arabs were receiving higher education. Some of the brighter pupils of this village have graduated to and are now students at the Hebrew University of Jerusalem and at the Haifa Technion - Israel's M.I.T.

The Mayor then proudly led the party to the new hospital which is in course of construction. And they then wandered round the village.

In his interview, Ed asked the mayor what conditions were like for the Arabs of Israel. The mayor replied that he could speak only for his village, and he had the highest praise for the way the Government had helped to raise living standards beyond anything they had enjoyed under the British mandate and beyond those of villages in the Arab lands. None had such high educational and health services, instruction in the use of modern agricultural techniques, water. "How about political freedom" asked Ed. "We have it," said the mayor. He had been elected by popular vote at the last election. "How many parties do you have in your village?" "Two" said the mayor. "What's the difference between them?" Here the mayor was somewhat nonplussed. He shrugged a shoulder, laughed, and then said that in fact there was little difference between the two. "In that case," said Ed, "whom do I vote for if I ever come back here and settle?" "Oh, me of course" beamed the mayor. He had one complaint against the Government. Araba living in the border area had to have a permit to move about the country. This was irksome, though he added that in the last two

years permits were given freely and for six months or yearly periods, rather than for each trip. He understood the reason as an anti-infiltration device, but still it was tiresome and he looked forward to the day when permits would be unnecessary.

The only casualty on this visit was Janet Murrow. While the units were busy filming, Janet wandered through the dirt-track alleyways of the village on her own. An Arab lady standing near the door of her house invited her in for tea. Janet was delighted at the chance of seeing how they live. In she went, through the courtyard and into a large room rich with rugs and tapestries. Tea was brought. Janet put the cup to her lips. She tasted a thick, syrup-sweet liquid, and was about to spit it out when she remembered youthful tales about Arab hospitality, and the importance of not offending by a refusal. With great stoicism, she drained the cup. It was a green looking Janet who joined up with the party an hour later....

From Tira the convoy headed north, to the Sea of Galilee (also known as Lake Kinnereth), through the Valley of Esdraelon and down to the Jordan plain. Ed wanted to interview the men who fish in this Lake and find out from them, rather than from the politicians, what they felt about the Israel punitive action against the Syrians some months ago. The party made for Ein Gev, also a kibbutz, on the eastern edge of the Lake, close to the Syrian border and two and a half miles south of the scene of the fighting. The sun was waning as the party arrived, but by a record - and back - breaking transfer of equipment from truck to jetty and the speediest possible setting up of cameras admittedly under the goaded barbs of Fred's tongue - Leo and Marty managed a glorious dusk shot of fishing vessels moving out into the sea.

Then came an example of Ed's and Fred's insistence on what they call "things being kosher." Nothing faked; nothing posed; nothing staged. Whatever is the normal activity - that is what the cameras must capture. Simulated

activity - even if the result on the screen is the same or better - is spurned.

Ed wanted to interview the fishermen while they were engaged in actual fishing. For a night shot, much light was needed. The easiest way to get this shot was to set up cameras on the jetty, run a power line from the settlement, and have the fishermen in their boats just a few yards away. In this way the cameras would be steady, the lights right, there would be no vibration from the engines to disturb the microphone, no need for intricate haulage of equipment, and the whole job could be wrapped up in an hour. It all seemed feasible, particularly as the shots would be close and none would know that it was being filmed near the jetty rather than in the open sea. There was only one thing wrong. It wasn't 'kosher.' "Do you ever fish near the jetty?" Ed asked the fishermen. "Never," they replied. "Where do you fish - where are you fishing tonight?" "About a mile and a half out, in the heart of the Lake." "Okay," said Ed, "that's where we'll do the interview."

Then Fred got busy, ably assisted by some of the bright Israel Government Press Office boys who had come along to help. They got a couple of Israel police launches to supply power for the lighting, camera crew, kibbutznicks and police hauled equipment from jetty to launch, and cameras were set up on either side of the bridge of one of the police boats from which the filming was to take place. Ed stepped into a light motor boat, used by the kibbutz for echo soundings, and the nautical party moved off into the night, extreme care being taken not to disturb the fish.

This is how they fish in the Sea of Galilee - probably the most noted ancient fishing spot in the world. The boat with the echo sounder does a reconaissance in the late afternoon to detect the fishing ground. The area is marked with buoys. At dusk, small vessels proceed to the grounds, equipped with large LUX lamps at their stern. On arrival they drop anchor and wait. The light from the lamps attract the fish. An hour and a half later, other

boats go out, drop nets around the area of light, and then haul in their catch. Sometimes they are lucky. Sometimes they draw a blank. The night the Murrow party went out, they were lucky to haul in four tons of fish. The interview took place while the catch was actually being brought in over the side.

As the party neared the fishermen, they were suddenly apprised of two problems. Fred told the captain of the launch that the cameras had to get to within ten feet of the fishing boats. But this endangered the nets, which would probably be torn by the propellers. And the engine had to be cut off, so as not to disturb the microphone. But this meant no control in case of drift. The problems were solved by the kibbutznick in charge of the light motor boat which was carrying Ed to the location. Fifty yards from the fishing ground, the launches cut their motors. They were tied to the light motor boat and brought gently in to the fishing area. Ed stepped in to one of the fishing vessels and began chatting to the men as they hauled the fish over the side, singing as they worked.

Fred barked orders to the cameramen, the soundmen, and the sundry kibbutznicks and police who were each holding a lamp to light up the men. The spotlights of the launches had proved unsatisfactory - they threw a powerful beam but the area of illumination was small. Improvised lighting had been hurriedly secured by removing the headlamps of every truck in the settlement and running them off the launch generators. Every spare man aboard held a lamp.

And then Fred gave the order for the cameras to roll. The sight was incredible. Ed standing immaculate in the fishing vessel as wet nets were hauled in at his feet, fish jumping and glistening in the bright light as they came over the side, a prevailing hush - even the fishermen stopped singing at the sound of Fred's roar "QUIET NOW" - and overhead, the star-studded sky covering the S a of Galilee as serene as it must have been two thousand years ago when other, more noted, fishermen cast their nets on this very spot. On

the prow of the police launch, having a whale of a time, legs dangling over the side, and flanked by Leo and Marty behind their cameras, sat Fred, like some biblical Bligh, running this amphibious show, and barking clipped orders to the cameramen as if they were marine gunners firing salvos. One youngster holding a lamp slipped on the wet deck in the middle of the shooting. He was saved only because Fred didn't know the Hebrew for "fifty lashes."

With the limitless possibilities for everything going wrong, it is amazing that everything went right. Technically, the sequences and the interviews were perfect. Again, there was an absence of self-consciousness as these young Jewish fishermen answered Ed's questions. "What do you think" asked Ed, "about the action against the Syrians for which your government was censured by the Security Council - the actinn which took place just off the Lake, a couple of miles over in that direction, I understand?" "Well," said one lad, "I'm not a politician, just a fisherman. This is our lake. No one disputes it. It's entirely in Israel territory. The Syrians put up positions on the lakeside and fire at us. You see how we fish. We go out in boats with lamps. The light attracts the fish. But it also attracts the Syrians. It isn't pleasant to sit out here in these boats, and have pot shots taken at us. Something has to be done. If members of the Security Council could be here and see what happens, I don't think we'd have been censured. I think they'd have had something to say to the Syrians. Incidentally, since the action, there's been no incident, and we've been able to fish without disturbance ever since."

The party left the fishermen singing songs from the Bible and songs of Israel pioneers, and returned to the jetty. As they landed they heard strains of Mozart coming from the settlement dining room. The crews broke their earlier record of transferring equipment and raced to set up cameras to capture for the screen the Saturday night concert in this border village.

It was being held in the dining room. Tables had been cleared, and room made near the kitchen for the celebrated Israel Quartet - Fenyvesz violin, his sister, viola; Thelma Yellin, cello; and Tal, piano - who played chamber works ranging from Mozart to Prokofieff, Beethoven to Dvorzak. The farmers and fishermen of this settlement, their wives and children, sat on bare forms in this stark room, entranced by music some of which had been composed for and first played in more courtly and ornate surroundings. But no eighteenth century ducal salon could have been more appreciative. And the audience was delighted when Fred requested some encores to shoot close-ups of the players. It was late when the party got to bed in the kibbutz guest rooms.

And they rose early next morning to make a precarious climb in a command car to the top of Sussita, the hill captured by the kibbutznicks from the Syrians during the War of Independence which the Arabs had used to pour shells on to the settlement. They descended to breakfast at the small rotunda-like open cafe at the lakeside, off grilled freshly caught catfish steaks. Ed, in biblical mood, chose instead grilled St. Peter's fish, the speciality of the Sea of Galilee.

Tragedy hit the party on their way to the next stop. At the kibbutz the previous evening, a bowlful of radishes had been put on the table. There was something special about them for the American visitors. They were the size of grenades, and they were delicious. It took three powerful men to remove Fred from the table so that the teams could get on with the shooting. Before retiring, Fred had been heard to murmur something about getting a supply of the radishes taken to the cars, to spice the journey. Halfway round the Lake, just as they were nearing the Mount of Beatitudes, Fred suddenly exclaimed, "where are the radishes?" A white faced Government press liaison officer had to confess that he thought Fred had been joking and apologised for this grave logistic snarl-up. Only Ed's persuasive insistence

prevented Fred from ordering the convoy to turn round and get back to the kibbutz. Radishes in Israel are now known as Friendly's Delight. Any connection with Sherwood is furiously denied.

Waiting for the party on a hill to the north of the Lake stood Bud Mollahan, an American agricultural expert who is in Israel under the U. S. technical assistance programme to teach Israel farmers new techniques. Ed interviewed him as they faced the Sea of Galilee. To their left was the Mount of Beatitudes, scene of the Sermon on the Mount. A little to the right was Migdal, birthplace of Mary Magdalene. Bud spoke of "Operation Cowboy," under which land unfit for cultivation was being reseeded for range farming, for the raising of beef cattle. As they spoke, Israel cowboys, one riding a short tough quarter horse which had been flown out from Texas a few months before, weaved in and out of the fine herd, for all the world as if they had been born in a corral rather than a European ghetto. "How do the Jews take to farming," Ed asked Bud. "Like a duck to water," said Bud. And he added in a rich and fluent drawl "it"s funny, the Jews have been away from the land for two thousand years. They've come here and started up again. And they make fine farmers. Look at what they've done in the desert down south." And he went on to describe farming in modern Israel and how eager these farmers have been to learn new methods which experts have come in to teach.

It was time to leave. Next appointment was with a jet-fighter squadron midway between the Jordan Valley and Haifa, taking in Nazareth on the way. The party was taken on a tour of this Arab Christian city, visiting the Church of the Annunciation, and the caves nearby where Mary is believed to have heard the news from the Angel Gabriel, where the family of Jesus lived, the stone table on the floor where they ate, the workbench of Joseph the Carpenter. A new modern church is now being built on the site of the Annunciation.

Four jet Meteors were just taking off when the party moved through the

gate of this Air Force base in northern Israel. Colonel Ezer Weismann, nephew of Israel's First President, and commander of the unit was waiting to greet Ed. He was one of the two officers on the field who had been trained by the RAF during the war. The rest were all Israel trained flyers. As they crossed one tarmac, Ed asked if it was long enough to take a Meteor. "Long enough to take a Sabre jet" was the Colonel's quick reply. This is a sore point with the Israelis. The Egyptians are now receiving big shipments of Russian MIG fighters. Israel has nothing to match them for speed. She has asked the USA for F 86s - which are by now too slow for the American Air Force but fast enough for Israel. So far the answer has been NO.

Not that the disappointment was discernible on Weizmann's face. It was as fresh and cherry as the text-book version of the face of a fighter ace. From his lips, when he talks to his men, comes a rapid fire of Hebrew interspersed with RAF witticisms. Ed interviewed him against a background of obsolete P 51s - the only planes Israel has received - on payment - from the United States.

When they shot a pilot entering a Meteor, they noticed that his forearm had a tattooed number. It transpired that he had been a refugee in a Hitler concentration camp. "Which one," asked Ed. "Buchenwald" was the reply. Ed Murrow happens to have been the first American correspondent to enter Buchenwald on the day of its liberation. They had been in the same camp at the same time. But the robust young flier of today had then weighed 75 pounds. He had been in the hospital, suffering from frozen legs. The Germans inoculated most of the patients with a death needle - but hadn't managed to reach his cot before the death camp was liberated. Today, an experienced fighter pilot, he serves as flying instructor to young Israeli cadets.

Lunch time next day found the party out at an Israel army parachute base to cover a drop. Marty and Larry set up their camera inside one of the planes

near the despatcher to cover the jump while Leo and Dave and the rest of the party drove out to the dropping area. Marty was put out by the refusal to give him a parachute. He wanted to follow the boys after filming them. And Ed was only restrained from jumping by Fred's ingenuity in having him driven to the dropping area straight from Tel Aviv. While waiting for the planes to come over, Israel's Chief of Staff, Major-General Moshe Dayan arrived. The interview had been arranged there to save time. But as luck had it - Friendly luck it was called - the paratroopers came over in the middle of the interview, forming an appropriate back-drop to the sequence. Dayan, like Ben Gurion, was utterly frank. The Americans, he said, were making the British mistake of jettisoning friendly Israel and trying to buy Arab support. History had shown that Arab so called friendship was worthless. It was built on shifting sands. Despite all the aid the Arab States had received from America and Britain, Egypt had just done a deal with the Russians, opening her doors to vast shipments of arms - and to Russian influence. The obvious logic would be for America to supply defensive weapons to Israel, matching the Czech supply to Egypt tank for tank, plane for plane, gun for gun. Instead the American logic seems to be "The Egyptians are getting arms from the Soviets; they must therefore keep getting arms from us." Egypt, having learnt the virtue of diplomatic blackmail, gets arms and aid from both sides, making her strong enough to carry out her threat of attacking Israel, while Israel's arms position remains static. This is the certain road to war in the Middle East.

Dayan, who lost an eye while serving in the British forces during the Syrian campaign, is a farmer. He was born in a kibbutz and brought up in a cooperative small-holding village which his father founded. He has a fine war record and is proud of the fact that the Israel Army devotes as much time and energy to the education of the soldier as it does to his military training. "We seek," says he "to make the Israel soldier a public-spirted

citizen in time of peace and an effective fighter in time of war." He considers the army to be the greatest adult educational force in the country for the integration of the immigrants. He is certainly an unusual brass-hat. Asked what he'd most like to do, he says - and he means it: "Get out of the army and back to farming."

From paratroopers to protocol. It was getting late and Ed and Fred had a dinner date with Foreign Minister Moshe Sharret in Jerusalem. They made it just in time. Dress was informal, though the dinner party was large. Janet learned some new recipes from Zippora Sharett, notably the grated beetroot, banana and nut. Ed couldn't eat too much as he had an interview immediately after. And Fred was delightfully unprotocolish by jumping up between courses to find out how Leo and Marty were getting along with the setting up of cameras and lights in the Foreign Minister's study. It was, however, a pretty well-fed lot that moved in front of the lenses for the television interview. The cameras started rolling at 11 and went on to just past midnight. Again, the Murrow method of putting interviewee at ease worked - and paid off, in spontaneity of reply, frankness and candour. Sharett talked to Ed, in answer to crucial questions, as he would to a fellow member of the Cabinet. An evening both enjoyable and profitable in terms of footage.

Fred left for New York next morning, and Israel began to breathe again. Characteristically, Fred took one of the camera teams with him to the airport. He had heard that a plane was arriving that morning bringing immigrants from Cochin India, and he was determined to get it covered before catching his own plane. His luck held, and he managed to finish directing this sequence a few moments before his own plane was due to take off. By this time, all the airport officials, police and customs men were conditioned to carry out his slightest behest. So it was a small matter for him to be

whisked from the immigrant plane tarmac to his waiting plane, the door shut behind him and the pilot signalled to carry him off.

Ed had one more assignment before leaving: coverage of an immigrant ship due to arrive in Haifa next morning. Eight o'clock found him at the port, standing at the foot of the gangplank, microphone in hand, interviewing some of the 852 immigrants from North Africa as they came off the ship. Most of them were going straight from the ship to a farm settlement in the south. Greeting them was a youth orchestra from Haifa, playing folk songs of Israel. Nearby were relatives andffriends, come to welcome them. It was a joyous sight.

As the cameras stopped rolling, the teams were about to utter a silent prayer of thanksgiving on completion of what was a fascinating but most gruelling assignment. The crews said that they had worked at that kind of tempo for two or three days at a time, but never for so sustained a period. But Ed had read the paper that morning. And his eye had caught a small stop-press item. It appears that the previous afternoon, Syrian infiltrators had crossed the border in the north and stolen a flock of 312 sheep belonging to Kibbutz Dan. "Let's go there and find out what happened. Let's set up the cameras at the actual spot where it occurred and interview the shepherd." So that's where the convoy headed for - Kibbutz Dan ("From Dan to Beersheba"), in the northeastern corner of Israel, situated on a finger-tip of land with the Syrians on three sides. Three hours later, Ed and the shepherd were 'on camera,' exactly three hundred yards from the Syrian frontier, and Ed learned that roughly the same time on the previous day, the shepherd had stood there with his flock when three Syrian infiltrators, one of them armed, had come across the border. He himself had been unarmed - as nothing had happened in those parts for a year or more. And so he had rushed back to the kibbutz to summon help, for many shepherds had been killed in Israel

in the last few years. When they had returned, the sheep had gone. "Didn't you feel like going after them?" asked Ed. The shepherd smiled. "Of course we'd like to. But we know what happens. We chase them, cross the border in pursuit, and then the United Nations condems us for violating the frontier rather than the Syrians for crossing and rustling our sheep." "Will you get your sheep back?" "Who knows," replied the shepherd. "They stole a herd six months ago from another kibbutz. They've admitted that the cattle are in their hands. But we're still waiting.

The party said Goodbye to Kibbutz Dan - and practically goodbye to Israel, for Ed was on the plane next morning in an effort to make his Friday night "Person To Person" show. The two camera crews were left behind to complete the shooting of background sequences which did not require the presence of Murrow. They left on 21st February, and by 7:30 A.M. on the 22nd, Israel went back to work.

Postscript: Word came though three days after Ed left that the Syrians had returned 292 of Kibbutz Dan's sheep. Only 20 had been lost. This return, so speedily after the theft, is unprecedented. The general kibbutz theory is that it is due either to the Murrow broadcast on the subject, given the same evening, or to the setting up of the cameras, including a telelens, for the interview on the same spot. For the television operation was under Syrian observatinn from three sides. At all events, Murrow will long continue to be an honoured name in the annals of Kibbutz Dan.

EMBASSY OF ISRAEL
Accra, Ghana. 31 march 58

שגרירות ישראל

Dear Janet and Ed,

Since warmest is what everything is in West Africa, from what more appropriate place could I send my high-temperature regards and belated thanks for your beautiful New Year wishes? Tell me, Janet, where were you when you wrote? Was it really Paris? It was very sweet and thoughtful.

And let me confess, its the real reason why I'm here. The good reason is that I had one or two things to discuss with the Government boys. The real reason is that only by travelling can one catch up on letter writing.

I've been in Ghana three weeks already and shall be here until the 20th april. But if you think that you can come to darkest or even brightest Africa without coming across Ed Murrow, you've another think coming.

I'm sitting in an open air cinema in Accra surrounded by the top government brass and diplomatic corps for a special film show to wind up their Independence celebrations. Immediately in front sit the Governor General Lord Listowel (whom you probably met in London as one of the old labour lords) and Premier Kwame Nkrumah. We're being shown two films, one on Ghana and the other I'd forgotten. The Minister of Information makes a speech, the lights go down, the screen brightens and within a few moments I hear Ed's familiar voice. What was the film? Your feature on Louis Armstrong! Can you imagine what an unexpected thrill it was for me, and how fortunate there was no ceiling for me to hit? I loved it - and your interview piece with Armstrong seated on the stoop when he untangled the jazz vocabulary was a gem. And I was delighted that they chose this film with which to mark one of the celebrations of their first anniversary of independence.

The boys here told me that alas neither you nor Fred had managed to be here for the Ghana sequences. A pity, for you would love this place - for a few days at least (for truth to tell its damnably humid, and the only times I've been dry since my arrival have been when I'm under the shower!) The people, however, are gay and cheerful and very good-hearted, and Israelis are made very welcome. For we've several technical experts here whom they've requested to help them on such things as cooperative farming, water resources, cooperative banking transport and marketing. We've a chap coming out next week to set up a Nautical College. Our largest building contractors, the agency of the Histadruth, has just concluded an agreement here to establish a Ghanian contracting company, with majority Ghanaian holdings, to carry out the major building projects in the country. And they're still very pleased with us for having done what no other country was prepared to do - help them set up a Ghanaian shipping line - the Black Star Line - with 60% Ghanaian and 40% Israel holdings, the first ships to carry an all-African crew with a few Israel officers until we can train Ghanaian officers.

The fact is, as some of their Ministers put it, that Israel technical aid to Ghana is given an added dimension because we ourselves, only yesterday, were faced with similar problems, and had to tackle them not always with limitless resources and huge capital equipment but by the use of little ingenuity and adaptability. And we seek nought in return except friendship - an international commodity in short supply for Israel. Our experts here work as they do in Israel - with an even greater missionary zeal because they want to show that what we have done can be done in Ghana.

So far we have, I think, done well by Ghana in international affairs, as Ghana has done well by us in her development field. She has resisted so far Arab attempts to throw us overboard, maintaining that as a free and independent nation, she alone will determine with whom to be friends. She wants to be friends with us and with the Arab States of the Middle East, and she would like to be the means of bringing us together. But I think Ghana underrates the persuasive power and tactics of Nasser. He may be coming to the Accra conference of the 8 independent African States which opens here on the 15 April. He has accepted, and has so far not cancelled. But it is my hunch that at the last moment he won't be able to get away - particularly if he has to go to Moscow, as this morning's papers suggest. But if he should come, I'm not at all happy about the outcome of his efforts to wean Nkrumah away from the Ghana-Israel relationship.

Now I don't know whether you have any strong anti-Nkrumah views, as we've never discussed him. But I'm wondering, if you have'nt, whether a single word from you may not have a very helpful effect. Nkrumah is visiting the U.S. some time in July at the invitation of Eisenhower. You may perhaps be meeting him at one or other of the official functions. If, when you meet him, you could slip in a smart congratulation on his courage and wisdom in maintaining such a close and friendly relationship with Israel, it would be very helpful indeed. For an endorsement by you who have your finger on the international pulse would give his policy an objective validity of weight and prestige which would encourage him to continue. It may be, of course, that you have thought of interviewing him on television. I cannot know whether he is sufficiently newsworthy for you. But if you should decide that he is, could you perhaps, with a straight face, enable us to extract a virtue from your decision by suggesting to him that the interview was recommended by me, or by the Israel embassy in Accra or just by your Israel friends?

Ed, I'm sorry to sound so damnably Machiavellian, but I am most concerned that he should be strengthened in his anti-Nasser and pro-Israel line by the encouragement of such distinguished gennelmen as you. And as I say, a few obiter dicta uttered by you in passing can be most helpful.

Incidentally, if you should decide that an interview is feasible and you don't mind letting me know, I can fix it up with him here. I hope I don't need to add that personal kudos is not my consideration. Its the old Caaaaauuuuuuuuuuuse!

I've stolen too much of your time. This screed is long enough. I close with all my love to you both. Yours ever, Meir

(1). My regards are regards that old kinnert sea-horse, Captain Red.
(2). I was intrigued and elated by the Time magazine snippet about the Senator from New York. I hope, despite your why, that there are positive developments. N.P.

Pearlman, Moshe

February 5, 1958

Dear Moish:

Many thanks for your letter of January 12th. I have also heard from Ted Lurie.

I would like very much to be able to write the suggested article for the Jerusalem Post, but I am just so loaded down with radio and television program activities that it is completely impossible for me to squeeze out enough time to do justice to the subject. You must know how sorry I am to have to say this.

Janet joins me in sending warmest good wishes.

Sincerely yours,

Mr. Moshe Pearlman

Dear Ed Murrow -

The Jerusalem Post is planning to mark the tenth anniversary of the birth of Israel with a special supplement scheduled to appear this spring.

In this connection, we would like to ask you to contribute a short piece of 700 or 800 words on any subject you yourself choose connected with our first decade. It can be a vignette of your most vivid experience during your visit here, or a brief expose of your own views on the future pattern of Israel, or your own personal estimate of the significance of the establishment of this State, or any similar subject.

One of the things the State has not been able to do in these 10 years is to balance its foreign currency budget, and it will not be possible for us to pay you a fee in your currency. We would, however, be happy if you would accept as a token of our appreciation of your contribution to this special issue a two years' subscription to our weekend (Friday) issue.

We have fixed as our deadline for copy February 15, and would appreciate it if you would let us have by return mail your acceptance of our invitation.

With all good wishes for the New Year,

Yours sincerely,

Ted R. Lurie,
Editor.

Mr. Ed Murrow,
Columbia Broadcasting Company,

משרד ראש הממשלה
PRIME MINISTER'S OFFICE

Jerusalem

12th January 1958

Dear Ed,

I was chatting the other day with my friend Ted Lurie, Editor of the Jerusalem Post, and he told me of his plan to issue a special supplement this spring to mark Israel's 10th Anniversary. He was anxious to adorn this issue with a few contributions from distinguished writers who had visited Israel. Can you blame me for allowing your name to escape my lips before Ted had even stopped speaking? I promised to accompany his official invitation with a note of my own, hoping that you could squeeze the production of a brief masterpiece into your crowded schedule. I speak, as you will quickly discern, both as a friend and as an eager reader.

Forgive this meagre vehicle for the transmission of my love to you and Janet, and my best wishes for the New Year. Know well that their terminal points are from heart to heart.

Yours ever,

Moshe

September 16, 1957

Dear Moshe:

We certainly made every effort to arrange the schedule so that we could undertake the piece on the Army of Israel but for the time being we have simply got to hold it in suspension. We have not abandoned it and I am determined that one day we shall do it. You might be interested to know that the brass in the Pentagon are also keen that we should undertake it partly in the hope that it might give some added impetus to their own information and education program. I doubt that it would.

We are all well. Casey and I drove to the West Coast during July and did a bit of fishing on the way and really discovered a bit of our country. I am more eager than ever for him to see Israel.

I will make you a signal as soon as even tentative plans are possible. In the meantime if anything should develop that causes you to think that I ought to come out for a quick trip or for a long one, please shout on the telelhone.

You will be interested to know that my colleague, Jesse Zousmer, returned from his trip confessing that I had in no sense oversold him on Israel and the people who live there.

Janet joins me in sending warmest greetings to you and Teddy and anyone else who may remember us.

As ever yours,

Mr. Moshe Pearlman

25th ~~July~~ Aug. 1957
Jerusalem

Mr. Edward R. Murrow and Mr. Fred Friendly,
580 Park Avenue,
New York,
N.Y., U.S.A.

Dear Ed and Fred,

While Teddy was still in the United States, I had a note from Reuven Shiloah telling me of his conversation with Fred. And when Teddy returned, he told me of his meeting with you.

Both Teddy and Reuven told me of your suggestion of filmed reportage on the Army of Israel as an educational institution.

The suggestion is wonderful, and we here will offer whatever help is necessary. This assurance is, of course, quite superfluous, for you already know that the mere whisper of the magic words Ed and Fred, open doors in Israel. Not even the latest electronic device can match the effectiveness of such whispers.

I have had a word with General Dayan, and we can count on full Army co-operation.

I am most excited at the prospect of seeing you both here soon. Do let me know what the chances are.

All love to you both - and to Janet.

Yours ever,

Moshe

Pearlman, Moshe

January 25, 1957

Dear Moshe:

Belated thanks for your note of the 24th. Wish we might have a long talk about many matters.

I particularly longed to stop off when I flew near you on a quick trip to Burma and back at the end of December; purpose of said trip to do an interview with Chou En-lai. I got it, but it wasn't very good. I form the impression, which is no more than an impression, that there is a barrier of some sort operating in China. It certainly didn't seem to me that Chou is "his own man" or running the show.

Somehow I hope to see you again in the late spring or summer.

As ever yours,

Mr. Moshe Pearlman

Dear Janet and Ed,

This note bears my love and kisses to you both and to Casey. With them go my very best wishes for the New Year, for your continued success, your idealism, your dedication to righteous causes, for your happiness and sense of inner contentment at life well spent and jobs well done.

Good luck to you.

As ever,

Moshe

Pearlman, Moish

May 17, 1956

Dear Moish:

A hasty note to say that I have seen most of the footage on Danny Kaye in Israel and some of it is really sensational. My guess right now would be that we will use more footage out of Israel than any other country he visited. This editorial decision, of course, has nothing whatever to do with the fact that Murrow and Friendly will be doing the editing. I was deeply distressed to hear about young Rothenberg.

Someway, somehow I have the feeling we shall meet again before too many months pass.

As ever yours,

Mr. Moish Pearlman

משרד ראש הממשלה
PRIME MINISTER'S OFFICE

Jerusalem, May 2, 1956

Dear Ed and Fred:

What a wonderful surprise I had the other day when your "I Can Hear It Now" albums arrived. I was, in a weak moment, putting in a reluctant appearance at the office when they came, since I have had, I fear, to bow to the Prime Minister's pressure to restore my nose to the grindstone. You gave me a magnificent excuse to grab the records, rush straight home and bung them on my record player. I confess unashamedly that I spent the whole afternoon playing and replaying. Hearing your voice once again, Ed, made me quite nostalgic. And the records themselves are a superb piece of radio documentary. Thank you, thank you, and thank you for your kind and charitable inscriptions. I was touched and delighted.

Danny Kaye left yesterday and so did your teams. They had a pretty tight and crowded schedule and I only hope they managed to shoot the kind of news that you wanted. You were both much missed.

As I say, I don't know how much successful footage the teams managed to capture, but Danny's visit as a visit was a tremendous success. He was wonderful with people and I think he was quite impressed by what he saw.

My respects and regards to you both. Please remember me with love to Janet.

Yours ever,

Moish

Moish Pearlman

P.S. This is a tragic P.S. which I feel you would not wish to have kept from you. Roi Rothenberg, 20 years old, member of Nahal Oz was murdered by the Egyptians the day before yesterday. I don't think you have a shot of him but you met him during the evening when you shot Uri at the watch tower. Do you remember, Ed, when you just finished filming, and you came down the rickety steps of the watch tower and we stood with a small group chatting away merrily? Roi Rothenberg was one of the boys with us at the time. It is very sad.

15 April 56

Dear Janet and Ed,

Its years since I saw you, months since I was warmed by Janet's kind letter, and weeks since I saw The Show. Please accept my belated thanks for the words, congratulations on the programme, and plea for forgiveness on my silence. You must surely know that the latter was prompted neither by indifference nor lack of regard. Indeed, had I written at all the moments when you filled my thoughts, you'd be doing nought but wade through my screeds. The fact is, as you must have guessed, that after the departure from this Land of the Major Prophet - I think he caught the morning plane from Lydda on 9 Feb - I returned to my cell to grapple once again with the tongue of the Minor Prophets. But I was'nt really the same chap after your visit. And when, a few weeks later, things here began to get a little hotter and the government resumed its pressure on me to forsake study and return to the grindstone, I succumbed. I am now almost back at the old stand, having wheedled the concession that I be relieved of administrative duties until the end of my sabbatical - which is July - and concern myself at the office only with policy for the moment. This enables me - in theory at least - to continue my preoccupations with the niceties of classical Hebrew style for part of the day. But in the last fortnight, what with border incidents and Dag Hammarskeld, I've scarcely opened my concordance.

I don't know how you felt in the days before 13 March but our hooks could'nt have been tenter. And then we counted the minutes before the arrival of the copy. And then we ran it, and for the next hour and a half I watched a most beautiful piece of reporting and documentary craftsmanship. To transmit the intangibles of one country - mood, atmosphere, thoughts, behaviour - to the people of another, is one of the more difficult things in this world. Ed, you succeeded in your programme more than anyone who has ever tried. You presented the issues of tension between the two countries, set in the context of what each is trying to do and what the people of each think and feel, with superb skill. In an hour and half, you taught millions what masses of news reports, feature articles and books have failed to transmit. I say these things with a touch of trepidation. For knowing that approbation from an interested party is the kiss of death to an objective reporter, I have always refrained from comment on the product of visiting writers. But I hope our friendship will prompt your forgiveness if I congratulate you on a brilliant job.

Living where I am and doing the job I do, I could, of course, have wished for a little more 'biassed objectivity'. That's not critisism but the natural expression of a partisan. Its quite clear that the moment you make it part of your purpose to take sides in obvious fashion, that's the moment when you cease to be the powerful influence and authority that you are. On detail, however, I offer one comment. I think that the Sharett interview was the least successful. (The rest were, I think, excellent). For there was too much wordage and circumlocution in his replies. He would, therefore, have improved much by heavier cutting. Two minutes clipped off him and four thirty second sequences inserted of children dancing and singing would not have disturbed the balance between the two countries but would have given a lighter rounding out of our picture.

(Now, Ed, take four minutes off to bash me over the head and say "Good Heavens, man - or any other expression you find appropriate - what do you think I did wading through thousands of thousands of feet in the cutting room if not wonder at every turn whether clipping another five seconds here or adding another five seconds there would'nt provide a truer picture? This is how we cut it, shedding blood with every stroke of the scissors. And now you come and tell me about 'four thirty seconds sequences'.") Okay, okay. Forgive again.

Can I achieve artistry in understatement by saying that I miss you both? It was wonderful to have seen you, to have spent time with you and to have found your friendship.

Yours ever,

Moish

Moish Pearlman.

Please send my love and congratulations to Fred Friendly.

Peden, Chic

March 17, 1959

Dear Chic:

You are a most thoughtful and generous and cherished colleague. Your letter is one of the few that I shall keep, for you are one of the few who understood that a great deal of love, ability and unprecedented teamwork went into SEE IT NOW.

I truly hope that our paths will cross in the course of the coming year, and that in the future we may again labor together in this not always fruitful vineyard.

As ever yours,

Mr. Chic Peden

ERM:jmi

Dear Ed:

Now that the hue and cry has become a dim ululation far beyond the kennels of Madison Avenue, may I speak up to say that I shall miss you keenly when I watch TV, or listen to radio. A year will be a long time awaiting your return; only lessened because of anticipation of the return of a much liked friend.

And while I scan thousands of feet of news film, I shall be thinking about you and your sabbatical. Being in the same age bracket, I envy you. Unfortunately, I aint in the same money category. But, vicariously, I shall enjoy thoughts when and if we hear of your whereabouts.

Only one thing is sure. As a guy with a few years up on you, news coverage-wise, I know that you are hooked, hooked as solid as a fireman, circus character, or gambler. Every headline will be a siren call to make the old pulse beat quicker for the action of whatever medium one pursues. And the ghosts of past great stories interlace your thoughts wherever you go.

That, Ed, was why I loved See It Now, so much. The trips I made for it offered opportunities to retrace places I had known when a very young man went forth to make the first sound films. Memories I couldn't share with anyone at the time. How could the others know what London, meant to me, the London of 1929, when Marcia, was born; and I as a very young bridegroom was priviledged to show my wife that city I love so much . . the friends there, the recollections of Lloyd George, G.B. Shaw, George the Vth, Alphonso . . all the figures we recorded for the first time. Berlin, and memories of a guy called Hitler, making a noise in Austria, youngsters manouvering gliders in anticipation of the future Luftwaffe. The Paris of Clemenceau. And Tokyo, where, in 1931, the Imperial Hotel, was a glamour spot

and a place to take a beautiful gal from some world tour ship, with promises to loook each other up if we ever got near Livermore, California. Even Shemya, where you kindly included me in a taped radio show with the CO, to recall my bomber days of early '43. And Tokyo, again, and thoughts of flying miles high with forty five hundred pound bombs in the belly of a B-29. Playing poker in a StratoOcruiser, enroute to Japan, where but a decade before I had flown unending hours in search of Jap subs, and wondered if I'd ever cover news again.

These are a few of the things SIN meant to me; and why I felt so dreadful when I was not asked to go along. But I understood. I was so damn anxious to give of those past experiences; but in the role of soundman, which I will always hold pride as an engineer, I couldn't very well speak up; and such is the odd-ball caste system of the trade, others were agin it.

It took a lot to pry loose until the Big Four Geneva Conference came along, and I was tapped to handle that in toto. It let me off the leash long enough to get in some good licks and rack up some pretty good stories.

Now I am an editor chasing other kids out, and sending a little bit of myself to each assignment, perhaps being a bit more critical when the film comes back and shots are missing or sloppy. I know why. And becoming impatient with red tape and fears and side-stepping of issues, or subordinating everything to money. It is like trying to order a fine dinner by first scanning the figures on the right; or passing up a delicious dish because someone doesn't like garlic.

Thanks, Ed, for setting a high and daring standard. The steps you and Fred made, are bench-marks future generations will be hard put to span. And I know that when you resume the parade, you will make bigger and harder prints.

If you ever feel like driving over Fairfield, way some time, just call Clearwater 9-3040, and we'll set out the decanter and branch water.

Some time soon Marcia, is getting married to a lad I like very much. He comes from tough Italian stock, and has risen as a splendid example to all these sickening punks who cry "under-priviledged". With nothing but heart he completed college and added studies at Georgetown. An ex-marine, and possessed of fine qualities, he is just what Marcia's New England blood needs. Yes, I am very proud of Wallace Angelo Capobianco. There will be no more male Pedens to carry on the name; but who cares.

And so, Ed, thanks for hundreds of delightful moments, and many fine personal thoughts. Enjoy every moment of your freedom. Your friends are legion.

Sincerely,

Chic Peden.

Peden, Chick

BENSON HOUSE
Fairfield, Connecticut

August 27, 1957.

Dear Ed:

The photograph was a delight; and I was made most happy by the thoughtful inscription and accompanying letter, a permanent reminder of an association with people and a project I keenly miss.

One of these days I hope you can visit with us at Benson House, to see a really historic old place still occupied by the same family blood lines since 1752. I'd like to show Casey, around it some day with its mementoes of Lafayete, Daniel Webster, Andrew Jackson, and all the loot its clipper ship masters brought home from their voyages.

Appreciatively,

Chic Peden

Peden, Chic

August 26, 1957

Dear Chic:

I am indeed honored and only wish I could have thought of a more appropriate inscription without getting too sentimental which is the way I feel about you and the early days of SEE IT NOW.

As ever yours,

Mr. Chic Peden

450 WEST 56TH STREET
NEW YORK 19, N. Y.

August I2, I957.

Edward R. Murrow,
CBS, 485 Madison Avenue,
New York City.

Dear Ed:

At long last, after five years of renovating, I have come to my particular room in the Peden menage.

This is by way of saying that there is an important space on the wall for a likeness of you; and I do hope you will honor me with a signed photograph. In all my news career I have never asked for these save from very few. Rather than a gallery of casuals, I far preferred mementoes which highlight certain episodes. Needless to say, the three years working on "See It Now", were happy ones with very nice people I have missed a great deal, and would have prolonged if possible.

The twelve pictures I had planned will be completed with yours. Each represents a "first", as yours would represent the pioneer effort of "SIN", in Korea. For instance: Sir Winston Churchill, very kindly recalled that I recorded his first film interview in I929; "Lt. Gen. Rosey O'Donnell" recalled that we hit Tokyo, together for the initial strike in I944, Mrs Roosevelt, has recalled our first filmed record when she graced New York's Executive Mansion.

I do hope you can see your way clear to grant this request, Ed. It will make a guy feel very happy.

Sincerely,

Vic Peden.

No Ans.

March I3, I956.

Dear Ed:

Thanks for the reply be it ever so gloomy. I aint downhearted; and I fully realize that your schedule is a pretty rough one for any extra-mural correspondence.

At least I feel that you will give me a "leg up" should any inter-office inquiry about me comes floating your way. Because I am going to work hard at gaining an interview with the right person if I have to write a new show and sell it to a sponsor.

My heart is in the newsreel end of the business; and I am not impressed at all with the whirly-gig way it is being handled by the networks. Something has got to give there pretty soon.

Just for the books, since I wrote you, I have been advised that the Washington, bureau of our firm received the HEADLINERS AWARD for I956, thanks to the technique and supervision of the Geneva Conference coverage I was priviledged to head up last summer.

Best personal wishes.

Sincerely,

Charlie Peden

Mr. Edward R. Murrow,

Peden, Chic

March 9, 1956

Dear Chic:

First of all, my apologies for taking so long to answer your cordial letter.

My present schedule of radio and television programs, together with the somewhat extensive traveling I am sometimes called upon to do, leave all too little time for my personal correspondence.

I have thought a considerable amount about your letter, but unfortunately have no suggestions as to whom you could consult here. As you know, we now operate our own business and it seems to be pretty fully organized at this time.

Sincerely,

Mr. Charles S. Peden
M-G-M Telenews

New York, New York

fc

November 21, 1955.

Dear Ed:

This is not an easy letter to write because I cherish your frienship too highly to impose, and have strong feelings about employee loyalty.

But, now, I am afraid I have had it so far as the motion picture industry's stand on TV, is concerned. It is unrealistic and vacillating. I love the newsreel business and want to see it brave and forward, not a timid thing governed by Hollywood wait-and-see policies. No news man worth his salt can do his best in such an atmosphere, especially when he notes the drive and awareness of the TV networks for better visual news.

I should like to discuss this in detail and confidence with some CBS news executive you might suggest - preferably one above the existing newsreel set-up for obvious reasons. There is still room for experienced liason and coverage between the actual news-gathering facilities and the field.

Since it is generally known in the trade, I do not feel it disloyal to mention that I recently surveyed and evaluated all competition here and abroad. Europe, is in a bit of a mess, as no doubt, your own man will report. There is more good equipment than personnel. Fox, by virtue of its long established bureaus (with which I had a lot to do in early days), has most of the top men, new and old. BBC ranks next. And NBC, has the edge here.

For instance, there are too few men of the calibre of Leo Rossi, and Charlie Mack, in TV organizations. This situation exists because established men were loathe to leave old connections; and those available stemmed from free-lance sources. These men know their tools, but in many cases they lack trained or instinctive news sense, and that necessary esprit-de-corps so important to optimum results. Many of the reporters and contact men are carry-overs from radio, documentary, or production film work, and are abysmally ignorant of the scope, not to mention limitations of much equipment. Easily achieved quality is sacrificed, and quite a bit of friction and petty jealousies develop. A guiding influence is indicated - someone with a technical feel of the equipment, editorial knowledge, and a working acquaintanceship with the men.

The first outfit to correct this obvious snafu is going to carry the baton to the fore and keep it there.

The attached article sums up some of my thoughts which have now been reinforced by a personal survey. Oddly enough, this rather critical piece was agreed to by my own firm, and hailed as gospel by almost everyone in the field, including free-lancers. It has been reprinted in many trade journals with warm editorial support. And I was able to prove my point when assigned to Geneva, to co-ordinate coverage for ours, and the John Daly TV Newsreel. With one carefully selected <u>news-concious</u> crew, which I was given carte-blanche to train and equip, we beat the pants off of all opposition, despite their four and five outfits and the best reportorial talent in Europe. In

addition, we secured eight exclusive pre and post conference interviews at Ten Dowing Street, the Quay D'Orsay, Bonn, and the only statement made by Nikita Kruschev.

I pulled out all stops and called upon decade old diplomatic contacts to set up our itinerary. But I will be the first to admit that my modus operandi stemmed from the things I learned under Fred Friendly, and a very happy association with "See It Now".

The kudos and subsequent bonus were adequate, Ed, but I would have gladly foregone these if there had been a follow-through to maintain the pace. We had it made! Only the Almighty, knows what logic persuaded the home office to rest on its laurels, and pass up our practically green-lighted visits to Moscow, the Vatican, and Chartwell.

I never want to know the bitter frustration and heartbreak I experiened at Orly, waiting to return, and being good-naturedly chided by Irving Levine, of NBC, who was at that moment enroute to Moscow, with equipment. A wonderful renaissance in attitude had died aborning, and something went out of me I fear can never be rekindled around here. All that remains are the honeyed phrases, publicity blurbs to clients, and the knowledge that our efforts garnered several nice accounts.

There are about ten more godd years left me to perform at top peak, Ed, and I am almost desperate in my desire to break away from a dismal landscape. Once before I thought the chance had arrived when I was assigned to "See It Now". For although I was limited to sound then, I felt that some day I would be able to put my other experience as a writer and co-ordinator to use. It was a live, daring project; and I had never worked with a nicer agregate of men - the Dick Hotellots, Alec Kendricks, Smiths and the "SIN" staff. It was a stimulating and prideful thing. And I know this exists at CBS.

I have attached a brief chronological history of my background. Just for the record, I have never been fired, and always went ahead with the kindest wishes from former employers.

This letter is unpardonably long, I know. I trust you will understand and wave a guy a hand.

Sincerely,

Chic Peden

REEL VETERAN SAYS:

GUTS, VISION CRYING NEEDS TO REJUVENATE NEWSREELS

by CHARLES S. PEDEN

CHARLES S. "CHIC" PEDEN is a newsreel sound man for News of the Day and has been since 1928. He is also a man with faith and a tremendous enthusiasm — faith in the medium in which he works and enthusiasm for the journalism of the screen which he believes is the greatest medium of communication devised by man. During his career he has seen the great days of the newsreel, roaming the world from Fiji fire-walkers to the first air raid over Tokyo, and he has seen and in fact worked in that offspring of the screen newsreel, television news coverage. Today he believes, as he always has, that the motion picture newsreel has a great place in the theatrical motion picture industry, that it by no means has to surrender to television. In The HERALD for March 31, 1951, Mr. Peden spoke vigorously on the theme, "if there must be a wedding of television and the film industry, let us be the one who picks the partner and runs the household. We wrote the book." Here, in an exciting and stimulating article, he enlarges on that theme, in the light of the experience of the past four years. The opinions, he says, are his own but "if it starts a fire I'll be happy."—*The Editor.*

I HAVE been a newsreel man in the field for more than 25 years. A career of which I am very proud; and a business I love. There was a time when people would stop us to ask about our adventures, and the inevitable question as to what left us with our greatest impression. And like my contemporaries I would name some big story or spectacular catastrophe such as the crash of the *Hindenburg*.

Nowadays, however, these same people only ask one question, "What happened to the newsreels?" I would be less than a good reporter if I answered other than that *rigor mortis* is setting in. It is the most bewildering and tragic thing I have seen in my whole newsreel career.

I refer to the amazing attitude of both the motion picture big brass and the exhibitors. They both raise their hands in horror if asked to return the theatre newsreel to its former great prestige and popularity by added subsidies and rental fees. Yet the former will devote hundreds of thousands of dollars to revive old tired plots or build up recalcitrant stars who have messed up things with their idiotic didoes; and the latter, paradoxically enough, recognize news and will spend fantastic amounts to rewire houses for giant screen, closed circuit TV shows of sporting events in the name of public service. Remember that last.

Those of us who make and love the newsreel know its value. The public once held it in high esteem and would embrace it quickly. Honest exhibitors know in their hearts that it was a great asset, an attraction people sought. And most important, we live in a news-conscious period as never before. Our editors know it, too. Who goofed?

Cites Television Stress On News Reporting

The thing becomes more incredible when it is obvious that the great television networks consider theeir newreel pictures important enough to spot programs all through the day. Famous commentators dress up the presentations. Competition is keen. And in one case, Edward R. Murrow's "See It Now" show has won every honor a news program can collect.

This writer knows a little about that. He was privileged to be on the staff of "See It Now" for three and a half years. Fred Friendly, the guiding genius and producer of the show, knew what he was doing when he came to the newsreels in the beginning for his film organization, equipment and personnel. Those of us behind the camera knew a great hope when he breezed in. Not for him the short cuts. No dubbing, clipped versions, etc. Despite much head-shaking, he demanded actual sound—if for no other effect than "presence"; he wanted to cover stories "back-of-beyond," and he was daring enough to bolster his beliefs with out-size cash before his idea had a sponsor. That is the sort of guts we operated under in the old days. No hill too steep. No sand too deep. Good reporters thrive in that atmosphere. He demanded the works and got it. His faith paid off.

Now any newsreel organization in the business could have done the same thing. The vision and know-how was there. The courage was lacking. Costs entered the picture at first. Yet, almost a score of rinky-dink, shoe-string TV producers will beg, borrow and steal to finance a pilot film of some chancy show because they have faith. The newsreel had everything else—worldwide organization, equipment, experience, and men willing to try anything.

Actually, with all due respect to Mr. Friendly, and the undeniable skill and personality value of Mr. Murrow, newsreels in the old days did the same thing when they frequently included certain feature stories in their makeup.

Mark Twain once observed that there is nothing so timid as a million dollars. This seems to be the case so far as backing newsreel production nowadays. A curious attitude that threatens to destroy a great property. Even now, one by one the top men behind the cameras, disillusioned and broken-hearted, are leaving decades-old connections to join the ranks of TV newsreel producers because they know that the magic spark, so necessary to good reporting, exists there—the competitive spirit and drive.

Before making a few suggestions, this writer wants to get one thing straight. He likes TV newsreels and accepts them. But he doesn't think theatre newsreels should even attempt to compete as they now do. The time element is too high a barrier; and it will grow bigger when pictures are transmitted via tape. The theatre newsreel's forte should be to elaborate on these news briefs people see at home. Build up the basic report so that TV audiences will know that when they go to a theatre they will see a detailed version done entertainingly.

Producing Newsreels For TV Networks

Only one good step has developed. The older companies are producing newsreel material for the TV networks. But it would seem this can have its disadvantages under the existing conditions. TV demands fast, brief and numerous subjects at the cost of quality sound and pictures. That is understandable and will improve in time. Unfortunately, in an effort to hit theatres quickly, this sort of coverage is slopping over into the original product. It seems wrong.

TV camermen are in very many cases newer men, accustomed to the silent hand camera techniques. It takes years to develop a good sound newsreel cameraman. The experienced ones should be allowed to work on their medium entirely. Let them develop better stories with some meat in them; as they can well do.

Never mind the man-on-street, off-the-curb-opinion type of coverage in theatrical newsreels. Show where that man comes from, what he is doing, who he is visiting. Who cares what politicians and so-called oracles, and others say about world affairs unless they can make solid statements? Let us see the thing in the works. A complete story of the Salk Vaccine from ring-tailed monkeys in Madagascar, to the injection is

(*Continued on opposite page*)

NEWSREEL NEED

(*Continued from opposite page*)

the sort of thing that theatre audiences could understand.

The old adage about the better mouse trap is still good. This should be the motto of the theatrical newsreel. Make it bigger, and better. Then exhibitors would be happy to present the newsreels in its former status as a feature of a well-balanced program. Pay for it, too.

Sure, this thing will cost money. What new and good thing doesn't at first? The men who make the newreels are dedicated to their work. All they ask is a little encouragement and backing from the top brass. They'll come up with a class product. These men who once roamed to the ends of the earth in search of material, now operate on a tether, a silver chain, almost inflexible financially, that makes assignment editors consult the tariff pages of timetables, rather than fast schedules. A hell of a note.

For these were the men of vision and daring who sent their boys with Byrd to the Antarctic, over the North Pole, into volcanoes, through swamps and impenetrable jungles, the boys who okayed chartered aircraft, boats, trains and even dogsleds to get a story. And almost without exception their men came back with epics. Stories that caught the public fancy and made exhibitors paste one-sheets outside their theatres.

Make the newsreel so good and big exhibitors will cry for it and wave fresh cash. They are seasoned showmen. They know a good thing when they see it. Return to the thousand-foot reel where a man can sink his teeth into a subject and tell a good yarn. Send those experienced men out again. Forget the inclination to let local men with so-so equipment take over assignments on big stories.

Bandung is a classical example. That distant meeting was no sweat for the old days. This time it was left to local men in most cases. Men who wouldn't dare poke a lens into some big wheel's face as old timers do. Here was one of the world's greatest international meetings, a hallmark of world affairs. What does anyone actually know about it? Mighty little from the films released. They were trivial by comparison with the past.

A Timidity That Is Turning to Rigor Mortis

This is the timidity that is turning into *rigor mortis*. A stifling, frustrating atmosphere. The public doesn't remember news that springs from restrictions—dull, factual news. It remembers color and spirit. Circulation was built on the daring things. Stanley's trek to Africa in search of Livingstone was the big story, not the final report. The way Floyd Gibbons covered a yarn was what caught people's imagination and made them look for more. When an atmosphere of daring pervades a news shop it rubs on the men and gets into the story. That devil-may-care, to-hell-with-the-expense-account coverage that makes the auditors cringe, but the public applaud, and the cash registers sing.

CHARLES S. (CHIC) PEDEN

Newsreels need a face-lifting and injection of new drive. They need fresh window dressing in the form of new techniques and a renewal of every trick in the bag — competition, not cooperation with each other. Individual treatment and coverage, not roto coverage. The sort of backing that makes a world personality welcome interviewers because he knows he is going to get a big deal. Integrity in news reporting depends on such things, not short cuts or haste.

Sure, this treatment would cost money. But think of the impact of occasional "premium" shots such as the Kentucky Derby, a national flower show, a regatta, a big football classic. Not in terms of cash, but prestige. TV does it when they sustain great shows, or present giveaway programs to hold a dialer's attention for one-half hour. The motion picture industry, with all of its fabulous assets and talents, can afford to do no less these days. The handwriting is bright and vivid on the face of millions of television tubes.

Finally, the newsreel business must begin to think in long range terms if it expects to attract new blood. The present atmosphere would scare away new talent. Electronics has only been scratched movie-wise; and may well solve all problems. Even put the industry on a happy, money-making basis.

Every big business from plastics to motor cars recognizes this policy of ear-marking certain sums for research and constant improvement to hold patrons and keep their trade marks before the world. Newsreels trail-blazed sound-on-film and were the best advertisement any motion picture producer ever had.

Here is what is on the horizon. Two years will see a practical and economical system of recording and transmittting motion pictures on magnetic tape.

The first newsreel company to adopt this system will become the unchallenged leader in both theatre and TV fields. A money-making outfit guaranteed to bring prestige to its sponsors.

Think of it? A newsreel, or newstape if you will, crew will cover a story on location, and transmit the sound and picture direct from source to key studios. There, the basic story will be re-recorded on a storage tape or processed immediately—just as directors and monitor men now do with live TV pickups. Experienced men will sit at master consoles and edit, add vault cut-ins, proper music, commentary (scripted from telephonic information at the news site), even include pre-taped titles. Then, in turn, the finished clip will be re-transmitted direct to theatres and TV stations for immediate release or storage tapes until specific spots allow for release.

Foresees Vast Interflow Of News Film Material

Ultimately, there will be a vast inter-flow of news picture material exchanged between network facilities, just as news copy is transmitted to newspapers via tele-printers. This is a whole new industry the great wire services may do well to investigate.

And it goes without saying that newsreels will have to adopt the newer sound recording techniques of tape and strip film just as production has done. The public isn't going to stand for the violent contrast between Hi-Fi sound on features, and standard recording.

Other new electronic gadgets will be used; just as some TV productions already are playing with the midget, wireless microphone. Its possibilities are many in news work. A newsreel contact man wearing one of these could pick up the direct orders of fire marshals or other leaders of rescue teams during catastrophies. Football coaches haranguing their teams; jockeys urging on their mounts. All the things spectators have not yet heard. Those "premium" touches that point up stories.

Some smart outfit will start the ball rolling one of these days. I hope it is mine. One good beginning would be to establish definite liaison between film producers and the electronic laboratories, so that both could know each others' problems and ideas.

Men with Purse Strings Hold Fate of Newsreel

Let's not get sand-bagged again, as we were 25 years ago because apathy and short-sightedness plugged ears when a synchronized disc transcription and a projector clarioned the end of an era.

Those of us who went everywhere and risked everything to build up newsreel prestige, willingly gave of all our talents and time to make a dream come true. Those who handle the purse strings, hold the ultimate fate of a great industry in their hands. We are ready, willing, and able. And are waiting for some daring guy to come along and slash the ropes. The whole newsreel business needs a renewal of faith and the same sort of vision and guts it asked of every man who ever covered a story.

Anyone for competition?

Peden, Chic

August 31, 1955

Dear Chic:

Your informative note of August 22 reached me in the country just as I was winding up my vacation. You were a very thoughtful guy to give me a glimpse behind the scenes at Geneva. Stop in and see us one day. We all miss you. I am taking the liberty of sharing your letter with Fred.

As ever yours,

Mr. Chic Peden
News of the Day

rh

August 22, 1955.

Dear Ed:

Trust this finds you enjoying a relaxing vacation. I am doing the same at Fairfield, after a rather strenuous go at Geneva.

Thereby hangs a tale, and the reason for this letter; but first may I congratulate you and yours on escaping harm in that plane affair. I just heard about it on my return.

Next, I am relaying a personal message to you from Lord Ismay, whom I interviewed in Paris. Somehow or other, his lordship sort of lumps all American film and TV units under one group, despite our careful announcement that we were covering for ABC. And along the same lines he naturally thinks of you as synonymous with any American outfits. He knew we were proceeding to Geneva, for the summit affair.

"Be sure to give Ed Murrow, my best," he observed. "My, I like that fellow . . had some wonderful moments with him." Then he mentioned something about Texas, and you that I didn't get. At the conclusion of our interview he repeated, "Now be sure to convey my greetings to Ed, and tell him he must stop by more often . . great chap."

That is the message I hoped to deliver to you at Geneva, having seen your name on the roster of those expected.

Well, t'was otherwise. I did, however, enjoy seeing Dick Hottelot and Alex Kendrick, though we were in opposing camps for a change. Our former association at Berlin, was and shall remain a pleasant thing.

This, however, was war. And I had to call upon all of my experience to prove a point - that one American film unit can outperform any European competition. We came away with eight exclusives, including the only interview with Kruschev; and I thought you might like to hear something about that for a chuckle.

When I received the assignment to co-ordinate and handle covergge, I decided to order a special midget power device for a very tiny sound camera we have. It had to be built in Dallas, and sent to me unseen, to Paris. I had in mind a possible invitation to Molotov's villa; and knew the Soviets would object to a large sound outfit.

Imagine my consternation when I regarded this power device, sent from Dallas to Paris. Never has anything so closely resembled an infernal machine. A riveted black box, about six by six inches, its designers had included a meter and a jewled binnacle light that glittered evily when the thing was operating. It also buzzed in a minor and mysterious key. There was no time to revamp it. We were off to Geneva, and the next day stood at the gate of the Molotov Villa. The guards frisked us, and for some perverse reason did not question the curious gear I had slung over my shoulder. But all other newsreel men were stopped because they had the larger outfits.

Walking up to the villa, I plugged into the hand-held sound camera, and then had to sort of approach the terrace in a lock step with my partner. The first bad moment came when I withdrew the slender pencil mike from my inside coat pocket. Its chrome-mesh end, not unlike the guard of a pistol silencer, caught the eye of a burly guard

standing beside Molotov. But just then I elected to snap on the Dallas, power device. "Here goes Buck Rogers and his ray gun," I thought. The buzz of the thing halted the approaching guard; but it was the evil, gleaming red light that really threw him for a loss. He backed away. Fortunately, M. Kruschev, not being able to see the gadget, grabbed the mike and started talking. I nudged his interpretor, who obliged with a running trahslation.

But for the rest of my days I shan't forget that buzzing gadget hanging from my shoulder, its meter needle wavering significantly, as though ready to hit a detonating peak, and the little red light glittering malevolently. Once away with our precious film, I spent the afternoon remving that meter and light, and burying the buzzing unit in folds of sponge rubber. We used it many times thereafter; but without our neck hairs rising.

And I have written that Texas electronics outfit to stop thinking up new refinements and sticking to specifications.

Just an episode I thought you might enjoy. Another, was a hundred mile an hour ride in a Mercedes-Benz 300, from the chancellory at Bonn, to catch an Idlewild-bound Lufthansa plane from Frankfurt, with our Adenauer piece. Hitler never went down the autobahn any faster. We left Bonn at seven-thirty, and wheeled up to the Lufthansa plane, due to depart at nine, with two minutes to spare!

My firm allowed me a four day respite in my beloved London, before returning. For like you, my first born opened her eyes in that wonderful city; and I have so many memories of those days. I looked in at Hallam Street; but no one was around - it being August Bank Holiday week-end. So I spent four wonderful, quiet days prowling about old haunts, and seeing old friends.

Best personal regards,

Nic Peder.

Peden, Chick

June 30, 1955

Dear Chick:

Belated but nonetheless heartfelt thanks for your note on the Cuero, Texas piece. Praise from a pro is high praise indeed, and we are all grateful and very much touched that you should take the time to tell us that you liked it.

Sincerely yours,

Mr. Chick Peden

May 4, 1955.

Dear Ed:

I cannot refrain from adding to your mail reading chore by loud huzzahs for the Cuero, Texas, story last night. This is "SIN" at its goddamdest best. The sort of thing anyone ever remotely associated with the news business can think about with deep pride and renewed hope in these days of malleable, journalistic integrity.

That piece should be a requirement of every school of journalism course in the land. The sight of that guy's face on hearing the news of his award (whether it was actual or staged) was epoch. And the coverage was eloquent. Would that I could chalk up something like that.

Best personal regards,

Chic Peden

Dear Ed:

Tharon and I are sailing April 10 for Japan where we plan to spend six months having a "look-see" at the economy of the country. It would be a very great help to me if you could give me a letter to your CBS fellow in Japan. I am sure he could help me greatly in understanding the country.

Our grass business is progressing famously. We are putting in more irrigation, buying more land and doing a lot of construction work, but this promises to be a very good year indeed for our new venture.

Tharon joins me in affectionate greetings to you, Janet and Casey.

Sincerely,

Milo

Dear Ed:

On the occasion of the 19th Congress of the Communist Party of the Soviet Union which convened in Moscow for ten-days in October, the London Economist and the London Times had several interesting articles and editorial comments on current Soviet policy. A series of articles in the Times (London) attempted to appraise Soviet military strength.

With the thought that our attention has been largely absorbed by the national election to the exclusion somewhat of foreign news, it seems worthwhile to note some of the recent developments in Soviet policy which are bound to affect us significantly. These articles discuss those developments from a point of view which is worth considering, although I doubt anyone's capacity to appraise Soviet intentions accurately.

I. Soviet Policy

The stage was set for the Communist Party Congress by the appearance of an important fifty-page article by Stalin in the leading party magazine, Bolshevik, in which he gave his interpretation of world events and enunciated the policy line for the Communist faithful to carry out. Both from the Stalin article and the proceedings of the Congress, it seems clear that the Soviet rulers have decided to place renewed emphasis on infiltration as their method of conquest, and to soft-pedal the use of force and violence. A shift in Soviet tactics in Western Europe has been taking place during the past year. Its meaning is now clarified by the official statements.

According to Stalin there is no great danger of war between the Socialist Camp and the Capitalist now; the danger of war is rather among the Capitalist powers struggling against each other for markets. Deprived of their markets in the Soviet Union, China and Eastern Europe, the Capitalist nations will be driven into desperate competition among themselves. Britain and France will be forced "to break out of the clutches of the United States and to clash with it." So too will Germany and Japan. Soviet policy therefore is to avoid world war, consolidate Communist gains, build up the economic strength of the Communist bloc, organize national feeling against the United States and destroy American influence wherever it appears, and exploit the differences among the Western Powers.

"To the parties abroad goes Stalin's new directive for the united front instead of revolutionary activity, with its implied rebuke to fractious militants in France and elsewhere". The two militant French Communist leaders who favored strikes and violence to achieve Communist aims in France have been dropped recently from their top posts in the French Communist Party. Until further notice the Communist movement is "to arouse the popular masses for the struggle to preserve peace and to

avert a new world war. Consequently it does not pursue the aim of overthrowing capitalism and establishing Socialism; it limits itself to the democratic aims of the struggle for the preservation of peace".

The Economist suggests that the Communists will find plenty of situations in Western Europe to exploit to their own advantage. Any relaxation in international tensions will make people question anew the need for arms programs and high taxation. Allied determination to match Soviet power by organizing the political, economic and moral strength of free Europe will be exposed in the months ahead to clever and continuous propaganda. To encourage a lull in rearming, to help create a situation in which the West will relax its defensive efforts while the Soviet bloc increases its economic power for a fresh challenge later, is the task of the Communist Party.

II. Soviet Military Strength

1. On the basis of the best available information, it is estimated that the Soviet armed forces now number at least 4,500,000 - with the Navy at upwards of 600,000, the Army at about 3,100,000, and the Air Force at about 800,000.

2. A comparison with the size of the armed forces of the United States and of Britain is made as follows:

"The British armed forces were reduced from a peak of 4,683,000 in June, 1945, to a post-war lowest level of 669,000 at March 31, 1950; this year the maximum authorised strength (which has not been attained) is 1,023,000. The armed forces of the United States totalled 14,404,000 at June 30, 1945. By the end of June, 1948, they reached their post-war lowest level of 1,443,000; and, after a temporary increase of some 170,000 in 1949, the total fell again to 1,458,000 at the time of the Communist attack in Korea. To-day they number 3,600,000; under the Universal Military Training and Service Act of 1951, which provides their man-power, they cannot exceed five million. British and American effectives to-day total about 4,500,000 together. The Soviet armed forces cannot number fewer than 4,500,000; the East European satellites account for another million; and both totals exclude the bulk of the frontier guards and security troops.

"In trained man-power Britain's reserves are increasing by something under 200,000 annually; and American reserves (when the remnant of the present man-power pool is exhausted) will increase by perhaps 500,000 annually. Soviet reserves are increasing by between 800,000 and 900,000 a year and satellite reserves by about half these numbers. At these rates of growth the Soviet and satellite armed forces will add more trained men to their reserves in two years than Britain and the United States will add in three; if the situation does not change otherwise, this disproportion will continue and, because of higher East European birth-rates in the past, it may even grow".

3. The present size of the Soviet armed forces, the tremendous Soviet output of weapons -- which the factory capacity exists to multiply on short notice -- indicate that the focus of the Soviet economy is on the production of arms and more arms. "The Soviet armed forces and the armament industries that supply them constitute the most formidable war machine the world has ever seen in times of nominal peace".

- - - - - - - - - - - - - - - - -

The London Times comments (October 4, 1952) that in the thirteen years between the previous Congress of the Communist Party and the October 1952 meetings, Soviet gains have been immense. "The Communist Camp which before the war consisted of the Soviet Union alone -- numbering then fewer than 200 million people, with adherents elsewhere having little more than a nuisance value -- now stretches from the Elbe to the borders of Burma and Indo-China and numbers 800 million people. Russia enforced her own kind of revolution in her own way in Eastern Europe, relying on the advancing shield of her armies, but the greatest gain of all came through the triumph of the largely independent Chinese revolution. This triumph changed the strategic and political map even more radically than the Russian revolution changed it in 1917. The two Communist Powers dispose of the greater part of the Eurasian land mass, with all the advantages of interior lines of communication and with vast material resources only at the beginning of development".

Calculations made outside of Russia suggest "that the country which began with little industrial production after the revolution (and had a good part of what it had in 1941 devastated by war) will by the end of the plan in 1955 be producing over 370 million tons of coal a year, about 45 million tons of crude steel, and nearly 70 million tons of crude petroleum".

The Western Powers abhor Stalin's methods but they "cannot lightly neglect the lesson of his basic plan of putting the building and expansion of basic industry first and foremost in the years of austerity".

(Summary above from: The Economist (London), September 27, October 11 and 18, 1952; The Times (London), October 4, 7, 8, 9, 16, 1952)

Sincerely,

Milo

SUMMARY OF MISCELLANEOUS NEWS ARTICLES

THE UNITED STATES

Survey of Current Business (U.S.Dept. of Commerce, May 1952).

LABOR INCOME IN THE POSTWAR PERIOD.

Compensation of employees is the largest component of the national income, forming about two-thirds of the total in the postwar years. It measures the income accruing to persons in an employee status as wages and salaries and supplementary labor income for their participation in current production.

Despite its sizable increase - from $117 billion to $178 billion - compensation of employees represented a virtually stable proportion of national income from 1946 to 1951. Except for 1948, when it dipped lower, in every postwar year it amounted to almost 65 percent of the national income total. This percentage also corresponds closely to the average proportion of national income constituted by employee income in years just preceding the war. Similar generalizations are applicable to the private sector of the economy, where compensation of employees accounted for three-fifths of private national income both in the postwar and immediate prewar years.

Wages and salaries averaged about 95 percent of employee compensation in the years 1946 - 1951, with the remainder consisting chiefly of employer contributions under government social insurance and private pension plans.

Private-industry wages and salaries moved up rapidly after the initial dislocations following the war's end. From an annual rate of $82 billion in the first quarter of 1946, they rose quarter by quarter to a rate of $118 billion at the end of 1948. In the mild recession of 1949, private payrolls were reduced slightly, but with the business upturn in early 1950 they recovered and in the second quarter of that year exceeded the high year-end 1948 totals. Following the invasion of Korea, payrolls and employment spurted sharply

into the first half of 1951, reaching a rate of $141 billion in the second quarter. Since then, the payroll total for private industry has been quite stable, as the expansionary effects of the rearmament program have been largely offset by curtailed consumer and business purchasing.

Advances in hourly earnings have been the most important factor in the postwar growth of private industry payrolls. The steady rise in hourly earnings - which encompasses the effects of wage-rate changes, shifts in the industrial composition of employment, upgrading, and other related factors - amounted to 45 percent from 1946 to 1951, and accounted by far for the major part of the total payroll change. Factors contributing to the expansion of hourly earnings have been a relatively tight labor supply and employee pressure to maintain real earnings in a period of rising prices. Except for 1949, the economy has absorbed the growth of the labor force, while the number of unemployed - averaging 4 percent of the civilian labor force, close to the minimum in a fluid economy - has represented no great problem on a national scale.

Wage rate patterns in the postwar years have been dominated by a series of settlements negotiated in the large mass-production industries and gradually extended throughout the economy. The first of these occurred early in 1946 as an effort to buttress earnings against the sharp curtailment in hours of work, particularly in manufacturing, after the end of the war. Pressure for further increases resulted from the sharp price advances following the lifting of price controls in the summer of 1946. The second-round increases, negotiated between mid-1946 and mid-1947, were of lesser proportions than the first.

A short-lived period of relative wage-rate stability then ensued as price rises slowed at the close of 1947. However, prices renewed their ascent in 1948 and negotiations took place which led to round three wage increases for a large number of industries. The mild recession of 1949 took the pressure off rising money wages, and in the new union-management contracts the main issues centered on the supplementary benefits of insurance and pensions.

The impact of Korea, with the spurt in demand and prices and the anticipation of wage controls, hastened the spread of wage increases in the latter part of 1950. Particularly noteworthy was the increasing acceptance by labor and management of the practice of tieing wage rates to the consumers' price index. With the enactment of wage-price controls in early 1951, this general principle was recognized by the Wage Stabilization Board, and wage rates in many industries drifted upward in 1951 to meet the increased cost of living.

The workweek in private industry which averaged 43 hours for all workers in 1946, drifted downward to 41 hours in 1951, when the decline was halted. Except for railroads and coal mining, where the workweek has declined since 1946 by 11 and 15 percent respectively, the hours reductions have been moderate. In durable goods manufacturing hours in 1951 averaged slightly higher than in 1946.

Increases in employees' average earnings among the major industry groups from 1946 to 1951 varied widely from 24 percent in agriculture, forestry and fisheries to almost twice that in contract construction. The largest advances were in contract construction, durable goods manufacturing, and mining, while those in the distributive sector of the economy and in nondurable goods manufacturing were about average. For the private industry sector as a whole the rise was 38 percent.

From 1946 to 1951 average full-time employment in all private industries increased from 38.2 million to 42.9 million, about one-eighth. There has been a significant shift in the industrial composition of workers over the past decade. Compared with 1940, larger proportions of private postwar workers have been engaged in manufacturing, contract construction, trade, communications, and public utilities, while proportionately fewer workers have been employed in agriculture, mining, finance and the service industries. Some of these changes are in keeping with long term trends, such as the declines in agriculture and mining and the increases in manufacturing and trade.

From 1946 to 1951 government wages and salaries - Federal, State and local - expanded from $20.6 billion to $29.1 billion. The total payroll of State and local governments has shown a steadily rising trend since 1946 reflecting increased employment necessitated by the large increase in school enrollment and the reinstatement of many public services severly curtailed during the war. The rise in the Federal payroll has been largely a product of post-Korean developments.

The 38-percent rise in average annual earnings of all full-time civilian employees, in government and in private industry, from 1946 to 1951 was somewhat in excess of the 33-percent rise in the consumers' price index over the same interval. In view of the 4-percent reduction in hours of work in this period, a rise of about 8 percent in the purchasing power of the average civilian worker's hourly earnings would be indicated. However, in many industries, employing one-fifth of all civilian wage and salary workers, the rise in employees' average annual earnings since 1946 has been less than 33 percent. In these industries workers' real wages, on the average, have suffered.

Supplements to wages and salaries in 1951, totaling $8.7 billion, were half again as large as in 1946, with all this growth occurring since 1948. They consist of employer contributions for social insurance and to private pension and welfare funds, compensation for injuries, directors' fees, pay of military reservists, etc. The growth in private supplements has been especially marked.

(This article spells out in detail many of the points mentioned briefly above and includes a number of pertinent charts and tables.)

EUROPE

The Times (London, June 3 and 4, 1952)

EAST EUROPEAN TRIALS

I. Threads in the Pattern of Communist Power and II. Motives of the War Against Heresy.

The new purge in Rumania focuses attention on Communist power in Eastern Europe. At regular intervals during the past three years the western world has read with astonishment of the disgrace of leading, seasoned Communists officials in the various satellite countries of Eastern Europe. The spectacle of the Communists liquidating their most exalted leaders, blackening their pure lights of Marxist orthodoxy, and reducing their revolutionary heroes to common spies, saboteurs and traitors, has been mystifying. As evidence of Titoist activities in these Soviet-dominated countries has accumulated, the assumption has been that the purges simply reflect a growing Russian awareness of potential nationalist deviations. But that is only part of the picture.

The duality of Russia's aim in Eastern Europe after the war was shown in her determination both to set afire and to control the flames of revolution, to incite the local Communists to gain power from below and then to impose from above the bureaucratic pattern of the present stage of the Russian revolution. Such an ambitious attempt to compress what is normally two consecutive revolutionary phases, inevitably required different human instruments to carry it out.

It was inevitable that after the first phase of seizing power from the social democratic and agrarian parties that Communists trained for decades to resist authority, steeped in rebellion and intrigue, should give place to more pliable Communists trained less in methods of revolution than in those of consolidation and bureaucracy. In a Communist country if a change of policy is required, the policy necessary to change must be represented as having been a heresy temporarily imposed by seditious elements working against the true interests of the regime. It is always the new policy that is the true Communist policy. Therefore, those with responsibility for the previous measures must be represented as deviationists or criminal wreckers. For them dismissal from office is plainly inadequate; they must also be punished.

In 1948 the second phase of Russian policy began with a marked speed-up of industrialization and collectivization in the Eastern European satellites and a general

tightening up of party membership. This new twist to the screw coincided with widespread charges of treason levelled against those who, on Moscow's orders, had carried out measures which represented a more gradual approach to the Communist millennium.

It is, then, the comprehensive nature of Russian aims in Eastern Europe, the attempt to compress two revolutionary phases which took some 30 years in Russia into less than a decade, which explains much of the rapid turnover of power in the satellite capitals. The fact is that purges are an essential thread in the pattern of Communist society.

In a Communist State the war against heresy is a normal and natural development. If authority is regarded as the protector of certain doctrines - to which messianic qualities are attributed - plainly its first duty is to cut out heresy even if in cutting out the canker much healthy tissue is removed as well.

To the Communist rulers, bent on preserving their personal power in order to serve the sacred doctrine, loyalty and disloyalty in the western sense of the words are two equally disagreeable faces of the same coin -- the inquiring mind. In a sense, the most reliable subordinates for the purposes of the Politburo, and the purge system will inevitably produce them, are people whose obedience is engaged less by conviction than by greed or fear. The kind of absolute obedience required, which can be switched from noble to base ends, is most reliable if it springs from those tangible motives which can be so easily manipulated in a police State. Loyalty based on conviction is useful in the sacrificial phase of revolution but afterwards conviction is always suspect. The truly convinced Communist is in the greatest danger for he is less flexible in his opinions, less able to change as the line changes, and therefore potentially dangerous.

Many of the purges have been motivated strictly by power considerations. However, the ideological background to the regime enables them to be carried out with methodical self-righteousness and a dedicated altruism, and to appear to the general run of Communists as a terrible necessity, rather than as the imposition of a tyrant's will. Each purge with its aftermath of bitterness among the victims' families, creates sufficient discontent to

justify another, until, like a drug, larger and larger doses are needed to keep the body politic alive.

Only by the most rigid control and a frequent turnover of power can Moscow hold the reins. The elimination of the revolutionary East European leaders earlier (Kostov, Gomulka, Rajk) and more recently the purges in Czechoslovakia and Rumania of the more pliable Moscow-trained Communist leaders (Slansky, Pauker) are the writing on the wall for all Communist officials in Eastern Europe and Russia alike.

THE MIDDLE EAST
SYRIA

The Times (London, May 30, 1952)

THE NEW REGIME IN SYRIA: DEMOCRACY THROUGH DICTATORSHIP

The present military regime in Syria has been in power for six months, dating from the coup d'etat of November 29, 1951. Parliament no longer meets, there is no cabinet and the ministries are headed by directors-general answerable to Colonel Selou as head of State.

Disorder in Syria has disappeared and crime has appreciably declined. Early steps were taken to improve the financial situation of the country. A system of progressive taxation was introduced which promises to ease the budget. Long disputed proposals of land reform were quickly made into law. In six months' time the Ministry of Agriculture will be in a position to begin its distribution of land to landless farmers.

Two large irrigation schemes have been drawn up, together with plans for hydro-electric installations, which aim at settling 25,000 families to find a new productive life on the land. The Government is negotiating with the International Bank of Reconstruction for a loan to cover the cost of these projects. It is also intended to expand, over five years, the port of Latakia to give it an unloading capacity of 800,000 tons a year, equal to that of Beirut.

The steps being taken are reminiscent of those taken by Kemal Ataturk after the Turkish Revolution. The ultimate aim in Syria, as it was in Turkey, is to reach democracy by dictation rather than by evolution. Before the successive coups the country had reached a state of political stagnation. There are now no rivals in Syria who could seriously challenge the program of the present Government. The Syrians themselves seem ready and willing to give the present regime a chance.

SUMMARY OF MISCELLANEOUS NEWS ARTICLES

THE UNITED STATES

Harvard Business Review (May-June, 1952)

THE MAN ON THE ASSEMBLY LINE by Charles R. Walker and Robert H. Guest.

Two years ago the authors undertook an exploratory survey of a modern automobile assembly plant for the purpose of defining more clearly the several "human equations" involved in assembly work and to search for answers to some of the practical problems posed for men and management.

In the present article they describe how an assembly line looks and feels to the men who work on it. The story is told by the men on the assembly line who themselves tell about their jobs and what they like and do not like about them. Over a period of months 180 workers were interviewed in their homes about all phases of their life on "the line". These workers constituted a substantial and representative sample of the total number of productive workers in the plant.

The men described exactly what they did and expressed their reactions to mechanical pacing, to repetitiveness, to the skills utilized and to the influence of assembly line workers on quality of product. On the basis of the comments made, the authors suggest certain measures management might explore in the interest of greater efficiency and of increased satisfaction for the individual operator.

The authors also comment briefly on the more basic problems involved in the impact of mass production on human nature through the character of work groups, the wage structure and the promotion system. They emphasize the workers' sense of anonymity within the production enterprise of which they were functional parts.

"It seems to us significant that the average worker appeared to be oppressed by this sense of anonymity <u>in spite of the fact that he declared himself well satisfied with his rate of pay and the security of his job</u>. The answer to this problem in the most general

terms would appear to be a program designed to re-create the sense and also the reality of a bona fide work community. And for such a program to be successful we believe that both union and management would have to agree on the measures to be taken. .....

"It is striking that throughout the survey of Plant X both union and management agreed with the authors that the more basic problems to be explored were not those connected with a particular plant, industry or corporation. Rather they were problems related to technological and organizational trends common to modern industry. Both agreed that modern American civilization as we know it rests upon mass-production principles quite as much as upon the natural resources of the United States. The attitude of both, therefore, was a simple and heartening one: Since these problems exist, let us get all the facts we can. In time we shall be able to solve them."

Business News Reports (U.S. Dept. of Commerce, May 9, 1952)

PERSONAL INCOME -

Personal income in March, at an annual rate of $258 billion, was virtually unchanged for the third consecutive month. The only changes registered were a decline in the income of proprietors and a largely offsetting gain in corporate dividend receipts.

Private industry payrolls, at an annual rate of $145 billion, were the same as in February, small gains in wage rates being compensated by reductions in employment. Payrolls in individual industries - manufacturing, contract construction, wholesale and retail trade and other major groups - were stable.

Government wages and salaries, Federal civilian and military, and State and local, were also unchanged in March, at an annual rate of $32 billion.

Nonfarm proprietors' income was half a billion dollars lower than in February as a result of some reduction in retail sales. Farm proprietors' income also declined in March due to the marketing of a smaller volume of farm products, together with lower livestock prices.

Personal receipts of corporate dividends in March rose about half a billion dollars to an annual rate of $9.7 billion.

Personal income in each month of the first quarter of 1952 was only one billion higher than the fourth quarter rate of $257 billion. While this stability in the income flow reflected the steadiness in employment and production totals, it also stemmed from several irregular factors which dampened the quarterly change. Fourth quarter wages and salaries included the payment of retroactive wages to Federal civilian workers. Fourth quarter dividends were raised as compared with the first quarter flow by extra, special and year-end disbursements. Deduction in the first quarter of initial payment of social security contributions by self-employed persons also served to reduce personal income in relation to the final quarter of last year.

Labor (Bureau of Labor Statistics, U.S. Dept. of Labor, May 20, 1952)

NATION'S FACTORIES REPORT 400,000 DECREASE IN PRODUCTION WORKERS OVER THE YEAR.

Production worker employment in manufacturing plants declined by about 410,000 over the past year, to 12.7 million in mid-April 1952. Additions to the workforce in defense-related industries were outweighed by reductions in consumer goods and building materials manufacturing.

The number of employees in nonfarm industries, at 46.2 million this April, was a quarter million higher than a year earlier. The gain, however, largely reflected the different timing of the Easter shopping season. Retail stores reported a pre-Easter addition of 170,000 workers between March and April.

Nonfarm employment rose by 280,000 between March and April, as a result of seasonal employment expansion in contract construction and service industries, as well as in retail trade. These gains more than offset seasonal employment declines in consumer soft goods manufacturing.

Over the year, production worker employment was reduced by 10 percent or more in

the lumber, textile, and jewelry, toys and miscellaneous manufacturing groups, and by from 5 to 7 percent in the furniture, paper, fabricated, metal, apparel, leather, and stone, clay and glass groups. Slackened demand for consumer goods and reduced expenditures for residential construction have resulted in higher inventories and curtailed production schedules in these industries. Taken together, these industries reported a net reduction of nearly a half million production workers between April 1951 and April 1952.

The only manufacturing industry groups reporting gains of over 2 percent in production worker employment over the year were transportation, equipment, machinery, instruments, and ordnance. These gains reflected expanded output of military goods and industrial equipment needed for the defense production program. However, the rate of employment expansion in defense-related industries has slowed down considerably in recent months. For example, production worker employment in aircraft plants has risen by an average of 5000 per month thus far this year, compared with an average monthly increase of about 13,000 between the Korean outbreak and the end of 1951.

In contrast to the decrease in production worker employment, the number of nonproduction workers in manufacturing industries rose by 210,000 over the year. In expanding defense-connected industries, nonproduction workers have been added to payrolls at a faster rate than production workers, reflecting greatly increased requirements for technical and administrative personnel. Also, industries where output has declined, overhead staffs - sales, office, technical, and supervisory employees - have generally been maintained, while the number of production workers has been reduced.

The number of workers employed in contract construction rose seasonally by 115,000 between March and April, and at 2.4 million was 50,000 below the record April 1951 level. Outlays for private residential and commercial building were below April 1951 rates, but military and industrial construction activity was up sharply over the year.

Unemployment at an estimated 1.6 million remained at a postwar low for the season.

EUROPE
UNITED KINGDOM

The Times (London, May 8, 1952)

AN ANGLO-AMERICAN EXCHANGE

On the occasion of the last full meeting of the Anglo-American Council on Productivity, the Times comments on the success of the Council's work. Leaders of the Federation of British Industries, the British Employers' Confederation and the Trades Union Congress worked in a cooperative spirit with American industrialists and trade unionists. The arrangements made were carried out with great enthusiasm by the 66 British teams which have visited the United States and by their American hosts.

Initially the criticism was made that it was unnecessary to send teams at great expense of time and money to study American industrial practice when the best British practice was as good as the American or better, and more directly applicable to British problems. However, the value and success of the Anglo-American Council must be judged by the extent to which it provided the spark necessary to catch the imagination and evoke joint contributions from management, technicians and workers on a national scale.

Some of the industrial teams which visited the United States made recommendations which were unrealistic or related to factors outside the control of their industries. Others suggested improvements which large firms had already adopted and small firms could not afford. In every instance, however, people drawn from all levels and all sections of each industry studied one another and one another's problems. From this exchange rather than from the study of American industry sprang the deeper interest in productivity and in efforts to improve it which is reported on all sides.

This does not mean that American practice included nothing which could be imitated here advantageously or adapted to British industrial needs. Rather it means that even on the technical side it is becoming clear that British genius is fully capable of devising the details of what is needed once the need is understood. For this reason, the individual

teams' reports on mechanisation, accounting, standardisation, and training have had a lesser effect than the reports of the specialist teams which studied the general principles of mechanical handling, management, accounting, simplification of products, and training, particularly of supervisors, in the United States.

The lesson of this very successful experiment seems to be that a psychological attack on inertia and resistance to innovation can produce better and quicker results in the practical field than concentration on the practical details themselves.

POLAND

The Economist (London, May 10, 1952)

THE CHURCH'S RESISTANCE IN POLAND.

The first copy of a pastoral letter distributed at Easter by the Roman Catholic Primate of Poland has just leaked across the iron curtain. It is a reminder of the extent to which the Polish hierarchy has maintained its unyielding attitude to Communism over the past seven years. Today it is the sole remaining outpost of the Vatican in Eastern Europe.

The object of the Polish Communists is to produce, as in the Soviet Union, an acquiescent priesthood and a church which is the instrument of the regime. However there are vast differences between the Orthodox Church in Russia and the Roman Catholic Church in Poland. While the Russian Church leaders have always been more or less subservient, the Polish episcopacy has a long record of stubborn resistance to authority, both that of the Czars and of their own rulers. Also, unlike the Russian, the Polish Church has the enormous support of the parent church outside, and within the country, of a congregation which remains unshaken in the faith.

Striking proof of this devotion was given last Christmas. For the first time the occasion was officially ignored and strenuous propaganda efforts were made to play up the New Year, linked to the Six Year Plan, instead of Christmas. Nevertheless, it is known that on Christmas Day the churches were crowded to overflowing and that people, including Party members, stayed away from work.

Among the organized nation-wide demonstrations in favor of the new Polish constitution, there has been no radio or press mention of clerical participation, except by the pro-Government "Union of Patriotic Priests". This Union is the regime's sole achievement in its efforts to undermine the Church's power and is the result of promoting a schismatic movement among the ill-paid lower clergy. Even so, the Government itself does not claim more than a few hundred members out of a total Catholic priesthood of about 9,000.

The Church in Poland today is carrying out the doctrine of non-cooperation. To what extent priests encourage or participate in any active resistance, is hard to say. From time to time priests have been tried for allegedly anti-state or treasonable activities. But there is no evidence that subversion is part of the Church's policy in Poland. It prefers to rely on non-cooperation and the preservation of a moral ascendency over a simple people.

The Church still has considerable material resources in Poland - in lands, monasteries, seminaries, etc. Attendance at the University of Lublin, the Catholic academic stronghold, has reached the record number of 6,000. In 1949, there were 6300 priests working as paid religious instructors in Polish schools. Many hundreds of them have since been dismissed in spite of the Hierarchy's protests. With the legal separation of church and state under the new constitution, it can be presumed that the rest of these priest-instructors will disappear along with the last vestiges of ecclesiastical authority over Polish education.

However, at least for another generation the dominating role of Catholicism in the lives of the people will continue. Poland is an agrarian country and life in the villages is still primitive. The Church and its ritual is and has been for centuries, the sole amenity and the sole consolation.

AFRICA
LIBERIA

Foreign Commerce Weekly (U.S. Dept. of Commerce, May 12, 1952.)

LIBERIA'S EFFORTS TOWARD ECONOMIC IMPROVEMENT.

Liberia, one of several small countries on the West Coast of Africa, has made

considerable strides toward economic advancement. The article describes the country's resources -- timber and mineral and its basic activity, agriculture. The most important agricultural production from the standpoint of the money economy of Liberia, is plantation rubber. The great majority of the people raise cassava, rice and yams or gather bananas and palm kernel for their food. The production of cacao, coffee, kola nuts and peanuts has been advancing in recent years and these products promise to become important cash crops in the future.

The Firestone Tire and Rubber Company pioneered the development of plantation rubber in Liberia after World War I. Private enterprises, representing American investments and local Liberian interests, are now engaged in various projects aimed at developing national resources. Iron-ore deposits are being developed by the Liberia Mining Co. and shipments are being made to the United States at a rate of 10,000 tons weekly.

Liberia has had close ties with the United States throughout its history. Recently, it was the first country to conclude an agreement with us to receive technical assistance in terms of the Point 4 program. Initially this program in Liberia is directed primarily toward agricultural development. It also encompasses work in the fields of public works and utilities, health and sanitation, education and housing.

The Point 4 projects have been integrated into Liberia's Five-Year Plan for economic development, a plan evolved by the Liberian Government, drawing heavily upon the work done by the U. S. Public Health and Economic Missions. These missions operated in Liberia during World War II when the United States was granted special privileges for the construction and operation of an airfield.

The Five-Year Plan will be financed by the Liberian Government largely from current revenues, although public loans and limited grants are expected to help. A joint Liberian-United States Commission for Economic Development has been established. Like other underdeveloped countries with ambitious plans for economic and social improvement, Liberia lacks sufficient trained manpower; the country has inadequate transportation, communication facilities and basis social services. Large sums of money will be needed to carry out the program. In this connection the Liberian Government has recognized the desirability of encouraging the inflow from abroad of private capital investments.

SUMMARY OF MISCELLANEOUS NEWS ARTICLES

THE UNITED STATES

Foreign Affairs (New York, April 1952)

KOREA IN PERSPECTIVE by Adlai E. Stevenson (Governor of Illinois)

Although it is too early to make any final estimate of the Korean experience, the writer believes that "we have made historic progress toward the establishment of a viable system of collective security." Certain positive gains for American foreign policy may be noted:

1. The Korean engagement put the American rearmament effort into high gear.

2. Our leadership in fighting aggression in Korea not only saved the moral and psychological defenses of Western Europe from possible disintegration but also sparked the rapid build-up there of physical defenses.

3. The Soviet Union now knows that the path of conquest is mortally dangerous.

4. Our support of the first great collective military effort of the United Nations to resist aggression demonstrated that the organization is adaptable to the role of enforcement as well as to that of conciliation.

5. We may record that the successful resistance in Korea has contributed greatly to the successful negotiation of a Treaty of Peace with Japan, as well as of arrangements satisfactory to us regarding the future security of that country.

6. We have learned vital military lessons in Korea.

American interests, power and responsibilities are world-wide. Two basic facts affect our position in the world. The first is that a world-wide imperialist war is now being carried on by Soviet Russia and its Communist satellites. The second is the existence of the United Nations - a world-wide organization of states "united in strength to maintain international peace and security." The relationship of the United States, the Soviet Union and the United Nations is the primary element in the American problem of foreign policy today.

Although the United Nations has worked haltingly and at times badly, it has worked. Because the present world-wide coalition of free peoples is inconceivable without a central forum and instrument for discussion and adjustment, the United Nations remains an indispensable part of our foreign policy. So long as the Soviet rulers continue their dual war - against their own people and against all outsiders, there is no reason to expect that the UN will be able to adjust the differences between the Soviets and the free world. Nevertheless, it maintains at least formal contact between the two worlds. Our own willingness to keep the door open for talk and negotiation is evidence for our friends that we will accept any reasonable opportunity to improve relations and avoid all-out war.

Despite differences in approach and emphasis, much of the free world now shares a wide range of political and economic interests which move it in the direction of unity. The United Nations is a most valuable instrument in harmonizing differences in those interests. It and other agencies such as NATO have given us and our friends, considerable experience "in this unceasing task of mutual accommodation". We will find support among peoples in the free countries to the degree that they believe the United States does not simply consult its own interests but gives consideration to their interests as well. Other nations have a reciprocal obligation to give weight to our interests too.

In his concluding paragraph, Mr. Stevenson writes, "What is incontrovertible, I think, is that America needs and wants allies. I think most Americans know this. I think we believe that the redress in the balance of power in the world must be completed, and quickly. I think we believe that the great experiment in collective security on which we embarked in 1945 is still in the long run our best chance for peace. I think we believe that international cooperation is more than elocution. In short, I think most of us have convictions about the position of the United States in the world today and accept the risks and responsibilities inherent in that position."

Statistical Series (Securities and Exchange Commission, March 27, 1952)

BUSINESS EXPECTS HIGHER CAPITAL EXPENDITURES AND SALES IN 1952.

American business is planning to spend $24.1 billion in 1952 for new plant and equipment according to the latest survey of capital outlays made by the Securities and Exchange Commission and the Department of Commerce. This total exceeds the previous high in 1951 by 4 percent in dollars and by almost as much in physical volume terms.

Capital outlays in 1951 were $23.3 billion and were very close to the expenditures anticipated by business in the survey conducted in the early part of last year.

Manufacturing concerns and electric and gas utilities have programmed capital expenditures in 1952 at 8 percent above 1951 and mining companies expect to spend 7 percent more. Among transportation companies the nonrail groups plan on investing 19 percent more than in 1951, while the railroads expect to spend the same amount as last year. Commercial and miscellaneous industries are the only major group scheduling lower capital outlays than in 1951.

The survey also furnished information on the sales expectations of businessmen in 1952. The largest increases in sales above 1951 are anticipated by mining concerns (11 percent) and electric and gas utilities and nonrail transportation companies (10 percent). Manufacturers expect their sales to rise 5 percent with a somewhat greater increase in the durable goods industries. Commercial and miscellaneous companies expect a minor increase in sales.

The Economist (London, March 22, 1952)

FRENCH TAXES AND BENEFITS.

The recurrent budget crises in France and the general atmosphere of fiscal

irresponsibility which has surrounded the Fourth Republic, have tended to distort two basic facts of French social life. The first is that the French nation as a whole surrenders almost as much of its income through taxation as the British. According to French official claims the figures are 38 percent of the national income in the French case and 40 percent in the British. The second fact is that since 1946 France has been building up a system of social security and free health services which is at least as comprehensive as any in Western Europe.

A comparison between the social benefits in Britain and in France indicates that both British and French families tend to receive rather similar benefits from their respective states. On the whole, the French employee earns less from his employer and receives more from the state while, on the whole, the English employee pays a higher income tax and a slightly lower contribution to social insurance. In both countries, children are educated free until they are fifteen; medical treatment is about 90 percent free; there are state insurance schemes against industrial injuries, other disabilities and chronic sickness; and a system of special assistance to the very poor.

Although the two schemes cover the same ground, they are very different in method and approach. Of the total sum which passes through the French budget, only 29 percent is raised by a direct tax on personal or company incomes; 10 percent comes from state properties, and 61 percent from indirect taxes on consumption and imports. Of the direct taxes, practically all are paid by employers on behalf of themselves and their employees. In addition, the employer has to pay the state around 29 percent on his basic wages bill in respect of social security contributions which are not included in the budget.

It is very profitable to have children in France - with three children the regular allowances are 60 percent of the basic wage. The results speak for themselves in statistics. In the years immediately preceding the last war, deaths on a yearly average, were

20,000 more than births. Since 1946, births have exceeded deaths by more than 312,000 on a yearly average. The French system maintains a degree of incentive which is absent from the British. Within certain limits, the more a Frenchman earns the more he receives from the state.

In practice the French system does not work so well as the British. But a careful look at the French taxes and benefits would indicate that France as a whole is not grossly undertaxed and that France is by no means backward in its social services.

THE NEAR EAST

KUWAIT

The Times (London, March 4, 1952)

KUWAIT'S BURDEN OF WEALTH.

Kuwait, an independent sheikdom under British protection at the head of the Persian Gulf, which has been for centuries an Arab trading center, has suddenly emerged as the fifth oil-producing country in the world.

This desert State of about 150,000 people will receive this year a revenue of some $56 million. If production this year from the Kuwait oilfield reaches 40 million tons, as is expected, the royalty and tax payable in 1953 under the agreement concluded in December will be around $140 million.

Kuwait has an unusually stable and pacific history and the ruling dynasty has been unbroken since 1756. Sheik Abdulla Salim, the ruler, is a serious, thoughtful man in his middle fifties, simple in dress, religious, and conservative in habits. His governing preoccupation is to dispose of the revenue from oil wisely for the good of his people.

Kuwait's first need is water. Its supply is brought in from outside in dhows which discharge their tanks at the quayside from which the water sellers load their skins.

The State will now be able to afford to pipe water from the Euphrates and pay for the privilege, if Iraq agrees. Political prudence, however, dictates that Kuwait should make itself tolerably self-sufficient in water. This is to be done by the largest system of distillation yet conceived.

The largest water distillation plant in the world today is the Kuwait Oil Company's plant at its leading port, Mina-el-Ahmadi. This plant uses the spent steam from the power generators to distil 600,000 gallons of fresh water daily from the sea, of which 200,000 gallons are piped to the town. The remainder serves the oil company establishments which are a self-contained town separated from Kuwait town by more than 20 miles of sand. Outside the old city a new plant designed to give one million gallons of water a day, is being built at State expense. It will be fired by oilfield gas. In the past the average Kuwaiti has used 1 1/2 gallons of water daily, a quantity far too small to allow for sewerage. This amount has already been doubled and next year it may rise to 8 or 9 gallons a head a day.

Reduction of disease is going forward under the State medical service. The present hospital was opened in October 1949 for 120 beds. It now has 180 beds and a tubercular ward in another building has been expanded from 60 to more than 100 beds. A permanent new tuberculosis hospital is approaching completion. A site is now being cleared outside the present town for a new general hospital of 750 beds.

Profound changes are also taking place in the field of education. Until 1910 the only schools in Kuwait were the Koran schools in which a few children were instructed in the scriptures. Two or three general schools were built in the next 25 years and in 1935 the policy was begun of importing teachers from more advanced Arab countries. Since 1945, eleven new boys' schools and seven new girls' schools have been founded. There are now 399 teachers instead of 119 seven years ago. The number of pupils has risen from 3,000 to more than 8,000. Education is free, the children receive a free meal a day, free clothing and medical treatment.

Since Kuwaiti women are strictly veiled, it is the more remarkable that as many as 2500 girls are now at school. The education of women in large numbers may make even deeper marks on Kuwaiti society than the coming of water or the reduction of disease. Young men are being sent to study in Egypt, Lebanon and the western countries with funds provided by the state and the oil company and 27 are now studying in England.

Kuwait is using its oil revenues to construct, in a decayed and neglected region of the world, a modern and advanced community.

THE FAR EAST

Foreign Policy Bulletin (New York, April 15, 1952)

TEN-POINT PROGRAM FOR U. S. IN ASIA by Chester Bowles (U.S.Ambassador to India)

Americans have reason to be proud of the way we have faced up boldly and imaginatively to the danger of Soviet aggression in Europe - through the Truman Doctrine in Greece and Turkey, the Marshall Plan and the North Atlantic pact.

However, in Asia we face a profound challenge from the already dangerously successful efforts the Communists are making there. We know Europe but we do not know Asia. Nor do the Asian peoples know our history and traditions. Skillful Soviet propaganda associates us with the nineteenth-century colonialism of European powers.

India occupies the key position in Asia today. India is the world's largest democracy. In four and a half years of independence, it has established complete freedom of speech, free elections, democratic courts, and a parliamentary system based on the best British, French and American experience. But the real test for India's democracy will be its ability to raise the living standards of the people. On this test the future not only of India but of Asia will largely rest.

A solid majority of the Indian people are hopeful that democracy can do for them what it has done for many Western nations. But in some parts of India - the Communists

are making significant inroads. If India goes under, no thoughtful person will question the fact that democracy in Asia is finished. A Communist Asia might well jeopardize the position of free countries throughout the world. We cannot allow that to happen.

Ambassador Bowles calls for a positive Asian policy which thoughtful Democrats and Republicans can support regardless of past disagreements. Nehru, he says, is the strongest individual anti-Communist force in Asia. In spite of occasional disagreements with him on specific questions, no one can question his deep personal devotion to democracy. We must be patient in our dealings with the Asians and their problems. Remember the great American traditions, take every opportunity to express our historic antipathy to imperialism in any form.

We should not get discouraged about the problems of population and food supply in India. If India's agriculture were only as productive as that of Egypt, its annual supply of food would be twice as great.

With our help India's Five-Year Plan by the end of 1956 can increase total food production 20 percent. This would eliminate the need to import food from abroad and free foreign exchange now used for that purpose, for speeding up Indian industrialization.

"This essential 20 percent increase in food production can be achieved only by a substantial step-up in our present village-by-village program of better seeds, increased irrigation projects, better public health and increased literacy. The program now under way draws heavily from previous failures to meet communism successfully in Asia. It is a realistic down-to-earth, house-to-house, village-to-village effort already tested and proven in actual practice.

"Twelve thousand villages will begin to receive the benefits of our present Point Four program in the next few months. But our minimum objective must be 200,000 villages and 120 million people by 1956. In each area covered, a 50 percent increase

SUMMARY OF MISCELLANEOUS NEWS ARTICLES

August 1, 1951

THE UNITED STATES

Federal Reserve Bulletin (June 1951)

1951 SURVEY OF CONSUMER FINANCES: PART I. THE ECONOMIC OUTLOOK AND LIQUID ASSET POSITION OF CONSUMERS.

This article, the first in a Bulletin series, presents the findings of the sixth annual Survey of Consumer Finances sponsored by the Board of Governors of the Federal Reserve System and conducted for the Board by the Survey Research Center of the University of Michigan. The article deals with the general financial position of consumers, with changes in consumer attitudes on economic matters during the past year, and with ownership and use of liquid assets.

"On balance, consumers appear to have improved their financial positions in 1950. Annual personal income rose considerably more than prices from average 1949 levels. The number of persons owning liquid assets increased by 3 million, the number that spent more than their incomes (dissaved) declined for the first time in the postwar period, and purchases of new houses, automobiles, and other major durable goods set new records.

"Price rises in the latter part of 1950 and in early 1951, however, tended to offset previous income-gains so that there was little change in the income-price relationship between early 1950 and early 1951. Although this was true on the average, many persons were adversely affected by rising prices.

"Consumers were not very optimistic concerning their income prospects in relation to expected price rises. Many people felt that times were not favorable for the purchase of major durable goods, primarily because prices were too high. This view was widely expressed even though very few people expected prices to decline in the near future. These last factors were reflected in the reduced number and greater uncertainty of consumer plans to purchase durable goods and housing.

"It is possible that incomes may rise more than was anticipated by consumers early this year, and prices less. Also, people may become accustomed to the new high level of prices. If such is the case, consumer buying in the latter part of 1951 may exceed the volume indicated by consumers earlier in the year.

"It is significant, nevertheless, that the majority of consumers are not disposed to reduce savings in order to acquire goods in anticipation of price advances. Moreover, they continue to prefer savings bonds and bank deposits to real estate and common stock as outlets for current savings. Even though the small number preferring real estate or common stock has increased somewhat over the past two years, the chief reason given for this preference was the higher return these assets were believed to yield. These attitudes make the task of controlling inflationary pressures less difficult than it would otherwise be."

The article describes in some detail the survey findings on each of the subjects mentioned in the above summary. Twenty-four pertinent tables are included.

The New York Times Magazine (Sunday, July 8, 1951)

PATIENCE: ATOMIC WEAPON IN THE COLD WAR by Barbara Ward.

The course of events since the war indicates that the Russian strategy is to play a waiting game. The rulers in the Kremlin believe that history is on their side, that capitalism is bound to disintegrate, and that communism is destined to conquer the world. This confidence in the verdict of history gives considerable strength and flexibility to Soviet strategy. There is no need to hurry for time is on their side.

For Stalin Korea is simply an episode. For the West to hold the enemy in Korea is victory, but it is the winning of a battle not of a whole campaign. The West must understand the Russian game and avoid all belief in sudden decisive settlements.

The Soviet strategy comports well with the Russian character. Probably no people on earth are better at waiting than the Russians. The Western peoples, on

the other hand, do not appear to have the reserves of patience which characterize the Slavs. Nor do they seem to be sustained by any particular view of world history.

Britain has had some limited experience with the waiting game. In the United States, however, the traditional emphasis has been on achieving quick results in all fields. In the face of Soviet policy, can the West be patient; can it display fortitude as well as force?

Nowhere in the West is there the endurance of the Russian people. However, during the past two decades the lesson of sustained effort has been learned in field after field of Western life. In the United States, particularly, there are many examples of this. In business enterprise the policy of preferring strength and continuity of the enterprise to the quick taking of profits is attested by the rise in the past decade from 30 to 60 percent of profits devoted to reinvestment. In agriculture, the emphasis has been on soil conservation and improvement.

Even in the field of diplomacy, the rationale of the "limited war" is patience. The Western powers are already showing also that they can match Russian endurance at the conference table.

Patience is not the only Russian asset. The Communists offer, particularly to youth, a picture of Utopia, of the perfect society which will come to pass when capitalists, kulaks, kings and priests, have gone to their inevitable doom. This is not an idle challenge. For whatever else it is, the Western way of life is not a Utopia. It offers no automatic security for the good life. What it does offer is the guarantee of life, liberty and the means of pursuing happiness. But each individual human personality must create his own happiness. The Western view of human destiny is infinitely more complex and provisional than the Messianic premises of communism.

On the other hand, the Soviet Union "suffers from the insurmountable obstacle that the Kingdom of Heaven descended in 1917 and has been getting more fixedly

intolerable ever since... So, today, the chief obstacle of the Soviet version of the millenium is that it has already arrived, and that its compulsorily happy millions are among the most wretched of mankind... By promising total happiness, the Soviet Union has undermined its capacity to promise anything at all."

In the West, the state makes no promises. It can only offer opportunities for the flowering of goodness and greatness in the individual personality of the free citizen--a goal beyond any goal proposed by communism. In the dignity of the individual, in the opportunities offered the individual through the Western way of life, lie the deepest roots of Western power.

THE UNITED KINGDOM

The Economist (London, July 7, 1951)

EUROPEAN CONSOLIDATION.

In the very important speech General Eisenhower made in London on July 3 in the presence of the Prime Minister and the Foreign Secretary, he was telling the peoples of Western Europe that his job would be extremely difficult--if not impossible--unless the European signatories of the North Atlantic Treaty would create among themselves more unity than they have today.

The system by which a single general is, in effect, responsible to over a dozen governments and has to deal with each of them separately is not working at all well. It is obvious that General Eisenhower is acutely concerned over the absence in Europe of any central organs of decision.

He might have gone on to say that it is not only in their lack of coherent organization that the Western European nations are deficient, but that there is something wrong as well with their spirit and morale. Public opinion in the West has treated the recent elections in France and Italy with a certain complacency. The Italian elections did not upset De Gasperi and the French elections guaranteed the continuance of moderate governments of the center. However, what these elections show of the state of mind of the French and Italian peoples ought to be

regarded as very disturbing. In the third year of the Marshall Plan which has succeeded beyond expectation in rebuilding the European economies, a quarter of both the French and Italian electorates voted Communist. If the good year is followed by a bad one, if the French or Italian voters come under the pressure of fear or misery, how much of democracy will survive?

The Eisenhower speech was made appropriately in London because however much the British may dislike and resent it, the key to European unity lies in London. The problem of Western Europe cannot be solved without the most active and positive British cooperation and General Eisenhower has deliberately served notice on the British Government that it must make an effort to provide leadership for Europe.

It is not within the field of practical politics today to set up a super-government for a federated Europe. A more fruitful approach would be to give the Supreme Commander what he urgently needs--an organ where decisions can be taken quickly and collectively, the peacetime equivalent of the meetings of the President and the Prime Minister. There are many things that the European nations already decide together and the organs through which they do so are scattered over half a dozen capitals. The first task is to bring together in one place and, insofar as possible, in one organ, all these pieces of international machinery. When that is accomplished, it should be possible for each government to send out a plenipotentiary minister, empowered to make bargains and take decisions. The plan might be given its initial impulse by a Conference of Prime Ministers.

The first job for such an organ is to define the aims and dimensions of the common effort. One of the factors at the root of the current malaise of the Western Europeans is their feeling that they are menaced by the unknown. The demands which the policy of resisting Soviet imperialism puts upon them seem to be unlimited; the cry is always for more, until sometimes it appears that the means of avoiding war are, on the economic and social sides, as painful as war itself. It is a great blunder that this impression has been allowed to grow. The program

cannot be defined in exact terms but it should be easily possible to say what it does not amount to. Roughly, the British program is equal to about one-quarter of a total war and it is the biggest in Europe. It is not true that the peoples of Europe have to ruin themselves in order to be safe. It is perfectly possible to draw up a program which will be large enough to convince the Americans that a real effort is being made and yet moderate enough to convince the European peoples that they will not be ruined.

The immediate agenda is therefore one of European consolidation--a consolidated organization working out a consolidated program. The present British Government need not be frightened to take the initiative. The criticism could be made that what is suggested is too little. But there are two points to bear in mind. The first is that politics is the art of the possible. The governments of Europe today are all of them so narrowly based that large gestures will upset their equilibrium. The other is that there is a limit to what can be done by governmental action and administrative devices in the absence of an active public opinion based on common belief in a positive creed of action. This is what is missing in Europe today. We know what we reject but we do not know in what we believe. Statesmen can help create an atmosphere in which minds can come together but the creation of a new faith is not within their powers. For that Western Europe still awaits its prophet.

THE FAR EAST

The Harvard Business Review (July 1951)

OUR ECONOMIC POLICY IN ASIA by Raymond W. Miller.

The author, a farmer, lawyer, visiting lecturer at the Harvard Business School and consultant to the UN Food and Agriculture Organization, has recently visited some fourteen countries in Asia.

His major point is that hunger is the most important fact in the world today, that the real challenge of the twentieth century is the race between man and

starvation. The great majority of the people of Asia today live in rural and urban slums under economic restrictions, social customs and superstitions of the past. Together with other free countries the United States must attack the conditions which cause these people to live in poverty, disease and hunger. Internal volcanic pressures are being generated in Asia which will erupt in this decade--as they have already started to do--unless we really lend a hand. Asia wants the United States to be a good neighbor, not a patronizing philanthropist.

The author's analysis of the problem and how to deal with it are summed up as follows:

1) At this stage, the idealistic visions of those who want to mechanize Eastern agriculture are impracticable. "Know-how" help at the grass-roots level is all Asia needs and all it is prepared to use for the time being. We could give enough of this type of help to influence profoundly the economies of the Far Eastern countries at relatively little cost.

2) The effectiveness of our help will depend on how we give it. Our aim should be to help the people of Asia to help themselves. We should support local adaptations under native administration of the American county demonstration agent. The tremendous potential of this "show-how" principle has already been demonstrated in Formosa, in India and elsewhere.

3) Not even the above program will succeed unless we raise our voice strongly for land reform. No program of increasing production can have any meaning unless the vicious land tenancy system is brought to an end.

4) We should also support the growth of cooperatives which are a valuable follow-up to land reform by making possible better purchasing and marketing practices.

The article discusses the above points in detail, applies them to specific countries in Asia, and contains many illustrations of how they have already worked or could be expected to work in Asia. It is an informative and stimulating piece.

AFRICA

Foreign Affairs (New York, July 1951)

THE BRITISH PROBLEM IN AFRICA (by Margery Perham, Oxford University, England).

The Gold Coast elections of February 1951 sent a shock right through Africa, south of the Sahara. The first assumption of ministerial office by elected Negroes in a British colonial territory marks 1951 as an important date in the political history of Africa.

The author, an authority on colonial administration in Africa, discusses the issue of self-government in various African territories, the tremendous cultural and educational problems, the conflicts between the numerically superior native groups and the dominant white minorities. She stresses the importance of the war period and the years since in British colonial Africa both in terms of Britain's altered position as a ruler of colonial peoples and in terms of the impact of the war on the social and economic life of the colonies. The different situations and issues in west, east and central Africa which challenge the British policy of a gradual transfer of powers, are discussed.

UNITED STATES

Scientific American (New York, April 1951)

THE CENSUS by Philip M. Hauser (University of Chicago, formerly Acting Director of the U. S. Bureau of the Census).

According to the official 1950 Census count, our population rose by over 19 million between 1940 and 1950 to a total of 150,697,361. This large increase was about seven million above the highest prediction made by population experts a decade ago. What is its significance?

From its foundation the United States has experienced a population increase unprecedented in human history for so large an area over so long a time. Since 1790 when the nation had only 3.9 million people, its population has increased 39-fold. It has doubled five times. The first three doublings each took 25 years. The fourth doubling took 35 years, from 1865 to 1900. The last took 50 years, from 1900 to 1950. Thus, as a long-term trend the rate of increase has been declining since the Civil War.

The population rise in the nineteen forties reflected in part a large "deficit" in marriages and births accumulated during the depression decade as well as the upsurge in our marriage and birth rates during World War II. One of its by-products is that the bumper baby crop of the 1940s will raise enrollment in elementary and secondary schools to more than 34 million by 1958, a forty percent increase over the enrollment of 1947.

There have been large shifts in the geographic distribution of our population with the biggest gains in the Far West. Other important shifts have been from rural to metropolitan areas and from the cities to the suburbs.

Another significant change is in the sex composition of the population. Women outnumber men for the first time in a Decennial Census report, in the ratio of 100 to 98. Two major factors figure here. The first is our immigration restriction laws. The second is the lower death rate of females.

A third major change is in the age structure of the population. The median age of the population rose from 29 years in 1940 to 31.2 years in 1950. There has also been a rapid increase in the number and proportion of persons 65 years old and older. While the population of the country as a whole has doubled since 1900, the number of persons 65 and over has quadrupled.

The Census returns indicate a substantial advance in the social-economic level of the American people during the 1940s. The proportion of persons with less than five years of schooling decreased to less than nine percent while those with a high-school education increased from 16 percent to about 22 percent and those with a college education from 3.8 percent to 4.4 percent.

Wartime mobilization of our manpower expanded the total labor force from some 55 million in April 1940 to a peak of 66.2 million in April 1945. In April 1950, on a comparable basis, the labor force was still 63.5 million, well above the prewar "normal trend." During the decade unemployment shrank from about 8.4 million to 3.5 million.

The Census shows a considerable increase in the real income of individuals and families during the decade. The median wage and salary income earned by persons 14 years of age or over rose from $789 in 1939 to over $2,000 in 1949, an increase of 156 percent. After making allowance for the decline in the purchasing power of the dollar, the average rise in real income was about 50 percent. Another set of data indicates that the gain in income occurred during the war and that since the war's end there has been no real increase in income.

The population changes of the past decade have important implications for national defense. In the immediate future there will be a relative decline in young manpower because of the birth rate drop during the depression years. After 1960 when the record baby crop of the 1940s begins to reach maturity, the supply of youths for productive work at home and for manning the armed services will climb rapidly.

The advances in education and in levels of living during the past decade are encouraging for our national future. The 1950 Census shows that we made substantial gains during the decade in both our human and our material resources.

Statistical Series (Securities and Exchange Commission, March 27, 1951)

PLANT AND EQUIPMENT EXPENDITURES OF U. S. BUSINESS 1951.

According to the latest survey of capital outlays made by the Securities and Exchange Commission and the Department of Commerce, American business is planning to spend a record $23.9 billion in 1951 for new plant and equipment. The anticipated rate of capital expansion this year exceeds by 29 percent the capital expenditures made in 1950, and by 24 percent the previous peak in 1948. It seems likely that at least two-thirds of the increase from 1950 represents higher physical volume.

All industries and size groups of companies anticipate larger capital expenditures in 1951 than in 1950, according to this survey made in the first quarter of the year. The 45 percent rise scheduled by manufacturing companies accounts for most of the planned dollar increase in the overall total--about $3.7 billion of the total gain of $5.4 billion. The relative increases among the other industries range from 41 percent in transportation other than railroads to 10 percent in the commercial and miscellaneous category.

Comparison with a similar survey made last December indicates that since that time businessmen have raised their projected rate of capital goods outlays this year about 9 percent, reflecting price as well as volume changes.

Current Population Reports (Bureau of the Census, U. S. Department of Commerce, April 6, 1951)

THE MONTHLY REPORT ON THE LABOR FORCE: MARCH 1951.

Employment went up sharply in March as expanding defense and seasonal activity brought an end to the mid-winter lull. In the week ending March 10, total civilian employment was estimated at 60.2 million, above the February level by 1½ million. This increase was one of the largest ever recorded for this time of year and with it the number of employed persons exceeded the March 1950 level by about 2½ million. Nonagricultural employment advanced by 800,000 between February and March to an estimated 53.8 million in the survey week.

Unemployment dropped by 300,000 to reach the lowest March level in four years.

The jobless total was estimated at 2.1 million in March, only about 3.4 percent of all persons in the civilian labor force in March.

Agricultural employment began to climb seasonally, rising from 5.9 million in February to 6.4 million in March.

The civilian labor force, which includes both employed and unemployed, was estimated at 62.3 million in March, about 1 million larger than in February. Apparently, a major factor in the increase was again the entry into the labor force of large numbers of housewives to take defense and other nonfarm jobs. In spite of the induction of large numbers of young men into the armed forces over the past year, the greatly increased labor force participation of women is responsible for keeping the civilian labor force at its current high level. In the first quarter of 1951, an average of 18.6 million women were in the civilian labor force, or about 800,000 more than in the same period of 1950.

EUROPE

U.S.S.R.

The Economist (March 24 and March 31, 1951)

THE SPIRIT OF THE SOVIET SOLDIER by a former Soviet Staff Officer.

The Soviet armed forces are first the armed forces of a Party and only second those of a nation. Party doctrine teaches that war is a product of class society and that as long as the capitalist system exists there will be wars. It further teaches that the class struggle must be developed to its logical conclusion--violent armed overthrow of the capitalist system.

The attitude which this doctrine fosters has become so deeply rooted in the consciousness of the ordinary man in the Stalinist Empire that any talk about peace which does not imply the violent destruction of capitalism seems to him to be empty words.

Equally significant is the Soviet doctrine that any war against Britain and America would be a just war because it would pursue the central aim of destroying capitalism and that any war against the Soviet Union would be unjust. The whole psychological training of the armed forces of the Soviet Union rests on this formula.

Ivan has assimilated it like a religious doctrine and nothing can unconvince him since there are no opposition parties and foreign magazines or newspapers are hard to get. If a soldier knows he is doing something just and that his opponent's cause is unjust, then his strength to fight will be immeasurably greater than without such conviction.

The Soviet Union is one of the most highly militarised states that has ever existed. At endless meetings of the Party, Komsomol, trade union and other organisations the word "war" is driven into people's consciousness. In thousands of lectures, reports, films, plays, exhibitions, monuments, placards and books the soldier is pictured as a physical and spiritual superman, a paragon of cleverness, ability, strength and greatness. The military profession has become the most honorable in Russia. From all this propaganda the ordinary soldier and citizen concludes that the aims and tasks of the Red Army are sacred.

What is the atmosphere created among Soviet people by all this? It is a new style of patriotism. Up to 1922 the Russian Federation was designated in the minds of Soviet people as "our country." Between 1922 and 1939 outer Mongolia and the whole of Turkestan became "our country." In 1939-40 the title was extended to include Eastern Finland, Estonia, Latvia, Lithuania, Western White Russia, Western Ukraine, Bessarabia and Bukovina. Between 1942 and 1946 it was extended to East Prussia, Memel, the Kurile Islands, Dairen, Port Arthur, Southern Sakhalin and the Carpathian Ukraine. What guarantee is there that tomorrow "our country" will not comprise Bulgaria, Poland, Rumania and Czechoslovakia?

Everything depends on the success of the world revolution. "Soviet patriotism" is a means of coercing people of many races to fight for the aims of the Politburo, of creating mass fanaticism and a blind willingness to die in the name of any aims which the Kremlin may have.

The whole army does not consist of robots. Nevertheless, for twenty-four hours a day military commissars are working at the job of creating them and in the rear the job is being done by Party, Komsomol and trade union organisations. All this must be taken into account along with the tanks, guns and planes.

SOME WEAKNESSES IN THE SOVIET ARMY.

The Soviet Union is an empire with 200 peoples of different histories, cultures, languages and religions. The Second World War showed that many non-Russian people were not only resolved not to fight for the Kremlin but actually rose in revolt in the rear of the Red Army. It is not surprising that in the Ministry of War, in the main political departments in Germany, Austria and other occupied areas, commanding staffs are drawn almost exclusively from officers of Russian nationality.

It is to be remembered also that in the recent war several million men left the Soviet army. Moreover since the war officers and soldiers in occupied Europe have seen that Soviet propaganda has lied shamelessly. Contact with the free world affected them so powerfully that even fanatics began to think. The units of the Soviet army which have served abroad are the most unreliable ones.

There are also significant weaknesses in the reserves of food for the Soviet army. As a result the soldier receives not more than fifty percent of the rations he is supposed to get. On the other hand a senior officer or general gets very rich rations for ridiculously low prices and is very well fed. In the Army the soldier is completely at the mercy of his superior officers. It is clear from an endless flow of secret orders that the practice of corporal punishment and striking flourishes in the Army. Little remains of the human dignity of the Soviet soldier. Since not all soldiers are complete fanatics, all this may sometime assume ominous and far-reaching proportions which bode ill for Stalin's empire.

THE MIDDLE EAST

Persia

The Times (London, March 22, 1951)

THE CRISIS IN PERSIA: INTERNAL ISSUES BEHIND THE OIL DEMANDS.

It would be foolish to regard the crisis in Persia only in terms of oil or to assume that it can be solved by a settlement of the dispute with the Anglo-Iranian Oil Company. Much of the instability of Persian political life during the past 150 years is attributed--and rightly so--to great Power rivalry in the country. But the

fundamental causes which have provoked conflict now brought to a head over the supplementary oil agreement, are the stupidity, greed, and lack of judgment of the ruling classes in Persia.

For many years Persian society has been in a state of disequilibrium, evident in many fields:

1. There is a wide gulf between Government and people. Nepotism is rife. No tradition of disinterested public service exists. Corruption is widespread. No clear decision has been made as to the nature of political power in Persia--whether it is to be wielded by the monarch supported by the army or by the Cabinet supported by the National Assembly or what is to be the nature of the Assembly.

2. There is a lack of balance between Teheran and the provinces. For years all commercial, economic and political activity has centered in the capital. The wealthy, the intellectuals and the professional classes upon whom local government in other countries depends, have gravitated to Teheran.

3. There is a lack of balance between the urban and the rural population. In recent years there has been a flight from the land to the towns. There is also antagonism of long-standing between the settled population and the tribes who form an important element of the population.

4. There is the uneven distribution of wealth. The main wealth of the country is concentrated in the hands of the land-owning class, which often includes the merchant and contractor class on the one hand and the upper sections of the bureaucracy and higher ranks of army officers on the other.

5. There is the gulf between the "westernized" element and the rest of the population. This element is out of touch with the masses whom they fail to understand and despise. Their western associations give them undoubted influence but they are not popular and knowing they cannot achieve power by themselves, they tend, whether from ambition or zeal for reform, to seek support from some outside source. The result is that since the present ruling class is popularly, though erroneously, supposed to be supported by Britain, these critics tend to become associated with left wing and pro-Russian movements.

The disequilibrium is not new. There has been an unwillingness to accept personal responsibility and a tendency for years to simplify social problems by blaming the unresolved conflicting forces within society on personified scapegoats. The corrupt ruling class was, and is, considered to be the creature of the British and the belief has been fostered that only the British Government blocked internal reform.

In reality British interests have demanded an independent Persia and forced her to deal with the Government of the day. Although Soviet Russia's activities have been such as would lead to the extinction of Persian independence, she has avoided the stigma which has attached to England. The demand for reform has become tied up with anti-British feeling and pro-Russian sympathy.

The inner tensions of Persian society have now become so acute that they can be met only by an acceleration of the drive against the external scapegoats. This is the real explanation of the present crisis. The Anglo-Iranian Oil Company has been substituted for the British Government as the target of abuse.

The old order in Persia is on the point of collapse. Unless a new order and a new concept of society emerges there is little hope for Persia. The present crisis goes far deeper than the question of oil and cannot be solved by the nationalization of oil as certain irresponsible Persian politicians claim. The oil question is only the point on which the conflicting forces within Persian society have been focused. The real issue is the emergence of a new Persia.

UNITED STATES

Office of Business Economics (U. S. Department of Commerce, March 9, 1951)

PERSONAL INCOME.

Personal income in January 1951 was at an annual rate of $239 billion, about $2 billion below the high December 1950 rate of $241 billion.

The December-January decline reflected a substantial reduction in dividends following a year-end bulge in December dividends. In January dividends were at an annual rate of $8.8 billion compared with $14.8 billion in the previous month. The aggregate of all other types of personal income increased from $226 billion in December to $230 billion in January, at annual rates.

Wage and salary disbursements continued to increase in January to an annual rate of $159 billion, $1½ billion above the December total. However, the rise in actual wage and salary receipts was limited to $1 billion, at an annual rate, due to increased employee contributions for social insurance reflecting mainly the expansion of the Old Age and Survivors Insurance program.

For the first time since February 1950 factory wages, which have accounted for two-fifths of the rise in total personal income since that time, showed no monthly increase.

Proprietors' and rental income increased from an annual rate of $47 billion in December to $49 billion in January. Farm proprietors' income accounted for about half the rise, as prices of agricultural commodities increased sharply. Farm income has risen considerably from the low point reached in the spring of 1950, but the January rate was still below the 1948 annual total of $17.7 billion.

Personal income at an annual rate of $239 billion in January, was 11 percent above the corresponding month of 1950.

Survey of Current Business (Department of Commerce, February 1951)

The February 1951 Survey of Current Business is the annual review number. Under

the general title "The Economy Expands Under Pressure of Demand," the United States economy during 1950 is reviewed. There is a wealth of statistical material and comment on the following subjects: national income and national product in 1950, price developments, industrial production, agricultural production and income, construction activity, domestic business investment, retail trade, foreign trade, financial developments, employment and labor conditions, and the business population.

CANADA

The Economist (London, February 17, 1951)

CANADA'S CONTRIBUTION IN STRATEGIC RAW MATERIALS

In recent years Canada has made tremendous advances in the production of non-ferrous metals. Nearly all the free world's nickel comes from Canada; its output of copper follows that of the United States, Chile and Northern Rhodesia. It is high on the list of zinc and lead producers and its reserves of power and relative nearness to Central American bauxite resources, make it a natural supplier of aluminum. Further, Canada has large iron ore deposits in Labrador and Ontario and, potentially, could become one of the chief suppliers of iron ore both to the United States and the United Kingdom. Canadian petroleum reserves are already supplying a proportion of domestic needs and might eventually become an important factor in total world oil supplies.

In the present shortage of strategic metals the main pressure is on expanded production of nickel, zinc, copper and aluminum. The article discusses plans and prospects for such expansion and points out some of the development and transportation problems involved.

EUROPE

Czechoslovakia

The Times (London, March 2, 1951)

CRISIS IN CZECHOSLOVAKIA.

Fact and fiction are hard to disentangle in the affairs of a "people's democracy."

Charges of espionage and treason have been hurled against ex-Foreign Minister Clementis and other leading characters in the Czechoslovak drama. Those men had been critical of the nationalized industries and of the drive for collectivization on the land and it is reasonable to assume that the Communist Government is reaching out to destroy any individuals or groups which might become leaders of resistance. President Gottwald made the point simply: Czechoslovakia must not become another Yugoslavia.

The Czech people have been eating too much and working too little for the good of their "eternal friendship" with the Soviet Union. Their Five-Year Plan set formidable production targets to supply the maximum amount of industrial equipment to Russia and other Cominform countries. Due to shortages of coal and manpower and the resistance of the workers to harder work for low wages, the targets set have evidently not been reached.

It would be useless to argue in Moscow that what is needed to stimulate production in Czechoslovakia is to fill the shops with consumer goods. For that would involve temporary diversion of resources from the purposes of the Cominform to the preservation for a satellite people of a higher standard of living than the Russian people have.

It has now been announced in Prague that the Five-Year Plan shall be completed in three years. The Czechs are to be turned into a nation of shock workers to make their country the sixth largest steel producer in the world by the end of 1953. The task of the Government cannot be either easy or agreeable. Czechoslovakia is a relatively advanced country in which democracy took root. It is a country of peasant proprietors who, as a class, are impervious to socialism. It is a country of workers with a history of independent trade unionism.

Tito had the mettle to resist Soviet demands. President Gottwald and his colleagues have been more impressed with the fate of the Bulgarian Kostov and the Hungarian Rajk, both of whom perished for championing too strongly the interest of their own peoples in economic dealings with the Soviet Union.

THE MIDDLE EAST

The Economist (London, March 3, 1951)

BASES AND TREATIES IN THE MIDDLE EAST.

The Middle East was largely a British sphere of influence until the United States entered the Second World War. Since then American interest in the area has increased so rapidly that thoughtful American politicians have come to consider this "Bridge of Asia" as important to the United States as Disraeli thought it vital to Britain.

American political interest grew in direct ratio to the discovery and acquisition by American companies of the rich oil deposits in the Persian Gulf. Its object is to defend these valuable possessions and to ensure that the maximum amount of petroleum from this part of southwestern Asia will be available to the Atlantic Pact powers in case of hostilities. A recent meeting at Istanbul of American diplomats in the Middle East reviewed the American position in the area.

There is cause for concern. Of the three countries--Greece, Turkey, and Persia--whose defense and administration have been built up to form a protective roof over the region, only Turkey is likely to stand firm in an emergency. However, until recently Turkey has not wanted to risk provoking Russia by allowing Britain or America facilities at air or naval bases on its territory. After the meeting of American diplomats in Istanbul, the Turkish Foreign Minister issued an official statement indicating that his country would "cooperate in the common and collective system of defence of the Eastern Mediterranean." It is now thought that Turkey will permit the Americans to equip and man an air base in Anatolia, grant facilities for British and American naval vessels in Turkish harbors, and most importantly, dovetail the strategy of the Turkish forces with that of the Middle East command.

It is fortunate for Anglo-American plans that Turkey is not hampered in its defense arrangements either by membership in the Arab League or by having recently been at war with Israel. Actually, although a Moslem state, Turkey has established relations approaching cordiality with Israel.

The aftermath of the Palestine war still hampers Anglo-American action in many parts of the Middle East. Egypt's land communications are broken with the other countries of the Arab Middle East. Jordan's sea communications with the Mediterranean are cut and there is no intercourse of any kind between Israel and its neighbors. Foreign governments find it difficult to be on cordial terms with both Israel and the Arab states. The Israeli Government might consider entering into a system for the collective defense of the area and granting American and British forces naval and air bases. But the project is unpopular with the Israeli army and, if effected, would make future treaty negotiations with Egypt and Iraq more difficult if not impossible for Britain.

While members of the Arab League led by Egypt have every reason to fear Soviet propaganda or Soviet imperialism, they have adopted a strangely neutral position. They claim that the League's own collective security pact is sufficient for the defense of the region at the moment. This pact is of little military value and Jordan, whose army--the Arab Legion is the best in the Middle East, is not a participant.

The immediate plans are to establish bases or modernize those already built in a semi-circle <u>outside</u> Israel and the Arab states. Their main object will be to protect petroleum fields, pipe lines, refineries and docks. The American and Anglo-American bases will also be within easy bombing range of one of Russia's most vulnerable areas--the Caucasian underbelly--and they will be supported by the RAF in Iraq and the Canal Zone of Egypt.

To the northwest of the petroleum area the U. S. Army Air Corps has operated since 1946 an efficient air base near Athens. It has naval facilities accorded by the Greek Government in the harbor of Piraeus and use of the port and landing ground at Salonika. The Americans are soon expected to join the RAF in the central Mediterranean at Malta. On the North African coast the American air corps has operated for several years a large air base near Tripoli while the RAF has smaller bases at Castel Benito (near Tripoli) Benghasi and El Adem (near Tobruk).

It is most unfortunate that no new treaty has been concluded with the Egyptian and Iraqi Governments. The failure of British diplomacy in this respect is due partly

to bitter feelings resulting from the Palestine war and the recognition of Israel. All efforts even to set up a joint command with the Egyptians for the invaluable air, sea and land bases in the Suez Canal Zone have failed so far. However, it is hoped that joint Anglo-American-Egyptian bases may ultimately be established in the Canal Zone and Anglo-American-Iraqi bases in Iraq.

Saudi Arabia is the only member state of the Arab League which contains a large and important American air base within a few miles of the oil fields. It is at Dharhan on the Persian Gulf and is superbly equipped for bomber and fighter units.

If the Kashmir dispute between India and Pakistan is settled, Pakistan will doubtless cooperate in the defense of the Persian Gulf area. The collective defense plans would then be spread more evenly over the region and not remain concentrated in the western sector.

Far Eastern Survey (New York, February 7, 1951)

PILOT DEVELOPMENT PROJECTS IN INDIA by Elizabeth Converse.

This article describes in some detail certain rural development projects now operating in several districts of United Provinces, India, which are successfully attacking the problem of low agricultural productivity. The first of these projects was undertaken in the fall of 1948 and covers about 100 villages and some 50,000 people in Etawah, a western district. The second, of about the same size, began in the spring of 1950 in the eastern district of Gorakhpur, and a third is now being started. These projects are not receiving foreign financial aid. The provincial government supplies the funds and the work is done mainly by Indian personnel. The projects were conceived and set up by an American, Mr. Albert Mayer, who now acts as visiting consultant, and several other Americans were originally employed to launch them.

The effects of a rural project are likely to last only if the whole-hearted cooperation of the villagers involved, has been obtained. In these projects work has

been from the bottom up with a Village Level Worker assigned responsibility for the work in four villages, whose job it was to know and work intimately with the local people.

Not only have crop yields increased significantly in these project areas, but important strides have been made by the villagers in the treatment of animals, in plant pest protection work and in the use of improved agricultural implements. Under the canopy of "village participation" a number of educational activities have been fostered--adult literacy classes, group discussions, village libraries and numerous demonstration projects in agricultural methods, anti-malaria spraying, road-building, and sanitation.

The United Provinces pilot projects offer a concrete example of what can be accomplished with very limited funds in an underdeveloped country. Their success is based on realistic planning, on a trained and sympathetic approach to human problems, and on genuinely democratic methods of operation. One of the American technicians employed, an agricultural extension man, expressed his conviction that once the Indian farmer had confidence in the project workers, he was as receptive, as eager to learn and as capable of doing so, as any farmers he had worked with anywhere.

The projects also demonstrate what immense improvement could be achieved by relatively limited outside assistance if applied in a scientific and understanding manner. Mr. Mayer estimates that an annual expenditure of $5 million by the United States or any other country would maintain 200 trained men and women who could undertake 100 pilot projects of this and other types in various parts of India.

SUMMARY OF MISCELLANEOUS NEWS ARTICLES

February 1, 1951

UNITED STATES

Statistical Series (Securities and Exchange Commission)

1. Release No. 979, December 24, 1950.

VOLUME AND COMPOSITION OF INDIVIDUALS' SAVING, July-September 1950.

The postwar trend of lower liquid saving by individuals continued during the third quarter of 1950. It is estimated that individuals saved on balance, during the quarter, only a nominal amount of about $100 million in liquid form, compared with $1.4 billion in the third quarter of 1949. Liquid saving in the third quarter of 1950 amounted to less than one-fifth of 1 percent of income after taxes compared with an annual rate of over 2 percent in 1949 and about 6 percent prior to the war. Substantial saving in the form of currency and bank deposits and insurance was offset by a record increase in mortgage and consumer debt and by a decrease in individuals' holdings of U. S. Government securities.

Non-liquid saving by individuals continued at a high rate during the third quarter of 1950. Home construction, including alterations and also construction by nonprofit institutions, amounted to $3.8 billion in the third quarter as compared with $2.3 billion in the same period of 1949. Purchases of automobiles and other durable goods amounted to a record $8.5 billion in the third quarter.

The largest component of individuals' saving in the third quarter of 1950 was a $2.1 billion increase in insurance and pension reserves. Private life insurance accounted for $1 billion and government insurance and pension reserves accounted for $1.1 billion.

Mortgage debt of individuals increased $1.8 billion in the third quarter of 1950, a new record rate. Other consumer debt also showed a substantial increase, $1.7 billion.

2. Release No. 980, December 27, 1950.

WORKING CAPITAL OF U. S. CORPORATIONS, September 30, 1950.

The net working capital of American corporations reached a new high in the third

quarter of 1950 and was estimated at $75.9 billion at the end of September. During the third quarter $2.2 billion was added to working capital, reflecting increases in cash, government securities and inventories, offset in part by a rise in federal income tax liabilities.

In addition to the increase of $2.2 billion in working capital, corporations invested about $4.1 billion in plant and equipment during the third quarter of 1950. To finance this $6.3 billion expansion, corporations obtained about $800 million from external sources, about one-eighth of their requirements. Long-term borrowings amounted to about $600 million. Net new stock issues added $200 million. Internal sources--depreciation accruals and undistributed profits--provided the remaining $5.5 billion for corporate capital expansion in the third quarter.

3. Release No. 982, December 30, 1950.

BUSINESS EXPANSION PLANNED FOR 1951.

A special survey of business plans made jointly by the Securities and Exchange Commission and the Department of Commerce estimates that business is planning to expand at a record rate of $21.9 billion in 1951. This is 21 percent higher than the estimated outlays for 1950 and about 14 percent higher than the peak expenditures in 1948.

With allowance for the rise in capital goods costs during 1950, the physical volume of outlays in 1951 is currently anticipated at about 17 percent above actual expenditures in 1950. In view of the demand which increasing defense outlays will make upon tight materials and manpower, there is some question as to whether the expansion planned will be fully realized in 1951.

Some two-thirds of the planned increase in capital outlays for 1951 over 1950 is attributable to manufacturing companies. They expect to add $10.6 billion to their plant and equipment during 1951, an increase of $2.6 billion or 33 percent over 1950. Iron and steel companies plan approximately to double their expenditures in 1951. The chemical industry also is planning substantial additions.

Railroads and mining companies are planning to spend about 19 percent more in 1951

than in 1950 while transportation companies other than railroads plan to spend 44 percent more. Electric and gas utilities plan to spend about 7 percent more in 1951. For commercial and other companies an 8 percent increase in spending in 1951, is estimated.

EUROPE

The United Kingdom

The Economist (London, January 6, 1951)

MID-CENTURY.

In spite of the difficulties which Western civilisation faces at the mid-century, there is room for limited optimism. For several years ahead the West can concentrate on the necessities of physical defense only at the cost of severely thinning the fruits of the free society. But it is important to see the sacrifice in proportion. As was shown in 1939-1945 even war itself can be fought without a catastrophic surrender of the basic personal liberties or the rights of criticism.

For all the postwar poverty of Europe, the West as a whole is richer than ever. It is necessary in this instance not to confuse the problems of the free world with the secular shift of the centers of power and wealth away from Europe. For what Europe lacks in economic strength the United States possesses in abundance.

"Against all the losses of the twentieth century must be set the fact that the United States has come of age. It has come to a heritage far different from anything anyone expected. The leadership to which the United States has succeeded has turned out to be that not of a gloriously expanding world economy but of a half-world on the defensive, and, therefore, imposing more in responsibilities than it provides in privileges. Those responsibilities the American people have accepted--with doubts and hesitations and even now inconsistencies, yet on the whole with remarkable foresight, courage and energy. Three years ago the United States came to see, and one must assume will continue to see, that it could not have security in the postwar world until the Russians were convinced that Western Europe would not be left either to succumb to invasion or to be so weakened by cold war as to fall under Communist dictatorship from within. It will be time to despair for the free world if ever this partnership of its

two halves should dissolve."

Union of effort is not enough. The free world cannot just go on preserving itself by being strong enough to deter aggression. At some point there must be a break in the international tension, whatever the Russian decision on peace and war. At some point in the twentieth century the success of the free world will consist not in its self-preservation but in its ability to go forward. In democratic terms this means its capacity to offer its own people and the poor communities in Africa and Asia--rising standards, both material and moral, which dictatorship cannot provide. For this, two things are necessary now. In defending itself against Communism the West must maintain, through perhaps a decade or more of acute mental and physical strain, as much as possible both of its freedoms and of its economic progressiveness.

The superiority of western society is not only that it is just and free but also that it is rich. The economic problem for the beginning of the half-century is to combine equalitarianism and full employment with the conditions of efficiency, flexibility and self-restraint necessary for effective defense and sustained economic progress.

The one certainty today is that the pattern of the next fifty years is more than usually undecided. It is possible for this generation more than most to shape the lives of many generations to come. There is no reason to despair of making those lives rich and fruitful but it will require iron nerves and strong heads.

THE FAR EAST

Foreign Affairs (January 1951)

PARTNERSHIP WITH ASIA by P. C. Spender, Minister for External Affairs of Australia.

More than one billion people have been caught up in political and social transformation in Asia in the course of less than ten years. In six countries of South and Southeast Asia, 550,000,000 people have passed through the crisis of Japanese aggression, later the complete elimination of Western political control, and have assumed the full responsibility for their own political future. Further, China has undergone Communist revolution and Japan has yet to be readmitted to the community of nations.

There is no more important task of international relations than the development of mutual trust and confidence between Asia and the countries of the Pacific, particularly the United States, Australia, New Zealand and Canada, and between Asia and Western Europe.

The non-Communist world must associate itself with the dynamics of Asia. Today Communist agents move among the peoples of Asia preaching doctrines of national independence, of reform of social equality, of economic development, and the elimination of the evils of landlord-tenant relations. These are objectives the Asian people want. Only the non-Communist world can help in their attainment. But exposure of Soviet ruthlessness and the falsity of Communist premises will not of themselves divert Asian people from Communism. The free world must take unto itself the constructive reformist ideals of Asia.

Nationalism in Asia was predominantly a movement against colonial imperial power with the objective of social reform as one of its significant features. The basic liberal conceptions--passionate devotion to individual liberty, political and economic freedoms--find limited acceptance among Asian peoples, accustomed to a social system centering generally upon the family unit within the larger organism of a paternalistic government which has taken a variety of forms of absolutism. The West has failed in the main to find the key to open the confidence of Asia and to hasten the assimilation by Asia of the best in Western democracy--liberal institutions, efficient government, principles of economic equality, techniques of social welfare and the technology of production. These ideas are foreign to the present Asia, however much her leaders may deny it.

The most constructive approach which the West can make is to participate, with the consent and encouragement of the governments of Asia, in the process of economic and social development which is part of the nationalist movement in Asia. Constructive policy will offer ready assistance to governments to carry out economic and social programs in ways of their own choice.

"What is required is a flow of capital to Asia to supplement the deficiencies in internal savings and to provide its governments with the means of financing new projects

of development. Private capital can play its part. The foreign capital will be spent on imports of all kinds both to sustain consumption and to provide the equipment needed for a rapid growth in productive output. Asia is rich in manpower, but poor in the capacity of its manpower to produce what it needs for a better life. Asia also needs technology from the Western world, and techniques of economic organisation and government administration. But the flow of aid of this kind must be adapted to the tempo of social change which is wanted by the countries themselves and which can be absorbed in their own cultural and political systems. The yardsticks of success will not be the extent to which production of the few major export industries is raised, but the extent to which economic resources are used and bring a general sharing of increased wealth and widened opportunities for employment. Merely to pour into Asia quantities of advisers, for example on the techniques of social welfare as developed in the advanced capitalist countries, will not necessarily lead to successful results. The problem of social reform requires a real pooling of ideas. The pooling can fruitfully take place in Asia itself, the more advanced assisting the less advanced within social systems that are generally similar to each other. In addition the partnership between Asian countries and the more developed countries of the West needs a two-way traffic of ideas which will dissipate our mutual ignorance of each others' philosophies, religions, social ideals and political objectives. In current planning of 'assistance' programs perhaps overmuch attention is being given to the one-way traffic in technical and financial assistance, while the advantages of an intake of ideas from Asia are being neglected. This is an area of cooperation where governments have a part to play by stimulation and exhortation. But the channels will be non-governmental--through universities, employer and trade union associations, international machinery like the International Labor Organisation, conferences of newspaper editors, scientists and intellectuals in all walks of life. In this way the non-Communist world can present to Asian people the best in its liberal democratic traditions and its sciences."

Bilateral aid arrangements between contributors and recipient governments can be successfully made in some cases. However in Asia there are substantial advantages in

using the United Nations and its specialized agencies. The British Commonwealth nations have undertaken an experiment which seeks to combine the most beneficial features of the bilateral and international methods of organising assistance. A Commonwealth Consultative Committee, consisting of India, Pakistan, Ceylon, the United Kingdom, Australia, New Zealand and Canada has established a Technical Assistance Bureau in Colombo and has prepared a comprehensive report on the development of India, Pakistan, Ceylon and the British Territories in and around the Malayan Peninsula. A program of economic development for each country over a six-year period beginning in 1951 is designed to bring help to more than 400,000,000 people in Asia. In this cooperative work will be found an effective partnership between Asian and non-Asian governments. Already the Commonwealth governments have suggested to other governments in the area that they join in the enterprise and preliminary discussions have been held. No program of regional assistance in Asia as a whole could succeed without cooperation and material support from the United States and other countries outside the area. A successful attack upon the problem would involve a regional inter-governmental arrangement which would include governments outside the Asian area which have special interests within it. In a wider venture embracing other countries, the organization would be changed and would no longer be identified as a Commonwealth enterprise as such.

The democracies have the advantages of tremendous resources, genuine humanitarianism, and the desire to work for the full sovereign independence of Asian peoples. Communism has none of these objectives. It has attracted many Asian people by its successful exploitation of the nationalist idea and because the Western democracies have had only limited success in reaching the minds of Asians. Through the United Nations the democracies of the world have been able to act against aggression in Asia. But the value of this demonstration will be dissipated unless we realize that the victory to be sought lies in the realms both of material welfare and abstract ideas.

SUMMARY OF MISCELLANEOUS NEWS ARTICLES

January 2, 1951

UNITED STATES

Survey of Current Business (U. S. Department of Commerce, November 1950)

FOREIGN TRANSACTIONS OF THE U. S. GOVERNMENT IN FISCAL 1950.

Gross foreign aid extended by the U. S. Government in the form of cash or goods and services in the fiscal year ended June 30, 1950 declined to $5 billion from the high of $6.4 billion in the previous year. This was the sharpest year-to-year change during the postwar period. It brings the 1946-1950 annual average to $5.7 billion.

Among the outstanding developments of the past fiscal year were: the initiation of the Mutual Defense Assistance Program, the enactment of legislation to implement the Point Four program proposed by the President in his inaugural address in January 1949, and the establishment of a new program of economic aid for the Far East.

Gross foreign aid rendered by the U. S. Government in the five postwar years which ended June 30, 1950, aggregated $28.1 billion. This is exclusive of the Government's investment of $3.4 billion in the International Bank for Reconstruction and Development and the International Monetary Fund.

Government aid played a large part in financing the export surplus of the United States during the postwar period. The recent decline in aid has been accompanied by an even greater reduction in the margin of exports over imports. Further, the sharp curtailment of aid in the form of long-term Government credits has contributed to the reversal in the flow of net foreign investment.

Developments since the invasion of South Korea on June 25, 1950 have greatly altered the outlook for additional new foreign aid and other activities abroad. New authorizations and appropriations by Congress from July through September will provide $8.7 billion in addition to the carry-over of $5.4 billion from previously authorized aid programs, making a total of $14.1 billion now available for grants and credits after July 1, 1950. Almost all of the new funds are for grants. The only new credit authority is that of $62.5 million for a loan to Spain. Nearly half of the new appropriations will be for military, in contrast to economic, aid.

The article reviews briefly the distribution of foreign grants under ECA and other programs,

the legislative implementation of Point Four, the status of the guaranty program, and expenditures for stockpiling purposes.

(A number of tables and charts are included.)

Business News Reports (U. S. Department of Commerce, December 8, 1950)

PERSONAL INCOME, October 1950.

Personal income continued its upward move in October and at an annual rate of $230.1 billion, was $1.4 billion higher than in September. The rise was accounted for mainly by increased wage and salary receipts which together with higher farm proprietors' incomes and transfer payments more than offset a drop in corporate dividend disbursements.

Disbursements of wages and salaries rose from an annual rate of $150.6 billion in September to $153.1 billion in October. Almost all of the increase occurred in manufacturing and government. Factory payrolls rose $1.1 billion at an annual rate as both employment and average hourly earnings continued upward. The rise in October brought factory payrolls to an annual rate of $53.1 billion as compared with $48.4 billion in June prior to the outbreak of hostilities in Korea. Factory payrolls accounted for nearly three-quarters of the June-October increase in private industry payrolls--from $122 billion to $128.4 billion at annual rates.

Government wages and slaries increased from an annual rate of $23.7 billion in September to $24.7 billion in October, largely due to rising military payrolls.

Statistical Series (Securities and Exchange Commission, December 11, 1950)

PLANT AND EQUIPMENT EXPENDITURES OF U. S. BUSINESS, 1950-51

Business expenditures for new plant and equipment planned for the first quarter of 1951 are expected to exceed any previous first quarter and after seasonal adjustment will be at the highest rate on record, according to the most recent survey of capital outlays made jointly by the Securities and Exchange Commission and the Department of Commerce. Expenditures planned for the first quarter of 1951 are estimated at $4.8 billion, thirty percent more than in the first quarter of 1950. Based on preliminary returns, if plans for the year as a whole are realized, 1951 capital outlays will be higher than in any previous year.

According to present estimates, total expenditures for the year 1950 will just about equal the total for 1949, $18.1 billion. Outlays for the last half of 1950 are expected to amount to

10.1 billion, about twelve percent more than the last half of 1949 and approximately equal to the record amount spent in the last half of 1948. Outlays during the first half of 1950 were about twelve percent less than in the first half of 1949.

Manufacturing corporations account for almost the entire increase in expenditures by business in the last half of 1950 compared with the last half of 1949. Manufacturing companies will have invested about $4.6 billion in plant and equipment in the last half of 1950 compared with $3.5 billion in the last six months of 1949. Expenditures by manufacturing enterprises for all of 1950 will amount to some $8.0 billion, about ten percent more than the 1949 total. Except for electric and gas utilities other industry groups will show some decrease in their 1950 plant and equipment outlays.

Actual expenditures for the third quarter of 1950 were about seven percent lower than previously anticipated. The present estimate of planned outlays for the fourth quarter of 1950 is fourteen percent higher than the previous estimate. All industry groups expect to increase their expenditures.

Current Population Reports: Labor Force (U. S. Department of Commerce, Bureau of the Census, December 8, 1950)

THE MONTHLY REPORT ON THE LABOR FORCE: NOVEMBER 1950.

Total civilian employment for the survey week ending November 11 was estimated at 61.3 million, a drop of half a million between October and November as harvesting operations entered the final stage. Even with the drop, civilian employment was about 1½ million above the previous November high in 1948.

Nonagricultural employment rose to an all-time November high of 53.7 million.

The downtrend in unemployment was interrupted in November when the jobless total rose to 2.2 million from 1.9 million in October. There was some evidence that this increase may reflect the entry of persons into the labor market, probably seeking temporary jobs for the holiday season. There was also a slight increase in unemployment among factory workers, some of which may have been due to temporary dislocations in industries affected by the defense program. Nevertheless, the unemployment rate in November was only 3.5 percent, compared with 5.4 percent in November 1949.

The civilian labor force which includes both the employed and the unemployed, was estimated at 63.5 million in November. The total labor force, including the armed forces, was estimated at 65.5 million, about a million larger than in November a year ago and 8 million larger than in November 1941 on the eve of U. S. entry into World War II. "The number of young persons under 25 in the labor force, however, was about the same in November 1950 as in 1941, both because the teen-age population has declined in numbers as a result of the low birth rate of the depression years and because many young women have remained outside the labor force as a consequence of the consistently high marriage and birth rates of recent years. In addition, many young veterans are still outside the labor force and attending school. Most of the expansion in the labor force since 1941 is attributable to the increased number of workers 35 years old and over, men as well as women. Among men, this increase has stemmed largely from population growth, but, among women, the higher degree of labor force participation has also been a major factor. As a result of both these factors, women 35 years of age and over accounted for about 16½ percent of the total labor force in November 1950, as compared with 11 percent in November 1941; and all women accounted for 30 percent as compared with 26 percent in 1941. Men 35 years of age and over accounted for about the same proportion of the labor force in November 1950 as in 1941--41 percent, even though the proportion which all men formed dropped from 74 percent to 70 percent."

Harper's Magazine (New York, December 1950)

THE DANGER POINT IN TAXES by Colin Clark.

Colin Clark, the well-known Australian economist, has an interesting article in the December 1950 issue of Harper's in which he asks the question: "How high can taxes rise without economic trouble?"

Based on the experiences of many countries during the past twenty-five years, his conclusion is--"that the safe political and economic limit of taxation is somewhere near 25 percent of the national income. In this figure all forms of taxation are included: direct and indirect, federal, state, and local. The figure doesn't tell what proportion of your individual income can legitimately be taken in taxation; it simply indicates how large a proportion of the national income can safely be taken."

EUROPE

Foreign Policy Bulletin (Foreign Policy Association, New York, December 1, 1950)

FEAR OF ASIAN WAR FOSTERS 'NEUTRALISM' IN EUROPE.

Whatever the immediate Chinese Communist reasons for intervening in North Korea, it is evident that this development interlocks with crucial decisions now being made in Europe. One of the most critical involves the proposed creation of unified armed forces with German participation, which would be able to resist future Russian aggression.

The Soviet Union has sought to disrupt these plans by proposing negotiation of a German peace treaty and the permanent demilitarization of the former Reich. Communist action in Korea, by absorbing much of America's military reserve, has shown how little armed aid the United States could give Europe if the Russians should start a serious offensive at several weak spots around the periphery of the U.S.S.R.

General Omar N. Bradley, chairman of the Joint Chiefs of Staff clarified the implications of this situation when he declared at Atlanta on November 17 that the Korean war had left the West without adequate military reserves except for the atomic bomb. Europeans fear the prospect of atomic warfare because they see their countries first overrun and then "liberated" by bombing.

These fears have fostered the growth of defeatism and strengthened the hand not only of Europe's Communists but also of "neutralists" who maintain that the "cold war" is chiefly a struggle between the United States and Russia in which other countries should refuse to become involved. Recent developments in the Far East have augmented this "neutralist" sentiment. Uneasiness about General MacArthur's leadership is part of it.

Recent changes in United States policy with respect to Spain has led some Europeans to claim that Washington intends to defend Europe at the Pyrenees rather than the Elbe or even the Rhine. The involvement of France and Britain in costly campaigns in Indo-China and Malaya respectively reduce further the availability of defense resources in Europe itself.

"Neutralist" sentiment has manifested itself in different parts of Europe in accordance with local political rivalries and traditional national interests. In France, it has combined with the historic fear of German militarism to produce strong opposition to any German rearmament which cannot be safely controlled. In Britain, which has been our most enthusiastic partner in advocating strong Western defense, some criticism has emerged recently within the Labor party

self directed particularly against plans for increased military expenditure within the framework of the North Atlantic pact. These critics feel that increased reliance on American aid will further reduce Britain's independence and may lead to a fatal arms race with the Soviet Union.

Perhaps the most serious setback to European defense plans has occurred in Western Germany. The whole concept of German rearmament prior to full independence, was dealt a blow at state elections in the American zone in November, when the Social Democrats who had made opposition to rearmament a major campaign issue, won substantial increases. Interpreters of the German scene think that these results, together with widespread abstention from the polls by young people, reflect strong popular opposition to involvement in any war as well as an attitude of defeatism and nihilism growing out of the bitter experiences of two world wars.

On October 21 at Prague the foreign ministers of eight Eastern European nations issued a declaration on Germany calling for a ban on German rearmament, the unification of Germany, the suppression of war industry, conclusion of a peace treaty and withdrawal of all occupation troops, and the creation of an all-German council representing East and West Germany equally, to set up a new government. Following this declaration the Soviet Union on November 4 formally proposed that the Council of Foreign Ministers meet to discuss a German settlement based on it. About a week later Britain, France and the United States rejected the Soviet proposal in somewhat different statements, attacked Soviet policy in Germany, and made alternative suggestions for a conference to discuss other outstanding issues such as the Austrian treaty and the Far Eastern situation, along with the German problem.

Many observers feel that the Soviet proposals were simply intended to strengthen neutralist sentiment in Europe among those who hope that negotiation may ease international tension. In view of recent developments in Europe, it is doubtful whether any progress could be expected to come from a conference called on the basis of the Soviet proposals.

A leading French journalist reports that Europeans are looking to the fate of Secretary of State Acheson as an index of whether or not the Atlantic policy of political, economic and military partnership in Europe will be replaced by a more active policy in Asia. Regardless of whether the stress on Mr. Acheson's role is justified, it is true that any signs of a renunciation of the Atlantic policy will increase neutralist hope of escaping involvement in any Russo-American hostilities.

THE FAR EAST

Ceylon

Foreign Commerce Weekly (U. S. Department of Commerce, December 11, 1950)

CEYLON: TECHNICAL COOPERATION WITH U. S. UNDER POINT-4 PROGRAM.

"The U. S. Department of State has announced that on November 7, Ceylon concluded a standard general agreement for technical cooperation with the United States under the Point-4 Program. The agreement sets forth the conditions under which the United States will provide technical training for nationals of Ceylon and the services of American tedhnicians to assist Ceylon in its efforts to develop its economy and improve the living conditions of its people. It also establishes a pattern for similar understandings with other countries.

"Under the general agreement, separate agreements will cover specific projects involving technical cooperation which will be carried out in Ceylon. (Such projects are being planned in a number of countries, and a large scale project for rural improvement in Iran was announced on October 19.)

"The general agreement with Ceylon is considered significant not only because it is the first of its kind to be concluded under the new Point-4 Program but because it clears the way for technical cooperation projects in an area of the world where technical assistance can contribute to economic development.

"Ceylon has rich agricultural resources, well suited to the production of tropical products. However, the production of rice, the principal food crop, is low, so that each year Ceylon must use about half its foreign exchange expenditures for imported foodstuffs. Although living on an island, the people catch only half the moderate amounts of fish they consume.

"The principal exports are tea, rubber, and coconut products. The sale of these crops gives Ceylon a favorable balance of merchandise trade, particularly with the United States. There is relatively little industry, and although Ceylon hopes to carry out a modest program of industrialization, its Government is devoting its chief effort to increasing the island's food production by bringing more land under cultivation and raising the production per acre through improved farming methods. One of the principal programs (among them the Gal Oya project) is that for water development, both for the production of hydroelectric power and for irrigation.

"Prior to achieving independence, Ceylon's principal experience was with British technicians,

at since 1948 the Government of Ceylon has begun to look to the United States, as well, for technical assistance. For instance, a United States firm is constructing a dam, a small power plant, and irrigation canals for watering 65,000 acres of rice and garden land, as part of the large Gal Oya project. Ceylon has obtained the services of a U. S. Bureau of Reclamation engineer to advise on airport development, and a Federal Reserve Board expert to assist in the establishment of a central bank, of which he is now governor."

Executive 1074.

New York, New York

Dear Ed:

It's been a long time since Tharon and I have been as moved by anything as we were by that exquisite windup to your broadcast last evening.

All my warmest, best.

Sincerely,

Milo

April 17, 1950

Dear Milo:

Again I am in your debt. I shall study the memorandum on Venezuela at the first opportunity and I am sure it will provide me with balance, or rather, counter-balance, when this business of oil from there comes up again as it undoubtedly will.

Please save an evening for us when you get back to town.

As ever yours,

SP

Mr. Milo Perkins
1200 Eighteenth Street, N.W.

April 14, 1950

Mr. Edward R. Murrow
Columbia Broadcasting System
Warner Building
Washington, D.C.

Dear Ed:

I realize that in your broadcast last evening where you mentioned the opposition of the coal industry to imports of oil from Venezuela that you were merely reporting the news. Having just returned from a couple of months in Venezuela, however, I am very sensitive to the vital importance of close commercial ties between our two countries. The other side of the story is set forth in a very excellent report of a group of Venezuelan businessmen and I am taking the liberty of enclosing a copy.

We sell Venezuela roughly half a billion dollars worth of goods a year which is considerably more than we buy from her. Any quota on Venezuelan oil would enormously increase the cost of fuel oil to the American consumers. It would also be a reversal of our effort to promote freer world trade.

Everybody I know - and I put myself at the top of the list, Ed - considers you as our number one radio commentator in this country. I hope you can find the time, therefore, in the next week or two to go over the memorandum I am sending along with this letter.

I'm so sorry we didn't get to have any visit of consequence at Dave Lilienthal's last Saturday night, but I thoroughly enjoyed the chance to visit with Janet at dinner. We've got to be in New York next week, but as soon as we get back I hope the four of us can get together.

With all good wishes.

Sincerely,

Milo

INTRODUCTION

The Venezuelan Chambers of Commerce and Production, aware of the eventuality that the U. S. A. might impose new tariff barriers or other restrictive measures to the importation of foreign oil, had thought it advisable to appoint a Delegation which, on behalf of all the sections of the private Venezuelan economy, would approach similar American institutions to emphasize to them the serious repercussions of any such decision on their mutual economic interests.

This Delegation, anxious to contribute to the maintenance and expansion of the long standing high volume of trade, between Venezuela and the United States, addresses this report to all those who are interested in the development of the American-Venezuelan commerce.

The following pages present fundamental facts about the Venezuelan economy - facts essential for a complete understanding of the problem. They indicate the growth and current position of trade between the two countries and consider the detrimental consequences of any restrictions on American importations of Venezuela's first export item, crude oil and its refined products.

INDEX

Members of the Delegation.

Chambers and Associations of Commerce and Production represented.

Introduction.

Chapter I ..... "Venezuela is an excellent market for the United States".

Chapter II ..... "Venezuela's role as a seller in the United States market and the relation existing between the two countries in international commerce".

Chapter III ..... "Venezuela is a country open to foreign trade".

Chapter IV ..... "If the United States were to restrict imports of Venezuelan oil, there would be adverse repercussions in both countries".

Chapter V ..... "Venezuela has always followed a policy of absolute equality between domestic and foreign investors."

Chapter VI ..... "If the United States were to restrict its purchases of foreign oil through the establishment of tariff barriers or other measures it would defeat its own policy favoring free trade and financial aid to underdeveloped countries".

Chapter VII ..... "Venezuela, because of its traditional monetary stability and free exchange is the most promising country for the investment of foreign capital".

Chapter VIII ..... "Venezuela has achieved its present state of economic well-being through the employment of its own resources".

Chapter IX ..... "Venezuela, by its own resources, achieved an appreciable increase in its investments in capital goods".

SUMMARY.

VENEZUELA IS AN EXCELLENT MARKET FOR THE UNITED STATES.

Venezuela's purchases from the U. S. A. have greatly increased in the last few years. Between 1938 and 1949, purchases in the U. S. have grown from $52,270,000 to $514,000,000.-, a net increase of 843%. The aggregate amount purchased by Venezuela from the U. S. A. during the last decade amounted to $2,072,100,000.-.

If one compares the ratio between purchases from the U. S. A. and total imports made by Venezuela, a similar trend is observed. In 1949 imports from the U. S. A. reached 73.6% of the total. See table below.

VENEZUELAN IMPORTS FROM 1938 to 1949

(In thousands of U.S.$)

Years	U. S. A.	Total	%
1.938	52.269	92.821	56,3
1.939	59.477	97.431	61,0
1.940	67.507	92.886	72,7
1.941	66.923	85.918	77,9
1.942	46.601	64.385	72,4
1.943	43.258	66.287	65,3
1.944	83.727	111.200	75,3
1.945	131.857	180.379	73,1
1.946	207.257	294.207	70,4
1.947	409.655	558.343	73,4
1.948	501.322	685.414	73,1
1.949 (°)	514.000	698.000	73,6

(°) Provisional Data.

Comparing the figures of U. S. A. exports to the various countries of the world shown in the tables below, one observes that:

1st: Venezuela is the foremost purchaser of American goods among all the countries of Latin America. For the year 1949 Venezuela bought 19.28% of the United States' total exports to the Latin American countries.

2nd: Venezuela is the fourth largest foreign market of the U. S. A. But since countries like England and Western Germany finance most of their imports with E. R. P. (Marshall Plan), dollars Venezuela may be regarded as the second largest world market for U. S. exports, second only to Canada.

Venezuela's total imports from the U. S. A. benefit almost all the States as Venezuela is a large purchaser of agricultural products and manufactured goods. If we exclude the countries included in the European Recovery Program, Venezuela becomes the foremost purchaser of American foodstuffs; that is to say, first among those customers of the United States whose purchases have not been financed indirectly by the American taxpayer. If Venezuela, through a lack of dollars, were to find itself compelled to reduce its U. S. imports drastically, such a reduction would immediately result in an appreciable loss for those regions producing foodstuffs and would probably result in an additional burden to the American taxpayer.

The following figures will give the reader an idea of Venezuela's consumption of American products:

	1.948	1.949 (°)
Foodstuffs and Beverages.-	$ 70.500.000	$ 69.200.000
(Iowa, Neb., Wis., Cal., Wash., Ore.)		
Cigarettes	$ 2.200.000	$ 2.800.000
(N.C., Vir., Ky.)

Chemical Products.-	$ 23.100.000	$ 25.200.000
(Texas, Penna., N.J. Mich., Mass.-		

(°) Figures based on statistical data covering eleven months.

CONCLUSION:

Venezuela is one of the principal and most profitable markets of the United States (73.6%). With a population of five millions, (Less than 5% of the total population of Latin America) Venezuela absorbs 19.2% of U. S. exports to Latin America. Venezuela is the second largest purchaser of U. S. goods, which are paid in full from receipt obtained from its own resources.

VENEZUELA'S ROLE AS A SELLER IN THE UNITED STATES MARKET AND THE RELATION EXISTING BETWEEN THE TWO COUNTRIES IN INTERNATIONAL COMMERCE.

Venezuela, as will have been observed, stands FIRST among all the countries of Latin America as a purchaser of American goods, and SECOND among all the countries in the world (with the exception of Germany and Great Britain).

Let us examine Venezuela's position as a seller to the United States and the rest of the world.

The following table shows the aggregate amount of Venezuela's exports including the value of crude oil exported to the Dutch Islands of Curacao and Aruba, for refining before re-export abroad.

Venezuelan Exports During the Years 1947 and 1948

(In thousands of dollars)

	1947	%	1948	%
1) United States	252,495	39.02	416,477	40.04
2) England	77,680	12.00	144,552	13.90
3) Argentine	38,913	6.01	61,402	5.90
4) Brasil	27,738	4.29	48,728	4.68
5) France	29,106	4.50	33,510	3.22
6) Sweeden	24,823	3.84	30,896	2.97
7) Holland	21,079	3.26	27,665	2.66
8) Canada	18,347	2.83	27,440	2.64
9) Trinidad	10,845	1.67	23,491	2.25
10) Spain Canary Islands	5,016	0.78	22,329	2.15
11) Belgium	12,771	1.97	19,186	1.84
12) Denmark	9,147	1.41	16,176	1.55
13) Norway	6,915	1.07	13,143	1.26
14) Italy	9,354	1.45	10,310	1.00
15) Uruguay	5,739	0.88	10,208	1.00
16) Portugal	5,378	0.83	8,178	0.78
	555,346	85.81	913,681	87.84
Other Countries	91,824	14.19	126,443	12.16
	647,170	100.00%	1,040,124	100.00%

The United States, it can be seen, is Venezuela's most important market having absorbed 39.02% in 1947 and 40.04% in 1948 of it's total exports.

This situation assumes greater importance when it is considered that the principal item among Venezuela's exports is oil from which it mostly depends.

On the other hand United States imports from Venezuela were only to 4.40% of its total 1947 and 5.89% in 1948.

Imports of the United States

(Thousands of Dollars)

Source	1947	%	1948	%
Venezuela	252,495	4.40	416,467	5.89
Other Countries	5,480,974	95.60	6,653,877	94.11
TOTAL	5,733,369	100.00	7,070,344	100.00

In the U. S. Venezuelan commercial relations there is another factor which favors the United States and it becomes apparent when the Trade Balance is analyzed.

Trade Balance of the United States and Venezuela

(In thousands of dollars)

	1947	1948	1949 (*)
Exports	$ 409,655	$ 501,322	$ 514,000
Imports	252,495	416,467	385,000
Favorable Balance	$ 157,160	$ 84,855	$ 129,000

(*) Provisional Data.

The above table shows that the Trade balance is favorable to the United States, in spite of the fact that the United States only makes less than six percent of its total foreign purchases in Venezuela.

The U. S. position, becomes even more favorable if we take into account the additional U. S. revenue from other sources. This revenue may be detailed as follows:

Freight charges paid to American steamship companies; maritime insurance; re-insurance; remittances from American citizens to their families in the United States; expenditures made by Venezuelan citizens within the United States (residents, students and tourists); rentals for motion picture films; and profits earned from American capital invested in Venezuela.

The approximate breakdown is:

(In millions of dollars)

	1947	1948
Maritime transport	66.8	95.5
Insurance	7.2	10.2
Remittances by Americans	10.0	12.0
Expenditures of Venzuelans in the U.S.	4.0	15.0
Earnings of American Companies	205.4	309.9
Motion Picture Rentals	2.5	2.8
T O T A L	295.9	445.4

This additional U. S. income, added to the favorable Trade Balance yielded a total of $433,100,000 in 1947 and $530,600,000 in 1948.

From this we must naturally deduct the income that Venezuela receives from the United States, from similar sources as well as the new investments of American capital. According to a study published in the International Financial Statistics of the International Monetary Fund, Venezuela received from the rest of the world the sum of $20,700,000 in 1947. Allowing an increase of 15% for 1948, the figure reached is $23,800,000. The re-investments of oil companies for 1947 were estimated by the Balance of Payments Yearbook at $124,200,000 and, according to data from the companies themselves, they were $214,900,000 in 1948.

Thus by deducting the foregoing amounts from the sums mentioned above, we obtain the following final balances in favor of the United States:

	1947	1948
	$453,100,000	$530,600,000
Less--------	144,900,000	238,700,000
Balance:	$308,200,000	$291,900,000

To summarize: The United States, in purchasing from Venezuela but 5.89% of its total imports, actually derives a much greater benefit than Venzeula.

Since Venezuela maintains a typically multilateral trade (in contrast with the bilateral systems that are so predominant in the world today), Venezuela's Trade Balance for 1948 was favorable everywhere except in the United States, and in Italy, where Venezuela also had a $3,000,000 adverse balance.

VENEZUELA IS A COUNTRY OPEN TO FOREIGN TRADE. In a world which every day tends more towards protectivism and in which new obstacles are daily being placed against the free exchange of merchandise, Venezuela stands unique as a country whose doors are open wide to international trade.

In Venezuela, as in other countries, there are, of course, import duties. (Some articles require import licenses, but, taking our foreign commerce as a whole, they play an absolutely secondary role).

Our import duties, in the majority, are not of a protective nature, and have very little influence upon the volume of imports.

Moreover, whenever the fiscal situation and general conditions of the economy have permitted, the Government has granted important exemptions from duties and reduced the tariff substantially. On the whole, so far as their influence on trade, the reductions have exceeded the new restrictions by far.

This policy, together with the absolutely free movement of foreign exchange in Venezuela, has resulted in the constant increase of imports as well as in the decrease in the percentage of customs duties.

This development is well illustrated in the following table which shows the value of imports, the amount of duties paid, and the percentage charge of duties.

The table covers the period from 1938 to 1949:

(In thousands of Bolivares)

	(1) Imports FOB Values	(2) Duties Paid	(3) Percentage Chge. of Duties (2/1)
1938	310,949	109,641	35.2
1939	326,393	127,220	39.0
1940	311,169	117,789	37.9
1941	287,825	93,152	32.5
1942	215,691	68,382	31.7
1943	222,060	82,280	37.1
1944	372,519	83,973	22.5
1945	604,270	122,006	20.2
1946	985,595	140,431	14.2
1947	1,870,448	229,953	12.3
1948	2,296,137 (*)	286,948	12.5
1949	2,241,011 (*)	315,746	14.1

(*) Provisional figures excluding parcel post and imports by air.

Import duties, which reached 35.2% in 1938 and 39% in 1939 of the F.O.B. value of the imports, dropped to 12.5% in 1948 and to 14.1% in 1949.

If further proof of Venezuela's liberal trade policy is needed, it may be found in the Modus Vivendi begun July, 1939 and still in force.

The Reciprocal Trade Agreement Act of 1934 which constitutes the basis of this Modus Vivendi for the United States establishes, as its principal aim:

> "The purpose of expanding foreign markets for the products of the United States (as a means of assisting in the present emergency in restoring the American standard of living, in overcoming domestic unemployment and the present economic depression, in increasing the purchasing power of the American public, and in establishing and maintaining a better relationship among various branches of American agriculture, industry, mining, and commerce) by regulating the admission of foreign goods into the United States in accordance with the characteristics and needs of various branches of American production, so that foreign markets will be made available to those branches of American production which require and are capable of developing such outlets by affording corresponding market opportunities for foreign products in the United States".

Of all the treaties entered into by the United States under the Act, there are very few that have achieved this purpose to such an extent as the one with Venezuela.

Under the Modus Vivendi the import duties for 96 categories were substantially reduced. At the same time, the Modus Vivendi fixed American tariff rates for 14 Venezuelan articles, among them crude oil and its products, the latter being subject to a duty of 10-1/2 cents per barrel, up to an amount equalling 5% of the total crude oil refined in the United States. Imports of Crude oil beyond this limit were subject to a tax of 21 cents per barrel. (Because of the treaty between the United States and Mexico, and in accordance with the most favored nation treatment, the maximum tax of 21 cents per barrel only remained in force during the first years of the Modus Vivendi).

During the ten years the Modus Vivendi has been in force, changes of a restrictive nature were made only for tires, crackers and lard. The importation

of these commodities are now subject to import licenses established after a friendly agreement with the U. S. A.

These restrictions were more than compensated by reductions of the duties on 26 articles to levels substantially below those established in the Modus Vivendi.

These articles, with their duties under the Modus Vivendi and those in force at present, are:

Article	Modus Vivendi (Bolivares per Kg.)	Present Tariffs
1- Fresh fruits (apples, pears, grapes)	0.75	0.10
2- Oats	0.20	0.10
3- Flour	0.24	0.04
4- Ham	1.20	0.001
5- Sausages	1.20	0.001
6- Canned pork	1.20	0.001
7- Vegetables and garden stuff	0.80	0.10
8- Frozen meats	1.20	0.001
9- Galvanized steel or iron sheets	0.20	0.10
10- Tin sheets	0.08	0.001
11- Chassis alone	0.01	0.005
12- Disassembled automobiles which paid from Bs 1 to Bs 0.55		0.001
13- Wheels for tires	1.00	0.10
14- Tubes	1.00	0.05
15- Automobile bodies	1.00	0.50
16- Mud guards	1.00	0.10
17- Rings	1.00	0.05
18- Brake liquids	1.00	0.50
19- Unprinted films	2.00	0.50
20- Sewing machines	0.20	0.001
21- Typewriters	1.00	0.10
22- Calculating machines	2.00	0.30
23- Motors	0.08	0.001
24- Spark plugs	1.20	0.001
25- Machines whose weight does not exceed 30 kgs. that paid from Bs 1 to Bs 0.35		0.50
26- Agricultural machines that paid from Bsl to Bs 0.05		Exempt
27- Batteries	0.50	0.20
28- Battery parts	0.50	0.05
29- Transmission belts	1.20	0.05

Venezuela, in an era of extreme economic nationalism, has succeeded in strengthing its economy without discarding the principles of a liberal policy in the field of international trade.

IF THE UNITED STATES WERE TO RESTRICT IMPORTS OF VENEZUELAN OIL THERE WOULD BE ADVERSE REPERCUSSIONS IN BOTH COUNTRIES.

Restrictions on the importation of oil by the United States would have unfavorable consequences, both in Venezuela and in several important areas of the United States economy.

In Venezuela oil is the greatest revenue producer for the National Treasury. From 1938 to 1949 Government revenue from the oil industry has risen steadily. In 1938 oil revenue represented 28.4% of the total and by 1948 it had increased to 59.4%.

The following schedule shows the rate of increase:

Year	Total Government Revenue	Revenue from Oil	%
1938	340.345	96.731	28.42
1939	350.903	92.128	26.25
1940	329.749	83.785	25.43
1941	352.263	132.249	36.81
1942	291.820	74.631	25.57
1943	340.226	76.354	22.44
1944	541.878	262.241	48.39
1945	659.638	315.064	47.76
1946	855.519	427.611	49.98
1947	1.281.001	685.247	53.49
1948	1.771.884	1.052.263	59.39

These figures indicate Venezuela's fiscal development which is reflected in a marked improvement of the country's well-being and social welfare. They are the chief source of meeting the country's pressing needs.

As far as U.S. oil economy is concerned, it should be borne in mind that the trade balance, despite the increase of imports (mainly crude and residual fuel oil) has been definitely in favor of the United States. In 1948 imports of oil by the United States amounted to $417.7 millions, while in the first ten months of 1949, it was $385.7 millions. In 1948 the United States exported refined products and to a lesser degree crude oil valuing $658.9 millions, and during the first ten months of 1949 its exports in this area amounted to $485.5 millions.

These balances result from the fact that the United States imports principally crude oil of slight value per unit while it exports mainly the refined product, which has a superior value per unit. In selling its refined product, the U.S. exports chiefly the value added to crude oil in the process of refining.

We have already seen that in 1948 the United States exported to Venezuela goods worth $501,320,000 while importing $460,470,000, worth to enjoy a favorable balance of $85,850,000. If the United States cut its imports of Venezuelan crude oil, our country would be compelled to restrict its purchases in the United States, not as a reprisal but simply because Venezuela would not have the U. S. $ to pay for American imports. Venezuela would have to limit its purchases considerably, or to cease them altogether - steel products from Pittsburgh, automobiles from Detroit, textiles from North and South Carolina, food from the Middle West, etc. - Venezuela and the producers in the United States would suffer accordingly.

But what is at stake is something far more serious than a greater or lesser exchange of goods between the two countries.

Venezuela enjoys to day a unique position in international trade.

We have already seen that Venezuela, excluding the United States, is one of the few bulwarks of free exchange of goods and free monetary exchange left in the world to-day. Because of its peculiar position, Venezuela has been able to organize its foreign commerce on a truly multilateral classical basis, purchasing more goods from one country than it sells, selling more goods to another than it buys, and compensating its deficit with the one from the surplus with the other. This position is not only advantageous to ourselves but also to the United States. As we have stated, Venezuela, in 1948 imported American goods valuing $501,320,000; this fugure swells to $946,720,000 by adding the income to the United States from services, profits from American investments, remittances from Americans residing in Venezuela, etc. Venezuela realized $419,470,000 through sale of its products to the United States, plus $214,900,000 from new American investments in Venezuela and $23,800,000 from other American sources, for a total of $655,170,000. The full balance was $291,900,000 in favor of the United States. This balance demonstrates that the economic relationship between Venezuela and the United States is in absolute terms, more beneficial to the United States than Venezuela. This is a direct result of Venezuela's role as one of the last bulwarks of multilateral trade.

If the United States restricts the importation of Venezuelan oil, it must not be expected that the trade between both countries will be reduced equally on both sides. The United States will not continue to maintain its present favorable balance. Not only the value of trade would decrease but the favorable balance would necessarily have to disappear for the following reasons:

First: The restriction would affect the profits of American companies operating in Venezuela and consequently the income of many thousands of American investors would be reduced.

Second: In order to protect its own exports, Venezuela would have to increase that part of its exports to countries other than the United States and make important concessions to those countries. Thus Venezuela would have to purchase more from other countries and modify substantially its system of foreign exchange and its commercial policy in order to adapt them to conditions peculiar to those countries. Venezuela would then cease to be a bulwark of free exchange and free trade on a multilateral basis and would have to take the road to bilateralism. The favorable balances that Venezuela to-day enjoys with respect to most of the countries of the world, outside of the United States, would be reduced or perhaps disappear and, as a result, the favorable balance of the United States would also suffer.

To summarize: If the United States were to reduce its imports of Venezuelan oil:

The United States would lose a part of its own oil exports.

The United States would lose a good customer for its industrial and agricultural products, one whose purchases exceed its sales to the United States substantially.

Venezuela would lose its privileged position in the field of foreign exchange which permits it to collect dollars from other countries and remit them to the U. S.

The United States would lose the greater part of the income which, apart from exports, it derives from its trade with Venezuela.

VENEZUELA HAS ALWAYS FOLLOWED A POLICY OF ABSOLUTE EQUALITY BETWEEN DOMESTIC AND FOREIGN INVESTORS.

The traditional policy of Venezuela towards aliens has been based on equality. Venezuela grants foreign citizens the same civil rights as its own nationals. As a result of this policy, and in contrast with the discriminatory conduct system that is growing so generalized in most countries of the world -- whereby greater advantages are conceded to domestic capital, at the expense of foreign investments and to resident investors at the expense of non-residents -- Venezuela, has preserved the doctrine of equal economic opportunity for foreign and domestic capital whether or not the investor resides within the country.

This policy has recently been strengthened greatly by POINT FOUR of President Truman's doctrine which implicitly condemns discriminatory systems and pleads for equal treatment to foreign investors in order to stimulate the investment of private capital in underdeveloped countries, thus achieving greater social wellbeing and establishing the bases for a new era of peace and prosperity.

The recommendation approved by the Inter-American Conference, held in Lima in December of 1938:

> "To endorse the negotiations of trade agreements embodying the principles of equality of treatment as the most beneficial and effective method of expanding and facilitating international trade"

is already a reality in Venezuela, consecrated in its legislation, as is clear below:

The National Constitution establishes absolute equality between nationals and aliens with respect to civil rights.

The Civil Code declares that aliens shall enjoy in Venezuela the same civil rights as are enjoyed by Venezuelans.

The Law Concerning Aliens reaffirms the same principle - that aliens shall enjoy the same civil rights as Venezuelans. The only restriction under the law concerns the exercise of rights and activities of a political nature.

The Code of Commerce prescribes the legal system applicable to commercial transactions as well as to business corporations without discriminating against persons of foreign nationality or companies organized abroad with agencies or branches in Venezuela. Concerning the latter, the Code merely requires the registration of documents that verify the origins of the corporation and govern its operations.

These rules of equality have also been incorporated into special laws regulating specified activities:

The Petroleum Law confers upon any person, whether national or alien, the right to acquire concessions to explore for oil and process its derivatives.

The Law of Mines provides that any person, whether national or foreign, may acquire mining concessions within the Republic of Venezuela subject only to the regulations established by the said law.

The Banking Law stipulates the formalities and conditions required for the organization and operation of banks within Venezuela. These are equally applicable to domestic banks and to the branches of foreign banks established within the country.

The Insurance Law provides that insurance operations, regardless of character, may be carried on within Venezuela only by enterprises legally authorized to do business within the country, but Venezuelan companies are subject to the same regulations as foreign companies.

The Income Tax Law is applicable equally, without discrimination, to the incomes of nationals and aliens, from activities carried on in Venezuela.

The Civil Aviation Law. Commercial transport service within Venezuela is subject to the grant of a Government concession. The law requires that at least 51% of the capital stock of corporations ejoying such concessions belong to Venezuelan citizens. The remaining 49% may be owned by aliens. This limitation, the only one found in the laws of Venezuela, is amply justified in view of the nature of aviation. Foreign capital has, nevertheless, been invested in aviation as is clear from the fact that of the four companies devoted to internal air transport - Linea Aeropostal Venezolana, Linea Aerea Taca, Aerovias Venezolanas (Avensa) and Linea Aerea Ransa - three of them are owned by both Venezuelan and American capital.

Venezuela, thus is today one of the few countries in the world which offers foreign capital a totally friendly reception and favorable opportunity.

IF THE UNITED STATES WERE TO RESTRICT ITS PURCHASES OF FOREIGN OIL THROUGH THE ESTABLISHMENT OF TARIFF BARRIERS OR OTHER MEASURES WOULD DEFEAT ITS OWN POLICY FAVORING FREE TRADE AND FINANCIAL AID TO UNDERDEVELOPED COUNTRIES.

Imposition of further restrictive measures against Venezuelan oil would defeat the policy of free trade which the United States has explicitly and repeatedly proclaimed in numerous declarations, agreements and international conferences. We refer below to some of them:

1°) President Truman defines the principle of aid to underdeveloped countries in the following terms:

> "Our aim should be to help the free peoples of the world through their own efforts, to produce more food, more clothing, more material for housing, and more mechanical power to lighten their burdens".

2°) Point IV of President Truman's Inaugural address before Congress, in January 1949 sets forth the basis for a liberal economic policy. A policy of restricting imports or imposing high tariffs would therefore be in direct conflict with balancing the economy of a sister nation.

3°) At the Conference of American States, held in Buenos Aires in 1937, the following principle was proclaimed:

> "That the American States abstain, so far as possible, from raising or augmenting tariff barriers and every kind of restriction which directly or indirectly hinders international trade and resulting payments;
> "That immediately, and to the extent that the several national economies permit, a policy of abolishing and gradually reducing the said excessive or unreasonable prohibitions and restrictions upon international commerce be undertaken and carried forward by each of the said States, through the conclusion or revision of bilateral economic or commercial agreements and treaties and through unilateral action by country....."

4°) At the Havana Conference held late in 1947 and in the Commerce Charter signed there, the United States openly opposed the possible adoption of discriminatory measures and quantitative restrictions which might affect the multilateral character of international commerce.

5°) The United States is a party to the General Convention on Custom Duties and Commerce adopted at a conference held a few months ago at Annecy, France. The principal objective of this convention was to establish a general system of tariffs and other measures to make possible a liberation of world commerce from the multiple existing prohibitions, restrictions and controlling measures.

6°) On June 24th last year President Truman reiterated to Congress the Administration's point-of-view with respect to its policy of mutual aid and of promoting international commerce. Among other things the President said: "Our experience has shown us that the volume of our foreign trade is much greater with highly developed countries than it is with those countries which have a low standard of living and inadequate industries. To increase the total production and the national revenue of less-developed regions, is to increase the very stability of our own economy".

Any new barriers that would interfere with the flow of Venezuelan oil to the American market would be against the principles underlying the free trade policy. They would moreover jeopardize the principle of elimination of hindrances and restrictions, of necessary cooperation to improve conditions in other countries, and of giving effective aid through the Marshall Plan, Point IV, and the Import-Export Bank. These principles are not purely fortuitous nor are they based on political expediency; they are the principles on which the foreign policy of the U. S. is based today. To act contrary to them even temporarily, cannot but detract from the trust that other nations have placed in the United States of America.

VENEZUELA, BECAUSE OF ITS TRADITIONAL MONETARY STABILITY AND FREE EXCHANGE IS THE MOST PROMISING COUNTRY FOR THE INVESTMENT OF FOREIGN CAPITAL

Among the basic factors which reveal the philosophy and principles of a country in its relations, is the attitude towards currency and monetary manipulations. For decades monetary inestability has been the chief factor affecting the free exchange of goods and services, and the sound economic relations among the peoples of the earth. What is Venezuela's history in this respect?

Venezuela, in 1879, fixed its monetary unit (the Bolivar) at a gold content of 0,290.323 grs. per unit, in accordance with the gold franc of the Latin Monetary Union. Before devaluation of the dollar in 1934 the Venezuelan rate of exchange, based on this parity, was Bs 5.18 to the dollar and then it became Bs 3.061.

The official gold parity of the Bolivar has not changed since 1879. To-day almost the entire flow of dollars into Venezuela are purchased at Bs 3.09; that is to say, with a surcharge above official parity of 0,95%. They are sold to the public at Bs 3.35, that is, including a surcharge over official parity, existing since 1879, of 9.4%. No other country has this record of monetary stability.

Venezuela has enjoyed its monetary stability almost without controls. In all its history Venezuela has only once resorted to exchange control as such. This occurred during a few months of 1940/1941, when shortly after the Nazi invasion of Europe Venezuela's exports became practically paralized. This abnormal situation soon was rectified and the purchase and sale of foreign exchange has been entirely free since then.

The monetary system of Venezuela is at the present time based on the gold exchange standard.

The notes issued by the Central Bank of Venezuela are backed by a large reserve of gold and foreign exchange convertible into gold; it is not backed by government securities of any sort.

As of December 31, 1949, the balance of the Central Bank was as follows:

		Millions of bolivares
1)	Gold	1.040.83
	Foreign exchange convertible into gold	221.60
	TOTAL	1.262.43
2)	Notes in circulation	814.34
	Demand Deposit	496.54
	TOTAL	1.310.88

The ratio of international reserves to notes in circulation plus deposits and other short term liabilities, as of December 31, 1949, was 96.3%.

Another factor contributing to the stability of Venezuelan currency is the fact that Venezuela has no Foreign Debt and that its Internal Debt amounts to only Bs 14,808,131.62, or about $4,420,000. The debt represents less than 5% of the cash reserves in the National Treasury and less than 1% of the present Federal Budget.

Conclusions: Venezuela has not changed the gold parity of its currency, not even in 1934, when the United States resorted to devaluation.

Venezuela, during its entire history, has never caused damage to foreign investors as a result of tampering with its currency.

Venezuela, because of its monetary stability has eliminated the risks of exchange fluctuations to foreign capital.

Venezuela is one, of the few countries of the world, that may take pride in its past and present monetary conditions.

VENEZUELA HAS ACHIEVED ITS PRESENT STATE OF ECONOMIC WELL-BEING THROUGH THE EMPLOYMENT OF ITS OWN RESOURCES.

The United States, through various government credit agencies, has aided almost every country in the world on a large scale; it has aided some countries so that they might reconstruct their economies devastated by the recent war and helped others to develop their internal potential resources.

This aid, which directly affects the American taxpayer, comes from loans granted by the Export-Import Bank, as well as other agencies such as the European Recovery Program (Marshall Plan).

Loans made by the Export-Import Bank
Total of authorized credits from
February 12th, 1934 to June 13th, 1949

	Thousands of Dollars	
LATIN AMERICA		
Argentine	93,690	
Bolivia	20,998	
Brazil	283,696	
Chile	112,681	
Colombia	65,279	
Costa Rica	8,723	
Cuba	90,367	
Dominican Republic	3,300	
Ecuador	20,617	
Haiti	17,350	
Honduras	2,700	
Mexico	155,659	
Nicaragua	5,235	
Panama	6,500	
Paraguay	7,800	
Peru	37,450	
Salvador	1,726	
Uruguay	43,727	
Venezuela	47,339	
Miscellaneous	118,983	
TOTAL LATIN AMERICA		1,143,820
EUROPE		2,147,176
ASIA		570,245
OTHER COUNTRIES		386,990
MISCELLANEOUS		14,942
GRAND TOTAL		4,263,173

If we compare the aggregate of the various loans made to Latin America, $1,143,820,000, with the loans made to Venezuela, it will appear that Venezuela's share represents only 4.13% of the total. But even this percentage drops to 2.39% if we take into account that Venezuela did not use the loan of $20,000,000 granted in 1942. The $27,339,000 which Venezuela actually received from the Export-Import Bank, has been almost completely amortized. The unpaid balance on all loans, as of June 30th, 1949 was $3,275,000.

Venezuela, foremost purchaser of American goods among the countries of Latin America, has availed itself of the financial aid offered by the Export-Import Bank to the limited extent of 2.39%.

VENEZUELA, BY ITS OWN RESOURCES, ACHIEVED AN APPRECIABLE INCREASE IN ITS INVESTMENTS IN CAPITAL GOODS.

Since 1936, Venezuela with its motto of "Let us sow our oil", has expressed its eagerness and determination to achieve a state of economic well-being and to diversify its production through investing its oil revenues.

Positive results have been achieved here and in the improvement of sanitation, education and other fields to promote the wellbeing of the country at large.

OIL, PARAMOUNT FACTOR IN THE ECONOMY OF VENEZUELA.

In order to ascertain the extent to which oil permeates the Venezuelan economy, let us note what its contribution to foreign exchange has been during the period from 1938 to 1948:

Years	Thousands of Dollars Sold by oil companies
1938	67.000
1939	72.000
1940	61.000
1941	70.000
1942	57.000
1943	67.000
1944	113.000
1945	192.000
1946	278.000
1947	409.000
1948	622.000
TOTAL	$2.008.000

UTILIZATION OF OIL RECEIPTS

The receipt from the exploitation of oil industry during the eleven-year period ended December 31, 1948, has been used as follows:

	Thousands of Dollars
International reserves in gold & foreign currencies	372,000
Government investments	492,000
Total private investments	677,000
Consumers' goods	468,000
	2,008,000

VENEZUELAN GOVERNMENT'S INVESTMENTS FROM 1938 TO 1948.

The investments made during this period by the Venezuelan Government were direct and indirect. The direct investments, including only the works undertaken by the Federal Government through the Ministry of Public Works, amounted to Bs 897,000,000. The indirect investments, of Bs 753,000,000, represent the contributions made by the Federal Government either as capital investments or as loans to agencies and to institutions of a mixed charac-

ter, with capital from both the nation and private individuals.

PRIVATE INVESTMENTS. Oil activities have contributed in large measure to Venezuela's national income. Therefore, the accumulation and investment of new capital by private individuals must be considered, to a great extent, as an investment of oil receipts.

The principal private investments from 1938 to 1948 were as follows:

	(In Thousands of Dollars)
In Buildings & constructions	353,000
In machinery & mechanical equipment	325,000
TOTAL	678,000

Venezuela has, therefore, shown its determination to attain the goal of "sowing our oil" and will be able hereafter to increase its production through the investments already made.

VENEZUELA INCREASED ITS PRODUCTION BY 120.4% IN TWELVE YEARS. The extent to which Venezuela has increased its production, is seen in the following indexes, taking 1936 as 100% and excluding the oil industry.

	Importation of products competing with national products	Industrial production of Venezuela
1936	100	100
1948	490.4	220.4

It appears from the foregoing that the national industry of Venezuela, excluding the oil industry, during the twelve-year period considered, attained a considerable degree of development - 120.4%. The figures show that while the national industry increased more than twofold, the increase in foreign imports during the same period was almost fivefold.

This discrepancy between the growth of national production and imports should not be looked upon with alarm. It shows merely that the exportation of oil has developed at a greater pace than other factors in our economy. Furthermore, 64% of the total imports for 1948 were represented by fixed capital assets.

Conclusion: From the ascending trends of the various sectors in our economic life; it can be observed that Venezuela is directing its efforts towards making better use of its own resources and is already increasing its production, thus fulfilling the task she has undertaken of "sowing our oil".

SUMMARY

I. Economic Relations Between the United States and Venezuela

Venezuelan purchases from the United States in 1949 valued $514,000,000, which was 73.6% of its total imports and 19.60% of all United States exports to Latin America. Twelve years ago our purchases amounted only to $52,000,000.

Venezuela's per capita annual consumption of American products amounts to $103.00. The next highest per capita consumption by any Latin American country is $70.00 per annum.

Venezuela sold the United States commodities valuing $385,000,000 in 1949, or about 40% of its exports, including oil.

Venezuela is one of the best markets of the United States:

A) Because it sells to Venezuela more than it purchases in return (In 1948 the favorable estimated surplus of the Balance of Payments amounted to $292,000,000).

B) Because it pays its debts punctually and in dollars.

C) Because it has had no need of financial assistance from the American taxpayer through loans.

II. Consequences of American measures restricting the importation of Venezuelan oil.

Conflict between Principles and Declarations.- The United States has undertaken the role of chief guardian of the principle of free monetary exchange and the free circulation of goods. To establish further restrictions to the importation of oil would constitute a serious contravention of this policy, so repeatedly proclaimed.

Abandonment of Multilateral Commerce by Venezuela.- The present freedom of our international trade could not be maintained if, in the search for new markets for our oil, we were compelled to follow the road leading to bilateral agreements. The result would unavoidably be the diversion of our present purchases of American goods to other markets with damage to all concerned. The favorable balance which the United States enjoys today in its economic relations with us may only be maintained under present conditions. Moreover, it must not be forgotten that part of the balance represents the profits which are obtained from American investments in the Venezuelan oil industry. These investments would necessarily have to be reduced if oil production were to be diminished.

A smaller importation of Venezuelan oil by the United States may improve the local market and domestic prices, but since the United States exports more than it imports, dollar by dollar, it cannot fail to feel the effect of a greater supply of oil in the international trade channels resulting from Venezuelan oil seeking out new markets.

A smaller exportation of oil to the United States would force us into a period of readjustment. The duration is not easy to predict and a chief consequence would be budgetary reduction with resulting unemployment that could create a state of unrest beneficial to none.

The true feeling of continental solidaridity which inspires our people and the cordial spirit of collaboration with Americans and their enterprises would also be affected. Any changes however transitory but none-the-less grave, could easily be avoided by preservation of the present commercial status which has been maintained for more than ten years with mutual and equitable advantages.

III. Economic, Financial and Legal Conditions of Venezuela.

Currency and Exchange.- In 1879 the gold parity of the Bolivar was established and since that time has not been altered. Monetary stability has been maintained without need of controls or interference, except for the regulations established for a relatively short period during the recent war. The international reserves of Venezuela amount to $375,000,000 which represent 96% of the paper currency in circulation plus bank deposits and other short term obligations. Our currency is therefore backed by a security that could hardly be excelled.

Export-Import Bank.- Venezuela's indebtedness at the present time to the Export-Import Bank is $3,275,000. - the balance due on a loan of $27,339,000. This loan equals only 2.4% of the total authorized by the Export-Import Bank to Latin American countries.

Investment of its Resources.- During the past eleven years Venezuela has received $2,000,000,000 from oil operations. Of this sum $1,170,000,000 have been invested in capital assets (by the Government as well as by private individuals). We have accumulated reserves of $370,000,000 and spent $460,000,000. Our industrial production has increased by 120% and we have improved immeasurably our sanitary and educational conditions.

Equality of Treatment for Nationals and Aliens.- Venezuelan legislation establishes no difference whatsoever between national and foreign investors; both pay the same taxes, enjoy the same rights and are subject to the same obligations.

SUMMARY OF MISCELLANEOUS NEWS ARTICLES

April 1, 1950

UNITED STATES

Current Population Reports (Bureau of the Census, Department of Commerce, March 2, 1950)

ANNUAL REPORT ON THE LABOR FORCE, 1949. Total civilian employment averaged 58.7 million during 1949, ranging from 57 million at the low point early in the year to about 60 million at the peak. The average for 1949 was about 700,000 below the 1948 level, but exceeded that for any other year in the Nation's history.

Unemployment was substantially above the 1947 and 1948 levels, as job opportunities declined in 1949 while the labor force continued to expand. The average for 1949 was 3.4 million, as compared with 2.1 million in both of the two preceding years. Most of the rise occurred in the first half of the year, with unemployment reaching a peak of 4.1 million in July when many youngsters were seeking summer jobs. During the last five months of the year, it showed some tendency to level off at the 3½ million mark.

Curtailed job opportunities in nonagricultural industries accounted for practically all of the decline in employment from the 1948 level. Nonagricultural employment dropped by 2 million between December 1948 and the middle of 1949. With the marked pickup in August, maintained in later months, most of the earlier losses were cancelled, however. For 1949 as a whole, nonagricultural employment averaged 50.7 million, as compared with 51.4 million in 1948 and 49.8 million in 1947.

Agricultural employment was at about the same level during 1949 as in 1948, averaging 8 million in both years.

Some cutbacks in hours worked accompanied the decline in employment in 1949. Generally, man-hours worked by the labor force in 1949 were about 2½ percent under the 1948 total, although employment dropped by only 1 percent. Special surveys conducted periodically during the year showed that the number involuntarily working short hours because of economic factors had practically doubled since 1948. In 1949, some 2½ million persons, on the average, were working part time (less than 35 hours) in any particular week because of slack work, material shortages, job turnover, and the unavailability of full-time jobs. In 1948 the corresponding number was estimated at 1½ million. However, even in 1949, most of these persons still had the equivalent of a 3 or 4 day work week.

Persons unemployed in 1949 were generally out of work for longer periods than those jobless in 1947 and 1948. The typical unemployed person in an average week in 1949 had been looking for work unsuccessfully for 5.7 weeks as compared with 4.3 weeks in 1948 and 4.7 weeks in 1947. Furthermore, the number jobless for relatively long periods of time - 4 months or longer - began a steady rise early in 1949 and started levelling off only in the late summer months. As a result, there were about 800,000 unemployed workers in this group at the end of the year, as compared with an average of 300,000 to 450,000 in other postwar years.

Labor Force Participation Rates

The total labor force which includes the civilian employed, the unemployed, and the armed forces, rose by 800,000 between 1948 and 1949 on the average - a change that is consistent with the expected annual increment. Except for the peak war years, the labor force participation rate, that is - the proportion of the noninstitutional population 14 years old and over in the civilian labor force or the armed forces, has changed only slightly since 1940. In fact, from the fragmentary data available, it appears that no marked changes have occurred in the over-all rate since the turn of the century. In 1949, the labor force participation rate averaged 58 percent, about the same as in 1948,- 57.8 percent, and only slightly higher than in 1940 - 56 percent. At the height of the war, however, with an unusually large proportion of the population in the armed forces, it averaged 62 to 63 percent.

Working wives continued to be an increasingly important element in the Nation's labor force. Their number increased by half a million between 1948 and 1949 and by 4 million since 1940. A significant increase has taken place since 1940 in the participation of women 35 years old and over.

Youngsters of high-school age who both work and attend school were about as numerous in 1949 as in 1948, and about four times as numerous as in 1940. In 1949, about 1.2 million 14 to 17 year-old boys and girls enrolled in school and were also gainfully employed, mostly at part-time jobs. In 1940, the corresponding number was only 300,000.

Turnover in the Labor Force

The labor force turned over at a rate of close to 5 percent a month during 1949. On the average, about 2,820,000 persons entered the civilian labor force each month during 1949, whereas some 2,770,000 left the labor force, the large majority only temporarily.

Much of the turnover in the labor force is attributable to the fluctuating demand for workers in seasonal industries such as agriculture and trade, although new workers and persons who are permanently retiring also contribute. Most of the turnover occurs among women and teen-age persons - the groups from which seasonal workers are largely drawn. Women 20 years of age and over constituted only about one-quarter of all civilian workers in 1949, on the average, but they formed about half of the entries and withdrawals into and from the labor force. Similarly, teen-age persons who constituted about 10 percent of all workers accounted for 30 percent of the entries and withdrawals.

Business News Reports (U.S. Department of Commerce, March 16, 1950)

PERSONAL INCOME IN JANUARY 1950. Personal income in January, exclusive of payment of the special insurance dividend to veterans, was at an annual rate $1 billion higher than in December.

The inauguration of the program for payment of the special dividend from the National Service Life Insurance fund resulted in an extraordinary increase of total personal income from an annual rate of $211.9 billion in December to $218.4 billion in January.

These special dividend payments to veterans of World War II amounted to $450 million in January. When put on an annual-rate basis to conform with other personal income data, the payments were at an annual rate of almost $5½ billion. However, the Department of Commerce emphasized that the payment of the special dividend will be substantially completed within a few months.

Wage and salary receipts in January, at an annual rate of $134.1 billion, were about the same as in December. The stability of factory wages in both the durable-goods and non-durable goods industries was in marked contrast to the sharp declines which took place in the same period last year.

Increased contributions by employees for social insurance, reflecting the higher rates under the old age and survivors insurance program, partly offset other increases in personal income in January. Such contributions, which increased from an annual rate of $2.2 billion in December to $2.8 billion in January, are deducted in obtaining the wage-and-salary component of personal income.

Interest and dividends declined from an annual rate of $18.9 billion in December to $17.4 billion in January. The drop was concentrated in corporate dividend payments, which in

December included a large year-end disbursement by one automobile manufacturing company.

Proprietors' and rental income rose from an annual rate of $43.5 billion in December to $46.2 billion in January. Most of this increase occurred in the income of farm proprietors, which on a monthly basis exhibits considerable irregularity. The January rise in farm income stemmed mainly from an increase in the seasonally adjusted volume of crops marketed or placed under Government loan. Nonfarm proprietors' income also rose in January, reflecting chiefly larger sales of retail trade establishments.

Transfer payments rose from an annual rate of $12.8 billion in December to $18.5 billion in January. Nearly all of this large increase was due to disbursements of the special National Service Life Insurance dividend.

Total personal income for 1949 was $209.8 billion as compared with $211.9 billion for 1948.

THE FAR EAST

China

Foreign Policy Reports (Foreign Policy Association, N.Y., February 15, 1950)

THE CENTRAL COMMITTEE OF THE CHINESE COMMUNIST PARTY by A. Doak Barnett. The leaders of the Chinese Communist party comprise a tightly-knit brotherhood of experienced, able, devoted, tough revolutionaries. The top men are members of the Central Committee and also hold key positions in the government and army. The fate of China for the foreseeable future is largely in their hands.

As a group the Central Committee is held together by both personal and professional ties. Most of them are old-time party members who participated in at least one important phase of early party history. The predominance of southerners is striking. Roughly a quarter of the regular members are natives of Hunan, the province from which Mao Tse-tung comes. A large majority come from south of the Yangtse River. These Communist leaders, however, built their army and party machine largely in North China.

A majority of the members of the Central Committee have studied abroad - largely in the Soviet Union though some in France and Germany. Until his recent trip to Moscow, Mao Tse-tung was one of a minority in the Central Committee who had never been outside of China.

Class origin of the Committee members includes both peasantry and gentry. However, the Communist Party in China has a larger proportion of top leaders from the lower classes than

any other important political group in modern China. All party leaders, regardless of class origin, have lived an austere, proletarian sort of life in their struggle for power. The leadership of the party has had greater unity and solidarity than most similar parties in other countries. No basic internal schisms or dramatic purges have occurred since the early 1930's when Mao Tse-tung assumed control after the failure of Li Li-san's "putschism". Li Li-san who returned to China via Manchuria with the Russians in 1945 is now a member of the Central Committee under Mao who replaced him as party chief.

Despite a lack of tangible evidence, it is widely believed that there is now growing tension within the party between a strongly pro-Russian faction associated with Liu Shao-ch'i as well as Li Li-san, and a basically nationalist faction associated with Chou En-lai. The position of Mao with respect to this reported division of opinion is vague. Mao has long been described as a thoroughly nationalist "Chinese Communist" but during the past year he has taken a strong stand favoring close alignment with the Soviet Union.

Mao is still the undisputed leader of the party. Chu Teh, the top Communist military chief, is always ranked second but he is aging and less active. The two most obvious contenders for succession to Mao's position are Liu Shao-ch'i - a theoretician, labor expert and party organization man seldom in the limelight, and Chou En-lai, now Premier and Foreign Minister of the Communist government. Chou is Mao's most effective political aide and the Communists' most experienced negotiator.

Japan

The Times (London, March 8, 1950)

JAPANESE POPULATION RISE. In 1946 the population of Japan stood at 76,155,000. In 1948 it was estimated at 80,697,000. By the end of 1950 a figure of approximately 84 million will have been attained. The problem of the ever increasing number of mouths to feed has been attracting widespread attention in Japan. The present excess of births over deaths is about 1,600,000 yearly. The fertility rate remains high. Due to the efforts of the Public Health and Welfare Section of Allied Headquarters the death-rate of 15.68 per 1,000 in 1946 was reduced to 11.96 in 1948. This is the lowest rate ever recorded for Japan.

The Japanese male has a life-expectancy today of over three years more than he had in 1941, and the Japanese female eight years more. Infant mortality has fallen sharply. The

incidence of diphtheria has been reduced by 83 percent, dysentery by 87 percent, and typhoid by 86 percent. The entire population has been vaccinated and in 1948 only 29 cases of smallpox were reported as against 17,600 in the spring of 1946.

Japan covers an area smaller than California and is comparatively poor in resources. After a careful study of the problem, Dr. Warren S. Thompson, an eminent American demographer, last year recommended birth control as the only effective way of relieving the pressure of population. Birth control knowledge is being disseminated but seems to have found little favor with the rural communities which constitute about one-half of the total population.

According to a survey, conducted by the newspaper Asahi, only 9 percent of married people said they had practised birth control, 87 percent said they had not. Some 39 percent professed to favor birth control.

Japan would be a rich country if it had fewer people. There is a limit to the number it can support even on a bare, subsistence diet. Dr. Okazaki, director of the Japanese Institute for Research into Population, has said the best population would be 50 million but that it would be possible to support more if further industrialization was carried out rapidly. He favors large-scale emigration as well as birth control.

The Japanese leaders regard emigration as the solution of the population problem. They look upon Borneo, New Guinea, and the tropical parts of Australia as suitable territories for emigration. Even if there were no political barriers, emigration on the scale required would be economically impossible. Ships would have to be found to move one and a half million people from their home country each year. Land would have to be cleared and housing built. That would take care only of the annual increase but would not reduce the number of people now crowded on the Japanese islands.

Increased industrialization is often said to be the only solution. It is doubtful whether the country can obtain enough foreign currency to purchase abroad all the food and raw materials she requires for her expanding population. Domestic resources can be improved both through increased productive capacity for food and materials and through improved industrial techniques but these things are likely to take decades to achieve.

A comprehensive survey of Japanese natural resources, recently concluded by Dr. E.A. Ackerman of the University of Chicago, confirmed Dr. Thompson's view that birth control was the

only solution of the population problem. If the population continued to rise toward 100 million, the people might achieve a standard of living equivalent to 1930-34, provided that financial aid from abroad was continued indefinitely. If the aid were not forthcoming the country might perhaps become "self-supporting" ultimately but only on the barest level of subsistence.

What We *Can* Do Under Point Four

Milo Perkins

SP

SINCE the end of the war we have put some $25 billion into various foreign aid programs. We are committed for nearly $10 billion more. We have put over $50 billion into our own military effort, which is of vital consequence to the non-communist world. We have averted catastrophes at terrific cost. But economic recovery on a self-sustaining basis in most of the world is not yet in sight.

It is slowly dawning on us here in the United States that we are not going to be able to buy world-wide recovery with a check book. If recovery is to be had at all, we must give of ourselves as well as our money. We must face up to the challenge for the century-long job that it is. We must speak frankly to our friends in other lands. We must not be ashamed to state our own self-interests openly before the court of world opinion. As bankers for half the world, perhaps we can't be loved. Maybe all we can hope for is a reputation of trying to be fair.

Thus far, our efforts to promote recovery in the rest of the world have been based largely on government-to-government grants and credits. These have averted disasters in many areas, but they have not built a recovery which can sustain itself without our continuing aid. I am unimpressed with statistics about production in Europe having reached 110 per cent or 120 per cent of the 1938 levels. Textile mills running on free American cotton and automobiles running on free American gasoline represent industrial relief and not recovery. There is a place for government-to-government credits in the future but they must take second place to private investment.

Cutting through the infinite complexity of this postwar world, two economic facts stand out like lanterns in a dark night. The first is this: that with only 7 per cent of the world's population, the United States has roughly half of its manufacturing capacity and a highly mechanized agriculture. Our production is growing at a faster relative rate than that of any other country. In the early nineteen-forties we spent tens of billions of dollars on plant and equipment for wartime purposes. Most of these factories are now turning out goods for peacetime use.

As though this were not enough, we have invested another $60 billion in plant and

Milo Perkins, former executive director of the Board of Economic Warfare, has done consultant work since 1943 for several large corporations on foreign trade policy matters.

equipment since 1945—and are still going strong. I suggest, in all humility, that the "climate" within which an achievement of this sort is possible—by free men—is worth examination by all peoples who want to raise their own living standards. We have accomplished this by being ourselves—by counting primarily on competitive enterprise and by using the powers of government to buttress our economy rather than to control it.

The second key fact which stands out is this: that production in most other countries is wholly inadequate to meet the needs of the people who live in the rest of the world. The fundamental crisis in most nations today is a production crisis and not a fiscal crisis. The simple reason why some currencies are "soft" is that those currencies cannot be swapped for goods at competitive levels in the countries which issued them. Until production is raised and prices are reduced within those countries and until that production is merchandized aggressively among the peoples of all lands, there is no hope of solving the money problems of the world. Devaluation, by itself, offers no final answer.

The famous "dollar shortage" is a phony in terms of semantics. What people in other countries are really saying when they use the phrase is this: that they want more of the goods which can be bought in the United States than they can afford—more than their own production permits them to buy. Most of us have had a "dollar shortage" in our personal affairs many times in our lives. All it meant was that we were not earning enough to buy everything we really needed.

Both production and distribution must be increased on a world-wide basis before the so-called "dollar shortage" will disappear and before the currencies of the world can once again be exchanged for one another without restriction.

So here is the heart of the problem which we must solve. The United States is able to produce more than it is possible to merchandise within our continental borders for the long pull—particularly more heavy machinery. The rest of the world, by contrast, is producing less than enough to satisfy the elemental needs of its people. It needs our heavy machinery to step up its own production. Our self-interest here in the United States and the self-interest of our friends elsewhere in the world is such that we ought to be able to combine our resources to our mutual benefit. Let's examine these self-interests.

Our economy in this country can remain healthy only if it continues to expand. Stop our growth and you start a depression. Our outstanding business need as far ahead as anyone can see is for an ever-increasing number of customers and for ever-broadening markets. The opportunity to participate in industrial expansion beyond our own borders is part of this concept. The rest of the world can offer us this.

The self-interest of other peoples with inadequate production is to increase the output of their factories as well as their farms. Our business men can join hands with their business men to reach this goal. Some American industries go abroad with wholly-owned subsidiaries while others prefer minority interests in foreign companies. Still others go in on a 50-50 basis with ten-year management contracts.

There are many ways to build the plants which are needed around the world but the trend will be toward joint undertakings. To borrow Eric Johnston's happy phrase, the time is ripe for us to take the lead in establishing "partnership capitalism" on an international basis. It's the surest road to higher living standards.

There is no mystery about them in a technological civilization. They can't be achieved by more human drudgery. They can only be achieved by multiplying human muscle power through machinery and mechanical horsepower. Better hand tools and the learning of simple skills must come first. As a general rule, light industries must be working successfully before heavy industries can be established. At the peak of industrialization, however, over $10,000 *per factory worker* must be saved by somebody and then invested in plant and equipment to lengthen the arms of that worker. It's just that simple to say, even though it has taken us decades here in America to achieve it.

If the rest of the world has to wait to generate its own capital to multiply human muscle power through investment in plant and equipment, it will take several centuries to do the job. If private capital from this country could flow outward on a broad basis

to the rest of the world, however, we could greatly shorten the decades necessary to reach our goal. Enormous progress could be made before this century has run its course. A good start can be made in the next ten years.

II

THE United States now holds an economic position with respect to the rest of the world which is very similar to that which the eastern seaboard of our own country has held toward the rest of the United States for over a century. When industrial development first began in this country we were dependent upon foreign capital. We welcomed it and it helped us. Those who provided it made the profit to which their savings and their willingness to venture entitled them.

Our eastern seaboard rapidly generated capital of its own, however. It was from this older area of our country that the money went west and south to build up the productive power of the nation. Had it not been for these early savings on the Atlantic Coast and their subsequent investment in factories and machinery beyond the eastern seaboard, the West and the South would have a very much lower standard of living today than they now enjoy. And what happened to business men and workers and farmers beyond the eastern seaboard in the process? They grew to be so successful that they are now generating most of their own capital.

Query: Can the United States now help the non-communist world to increase its own productivity along lines somewhat similar to those through which the eastern seaboard once helped the rest of the United States with its program of industrialization? I think it can if men in each country will examine their own self-interests objectively. That examination will force countries toward gradual economic union. People as individual producers and consumers will slowly become more important. Sovereignty as such will gradually become less important.

Obstacles to a greatly increased flow of private capital abroad such as currency inconvertibility, excessive government control, and outright discrimination against American business will not be easy to overcome. Nor will the political and psychological barriers to widespread industrialization be easily eliminated. However, there's a gambler's chance of success if the Point Four program is carried out intelligently. The stage *can* be set for a level of world-wide prosperity and industrial growth which can run for a century or two. It's a job for hardy souls with infinite perseverance but it's also our best bet for avoiding an atomic war.

President Truman has suggested a direction in which all of us might move together toward this goal in what has now become his famous Point Four, so named because it was the fourth point in his Inaugural Address last January 20. Briefly, he proposed that this country use its resources to help develop the underdeveloped areas of the world.

Actually, the opportunities are even greater in the more developed areas. But so much the better. This means that Western Europe can slowly be brought into the program as well as Latin America, Africa, and Southeast Asia. The opportunity ought to be open to free men everywhere who are willing to *work* for higher living standards.

The President stressed the place of private capital in this long-range venture. A few days later Secretary of State Acheson significantly put great emphasis upon the necessity for a "climate" in other countries which would be attractive to private capital. Since then, many business groups have worked hard on the matter, keeping in close touch with government people working on the same problems; and the rapid rate at which ideas in this area have been developed is solid reason for having great hopes for the future.

III

WE COME now to a consideration of the key elements of an intelligent Point Four program. I want to discuss those which seem vital to me, one by one. Some of them have already been suggested by the Administration. Others have their origin elsewhere. The responsibility for emphasizing some more than others is my own.

(1) First of all there is a deep need for *a foreign investment policy on the part of this country which faces up, without apology, to the fact that we are a competitive enterprise nation.* We need to say that for the long

pull we shall be unable to help other peoples raise their living standards unless they are willing to count on competitive enterprise for the biggest part of the job.

Secretary Acheson went a long way toward enunciating such a policy in his speech of September 19 before the Pan American Society when he said:

> This country has been built by private initiative and it remains a land of private initiative. . . . Therefore it will be our policy, in general, not to extend loans of public funds for projects for which private capital is available. It is our purpose, also, to emphasize the desirability of loans which increase productivity.

Until this policy is well publicized and thoroughly understood both at home and abroad, there will be lingering hopes among government people in other countries that government-to-government grants from the United States Treasury will continue indefinitely. These hopes must be smashed before we can work on a partnership basis with the *peoples* of other countries to build the kind of world recovery which can pay its own way.

The grants of billions of dollars which we have made in the emergency period following the war have served essential purposes, but we cannot continue them as a way of life and remain solvent. This does not mean that we should stop them overnight nor that we should run out on our Marshall Plan commitments. But it does mean that we should tell the world in unmistakable terms that a way must be found by like-minded peoples to work together to build recovery on a basis which can be self-supporting. So far as we are concerned, this means counting primarily on private capital.

Many nations may not want to co-operate with us on this basis. That is their business and we shouldn't get provoked when we encounter ideas which are different from our own. Our policy should be to husband our resources for those countries which *do* want to build up productivity in the only way we know how to do it—through encouraging the individual to engage in competitive enterprise with the minimum amount of government interference. We'll be respected for being honest. The world is waiting to hear the terms upon which we want to stay in the international game for keeps.

(2) The second part of an intelligent Point Four program is *the negotiation of treaties with like-minded countries which guarantee fair treatment for United States private capital when it goes abroad.* No nation which discriminates unfairly against our businessmen has any long-term right to help from our government which is supported by taxes from a competitive enterprise economy.

Business men from thirty-two countries working through the International Chamber of Commerce recently completed a code for the Fair Treatment of Foreign Investments. Our own government would do well to use this model code as a basis for its own negotiations. All we want from these treaties is the simple assurance that our business men will be treated as fairly when they go to another country as the nationals of that country are treated when they come to the United States to engage in business. We are not entitled to any preferential treatment and no responsible person is suggesting it.

Unless we get reciprocally fair treatment, however, and unless there is a chance to make a profit commensurate with the risks of doing business abroad, we are not going to invest our savings in factories in other lands. Business without profit soon goes out of business, which is hardly a service to either the employees or the customers. Nor to the governments, whose huge budgets can only be supported by good earnings. This is so elementary that it's silly to pussy-foot on the issue with other nations.

(3) The third way in which we can implement Point Four is through *giving as much technical assistance to other nations as we can spare and as they can digest in a given period.* Immediately after the signing of investment treaties with other countries, we should set up missions to review the resources of those nations and the opportunities there for industrial as well as agricultural development.

These missions should be composed of government as well as business people from both the United States and the country being visited. The Abbink Mission which recently finished a survey in Brazil was constituted in this way. Its joint report by Brazilians and Americans was one of the outstanding jobs of the past few years. The survey covered in considerable detail the outlines of a program

for stepping up production within Brazil. It set a pattern for hard-headed United States–Brazilian co-operation for a generation to come.

Following broad surveys of this sort, smaller technical missions working on specific assignments could make a real contribution to overall economic growth. In some instances such missions would be sent abroad by the United Nations, in others by either the International Bank or the Export-Import Bank in connection with loans being sought by governments. In still other cases they might go abroad on assignments unconnected with loans, such as those of straight technical assistance in the many fields of agriculture.

The chief technical assistance which we can render to people in another country, however, will come from the establishment of *actual plants* in which our business men have a direct interest. This gives our engineers and technicians a chance to increase production in a business which they understand fully. It also gives the nationals of other countries an opportunity to learn the skills without which higher living standards are impossible in any country. Technical assistance can't be peddled like toothpaste but it's an integral part of long-range industrial growth and therefore part of any well-rounded Point Four program. It is most effective when it is tied to capital investment, either public or private.

(4) The fourth area in the carrying out of Point Four has to do with *government-to-government credits.* There is a need for these where they are quite outside the scope of private financing and where the use of government funds in carefully selected fields definitely broadens the opportunity for private investment—both for United States citizens and for nationals in the countries receiving the loans. The fact that it also broadens the opportunity for private investment by business men from third countries is an added dividend which will tend to keep competition vigorous.

I am thinking of United States government credits for the building of roads, the improvement of harbors, the betterment of transportation and communication facilities; for sanitation; and in some cases for the development of electric power. It goes without saying that the loan applications should be carefully scrutinized and that any expenditures under them should be carefully audited.

We use government money for many of these purposes in our own country and it enormously improves the climate for private investment. It is desirable in many instances to use United States government credits abroad for the same purposes in any country determined to count primarily upon competitive enterprise for its economic well-being. The facilities provided by these government loans should help all business firms within the country receiving them to grow and prosper and thus earn the tax money necessary for the repayment of the credits.

(5) The fifth way in which Point Four might be implemented is for us to develop a *much bolder program for the purchase of strategic materials from nations co-operating with us.* Quite aside from their military importance, our growing economy will require all the lead, tin, zinc, copper, manganese, etc., which the world can produce and sell us for the rest of this century. Where any nation is working desperately to raise the living standards of its own people through providing maximum opportunity for the individual, we should be willing to buy any strategic materials they care to sell us so that they can *earn* their way in the world and not be dependent on us for grants.

We should assure all nations which have signed investment treaties with us a stable market for such primary materials. Our government should be willing to enter into long-term contracts for their purchase with escalator clauses on price and quantities to be delivered. The contracts should also contain reasonable anti-dumping provisions. This would help countries getting started on industrialization programs to earn the dollars requisite for the heavy machinery they would need from this country. It would be an enormous help to them on their balance of payments problems while the whole Point Four program was getting under way and their own new industries were being established on a profitable basis.

(6) Now to my sixth point. *I feel that any nation willing to go this far in co-operation with us is entitled to a bigger slice of the American market for its own products.* I

would, therefore, like to see selective tariff cuts made for countries which have given evidence of their willingness to co-operate with us on a competitive enterprise basis. I'd like to see these cuts come just as close to free trade as possible for products produced within the co-operating country.

I realize that this would be a departure from the traditional interpretation of the "most favored nation" clause. However, all nations signing the same investment treaties with us and working with us on the other phases of the Point Four program would be entitled to the same tariff treatment. After we have entered into such arrangements with countries A and B, the next step would be for those countries to make similar arrangements with each other.

I want to see a multilateral world and I've stood for one all my life. But I've come to the reluctant conclusion that if we are to have one we shall have to build it bilaterally, brick by brick. In today's world of excessive trade restrictions, this is the only practical road to currency convertibility and ultimate economic union.

Certainly we haven't got very far by piously setting up one multilateral organization after another with a charter to do the impossible. We might get further if we set out consciously to build a "club" of like-minded nations who wanted to play ball with us in the only way that we know how to play it successfully. I wouldn't expect the whole world to join us at once and if they did we wouldn't have the resources to meet their demands. But I would expect more than enough countries to establish a partnership capitalism with us to give this new approach a fair trial.

(7) And now to the last point. Once this kind of commercial relationship has been achieved between the citizens of our country and those of another, *our own government might well offer to sell insurance to American business men investing in foreign countries.* This insurance, whose purchase would be optional, could cover certain extraordinary risks such as the inability to convert profits *already* made in a foreign country into dollars. The insurance might also cover the risks of expropriation and in my judgment should apply both to old and new investments.

The actual risks for the United States Treasury would be greatly minimized in countries which had already signed investment and commercial treaties with us and were working closely with us on a dozen other fronts. A nominal premium of 1 per cent or less ought to be adequate to cover the few losses likely to occur under these favorable trade circumstances. Beyond this, some countries would be willing to pledge a proportion of their dollar earnings to a joint fund set aside for servicing American investments. This would further reduce the risks of our own insurance program.

Medium-sized businesses in America need this insurance more than the larger corporations. There are excellent reasons for encouraging them to set up partnership arrangements with business men in other countries. I feel that if this insurance were made available *after* all the other elements of a Point Four program had been worked out, it would help to assure its total success.

IV

These are the seven key elements in the intelligent implementation of Point Four as I see them. It is vital that we come to agreement on them country by country through bilateral negotiation. These negotiations should take the form of what might be called "four-basket conferences." These would be sessions in which we brought to the conference table two baskets, one containing what we wanted from another country and the other containing what we would be prepared to give. Representatives from the other nation should also bring two baskets, one containing what they were prepared to give and the other containing what they wanted.

The contents of all four baskets should be spread on the table and explored objectively by both sides. This is the "package" approach. It has a chance to succeed whereas the "piecemeal" approach of doing a little here and a little there and asking nothing in return for what we give is certain to fail. Signing checks for what other nations want before getting the things we want in return makes no sense whatever.

All seven elements of the Point Four program should be discussed in detail at such a conference. There should be a meeting of minds on *all* of them. At the end of these

sessions, if an agreement emerges at all, it must be a complete agreement and one under which *both* sides stand to profit. Otherwise it will not last, and under such conditions it would be better not to enter into any agreement at all.

I would like to see the United States conclude such a set of arrangements with no more than two or three countries as a beginning. They should be "show piece" arrangements in the finest sense of that phrase. Experience with these could then guide us in the intelligent handling of this kind of bilateral negotiation with other countries later on. We should put everything we have into making the first programs work. *If* they work, other nations would be seeking the same sorts of arrangements with us faster than we could conclude them.

This is the best long-range answer to communism. Communists can promise the moon but only the United States has the productive resources to deliver the goods. We have been doing some of the things already suggested under the Point Four program on a piecemeal basis for several years. But for that very reason we have not achieved the cumulative effect which we might have achieved, had we done the whole job with completeness at one time, nation by nation. The whole of anything is always more than the sum of its separate parts.

On the government side we have already sent a good many technical missions abroad. We have extended some credits which have a chance of repayment, and we have engaged in some modest stockpiling of strategic materials. We have concluded some commercial treaties, the best of which was with Italy. But even this treaty did not come to grips with the crucial problem of currency convertibility.

None of these government actions has been openly conditioned upon the kind of opportunity for United States competitive enterprise in other countries which our government gives the business firms of those same countries here in the United States. None of it has faced our necessity as a creditor nation to have foreign areas open to us for private investment and industrial expansion. Consequently, there has not been an earnest effort in most other countries to improve the climate for private investment within their borders.

Nevertheless there are some foretastes of what Point Four might be like insofar as American private investment in other countries is concerned. Those who have been critical of the past activities of American companies operating in foreign lands—and often with good reason—would be surprised if they could go abroad today and see what some leading American concerns are doing for people in other countries.

The oil companies of this country, for example, have large investments throughout the world, with heavy ones concentrated in Venezuela and the Middle East. The net effect of these at a business level has been to give a good return to American stockholders *and* to bring a stream of dollars to the countries in which the petroleum was found. Venezuela, for example, has no external debt. Her government gets roughly half the profits of the oil companies operating within her borders. Her greatest natural resource was of no value to her until it was developed. Now it is her greatest source of revenue.

More importantly, the citizens of Venezuela have had a large number of opportunities opened up to them as a result of these investments. Creole Petroleum Corporation has made enormous progress in this direction in one short generation. Workers have become foremen and foremen have become managers. Young men have been trained to handle the most technical jobs.

Numerous small businesses serving the oil companies have been started by the nationals of the country. Wages have gone up sharply, and better housing has come in. A quality of medical service and a level of schooling have been introduced which were previously unknown. This is partnership capitalism at work—and working well.

In the merchandising field, Sears Roebuck has established several large stores in Latin American countries. Prices to the consumer have been reduced and the wages paid to store employees have risen. Various employee security benefits which were previously unknown to those who worked in stores in these countries have been established.

Much of the merchandise which was first supplied from the United States is now being

supplied from local sources. Sears has often acted to bring American manufacturers and foreign manufacturers together in partnerships to produce these goods. It has partially underwritten the success of these joint undertakings by agreeing to take part of the output. When it started its Mexico City store, 90 per cent of the merchandise came from the United States; 80 per cent of it now comes from Mexican sources.

In the manufacturing field, International General Electric Company has done an outstanding job of practicing "partnership capitalism." Most of its foreign investments are joint undertakings. One of the most significant things about them is the large amount of technical know-how which has flowed *from* these foreign plants *to* the United States. I.G.E. has made Point Four work for thirty years on a *two-way* street.

In the agricultural field, the United Fruit Company has done a really outstanding job of producing fruits in the Caribbean area which are marketed chiefly in the United States. Wages on the United Fruit plantations are considerably above those in the surrounding areas. Food prices have been subsidized at plantation stores to keep them close to prewar levels.

The workers and their families enjoy a degree of medical care, educational opportunity, and improved housing which represents very real progress for people in the countries where "La Frutera" operates. United Fruit is making money all right, but if it weren't it couldn't afford to give its workers a standard of living several hundred per cent above the levels that exist in the same countries for other workers.

Its agricultural school in Honduras for 150 boys from the Caribbean countries is one of the most exciting places I have ever visited. The purpose of the school is to develop knowledge about diversified agriculture in the tropics. For three years the youngsters study everything except the culture of bananas—which is the backbone of United Fruit Company's business. This investment in the growing competence of young men ought to pay good dividends. The Caribbean is one of the great frontiers still left on the planet and it's going to need leadership in the decades ahead.

I feel that the contribution toward better living standards abroad which a number of American companies are making, is heartening. However, much still remains to be done. The opportunities for local participation have only been scratched. We must dig deeper and work more closely with the nationals of other countries so that they can make their maximum contribution to industrialization within their borders.

V

WORLD recovery requires more of this kind of private activity and fewer doles from the United States Treasury. It also requires closer co-operation between business and government here in our own country. If Point Four is to succeed, American business will need fair but more vigorous diplomatic support from our State Department than it has received in the past.

We have more to contribute to other countries than capital and technical skills. We also have a "spirit" to contribute: our enthusiasm for putting machines to work for us; our belief that *any* individual should be able to climb to the top and that he should have every chance to do so; the way in which we use mass production and mass distribution to raise living standards; the way we count on high volume rather than high mark-ups for our total profits; our belief that decent wages mean broader markets for our products. (This is rank heresy in many foreign countries where 40 per cent returns on capital are not uncommon and where low wages are often considered a "competitive advantage.")

It's also our faith in *competition*. Neither labor nor management in most countries shares this faith. Their business men prefer cartels to "price-cutting" and their labor leaders are afraid that improved machinery will throw the workers out of their jobs. Competitive enterprise, as we know it here in America, has never been *tried* in much of the world.

Changing attitudes is a tougher job than building factories, but it's worth trying. There are sound economic reasons why an intelligent Point Four program could be developed to the advantage of people in many countries. But there are real *psychological* obstacles which will make it very difficult to reach this goal. They have to be faced.

Here at home, one of our chief psycho-

logical hurdles lies in the fact that so few of us have ever made our bread and butter out of foreign trade or foreign investment. We have made some progress in the past ten years, but we have a long, long way to go. Our frontier love of adventure in far places needs to be re-kindled.

Another hurdle lies in the fact that we take fright much too easily when some one calls us naughty names like "Yankee imperialists." We have not yet accepted the role of being bankers for the non-communist world as part of our every-day thinking. Events thrust this leadership into our lives. Not having sought it, we don't yet know what to do with it. I suppose better than half of us wish it had never happened. We haven't thought through all we can contribute to people abroad while making a profit for ourselves in the bargain.

Finally, we must get over our hesitancy to take goods from other countries in volume. If the rest of the world would make it profitable for us to build plants in other countries, this would give us a selfish reason for being more free-trade-minded. The deeper our roots go in the rest of the world, the more we shall act like citizens of the world.

VI

THERE are also some real psychological hurdles to be overcome in other nations. Excessive nationalism is certainly the most deadly of all. We have our share of it here in the United States, but that doesn't keep it from being one of the few truly evil forces on this planet. In addition to the normal concern in other countries with our overwhelming economic strength and the fear that we may use it to dominate other peoples, there are also some pressure-group concerns about any intimate business association with us.

Many groups at the top in other nations hide under the canopy of excessive nationalism—business men who are afraid of our competition and landowners who feel that they must have large pools of cheap labor. They talk about "dollar imperialism" but what they really mean is that they don't want any large-scale economic development with its emerging middle class in their countries.

Then, there are politicians in other nations who are being kept in power by United States cash which they are now handing out to the citizens of their own lands, and who would scream loudly about "interference with sovereignty" if the flow of government grants from us were to taper off and we began to talk about a fairer break for American business in their countries.

There are also privileged groups in some foreign nations, not in government but close to top people in government, who stand to profit by a climate which discriminates against American private investment in their countries. This climate of discrimination enables them to act as middlemen to "fix things up." Naturally, they aren't going to accept a program on its merits that might break up their little playhouses.

These efforts of privileged groups to protect themselves are part of the frailty of human nature in all countries, including our own. We'll get further if we keep our sense of humor about them and don't take the name-calling too seriously. What we should take seriously is the genuineness of our desire to build a partnership capitalism on an international basis. Are we going to build a better world *with* other peoples or are we planning to do things *to* them? That's going to be the key question abroad for a long time to come.

There are also psychological hurdles to the implementation of Point Four which spring from the people themselves in other countries. They know by instinct that science can raise their living standards. What they do not realize is that this takes time; that people have to work hard and learn new skills and save a lot for investment in plant and new machinery before these higher standards can be achieved; that expanded welfare services cannot be had for long simply by passing a few laws, but that it takes enormous production to support these programs; and that social welfare services are the result of economic development, not its cause.

PERHAPS the most valid psychological hurdle to the implementation of Point Four in other countries is the mistrust of our American culture. Other peoples know that it produces high living standards with a large amount of personal freedom. But they know that it also produces high divorce rates, tawdry entertainment, and stomach ulcers. They see the tensions which keep us in a con-

stant hurry and they find them unattractive. We Americans must realize that what we have to offer is not an unmixed blessing; that we must not try to force our American way of life on peoples who don't want it; and that we have much to learn as well as much to offer.

The hurdles we have been considering are real hurdles and the job we've been talking about is a very long-term assignment. But suppose we don't get on with it in our mutual self-interest? What's the alternative? Probably the Communists will pick us off nation by nation until in desperation what's left of the Western world will turn to atomic war rather than risk slavery in a police state.

By moving boldly to make a Point Four program work, we should be able to transfer an increasing part of the cost of foreign development from government to private shoulders. We should be able to increase the relative strength of the West as compared with the Soviet sphere. We can even hope that a strong Western world will ultimately become a magnet to draw some of the countries in the Soviet orbit closer to us. No matter what we think of the Kremlin we should not close our hearts to the Russian people. One World is only a dream in 1949, but who is wise enough to say that the dream will never be realized?

By broadening the area of industrial expansion beyond our own borders we shall increase the markets for our heavy goods industries. A search for more customers is nothing that needs to be hidden. Customers are essential to our prosperity and our prosperity is the hope of the world. There can be no international stability without it.

More importantly, we shall be working with the *citizens* of other countries to increase production and therefore the living standards of *people.* They will be learning new skills, both with their hands and with their heads. There will be many partnership arrangements between our business men and those of other countries. There will be a helpful exchange of ideas between our labor leaders and those of other nations.

These closer working associations of a mutually satisfactory nature can furnish "the tie that binds." To move in this direction is to take the offensive against communism rather than trying to "contain it." And it's still true that the offensive always wins. In any competition for improving the lot of people, we've got what it takes for victory.

MILO PERKINS
1200 EIGHTEENTH STREET, N. W.
WASHINGTON 6, D. C.

January 13, 1949

Mr. Edward R. Murrow
485 Madison Avenue
New York, New York

Dear Mr. Murrow:

Mr. Perkins has written me from London and asked that I send you these observations of his on France for your personal information.

Sincerely,

Sally Seitz

Secretary to Mr. Perkins

Impressions of France - November - December - 1948

January 12, 1949

A friend I met on the boat told me that if I spent only two weeks in France I'd be able to write a book about it but that if I stayed two months I'd be thoroughly confused; he said I'd then have to wait two years to write even a magazine article.

I stayed exactly two weeks and saw a great many people. Since then I've discussed the French situation in Switzerland, Holland and England. France, along with Western Germany, is so much the key to recovery on the continent of Europe that I want to give you some quick impressions of the country as we approach the second year of E.R.P.

On paper, France has a chance to recover faster than most of the Marshall Plan nations. Her resources are considerable. Her farm lands are rich; she can feed her own people and might even export some foodstuffs if there were a change in her land use patterns.

As individuals, her people are thrifty, intelligent and industrious. Their tempo of work differs from ours but most of them work hard nonetheless. Remarkably hard, when one considers the scars left by two wars, a depression and the German occupation all crowded into one generation.

Her industries are hampered by strikes, shortages of raw materials and electrical power, but even so they are back roughly to their 1938 levels. One textile manufacturer told me that production per worker in his mills in eastern France was now 95 percent of pre-war. Her government-owned railways have made the best come-back of all. Three years ago nearly all the bridges were destroyed; today the majority have been restored and the service is acceptable.

When you cross one of the broad Paris streets at 7 p.m. the traffic jam is as bad as any in New York. The restaurants are getting ready for the evening crowds and there's nothing in the States to match what's served to you nor to match the way in which it is served. The most expensive eating places are crowded both at noon and at night.

The shops in Paris are full of all kinds of goods. Even in the poorer sections both food and clothing are available, although prices are very high. Taking 1938 as 100, prices have risen to 1700 and wages to only 1200. Workers, particularly middle income white collar workers, are being squeezed a little tighter each day.

Almost no new housing has been built since the war. (Very little was built between the two wars.) There seems to be less complaint about over-crowding among poorer people than about the high price of food, however. Rents in France are incredibly low and effectively frozen which helps everybody but the landlords. Taking the longer view, it makes new construction virtually impossible.

Social Security coverage in France is broader than in the U.S.; broader in all likelihood than the country can afford. One interesting feature is the large family allowance payment based on the size of the family. An ordinary worker with four children making 15 thousand francs a month ($50.00 at the official rate), pays about 1000 francs in taxes and gets 15 thousand francs a month from the government as a kind of parenthood bonus. (His employer pays the bulk of the tax.)

Everyone seemed agreed that Communism in France could be stopped with plenty of good food at lower prices and a stable franc that was save to save. The non-Communist unions have made great strides in recent months. Their demands have been exceedingly restrained in view of the inflation and the virile competition from the Communist-led unions. But I don't see how such restraint can last without basic fiscal reform.

I was struck by what appears to be an almost universal sense of military insecurity - a deep fear that the Red Army might be quartered in their homes before another decade passed. We sensed more fear of this than of a German revival. Nothing short of an absolute guarantee against invasion will satisfy the French and that is impossible. At most, and at great cost, we might make invasion more costly and slow it down, but that's all. U.S. air power is the real deterrent to a Soviet attack from without.

Another seemingly universal conviction was that all the troubles of France stemmed from bad government. "Blum got us into this and it may take deGaulle to get us out" is the way it was once put to me. No awareness of permanent dislocations caused by

two wars - no deep sense of personal responsibility for the welfare of France - no individual willingness to undergo any prolonged period of austerity. For many, just a simple faith in a new leader.

It is difficult to realize that the surface activity which one sees in France - all this keeping up of appearances - covers several running sores. The worst is fiscal instability. One French business man agreed it was bad but said it was nothing new - that France had been living on false money most of the time for seven centuries.

The Exchange Rate

Three hundred and fifteen francs to the dollar is the official rate of exchange for tourists. The best hotels offer you 410 and are astonished when you cash your checks at the official rate. You can get 440 on the street and over 500 francs to the dollar in Switzerland. It's all illegal but no effort whatever is made to check up on American tourists at the border on leaving the country. Before the recent inflationary swell, 80 percent of American tourist dollars were converted at the official rate and the French government got this critically needed foreign exchange.

Now, I am told, over 90 percent of the American tourist dollars are exchanged for francs in the black market which means that the money is either hoarded within France, or, as is more likely, taken outside the country. The French Government presently is losing these scarce and badly needed dollars at the rate of several hundred million a year.

Everybody deplores the situation and nobody does anything about it. Neither the Swiss nor the Dutch, nor several other European countries for that matter, tolerate any such leakage of dollars in today's world-wide dollar shortage situation. They require evidence when you leave the country that your travelers checks were cashed at the legal rate. The French have fiscal control offices at the frontier but they just don't function.

We were told that servants, on pay day, rush to exchange their French francs for Swiss francs or any other black market currency which is safer to save. (The German occupation undoubtedly helped to make black market operations the accepted thing.)

Others, who can afford it, buy consumers goods they don't need rather than keep francs on hand which are worth a little less each day. Running a business under such conditions is obviously maddening. Everybody tries to stay just as non-liquid as possible. You can do better by hoarding inventories than by selling goods.

It is estimated that billions of dollars in gold and hard currencies are hoarded illegally by French citizens both within France and outside the country. In the face of all this, it is astonishing to learn that no government has yet been able to figure out a way to tax the French farmers, particularly in this period when they are more prosperous than any other group. Even business men expressed the opinion that they were not ethically obliged to pay taxes if they disapproved of the particular tax law. It is said that three out of every four owners of American cars in France are not on the Treasury's tax list. You can't avoid feeling that there is more of anarchy than democracy in the present situation. It's a case of individualism run riot.

Everyone says a balanced budget with less government expense and higher tax collections is needed. But one gets the feeling that a "good government" would be the one that achieved such a balance out of the other fellow's pocket. We heard many rumors of corruption among French officialdom but saw no evidence of it even at petty levels. during our short stay in the country. The new French budget as of late December is quite inadequate to cope with the present situation.

Relief not Recovery

This is the climate into which we have been pouring our Marshall Plan dollars. If their chief purpose was to hold back communism and establish a measure of recovery at any cost, then the operation has been a success the first year.

But so far it's a relief operation and not a recovery operation which will be self-sustaining. In my judgment it was a very necessary relief operation last year, especially in view of the disastrous 1947 crop failure. It restored a measure of confidence to the French people, and it gave the appearance of normalcy and recovery from a terrible period of occupation. So far so good.

But textile mills which are running on free cotton and free wool and automobiles

which are running on free gasoline do not represent a recovery which can last. This is industrial relief. The French must buckle down to earning the dollars for petroleum and fibres and metals which they have to import. And we must buckle down to insisting on this. (The bankers of the world have always interfered just a little bit with the sovereignty of borrowers.)

The French can earn the money. But they'll have to get rid of their artificial rate of exchange for exports which prices their products out of world markets. They'll have to continue their excellent program to attract tourist dollars and then go in for enough fiscal discipline to keep those dollars for the Bank of France.

They'll have to step up production within France and within their overseas territories. The French colonies could supply large and greatly increased amounts of strategic materials which would be excellent sources of greater dollar income for the future. This is not taking place except on paper.

The French are afraid of over-production and they are afraid of competition. They don't want private U.S. investment on French soil no matter what lip-service they pay to this way of helping them to get production. We shall have to get very firm before matters change. Excessive nationalism is a luxury no nation can afford when it's on the verge of bankruptcy.

They will also have to make a sales drive to market their specialities and luxuries in hard currency countries. At the moment, with Marshall Plan billions in the offing, they are making no such effort. Men's French lisle hose, for example, were a great pre-war export item. One now has to wait months in the U.S. to get them. When they finally arrive they cost $5.00 a pair. The same top quality hose in France cost $1.80 at retail stores which are well stocked with them.

One of the thorny problems in running E.R.P. is that the present system appears to put a premium on doing badly. If a country succeeds by hard work and austerity it gets less dollars. If it does next to nothing to earn dollars, it gets larger grants, not only from us but from other E.R.P. countries like England. Surely it is irresponsible not to "interfere a little with sovereignty" under such exasperating circumstances.

Business men in Switzerland and in Holland expressed amazement that the U.S. was choking so much "planning" down the throat of Europe. They said no detailed three-year plan in this world of uncertainties could possibly be worth the paper it was written on. They asked why the leading private enterprise nation of the world was using techniques abroad it would not dream of using at home. They asked why, since competitive enterprise was responsible for our industrial strength, we were ashamed to insist that it have a major place in European recovery.

They said further that our emphasis on government planning is giving a stature to the bureaucrats of Europe that they could not possibly earn by their competence in their own countries. I certainly found that there is too much of an iron curtain between the government officials in France who are doing the planning and the business men who will have to carry out many of the plans. No lasting increase in production has ever yet been achieved by government to government loans, and I don't think the last three years of the Marshall Plan will be any exception. There can't be a lasting recovery without increased private investment. This can never take place in volume until our own government insists upon it as a matter of public policy and then backs up its lip-service with action.

Our Economic Cooperation Administration officials in Paris are well aware of these matters but hesitant about "interference with sovereignty". My friends outside France tell me that we interfere on little things which annoy the French but fail to make the bold moves which might really get us somewhere - even though there would be risks in bolder action. The greatest risk would be to raise deGaulle to power. Since this might easily wreck the E.R.P. as now constituted, one can understand the hesitancy at Paris.

Nearly everyone we met in France expected deGaulle to come into power before spring as a strong man and no one to whom we talked wanted him. He is regarded as sincere and honest but arrogant and an ignoramus in the fields of business, labor and international affairs. His comments on the "Corporate State" sound something like Mussolini in his early days. As an extreme nationalist, unfriendly to the Anglo-American world, he would present quite a problem. His advisors are mainly men from his London war days and are not trusted. A Swiss student who has listened to some of these aides

tells me they make emotional speeches about liberty and the greatness of the General, but have no program whatever.

In France, the deGaulle program is regarded as negative, being based entirely on anti-communism. (It was under his regime that Thorez returned to Paris from Moscow to lead the French communists. This was the period when Soviet recognition was being sought.) Many French business men fear that the wane of Communism in France might be halted if deGaulle came in and set up a dictatorship of the right.

All agree that the sooner French elections are held the better, since the present Assembly no longer represents French public opinion. Some Frenchmen think deGaulle would get only 40 percent of the vote and be obliged to bring in able men like Schuman to form a government. They think such an alignment might keep deGaulle from going too far. Political instability in France is as serious a cancer as fiscal instability.

Concluding Comment.

Anyone who hinted that the French were victims of a mild form of alcoholism would have the country up in arms against him but this is the tentative conclusion of a competent sociologist whom I met over here. This person pointed out to me that France is on a net import basis on wines and that more of her farm land each year is being diverted to grapes. Wine is served with every meal and three or four kinds are drunk at dinner. Children drink it diluted with water and the doctors applaud.

Workmen, I was told, take a glass after breakfast on the way to the factory. It is also part of the long luncheon period which means so much to them. I saw no drunkenness in France of the volatile sort one meets in the States, but if the whole French nation lives along on a very mild sort of continual "binge" it might account for some of their charming irresponsibility toward economic problems.

Their intellectuals talk about France leading a "Third Force" on the Continent - midway between the Soviet Union and the U.S. - thus preserving the diversity of cultures on the Continent and being in a position to offer ultimate mediation between the giants of the East and West. This seems to me to be an unrealistic bit of escapism in a world headed for a showdown with police-state imperialism.

France leaves an American somewhat bewildered. The French don't want recovery as we understand it with more plants being built to make more things for more people. They don't want what we've got and they can't afford what they want.

Mainly, they want what they treasure as "their way of life". It's an elusive thing to an American. It's the pomp and ceremony with which they fix your crepe suzette at the table. It's the grace with which they give a dinner party in the evening. It's the look in the eyes of their every-day folks when they stand in rapture at the ancient grandeur of Versailles with its glorious gardens. It's the ease with which their hearts turn to yesterday and shrink from tomorrow.

It's the leisure even a workman treasures when he insists on at least two hours to go home for lunch. It's the chance to walk in their lovely woods with their families. It's the "appearance" which you must keep up by way of a dinner out for your friends every week or so even if you have to starve yourself to do it. (No matter that your friends know it and will starve themselves the next week to impress you the following one.)

It's the broad, beautiful vistas in the lovely city of Paris. It's the Louvre with its art treasures. These are only some of the facets of the unique French culture of which every Frenchman is proud. It's neither Eastern nor Western. But it's theirs and they love it and they'll fight to keep it.

Most significant of all, there's no team work in France as we Americans know it. I was shocked when a high French official told me that a CED approach to increased production in France was impossible due to deep-seated hatreds. He said that these hatreds were too strong to get labor and business and agriculture around the same table to discuss the common problems in one community.

Holland was refreshingly different. The Dutch are making great personal sacrifices for recovery. They have met one very strong capital levy - are paying high taxes presently - and putting up with having other Dutch families quartered in their homes because of the housing shortage resulting from the bombing.

A cab driver in Holland gave me a very intelligent explanation of Benelux Union. At the finish he said that real union was being delayed due to differences in the price

level in Belgium and Holland but that the Dutch were doing their part by letting price levels rise in Holland by cutting government food subsidies. He said it would cost his family a little bit more to live but that Union was worth it. I'll bet on any nation whose citizens have a sense of personal responsibility for the general welfare of their country.

Let's be understanding with our E.R.P. officials who are trying to do a practical job in the French climate. One fact of arithmetic may help them. It will be almost impossible to spend as much the second year of the Marshall Plan as the first. The first year the money went fairly fast forcereals and coal - bulk commodities that were needed and easy to distribute in volume. (Even so, much of the first year's money is still unspent although it has been allocated.)

Now, as relief in Western Europe gives way to attempts at a lasting recovery, it will take longer to allocate money for machinery and longer still to get delivery. I should think that a four billion dollar total for the second year of the Marshall Plan would be a top amount. I doubt three-and-a-half billion would hurt. It might help our French as well as our other European friends to come to grips with some of their more basic problems which many of them won't face until circumstances force them to do so.

The French would like a ten year Marshall Plan even though less were available each year than now..Under such conditions they could avoid any basic changes in their way of life. We cannot permit any such leisurely approach. Ours is the delicate job of moving just as fast as we can in nudging France toward real and more rapid recovery without being too over-bearing about it.

It's in our self-interest to do all we can to prevent a complete collapse. But some measure of greater firmness must go with our future aid if E.R.P. is not to degenerate into an international W.P.A. Large numbers of people in the four countries I have visited would welcome a more business-like attitude on our part.

Unfortunately, economic recovery in Europe is inseparable from the military task of defending Western Europe from outside attack. It is also inseparable from the political problem of preventing the rise of Communism within some of the countries.

Then there is the added psychological problem presented by many left wing governments over here which are determined to push their social welfare programs at a faster rate than their productivity permits.

As though this were not enough, we must work in an atmosphere which is very restrictive as to a free movement of money, people and goods. If these same restrictions were to be applied at our forty-eight state lines our economy would grind to a halt in sixty days.

We shall need great patience in the years ahead. Europe will not be able to carry forward on her own by 1952. The current three year plans from nineteen countries all propose to solve their balance of payments problems by sharp cuts in purchases from other countries and greatly increased sales to the same countries. It is the age-old problem of folks wanting to have their cake and eat it too.

These excesses of European nationalism are a great handicap to true recovery. Our own shrinking from incisive action is another. We take fright too easily when someone calls us "Dollar Imperialists".

This is the time to back up and review our efforts. Our leadership these next three years must be bolder and it must take deeper account of our own self-interest. It must rely less on government planning and more on competitive enterprise if the production goals are to be reached. The rate at which the Communists are blackening the map of the world speaks insistently for those who have ears to hear.

July 2, 1948

Dear Mr. Perkins:

This is to acknowledge your letter and notes of July 1st. They have been received during Mr. Murrow's absence from the city and will be called to his attention as soon as he returns to the office.

Sincerely yours,

Dorothy McDonough
Secretary to Mr. Murrow

July 1, 1948

Mr. Edward R. Murrow
485 Madison Avenue
New York New York

Dear Ed:

1

Events in the coal industry have moved rapidly in the last few weeks. So much else has happened in the same period that it seems worthwhile to summarize the developments.

Following the Goldsborough decision on the much-controverted Welfare Fund, John L. Lewis won a most important settlement for the miners.

On June 22, 1948 Judge Goldsborough held that any two of the three Welfare Fund trustees can decide any disputed issue arising in connection with the application or administration of the Fund.

He further held that members of the union employed by operators not contributing to the Fund are also entitled to all Fund benefits and sustained Lewis' position that miners 62 years of age with 20 years of service in the mines are entitled to a pension of $100 per month if they retired after May 28, 1946 (date the Welfare Fund was established).

This decision enormously strengthened Lewis' bargaining position in the then-pending negotiations with the coal operators.

Terms of the Settlement.

Lewis and the Operators signed a one-year contract on June 25, which represents a sweeping victory for the miners. Under its terms, the

miners receive $1 a day more in wages, thus raising their basic daily pay from $13.05 to $14.05. Further, the Operators agreed to pay another ten cents a ton, making a total of twenty cents, into the Welfare Fund from which miners are to draw pensions and other benefits. This will mean an annual fund of $100,000,000.

Lewis also won the general operators to a continuation of the union shop provision of last year's contract. The captive mine operators have thus far declined to sign the new contract upon the ground that the union shop clause is a violation of the Taft-Hartley law.

Significance of the Settlement.

Two factors of particular significance stand out as a result of the coal contract.

1. Inflationary aspects.

There is little doubt that the wage increase will be passed along for the consumer to pay. Higher freight rates added to the increased cost of mining coal indicate a probable rise in the price of steel too before the end of 1948.

The improvement factor in productivity in our tight economy is not apt to run over 3 percent annually. With wage rises in important sectors of the economy nearing 10 percent, the inflationary spiral gets another vigorous whirl for the rest of the year. It is true, of course, that a prolonged stoppage in coal production would also have been highly inflationary. The present settlement avoids that but the price we will pay for averting a strike is high.

Miners the world over are getting special treatment, however, and the nation is getting results in terms of production far beyond any

records being established in nationalized industries abroad.

2. Union bargaining position.

The effect of the Lewis victory and the Goldsborough decision, is to give the unions a highly important organizing weapon. Non-union coal miners are left out in the cold. The pulling power of the union is enormously strengthened and the way is at least open for similar gains by other big unions which might succeed in making comparable Welfare Fund arrangements with management.

With all my best wishes.

Sincerely,

Milo

April 27, 1948

This is a good time to summarize some of the thinking here now that the Italian elections have been won by the anti-Communist parties and the Marshall Plan is beginning to operate.

No one doubts the very critical nature of the world situation, but it may well seem worse to us as individuals than it actually is. Due to rapid modern communications every trouble from every troubled spot of the world rains in on us every hour of the day. Bad news always makes better headlines than constructive news. It's the old story of the house on fire being a news item, whereas the house in process of construction is not news.

Since V-J Day

Looking back to V-J Day certain bold facts stand out in my mind:

1. The war has left this country stronger than ever before. In terms of modern plants and skilled manpower as well as financial liquidity we are now at our peak. England has been seriously weakened. Some of the countries on the Continent have sunk close to a number one mandate status, having lost two of the main attributes of sovereignty - the ability to defend themselves and the ability to feed their own peoples. Russia is sorely wounded but her large land army faces only an egg-shell defense at this moment in Western Europe. Apparently she is building up her submarine fleet which could not

full ten to fifteen percent more than informed persons felt possible six weeks ago. The preparedness moves in this country indicate an awareness that war could come before five years. The change in our Palestine policy based primarily on a determination not to give the Soviets a "corridor" through the Middle East and the drawing together of England, France and the Benelux countries are both very significant steps in so brief a span of time.

The Prospect for Peace.

Informed people still feel that there is more chance of peace than of war in 1948. War could come, of course, by "self-ignition" although the post-war world has survived a good many difficult incidents thus far without shooting. The best chance for peace probably lies in the fact that at this juncture neither side can deliver a body blow at the other.

The Possibility of a Compromise with the Soviets.

If there were to be an early war it would probably be a long one. If there is no war in 1948, a conference with the Soviets seems quite likely by 1949. Some sort of "deal" is even possible, based upon a "spheres of influence basis", although naturally it would not be presented publicly in these terms. The fear here is that such a conference would come to naught until our military strength is actually on the up-grade and until our capacity to wage propaganda warfare at a political level licks the Soviets in some areas other than Italy. Given progress on these two fronts, however, there is a feeling that a compromise might be reached in a year or two which would at least assure the world of a long truce without shooting.

European Recovery Program.

Mr. Hoffman is considered a good choice to head the Economic Cooperation Administration. Three tough problems would seem to face him.

1. How to get better than second-rate men to staff his organization.

only make the battle of the Atlantic more difficult in another war, but could also subject American coastal cities to attack with atomic weapons from submarines given a few years for their improvement. Soviet air defenses at home are being strengthened. The Communist infiltration techniques in most countries beyond the Iron Curtain are a formidable weapon. Strong Communist parties in the same areas represent much more threatening Fifth Columns than Hitler ever had.

2. Personal freedom in the United States is being increasingly valued above peace at any price. It is seen as worth fighting for outside the United States before the Soviets invade Western Europe and the Middle East and sit astride three continents.

3. The continued tension ahead in the world offers a tremendous challenge to the American people. We are unaccustomed psychologically to living in an atmosphere of impending doom. It takes some time to arouse us but once we are aroused we become volatile and want to take action the next morning. Can we live with poise in the period ahead? Can we keep our heads as well as General Clay kept his recently in Berlin? Can we continue to do this for a few years if the Soviets keep on probing for soft spots around the periphery of their vast empire?

The Last Six Months.

The West has taken an impressive amount of action since November in addition to the successful launching of the European Recovery Program. The Soviets have forced western civilization toward a kind of unity in a very bried period that might not otherwise have developed at all. In the battle for the Italian vote there was a political offensive of some viger in additich to the economic offensive. Civil disturbances are still possible there, but the victory is a

2. How to avoid energy consuming conflicts with the State Department.

3. How to keep a recovery program from degenerating into a relief program.

Economic Trends

In the United States a "bust" part of the boom and bust cycle may well be postponed as long as tension with the Soviets continues. Until those tensions are resolved it would seem likely that we will have full employment and gradually falling living standards as our production is diverted to military ends and exports without corresponding imports. Tax increases may well be required next year to meet mounting expenses. Deficit financing is unlikely in the enxt year or two. As taxes have to be increased it's a good guess that corporation rates will go up notwithstanding the needs of American business for continued capital expansion. Individuals seem certain to bear only part of the brunt of future tax hikes. Even then the community property principle for all states insofar as income taxes are concerned, is likely to be kept. In the event of war, excess profits taxes would probably take more of corporate income than in the last war and the principle might also be applied to individuals. Capital levies might ultimately become necessary in a prolonged conflict.

Bogota

What really happened in Bogota remains something of a mystery. There is a feeling that General Marshall may have spoken prematurely in blaming the Communists for the revolt without buttressing his statement with documented facts. Evidence that the revolt was Communist inspired and directed appears circumstantial. Revolt in Latin American countries has not been uncommon. Bitter political and economic differences between the Conservative and Liberal parties plus conflict within the Liberal party stemming from the 1946 elections

in Columbia, were certainly important factors in the eruption. Whether the relatively small Communist group in Columbia engineered the acute resentments into open revolt at a time calculated to be of greatest embarrassment to this country, is an unanswered question. That they took advantage of a situation to promote chaos seems evident. In any case, it is felt that concentration on the Communist menace in Latin America should not blind us to the real economic and social problems besetting our neighbors to the South.

March 29, 1948

Dear Milo:

Many thanks for yours of the 9th and for the copy of Poage's speech on margarine.

It was good seeing you again; let me know when next you are in town.

As ever yours,

Mr. Milo Perkins
1200 Eighteenth Street, N.W.
Washington, D.C.

MILO PERKINS
1200 EIGHTEENTH STREET, N. W.

March 9, 1948

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York, New York

Dear Ed:

I want you to know how very much Tharon and I enjoyed lunch with you last week. Let's do it more often. The next time we hope that the four of us can be together and that your little girl will be well again.

In your broadcast last night you mentioned the oleo-butter squabble, and this morning a friend of mine sent me a copy of a speech on the subject which is really pretty fascinating reading if you ever get time to get to it.

With all good wishes.

Sincerely,

Milo

PROCEEDINGS AND DEBATES OF THE 80th CONGRESS, SECOND SESSION

Anti-Margarine Legislation—An Unjust and Inflationary Discrimination Against a Wholesome Food

SPEECH

OF

HON. W. R. POAGE

OF TEXAS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, January 14, 1948

Mr. POAGE. Mr. Speaker, I have introduced a bill for the repeal of all Federal taxes and license fees on margarine. These antimargarine laws, in one form or another, have been on the statute books for years. The butter lobby has managed to defeat every effort to put margarine on the same basis as any other nutritious and perfectly good food product. However, I have predicted on many occasions in the past, and I now renew that prediction, that the Federal antimargarine laws eventually will be repealed. They are unfair and unjust. In a democracy history shows such class legislation is repealed once the public has become thoroughly informed on the issue.

And right here let me say that the margarine issue is not a sectional issue. It should not be a partisan issue. The proposal to repeal the antimargarine laws is not an attack upon the dairy industry, or even upon the butter industry, as my colleagues to my left have in the past seemed to assume. In years past this reform has been blocked by the almost united opposition of Republican Members of Congress. They pleaded that they were protecting the butter industry. Before the war they could make the contention with some plausibility; that it might be possible to supply the American people with enough butter to meet their needs for a wholesome table spread, although this never has been done.

Today even the butter manufacturers themselves have to admit that it is impossible to supply adequate milk for America's children and at the same time supply enough butter for America's tables at any price. The issue now is: Will we deny our citizens a wholesome table spread which the butter industry cannot supply? I do not believe my Republican friends will continue to insist on keeping this legislation on the books. I would welcome their cooperation in a completely nonpartisan effort to aid all consumers, to help millions of farmers, and to strike a blow for free enterprise and equal treatment for all by repealing the discriminatory margarine laws.

The conditions which served as an excuse for the first antimargarine laws have changed, even though the laws still are in effect. The first oleomargarine was a poorly made product by comparison with modern margarine It imitated butter, but it was not nearly as nutritious as butter, and it was made in some instances under unsanitary conditions.

When the original Federal antimargarine laws were enacted, there were no Federal and State pure-food laws. As all of you know, both the Federal Government and the States have enacted comprehensive and adequate pure-food laws since that time. Among them is the Federal Food, Drug, and Cosmetic Act of 1938. Under it, an official definition and standard of identity for margarine was adopted by the United States Food and Drug Administration in 1941. Margarine which is made according to this standard, and 100 percent of it is so made, has a minimum fat content of 80 percent and a minimum of 9,000 United States Pharmacopoeia units of vitamin A per pound. Ninety-nine percent of all margarine now is fortified with 15,000 units of vitamin A, the content always being indicated on the label.

I do not think that even the persons who contend that the antimargarine laws should be continued will deny that modern margarine is a nutritious and high-quality food. For anyone still doubtful, I refer them to a report on margarine by the New York Academy

of Medicine, a Report on Margarine by the Food and Nutrition Board of the National Research Council and the verdict of many other nutrition groups and nutrition experts.

The Federal antimargarine legislation is the keystone in the almost Nationwide legislative structure built up against margarine. So long as the Federal Government gives its blessing to discrimination against margarine, we can expect State laws against margarine to continue.

Charges that margarine was sold under fraudulent conditions and that it was an unhealthy product were the arguments used to push through the first margarine laws in 1886. Some Congressmen argued logically that the Government should go directly to the heart of the matter through pure-food laws instead of using the taxing power against a domestic product. The interests pressing for legislation did not like this suggestion. The thought that a tax on margarine, coupled with regulations for the labeling of margarine as such, would kill the product. Their aim all along has been to kill margarine, or to cripple it until it no longer interfered with butter. That is the aim today of the group which insists on perpetuation of the antimargarine laws.

Recently I examined the debates and hearings which accompanied the passage of the three Federal antimargarine laws, the first in 1886, the second in 1901, and the third and last in 1931. They confirmed something which has been apparent all along—that the antimargarine laws are class legislation; that they were intended to kill one domestic product for the benefit of a competitive domestic product, and that they have failed in their purpose. Margarine has increased its production in spite of the strenuous efforts to legislate it out of existence. But the antimargarine laws have been costly. They have set a most vicious precedent. All through the years, they have forced the low-income groups to pay a higher price for their table spreads. Finally, the price of butter has risen to such fantastic heights that the majority of American families are low-income groups so far as butter is concerned. Almost everybody uses some margarine, but housewives, if they prefer to serve it yellow, as most do, are forced to waste time and effort in mixing in the color. It has been estimated that from sixteen to eighteen million pounds of margarine were wasted last year in the mixing process and that more than 88,000,000 hours were required to do the work.

As might have been expected, the enactment of the first Federal antimargarine law was preceded by a huge meeting of dairymen in New York City. As described by Representative Scott of Pennsylvania, the convention was composed of representatives from 26 States. They decided to seek legislation to remedy what Congressman Scott called the traffic in oleomargarine. As a result of this and similar meetings, Congress was flooded with memorials urging antimargarine laws.

Despite the pressure, the charges of fraud and unsanitary oleomargarine had to be repeated over and over again to get the measure through the House by a 177 to 101 vote.

For example, listen to Representative Scott in the House on May 24, 1886:

> Within a period of less than 10 years a gigantic traffic has grown up which has already displaced one-fifth of butter and substituted therefor an article, the ingredients of which are acknowledged to be not only offensive in their original character to human taste but positively injurious to the public health. * * * The genius which has succeeded by the application of chemical fluids and compounds in transferring a mass of loathsome and unwholesome ingredients into an article of food at a trifling cost does not hesitate to impose the produce upon the public and receive in the way of excessive profits the difference between the cost and the price of butter.

Although the oleomargarine bill was, on its face, a revenue measure, it was never seriously considered as a money-raising bill during congressional debate.

> I have no desire—

Senator Miller, of New York, said—

> to introduce such a bill for taxation. I want no money from this bill in the Treasury. I want protection to the dairy industry of New York. I want it to go as far as to exterminate the rival industry, if necessary.

This brings to mind that an editorial on June 18, 1941, in the Dairy Record, a magazine representing the dairy industry, said:

> The dairy industry must set as its goal the complete extermination of oleomargarine. It must never rest until the manufacture and sale of oleomargarine have been outlawed in this country.

Senator Miller admitted frankly that—

This—

The 1886 statute—

doubtless is a new species of legislation, or largely so, in this country and under our system. But the exigencies of the occasion seem so great that this body cannot afford to ignore them.

I am indeed thankful that the precedent established by this first law has been confined to margarine. Otherwise, there would have been economic chaos in these United States long ago. Cotton would have placed a tax on rayon, lard a tax on vegetable shortening, and so on, through an endless list.

Time and time again in the 1886 debate the assertion was made that margarine would not sell if it were known as margarine. This apparently was taken for granted by even the defenders of margarine.

Representative Frederick, of Iowa, said:

The fact is, as shown by all the testimony, that it—

Margarine—

will not sell when known.

President Cleveland expressed a similar belief in signing the bill. The foes of margarine felt that they had put the quietus on margarine, butter's competitor, and were satisfied.

It looked for a time as if they had succeeded. In 1887 the production of margarine dropped to approximately 20,000,000 pounds. It had been estimated that at least 200,000,000 pounds of margarine annually were being manufactured before the law went into effect. Despite that first sharp decrease, the production of oleomargarine by 1889 had increased to 83,000,000 pounds.

The butter interests saw they had not killed margarine. In 1901, they again took their case to the Federal Government. This time they attacked margarine on the grounds that it should not be allowed to be colored yellow.

The fact that there was almost no reference to the color issue in 1886 did not deter them. When the first Federal margarine law went through Congress there was no claim that butter had any preemptive right to use yellow to the exclusion of oleomargarine. I could find but one reference to color in the 1886 debates. Representative Henderson, of Iowa, did propose that oleomargarine be colored pink. His argument, however, was that this was necessary to prevent fraud. He set up no claim that butter had an exclusive right to yellow.

The 1886 statute imposed a tax of 2 cents a pound on all oleomargarine, but it did not differentiate between the colored and uncolored product. In addition, it defined butter as the product of the cow and defined all other table spreads as oleomargarine. License fees were placed on manufacturers, wholesalers, and retailers, and there were various labeling and packaging requirements and requirements also for the keeping of records.

The 1901 Federal statute reduced the tax on uncolored margarine to one-fourth cent and levied a tax of 10 cents a pound on colored margarine. There was a section which applied the laws of a State with regard to oleomargarine to oleomargarine shipped into the State. At the time, 32 States prohibited the sale of colored margarine, most of these statutes having been enacted after the butter industry saw that the 1886 Federal statute and other State laws would not kill their competition.

In 1901, the health argument figured very little. By that time, admittedly, most margarine had become a healthful and nutritious product.

By and large, the proponents of an amended law centered their case on alleged frauds. They claimed that most oleomargarine still was sold as butter. The majority report from the House Agriculture Committee said that four-fifths of the colored oleomargarine made was so sold despite the legal prohibition against such sales. This statement was challenged in a minority report, signed by six members and the gentleman from New York, Chairman Wadsworth. The gentleman from New York, Representative Wadsworth, stated that that fraud practice was largely done by retail dealers in butter. The gentleman from Mississippi, Representative John Sharp Williams, quoted the Commissioner of Internal Revenue, charged with enforcement of the 1886 act, as saying that no more than 5 percent of oleomargarine was sold as butter.

The minority report, read by the gentleman from New York, Representative Wadsworth, flatly charged that the real object of the legislation was to destroy the oleomargarine industry. He quoted a statement by a Mr. Adams, pure food commissioner of Wisconsin, before the

House Agriculture Committee, which said:

There is no use beating about the bush in this matter. We want to pass this law and drive the oleomargarine manufacturers out of business.

He quoted also a statement by Charles Y. Knight, secretary of the National Dairymen's Union, in a letter to the Virginia dairymen, dated March 18, 1900:

Now is the time for you to clip the fangs o' the mighty octopus of the oleomargarine manufacturers who are ruining the dairy interests of the country by manufacturing and selling, in defiance of law, a spurious article in imitation of pure butter.

The gentleman from New York, Representative Wadsworth, also called attention to an utterance by W. D. Hoard, ex-Governor of Wisconsin, and at that time president of the National Dairymen's Union, before the House committee. Mr. Hoard said:

It is provided that a tax of 10 cents a pound shall be imposed on all oleomargarine in the color or semblance of butter. In plain words, this is repressive taxation.

Representative Wadsworth's reaction to this confession was as follows:

Just here the minority of the Agriculture Committee parted company with the National Dairymen's Union, for we do not believe that the Congress ought to ruin one American industry to benefit another. And that is just the object sought by these men by their own confession.

The objective of the bill also was summed up boldly by Representative Grout, of Vermont, sponsor of the House measure. He said:

Most of the 38 oleomargarine factories now running will make room for 1,000,000 additional cows and the butter maker whose business now suffers from this competition will feel the relief as from a nightmare and will rejoice that he is at last permitted to reap the fruits of honest toil and the whole American people will be thankful that they are released at last from this oily monster which now lurks for entrance into every household, and for a place at every table.

It—

Oleomargarine—

may suit the stomach of the average workingman but it is true that it is not assimilated by the delicate.

From the fact that 700,000,000 pounds of margarine was consumed in this country in 1947, it is evident that Representative Grout did not have the gift of prophecy.

774578—23501

The minority report clearly summed up the heart of this issue in a statement which is as true today as it was almost 50 years ago. The report said:

Congress is being asked to ruin one industry to benefit another and this, in the opinion of the minority is the thing Congress ought not to do. The minority believes it to be class legislation of the most pronounced kind and it would establish a precedent which, if followed, would create monopolies, destroy competition and militate against the public good.

As I have stated previously, it is indeed fortunate that the precedent has not been followed. Nevertheless, the legislation, most unsavory in character, remains. It is time to get rid of it.

I told the House previously that the color issue, the chief talking point today of the butter lobby, was not raised in 1886. The butter spokesmen embraced this line of reasoning after they discovered that taxing and labeling oleomargarine left it still very much alive. The 1901 discussion has a strangely modern sound and I would like to quote some pertinent passages. It shows that butter's claim that it has an exclusive right to use yellow is as full of holes as the most perforated piece of cheese.

The case for butter was made by that champion of the dairy industry, Representative Grout. He said:

The trouble all comes from giving it—

Margarine—

a color not its own, but the color of butter—always yellow. The oleomargarine men complain because butter is sometimes colored but the coloring of butter only intensifies a little its natural color—the color that belongs to it, the color by which the world knows it, the color that this false product seeks in order that it may palm itself off for butter. * * *

We know that to meet a varying taste coloring matter is introduced into butter. I, myself, think it a foolish practice. I think that the taste of anyone which requires artificial coloring matter in butter is an abnormal and perverted taste.

Representative Wadsworth replied to Representative Grout in words which I cannot hope to improve. Anyone who really believes that butter has some sort of sacred claim to yellow will read his words closely. They are as true today as they were almost half a century ago. This is what Mr. Wadsworth said:

It is claimed by the extreme butter men that yellow is the natural butter color and that practically no other food product has the right to use it. If that claim is true,

what shade of yellow is it entitled to? * * * It is only in the months of May and June, and I speak as a practical butter maker myself when I make the assertion, that creamery butter, and that, of course, is the butter of commerce, has a decided yellow color or tint and that color disappears entirely or almost so when the fall and winter sets in. * * * Here are samples of butter purchased by me this morning and no two are alike. As a matter of fact, every sample is artificially colored. * * *

I deny that butter has the copyright, patent right, or any other right to any particular color, whether yellow or otherwise. * * * If coloring oleomargarine a shade of yellow helps to perpetrate a fraud, then the coloring of butter is actually a fraud because it makes the consumer believe, and necessarily, that fall or winter or white butter of any season of the year is June butter, which is generally considered the best.

Representative Williams, of Mississippi, who became nationally known for his wit and ability when in the Senate later, summed it up trenchantly:

Now what is butter color? Why, it runs all the way from a pure white in the hill country of Mississippi and the piney districts of the United States—almost as white as this piece of paper I hold in my hand—to as red a color as that which used to be the glory of the Goshen butter manufactured in Pennsylvania, the butter which had the widest reputation and the largest sale of any in the country and which everybody who was able to secure, desired for his table. * * *

If they are going to tax uncolored oleomargarine why do they not tax uncolored butter and if they are going to tax colored margarine out of existence, why do they not also tax colored butter out of existence and let everything stand on its own basis of color without artificial incentive to the buyer and without any sort of attempt at deceit?

Despite the convincing arguments of those who held that no food product holds an exclusive right to any particular color, the dairy lobby again prevailed. Butter, by action of Congress, was in effect, granted a preemptive right to yellow as against margarine.

Once again it seemed that butter had dealt margarine a fatal blow.

In 1901, per capita consumption of margarine had been 1.6 pounds, according to the Bureau of Agricultural Economics of the Department of Agriculture. In 1902, it fell to nine-tenths. The following 3 years it was constant at six-tenths—or slightly more than half a pound a person.

But this decrease in margarine consumption was not accompanied by a corresponding rise in butter consumption. The low-income groups decreased their purchases of margarine but they did not increase butter purchases, probably because they could not afford to.

In 1902, butter consumption was 17.5 pounds per person as compared with 19.9 pounds per person in 1901, a decline of more than 2 pounds per capita. During the next 3 years, when margarine was being consumed at a little more than one-third of its 1901 rate, butter consumption still showed no compensating increase. As a matter of fact—and I hope those gentlemen who have been influenced by the contention that it is necessary to keep these laws against margarine in order to protect the dairy industry from ruin will follow me closely—not once, not in one single year, since the drastic antimargarine legislation of 1901 was passed has per capita butter consumption reached the peak it achieved in 1900—the year before the legislation was passed. In that year the American public consumed 20.1 pounds of butter per person. It has never been that high since.

Today, nearly a half a century after the passage of this most drastic of the antimargarine laws, butter consumption is estimated at less than 12 pounds per person per year.

As time went on, two processes were developed for manufacturing a naturally colored margarine which, inasmuch as it was free from artificial coloration, could be sold at the one-fourth-cent tax rate per pound. In 1929 the Commissioner of Internal Revenue, charged with enforcement of the antimargarine legislation, ruled that palm oil and soybean oil could be introduced into margarine without paying the almost prohibitive 10-cents-a-pound tax. These naturally colored oils gave the margarine a yellowish tint.

And then the butter interests moved in again.

They had, they thought, established an effective monopoly on yellow as the color of their table spread. They know that housewives prefer their table spread yellow, just as they prefer oranges yellow. Color tastes, so far as foods are concerned, are matters of conditioning and habits. We want certain foods colored certain ways and, knowing this, food manufacturers use artificial color, if that is necessary, to give the customer what he wants. But butter is the only food

774578—23501

which seeks, by law, to prevent a competitor from using a color.

In 1931 butter again attempted to drive margarine from the competitive market, by seeing to it that margarine could not be colored, naturally or otherwise, without payment of a penalty.

A bill was passed amending the 1901 act, which had placed a tax of 10 cents a pound on artificially colored oleomargarine. It provided that, thereafter, all margarine should be held to be yellow in color when it was a tint or shade containing more than 1.6° of yellow, or yellow and red collectively, and subject to the 10-cent tax. By this amendment colored margarine produced from oils naturally yellow, as well as artificially colored margarine, was brought within the more drastic taxing and licensing provisions of the Federal margarine law.

Henceforth, domestic cottonseed and soya-bean oil—both of which contain some yellow color in their natural state—would have to be bleached before being used in the making of margarine.

Butter was now, it seemed, to own yellow as a table spread color—or at least 98.4 percent of it.

Now, in 1886, as we have seen, the butter interests established special privileges for butter as against margarine by claiming that they were thereby protecting the public from fraud and from an unhealthy food product. In 1901, their charges of impurity against margarine having been dissipated, they advanced once more behind a smokescreen, crying "fraud."

In 1931, their original purpose—to drastically curb or eliminate butter's competition—as strong as ever, they shifted ground once more. Margarine was being made with foreign oil, they said, to the detriment of American farmers. The fight was described as a battle between United States dairy farmers and "the coconut cow" referring to oil made from coconuts.

It was true that large quantities of palm oil and coconut oil were at that time being imported into the country and used in making margarine. But it is also true that considerable quantities of oleo and cottonseed oil were also going into the manufacture of margarine.

In 1931 the butter industry came out into the open. Their spokesmen said frankly that their first purpose was to protect the butter industry.

774578—23501

Senator Townsend, of Delaware, summarized the whole history of antimargarine legislation when he said:

> The record of the proceedings of Congress during the debates of this act will convince any reader that the intent of the enactment was to protect the dairy interests.

Then he went on to mention Alexander Legge, Chairman of the Federal Farm Board, who, in testimony before the Agricultural Committee, he said, "was especially insistent that palm oil be embargoed on the ground that it displaces American dairy products."

However—

Senator Townsend continued, with what, I am happy to say now, was considerable foresight—

> it is my opinion that an embargo or a tariff will not relieve the situation permanently, for science will discover something that will take the place of palm oil unless the law is strengthened with respect to color in oleomargarine.

Science, as you know, did just that, even though "the law was strengthened." Margarine was further improved and fortified with vitamin A until today it is the nutritional equal in every way of butter.

It is hard to put a halter around ingenuity and enterprise as the butter interests have found out. In our economy it is hard to stifle competition. But the butter lobby tried again, and again, and again.

With a frankness matching that of the Senate sponsor, Representative Brigham, of Vermont, said:

> The unrestrained sale of oleomargarine, costing as it does less than one-fourth the cost of dairy butter, will drive dairy farmers out of business.

There was, as has so often been the case, nothing in the record to support this oft-reiterated assertion. Restrictive legislation against margarine, as we have seen, had not helped the dairy industry. It had merely hurt the margarine industry and the people, mostly in the low-income groups, who use margarine.

Today antimargarine legislation is simply one more factor in adding to the high cost of living and in promoting inflation.

What happened after the passage of the 1931 act? Margarine consumption dropped again. Agriculture Department figures show that the per capita consumption of margarine declined from 2.6

in 1930 to 1.9 in 1931 and 1.6 the following year. Butter consumption fluctuated within narrow limits. It rose from 17.2 in 1930 to 18.0 in 1931 and 18.1 the following year. Then it dropped to 17.8, rallied briefly to 18.2, and the following year, 1935, it was 17.1—one-tenth of a pound lower than it had been in 1930, the year before the last Federal antimargarine law was passed.

After 1935 per capita butter consumption dropped to 16.4, where it remained until 1940, when it rallied briefly, but then it fell steadily again. In 1946 it was around 10½ pounds per person. Last year butter consumption is estimated to have been approximately 11½ pounds per capita. Compare this figure with the high of 20.1 pounds of butter consumed per person in 1900 and the all-time high of 22.2 pounds in 1896, and ask yourselves again if protection—however drastic—has really benefited the butter industry.

I see no indication that the production of butter will rise at any time in the near future. More and more, dairy farmers are realizing that the most profitable sale of their product is as fluid milk. A sale as butter is the least profitable, a point which I hope to develop at greater length later on.

Butter is not the only industry which has tried to use the law to kill off its competition. There are similar instances on record. The English wool industry secured legislation against calico years ago. I want to digress here a moment to tell you what happened in this instance, for the case has many aspects similar to the butter-margarine controversy.

In the sixteenth and seventeenth centuries especially, wool was the great English industry—more important even in that country's economy than the dairy industry has ever been in the United States. Thousands of sheep, grazing on the green English countryside, produced the finest wool in the world and this was spun and woven into cloth of the highest quality by the cottage weavers. And then the Government, jealous of the superior quality of English wool, moved to protect it from any possible competition by forbidding the export of raw wool. It was feared apparently that foreign hands might prove as skillful in the weaving of the cloth as English hands, and that the finished product would then compete with English woolens. To increase wool's use, a law was passed that funeral shrouds must be wool.

Thus, for more than 120 years—

Leggett tells us in his Story of Wool—

it was illegal to bury a person in any other shroud or covering than pure English wool.

Not everybody liked this kind of legislation. As was said at the time: "This law forces our dead to consume what the living were inadequate to purchase."

Late in the seventeenth century calico prints began to appear in the English market. They were not hand-woven in a thousand scattered cottages as was English wool. They were machine-made—by primitive machines, it is true, but nevertheless the products of imagination and enterprise. The cloth was poor in comparison with wool. At first only the very, very poor bought calico.

But where the wool growers were complacent, the calico makers were enterprising. The quality of the cloth improved. More people bought the cheap cotton substitute for wool. And then calico began to be manufactured in England.

The Government moved to protect its greatest industry. It placed a tariff upon imported calico and a heavy tax on its domestic manufacture. It was a discriminatory tax—like the tax on margarine—favoring one domestic industry at the expense of another. This kind of internal tariff is a rare thing in Anglo-Saxon history, almost unprecedented. Its two most painful examples, and saddest failures, are the tax on calico to favor wool and the tax on margarine to favor butter.

What happened in the latter instance also happened in the first. Wool, like butter, won little or no advantage; the calico and printed-goods industry, like the margarine industry, was hurt, but it did not die. And then, in 1700, Parliament acted again in behalf of its "petted and pampered trade," as a contemporary critic referred to the wool industry. It prohibited the selling of cotton goods in England and, 12 years later, it forbade the weaving of cotton goods and placed a fine of $25 on the weavers and $100 on the venders.

But enterprise is hard to kill, and, try as they would, the wool industry could not kill calico.

The woolen manufacturers went so far as to hire Daniel Defoe, the great

novelist, as a public-relations man. Defoe's assignment, for which he was well paid, Leggett says, was "to prepare a pamphlet making sport of chintz and calico."

Defoe assumed the task with all the ardor of a dairy spokesman attacking margarine.

Chintzes—

He said—

were advanced from being upon the floor to the backs, from footcloths to petticoats. * * * We see persons of quality dressed in India carpets which, but a few years before, their chambermaids would have thought too ordinary for them.

Another law, passed by Parliament in 1720, was a measure of the failure of the earlier restrictive legislation in behalf of wool against calico. It was the most drastic of all and prohibited the purchase and use of "printed, painted calicoes, the wearing of which manifestly tends to the great detriment of the woolen manufacturers of the Kingdom."

It would appear that this should have been enough, once and for all, to kill the competition of cotton with wool, and hence, as its proponents thought, to save the wool industry.

But, as Leggett points out, the wool industry "while sheltered from the economic stress of foreign competition, was to a large extent stagnant at home. For many decades no new fabrics or designs were developed. As late as the eighteenth century woolen yarn was still being spun and woven by hand in the homes of weavers."

Wool, like the butter industry, was too complacent, too content to rest on the mythical protection of restrictive laws against its competitor. It was old fashioned. It had been slow to develop new processes and new techniques. It suffered accordingly.

But neither the wool industry nor the manufacture of cotton cloth perished in England. There was a place for both; a market for both. Eventually the costly wasteful, prowool, anticalico laws were repealed and that place and that market were found, both for wool and for cotton.

The woolen manufacturers, faced with vital competition, replaced the cottage industry with factories and developed new machines. And cotton, at long last, won the same right to be worn by the living—and even the dead in shrouds—as wool enjoyed.

774578—23501

I sincerely hope that this Congress will write the same ending to the discriminatory antimargarine laws as the English Parliament long ago wrote to the anticalico laws.

I have already stated that dairy farmers are more and more coming to realize that the most profitable sale of their product is fluid milk and that the least profitable is butter.

This realization upon the part of the farmer is shown by the decline in butter production and a corresponding increase in milk production during the past 10 years. Butter production dropped from a prewar—1937-41—annual average of 2,200,000,000 pounds to 1,500,000,000 pounds in 1946. During the same period, milk production increased from a prewar—1937-41—average of about 108,000,000,000 pounds to about 120,000,000,000 pounds in 1946.

Despite the increase in the production of whole milk, the United States Department of Agriculture reports that there is still not nearly enough milk to supply the people of this country at the high level of consumption of 1941, a level which nutritionists say is highly desirable. To achieve this health goal, 657 pounds of milk or its equivalent per capita is required, compared to the estimated 1947 supply of 430 pounds, of which 403 pounds is fluid milk or cream. To fill the gap of 227 pounds per capita approximately 5,800,000 additional dairy cows would be needed at the 1946 high rate of production per cow.

What caused the dairy farmer to divert more and more of his product from butter production to whole milk?

It was the simple fact that he got more money for one than for the other.

The average price paid for milk sold as fluid milk or cream during the 10-year period, 1936-46, was about 74 cents per pound; for butterfat, about 37 cents per pound. The prices paid for milk for use in ice cream, cheese and other products fell between these two levels.

In other words it was twice as profitable during this period for the dairy farmer to sell his milk for whole milk use as it was for him to divert it to butter manufacture.

As a result butter today is a minor factor in farm cash income and in the income of dairymen themselves. Farm cash income amounted to $24,519,000,000 in 1946. Butter and butterfat contributed about 2 percent of this amount.

Farm cash income from all dairy products in 1946 amounted to $3,716,000,000. Of this total, butterfat and farm churned butter accounted for $549,000,000, or 14.7 percent. It is interesting to compare this last figure with the percent of their milk which dairy farmers diverted to butterfat use, which I cited earlier. This comparison shows that, although dairy farmers in 1946 disposed of 23.35 percent of their milk for butterfat, their income from that amount was only 14.17 percent of their total income from milk.

An examination of the use of dairy products as milk or butterfat throughout the country reveals that in certain sections butter is such a minor factor in the dairy industry as to make the claim of the butter lobby that the industry's continued prosperity depends upon the suppression of margarine an absurdity.

In 1946, for example, the northeastern region, Pennsylvania, New Jersey, New York, and the New England States—produced over 18,000,000,000 pounds of milk. Of this amount, only 3.61 percent was disposed of as butterfat.

All indications are that butter will become increasingly less important in the over-all dairy picture. I have read recently a very significant speech by W. A. Wentworth, vice president of the Borden Co., at a meeting of the Minnesota Ice Cream Manufacturers Association in St. Paul. Mr. Wentworth dealt in figures, not emotion and prejudice, and these figures clearly indicate to me that butter is likely to become less and less important to dairymen.

Mr. Wentworth pointed out that in the prewar years, 1935 to 1939, an average of 58,515,000,000 pounds of milk was used in the production of fluid milk and cream, cheese, ice cream, evaporated milk, condensed milk, and whole milk powder. In 1947 approximately 84,640,000,000 pounds of milk were used in the production of fluid milk and cream, cheese, and the other whole-milk products mentioned. To state it another way, 56 percent went into the whole-milk products before the war; 70 percent of the milk produced is being used for the listed products now.

On the other hand, Nation-wide butter production in 1947 will approximate 1,700,000,000 pounds, which is 22 percent less than the average annual production of 1935–39. If the population increase is taken into account, the per capita consumption of butter is 31 percent less than that of 1935–39; or in other words, only about two-thirds as much butter per capita was available in 1947 as in the prewar period mentioned.

Mr. Wentworth points out that if sufficient butter were produced to make prewar per capita consumption possible, that 13,500,000,000 pounds more milk would have gone into butter in 1947. This is nearly one-fourth of the expected sales of fluid milk and cream. He points out that if the 13,500,000,000 pounds were diverted into butter that the total volume of milk for fluid milk and cream sales would have to be reduced to the volume consumed annually in 1935–39. On a per capita basis, consumption would be substantially lower now than in the prewar years.

From a nutritional standpoint and from the standpoint of the dairyman, this shift from fluid milk and cream sales into butter production is undesirable.

What the trend away from butter production and increase in the consumption of fluid milk and whole milk products means is strikingly emphasized in Minnesota. Ten years ago, approximately 77 percent of Minnesota's milk production went into the manufacture of creamery butter. But in 1946 only 42 percent of the milk produced in Minnesota was used in the manufacture of creamery butter.

The proportionately large production of butter in prewar years indicated in reality a waste of milk—a huge quantity of skim milk being fed to animals—to the loss both of the consumer and the dairyman.

There still is entirely too much thinking in the terms of scarcity economics in some dairy industry circles. Some people still regard butter production as a possible refuge for the industry if income declines and people are forced to curtail milk consumption. On the other hand, the increasing awareness of the value of milk from a nutritional and health standpoint would tend to keep milk consumption comparatively high even if there should be a business recession.

The real interest of the dairy industry lies in expanding its market for fluid milk and in selling its extremely valuable products in ever increasing quantities at reasonable prices. This is in the best interests of the industry and of the Nation as a whole. It is evident, therefore, that dairymen no longer are dependent upon butter and that butter will be less and less important to the industry.

774578—23501

There will continue to be, of course, a market for butter. It is preferred by many people and always will continue to be regardless of the fact that margarine is as good nutritionally and will sell for a cheaper price. But the dairy industry as a whole will not be hurt if margarine greatly expands its present market. In fact, it will be helped if it pursues a statesmanlike course and also expands its markets in its most profitable field, that of whole fluid milk and whole milk products.

It is interesting to observe that, for the most part, the greatest butter production is in those areas where the soybean industry represents an increasingly important part of the farmer's income: Illinois, Ohio, Indiana, Iowa, Minnesota, Missouri, and Kansas—to mention a few.

Are the gentlemen who represent the people of these States going to say to the soybean farmers, who produce almost 45 percent of the oil used in margarine, "This food, into which so much of your product goes and upon which your livelihood so largely depends, is not worthy to compete in a free American market with butter. We are going to continue to restrict it and curb it and hamper it."

For more than a half a century that is what has been said by this Congress to the cotton farmers of the South whose cottonseed oil was used in margarine.

The cotton farmers protested in vain. Their protests were drowned out by the clamor of the butter interests demanding protection and special privilege for their product. The butter interests were well organized and they threatened vengeance on any Congressman who wanted to do the fair and right thing.

And so butter, like wool in England, remained a "petted and pampered" industry. But the butter industry was not the gainer. There was no gainer. There were only losers—the low-income consumers, the workingmen, the cotton, soybean and livestock farmers and the country as a whole.

What this vicious discrimination against margarine means to the poor farmer of the South has been well stated by Oscar Johnston, president of the National Cotton Council, in testimony before a Senate Agriculture Subcommittee in June 1944. He pointed out that it was the poorest farmers, the sharecroppers and the tenants, upon whom these antimargarine laws laid the heaviest burden. The mortage against the tenant's crop, drawn to assure payment of funds advanced him to make the crop, ordinarily did not cover cottonseed.

The seed, he testified, frequently provided the source of income on which the farmer lives.

The discrimination against margarine has curtailed the use of cottonseed, has decreased their value and thereby has taken millions of dollars out of the pockets of the neediest farmers in America.

The butter industry would have you believe that the fight over margarine is still largely a fight between the cotton producing South and the dairy industry. The consumer of course has been ignored because he was unorganized.

But, as I have indicated, this is no longer a struggle between the cotton South and the butter interests, even if we do not take the consumer into account.

The soybean farmers, many of them living in the Middle West, are in this fight, too, standing side by side with the cotton farmers, demanding that these unfair antimargarine laws be wiped out.

Ersel Walley, president of the American Soybean Association, recently made this statement:

> Modern margarine is a clean, nutritious, widely accepted product of American farms. It is the only food product on the American market upon which specific discriminatory taxation has been levied. This discrimination should be removed as quickly as possible.

In the 10-year period between 1936 and 1946, soybean production in the United States rose from 33,000,000 bushels to 196,000,000 bushels. In 1936, the value of soybeans harvested for beans was estimated at $520,000,000. In 1946 the value was even higher.

In Iowa, a leading dairy State, cash receipts for soybeans produced in 1946 were two-thirds of all dairy products. The Iowa crop of harvested soybeans sold for $82,182,000; all Iowa dairy products, for $123,752,000.

The value of soybeans produced in Illinois in 1946 amounted to $183,243,000; dairy products to $146,022,000. In Illinois the value of the soybean crop is $37,000,000 greater than the value of dairy products.

The Indiana soybean crop was worth $56,897,000; the Missouri crop—$34,290,000; and the Minnesota crop—$22,172,000.

I do not think all the Members of this House are fully aware of the tremendous importance of the soybean industry to this country, of its amazing development

and growth, and of its value to the farmers of their own and other districts. I have assembled some of this information and will be glad to give it to any Member who is interested in it.

There are districts I could cite in the so-called heart of the butter country where soybeans are a more important source of income to the farmer than butter. And without a profitable market for the oil which comes from the soybean, the farmer cannot economically produce that crop. I shall only add that in 1946, soybeans contributed $600,000,000 to the farm income of the Middle West alone.

Soybeans are very important in the whole food picture. For example, soybeans are an important source of protein feed—essential for the production of meat, dairy products, and eggs.

Soybean oil meal, as Mr. Walley points out, today leaves the processing plants at approximately the same price per pound as is paid for wheat or corn by live stock feeders.

Yet—and it is important that the Members of this House understand this fact—one pound of soybean oil meal will replace from 3 to 4 pounds of corn in the livestock ration, and will, therefore, help alleviate the critical grain shortage.

The expanded use of soybean oil meal by livestock feeders thus offers a way to meet the needs of the hungry peoples of Europe and of our own people, and, at the same time, benefit the American farmer.

But—and I want to stress this point—in order to get the soybean meal to the chickens and the cattle economically there must be a profitable market for the oil which is crushed out of the bean before it becomes meal.

The ability of the soybean industry to produce protein meal on an efficient basis—

Mr. Walley says—

is contingent upon profitable usage of soybean oil. This means that soybean oil, unhampered by outmoded restrictions, must go into food products in increasing quantities over a period of years.

I said earlier that the interests of the consumers had been largely ignored on this question in the past because consumers were unorganized. But I am sure no Member of Congress believes today that, with butter selling around a dollar a pound, that consumers are indifferent to the situation created by these discriminatory laws. If anyone doubts what I say, make your own poll of housewives. You will find that they are overwhelmingly in favor of legislation which will enable them to buy margarine already colored.

These taxes and license fees on margarine are direct levies upon the consumer's pocketbook. They add to the high cost of living at a time when one of the country's chief concerns is inflationary prices.

Since 1939 the over-all cost of living has increased 60 percent. In 1939, according to the Department of Agriculture, the weekly food bill for an average household amounted to slightly more than $6. In October 1947 it was more than $12. Today it is even higher.

It is little wonder that housewives, anxiously trying to stretch their food budgets are demanding margarine at the grocery stores of the country. And yet, due to these Federal—and State—anti-margarine laws, more than half the grocery stores in the United Statse do not sell margarine, either colored or uncolored.

These are mostly the small independent stores, operating on little capital, afraid or unable to pay the fees and meet the other restrictive requirements of the law. And these are, generally the stores patronized by the lower-income groups whose need for an economical supply of vitamin-giving fat foods is greatest.

Margarine or butter is essential in the individual diet. The same Federal Government that tries to strangle margarine with taxes and fees lists it as one of the seven basic foods. And yet combined margarine and butter consumption for 1947 is estimated at only 16 pounds per person, considerably below previous nutritional levels.

Only one retail grocer in a hundred sells colored margarine; this is due, it is true, to State as well as Federal laws. But even in those States where only Federal fees and taxes operate to restrict the sale of colored margarine less than 1 store in 20 sells it.

The housewife wants to serve margarine yellow. This is a matter of food tastes and food habits. Butter meets the consumer preference by using artificial coloring without penalty. The housewife has to mix the coloring and margarine herself.

This is a time-consuming and wasteful process. From 2 to 2½ percent of the margarine is lost in the process of mixing, thus about sixteen to eighteen million

pounds were wasted in 1947. It is also a totally unnecessary process. There is no reason, except these discriminatory laws, why all margarine should not be colored in the factory and sold to the consumers as they want it.

Yes, the antimargarine laws have their place in the total inflationary picture.

And right here, I want to repeat my hope that the leaders of the Republican Party will not, as they have generally done in the past, make a party issue out of this struggle to repeal the antimargarine laws. In the past, efforts to get legislation to repeal the antimargarine laws have met the united opposition of the Republicans. This state of affairs could not happen if the Republican leaders had been sympathetic to repeal. This effort to give long overdue justice to the farmers who produce domestic oils, and to the makers of margarine, and to the consumers, should be bipartisan. I do not see how either the Republican or Democratic leadership can afford to identify themselves as standing against the repeal of vicious, inflationary, un-American class legislation.

Unfortunately, some of the measures taken by the Republican leadership of this Congress have, in my opinion, contributed materially to the rising cost of living. This is not the place or time for a bill of particulars on this subject. I repeat that in this instance where the issues are startlingly clear once they are examined squarely, I hope that right-thinking men in both parties will join together. The Eightieth Congress will bring credit upon itself and do the entire country a service if it tears out these antimargarine laws by the roots and flings them where they belong—upon the scrap heap of oblivion.

U. S. GOVERNMENT PRINTING OFFICE: 1949

COLUMBIA BROADCASTING SYSTEM, INC.
485 MADISON AVENUE
NEW YORK 22, N. Y.

November 13, 1947

Dear Milo:

Many thanks for yours of the 10th and for your comments on the food situation. I am right now in a frenzy of preparation for a trip to London the end of this week, but I am looking forward to reading your notes when I return.

As ever yours,

Mr. Milo Perkins
1200 Eighteenth Street, N.W.
Washington 6, D.C.

"Comments" in "Reports" file.

November 10, 1947

Mac — tell him many thanks

Mr. Edgar Murrow
Columbia Broadcasting System
New York, New York

Dear Ed:

It seems to me that we <u>might</u> do the job of helping to feed Europe with less inflationary threat to our own economy than now exists. I have put my thoughts on this subject in memorandum form and a copy is enclosed for your information.

With all my best wishes.

Sincerely,

Milo

Enclosure.

Dear Ed-

For whatever personal use, without attributing ideas to me, you might care to make of this -

Yours -

Milo

Comments on the Food Situation in the Western World

with Some Suggestions for Action

November 4, 1947

The international food situation has been one of the most important subjects under consideration in Washington during October, both because of the inflationary threat here at home and the desperate needs in Europe.

While a great deal of information as to food supplies has been available from governments and through the press, I think it might be well to give a few simple statistics regarding the production situation for the major foods; to comment on the food outlook for the Western World, and to suggest certain steps which might improve the situation.

1. The current production situation. Supplies of food for the world as a whole will be somewhat less this crop year than last and below pre-war production, particularly in those areas of Europe and Asia where the need is greatest. World wheat production, for example, while about the same as the pre-war 1935-39 average, is very badly distributed. North American production is about 64% above pre-war, but production in Europe is now estimated at the disastrously low level of only 68% of pre-war. (See table attached.)

Oats and barley, important fodder grains and in some sections of the world very important food grains, are both about 6% below the pre-war average. Rice production is down about 5%, but some very important export areas, such as Burma, Siam and French Indo-China show such low production that it appears there will be very little rice available for shipment from these important exporting countries this year.

Potatoes, very important in the diet of Europe, show a world production of about 16% below the pre-war average, but the tragedy in this situation is that most of the reduction has taken place in Europe, the area least able to afford the reduction from the standpoint of its over-all food position. Persons recently returned from a tour of Europe and Germany inform me that, in

Germany particularly, the potato crop is very poor both in volume and quality. Fats and oils still remain in short supply.

In appraising the statistics given above, it must be remembered that there has been an increase in the population since the beginning of the pre-war average period, hence the situation per-capita is worse than indicated on the basis of the gross production figures. Further, competent observers report that the distribution of the available food supplies in Europe is spotty. A large portion is either being retained on the farms or moving into the black markets, resulting in an unequal distribution of the available food among the populations, with the worst effects in the cities.

2. The outlook. It is too early to secure any information that would warrant an estimate of the food position, production-wise, for next year. However, I wish to point out certain sore spots in the world agricultural situation that indicate little real chance for large-scale improvement in the production for quite some time, perhaps for several years. We all know that there has been a crying need for fertilizer, farm machinery and other tools of agricultural production, particularly in Europe, since the middle of the war. Lack of adequate fertilizer and good cultural practices tends to be cumulative in effect. The production machine in Europe, if it does not actually deteriorate further, may be barely able to hold its own. The insecurity of governments and the fiscal uncertainties both within countries and between them have aggravated a situation already made desperate by war's destruction.

Here in North America, we have been blessed with an unprecendented period of fine crop years, but there are ominous signs that our luck may be running out. It has been eleven years since there was a major drought, and merely on the basis of statistical history, we should expect a major drought before many more seasons are past. As a matter of fact, the Southwestern winter wheat belt has been very dry at a most crucial time--that of seeding next year's crop. A few more weeks will tell more of the story in this area. There are not many factors pointing

to optimism in the food production outlook for next year.

3. Current U.S. Government operations. There is little to add to the comments in the press and on the radio by prominent officials with reference to the program for alleviating the critical food situation in Europe by voluntary measures. This program will no doubt have some effect, but I believe the effects will be limited.

Truly effective action to stop the price inflation which we are experiencing is not likely during the emergency session of Congress beginning November 17. Price and rationing controls, by all means the most effective war-time devices for the control of inflation, are not likely to be instituted except as a very last resort in the event of threatened crop failure next spring. That might be too late and yet if they were instituted earlier they might discourage production, thereby increasing our inflationary pressures. The Congress, quite aside from political considerations, will face a real dilemma when it meets to consider this matter.

4. An action program. This does not mean that the situation is hopeless. A small group of informed people has been working on the problem. They have developed an action program, the highlights of which are as follows:

A. Convene the Secretaries of Agriculture of the Western World immediately so that Western civilization can tackle the job of feeding itself on a truly cooperative basis. In a tight situation such as this, there are no panaceas, but there are a long series of concrete steps that can be undertaken with the promise of good results if each nation will contribute all it can to the common job.

B. Buy more foods other than wheat within the U.S. There are some foods here that are in relatively heavy supply such as raisins and prunes, canned vegetables, and eggs, particularly dried eggs. These foods could be sent to

Europe, with very little tendency to increase inflationary forces here. True, they would cost more than the grains, but the question here is how to supplement the amount of grain we can send to Europe without increasing to any marked extent the inflationary trends now so evident in this country.

Of the $350,000,000 appropriated for relief to Europe when U.N.R.R.A. passed out of the picture, about 80% of the money is being spent for food, and of that amount approximately 80% is being used to purchase wheat and flour. The State Department and the Army feel that Europe needs at least 570 million bushels of wheat, while the United States Department of Agriculture feels that it would be quite unwise to commit more than 470 million bushels at this time. Although we produced the largest wheat crop on record last year, our production of all cereals was down by about three-quarters of a billion bushels due largely to our shorter corn crop.

When wheat was $2.50 per bushel, it was calculated that every increase of fifty cents per bushel would add two and one half billion dollars to the cost of living in the United States. An advancing wheat market, therefore, can produce considerably more inflation here which would be compounded if we should have a drought next crop year. Continued inflation gives the labor unions a very persuasive argument for increasing wages, thereby adding substantially to the possibilities of a boom-bust cycle.

From a point of view of the operating agencies responsible for feeding programs in Europe, the primary emphasis on wheat and other bread grains these last two years has been quite understandable. They felt it was justified by the over-all fiscal position. Wheat and flour gave these organizations the highest caloric measure for the least money. With limited funds, it is but natural that the various agencies, including the foreign governments involved, were interested in spending as much of their money as possible for bread grains.

With the declining availability of cereals, however, we may well have to turn to more expensive goods for foreign relief. This will not only help to

curb inflation at home but it will provide for a more balanced nutrition in Europe.

C. Stop extravagant use of grains on European farms. Part of the food problem in the Western World has to do with understandable hoarding by farmers in Europe who would rather convert grain into livestock and sell the livestock on the black market than take paper currency for bread grains when no consumer goods are available. Or they would rather keep their food on the farm for a higher level of family consumption. This represents a terrible waste of grain right in Europe where the need in their cities is going to be critical this winter. The War Assets Administration has over 100 million dollars of surplus consumer goods which European farmers want. Stock includes such items as shoes, rubber boots, axes, etc. If these surplus goods were sent to Europe and bartered to farmers for bread grains before winter sets in it could help considerably.

D. Buy all surplus stocks of food available outside the U.S. Some surpluses of food exist in the Western World because the holders want dollars rather than weak currencies for their products. Stocks of tinned fish in Norway and Iceland fall in this category and their procurement would not increase inflation here. Fishing fell off during the war. Large catches could be made in southern waters off the coasts of Peru and Chile, in the Carribean and off the coast of West Africa. It is not too late to develop such programs now.

Other supplies of food, such as copra from the Netherlands East Indies, are not now entering world trade because of political difficulties. These islands pre-war exported a large volume of copra. Coconuts represent a source of scarce fats and oils that can be had without raising a crop. Pending the establishment of a stable peace, a truce in the Netherlands East Indies should be arranged solely to permit the gathering of copra. Consumer goods such as textiles should be taken in so that native labor would receive something tangible for its work.

An outstanding job of rehabilitating the copra industry has been done in the Philippines. A program designed to meet the basic needs of the natives for trade goods was inaugurated and good cooperation between our government and the Philippine Government has resulted in an output of copra for this calendar year now estimated as the largest on record. This was done by a well integrated program of furnishing workers with needed supplies, of furnishing needed transportation which is an important factor in a country seriously damaged by recent fighting, and by full cooperation between the Philippine Government and the business firms involved.

E. Contract now for crops abroad to be harvested next spring. The worst problem of hunger in Europe may well come next spring and early summer before the 1948 crops are in. Certainly that appears to be the best forecast now. This danger can be partially lessened by a determined effort to secure supplies from areas where the production season is the reverse of that in the Northern Hemisphere, such as South America.

If the United States Government would offer now to buy any unsold parts of such crops at good prices and if it would agree to take delivery next spring when they are harvested, it is highly probable that a large amount of additional food could be secured. Crops such as beans and rice from Brazil come to mind. These purchases should be in amounts which would avoid further inflation in Latin American countries.

Argentina presents a special problem, but at a conference of the Secretaries of Agriculture of the Western World, some program could surely be worked out for tapping this rich source of supply. It might even be possible to persuade the Peron Government to modify some of its present agricultural policies, which at this time appear to be discouraging planting. It might also be possible to work out a more reasonable basis for releasing present stocks in Argentina to Europe before winter. It would pay us to put in dollars for this purpose.

This foreign procurement of foodstuffs on the part of the United States

might have been difficult from the political point of view two years ago, since farmers would have felt that our Government was stimulating foreign competition. The threat of further inflation within the U.S. on the food front is now so great however, that I think there would actually be political support for such a program at this juncture.

General Comments.

When the shortage of fertilizer and farm machinery is taken into account, it looks as though there will be food scarcities within the Western World for many years even without crop failures. This is the sort of situation in which virile efforts to step up production in all countries can be undertaken with a minimum of resistance from nationalistic minded groups of producers.

Quite aside from the problem of Soviet domination in Eastern Europe, the shift in that area toward a more diversified type of agriculture means that Western Europe will have to count much more upon the Western Hemisphere for its food in the years ahead than it has ever done in the past.

There are well-founded rumors coming from European sources that the Soviets plan to offer some grains and meats from Poland, the Balkans and the Ukraine, to Western Europe later this winter with a tremendous amount of propaganda designed to discredit U.S. efforts to help Western Europe. The great amount of propaganda emanating from the Soviets last winter when they shipped a dribble of wheat to France comes to mind. They cashed in on that move politically within France.

Their operation this coming year may far surpass that of last year insofar as wringing the last iota of propaganda value from small help is concerned. If a session of Secretaries of Agriculture of the Western World were called at this time, they might publicly ask Russia to join in help for Western Europe now with food. Such an invitation, if ignored or rejected, could discredit any Soviet effort next winter to play politics with hunger in Western Europe.

Incidentally, we do very little in the U.S. to secure any propaganda value from our foreign aid. We turn wheat and flour over to European governments at

U.S. ports and the average housewife on the Continent has only the vaguest notion of our assistance. We aren't even imaginative enough to send millions of narrow paper wrappers to put around the long loaves of bread baked from our own wheat in a country like France with some such wording on them as:

"This bread was made from wheat grown partly on French farms and partly on American farms. Recovery in Western Europe is our common goal."

As much food as possible should be sent to Europe in packaged form, both to avoid spoilage and pilferage from bulk shipments and to get the maximum awareness of U.S. aid on the part of individual recipients. The excellent C.A.R.E. program has proved this point.

Even at this late date a driving singleness of purpose which put the procurement of additional food supplies above political considerations could accomplish a great deal. Two goals should be the basis of the program; a minimum of inflation within the U.S. and the maximum contribution from every nation of the Western World tackling a common job together.

Table 1.- WHEAT: Production in specified countries and areas, 1935-39 average, 1946, estimated 1947, and percentage that 1947 is of the 1935-39 average.

1947

Ways in Which Point Four of the President's Inaugural Address Might be Implemented

In making the fourth point of his Inaugural Address on January 20, the President said, "We must embark on a bold new program for making the benefits of our scientific advances and industrial progress available for the improvement and growth of underdeveloped areas." Actually, the opportunities for increased investment and higher production are very great in the developed areas of the world as well.

Several government departments are now studying specific ways in which the President's proposal might be put into action. Some of the thinking is in the direction of reliance upon government-to-government credits. In other official quarters there are high hopes for what can be achieved by sending American technicians abroad to help foreign peoples develop and enhance their own resources and skills. The need for private capital in the less developed areas is recognized. So is the desirability of getting American business to participate in this long-term program. Just how all of this can be achieved in action is still unclear.

Many business men dislike seeing government go any further into programs touching business, while many government officials are wary of giving too much support to business abroad because it might lead to charges of imperialism. It seems to me that both extremes can be avoided and that Point Four embodies a long-term objective of real worth which can best be realized through both government and private effort.

We have more to contribute to other countries than capital and skills. We also have a "spirit" to contribute. It's our enthusiasm for the building of more plants to make more things for more people. It's our belief that <u>any</u> individual should be able to climb to the top and that he should have every chance to do so. It's our faith in <u>competition</u>. Neither labor nor management in many countries shares this faith. Competitive enterprise as we know it has never been <u>tried</u> in much of the world. Changing attitudes is a tougher job than building factories but it's worth trying.

On February 16 the Executive Committee of U.S. Associates, which is the American section of the International Chamber of Commerce, announced that it was undertaking a study of five means through which the President's objective might be reached:

1. By working to create a business "climate" in other countries more attractive to private investment.

2. By sending U.S. technicians abroad on carefully selected projects.

3. By using government loans to develop basic resources in such a way as to increase the opportunities for private investment in the borrowing countries.

4. By increasing the production of strategic materials in foreign countries .

5. By selling some form of insurance to U.S. business to cover the non-commercial risks on private foreign investments, chiefly in the field of currency convertibility.

As a basis for further discussion, I would like to make these observations.

1. Climate. In his comments on the President's fourth point, Secretary Acheson said, "There is also in many places a failure to understand that unless the conditions are created by which investors may fairly put their money into that country then there is a great impediment to development."

Neither the proposed I.T.O. Charter nor the Bogota Agreement with its many reservations provide even the minimum assurances necessary to encourage increased private investment. There are many things our government can do to work with other countries for the improvement of the present climate. The first step is to get a reciprocal investment code signed which is fair to both sides. These negotiations should be conducted bi-laterally in the beginning. Business men of both nations should sit in as advisors. The International Chamber of Commerce is now working on such a model code and expects to have it ready for consideration by governments early in June.

We should seek no preferential treatment for U.S. nationals. All we want is reciprocally fair treatment - as good a break for our citizens in other countries as we give the citizens of those same countries in the U.S. We believe in reciprocity in trade and tariffs; why should we not advocate reciprocity of opportunity? We can afford

to be firm. Our resources won't permit us to go very far in any one year. Countries which discriminate against U.S. private investment should not expect continued aid from our government over the longer pull. We shall be respected for being clear on this point.

2. Technical Missions. By sending these abroad on specific assignments and by giving technical training to foreign nationals in the U.S.A., a great deal can be accomplished over the years. There won't be any miracles, but there can be slow and steady progress. Technical assistance is especially appropriate in agricultural fields and in the development of small industries.

When it comes to government missions connected with large-scale industrial development abroad, I believe we should proceed with caution. Even in countries where there is an economic base for large-scale enterprise, the problems of co-operation will have to be thought through carefully. American business, for example, has billions of dollars invested in its "know-how". There are conditions under which we can share part of this with foreign countries, but we have to consider our own self-interest and judge each case on its merits. The important thing is to be sure that there are mutual advantages to be gained from each individual project.

3. Government Credits. There is an important field for these, especially in transportation, roads, communications and to some extent, electric power. This kind of development is often outside the scope of private financing and non-competitive with American business. Soundly, handled, such credits can increase private investment opportunities and result in higher production. Business and labor in the borrowing countries would benefit even more from this expansion than U.S. investors. Part of our job is to make this clear to all the citizens of such countries. After credits are extended, we should take steps to be sure that the funds are being used efficiently and economically. This is essential if higher living standards are to be realized.

4. Strategic Materials. We need all of these at fair prices that the world will sell us. I'd rather store copper and zinc and lead and tin above ground in Kentucky

than bury gold beneath it. We need these materials to keep a rising level of production going year after year in our own country and we'll need them still more if we ever get into another war.

Their production is not being stepped up abroad as it should be. Part of the fault is ours. We have been unwilling to make long-term contracts with escalator clauses and with reasonable anti-dumping provisions. Part of the fault lies with certain foreign countries which feel that E.R.P. appropriations will be cut by the amount of any increase in production which is sold to us for dollars. Of course it will be and it should be if E.R.P. is accepted as a self-help program. Part of the fault lies with some politicians and some business men in other countries who don't want U.S. investments on their soil.

None of these hurdles is insurmountable. Here's an area where other nations can earn dollars for exports of strategic materials from their overseas territories and use those dollars for goods they need to buy both from us and from other countries. It's time to work out specific contracts for specific materials from specific areas in increased amounts.

5. Insurance. Government-to-government loans cannot of themselves bring about a lasting recovery in the Western World. Private investment is also needed. When U.S. business goes abroad it should assume every normal commercial risk, including that of going broke. These risks have always been greater in foreign countries than they are at home and business expects to assume them. It's the non-commercial risks that worry business today. These stem mainly from actions by foreign governments and no single business can cope with them.

There is the risk of another war with its destruction of physical properties. There is the risk of losing a foreign plant through nationalization and not being paid for it in dollars. There is the risk that if profits are made abroad, they cannot be converted into dollars and brought home for dividend payments to stockholders.

These extraordinary risks deter many of our largest corporations from building plants abroad; they virtually stop any smaller businesses from such ventures. If insurance could be bought to cover these non-commercial risks, business would certainly buy it since it would then be assured:

1. That it could get dollars for the loss of its plant through war or internal revolution.

2. That it could get dollars for the loss of its property through nationalization.

3. That it could convert into dollars that part of its depreciation reserves set up in local currency which might be needed to replace equipment from dollar supply countries.

4. That it could convert into dollars any part of its foreign profits it cared to bring home and include in its U.S. taxable income. The surer business is that it can get its profits out of a foreign country, the less eager it is to do so on other than a routine, business basis.

The proposed insurance should be available for both old and new investments at the option of business. Otherwise, established investments abroad would be at a disadvantage compared with new and insured investments. Established business need be under no obligation to take this insurance, but it should be privileged to buy it if it cared to do so for competitive reasons. Although premium rates would have to vary by countries, an average rate of 1% per annum seems possible. This would be a very high rate if war is somehow avoided.

Who should sell such insurance? Lloyds of London will issue specific policies to cover some of these risks, but no combination of private American insurance companies is likely to set up such a venture on the broad scale outlined. It might be possible to do so under private management if our government would underwrite 90% of the potential risk. One advantage in this approach would be that private management could vary premium rates by countries more gracefully than a government agency could. Or it might be done by having our government itself sell the insurance directly to business as one way of strengthening our foreign policy.

Precedents exist for such an insurance program. Bank deposits are now insured by the FDIC and real estate mortgages are now insured by FHA. Both programs have worked well for over ten years. Many of us forget that no accurate actuarial basis existed for premium rates at the time either of these programs was launched. There is no reason why the proposed insurance should involve any more government interference with private business than the two systems already established. If it did, I would be opposed to it.

Congressman Dirksen of Illinois proposed an insurance program along these general lines in an article in the February 1948 Atlantic Monthly. Eric Johnston has suggested a billion dollar guarantee fund for these broad purposes without yet having spelled out details. Another suggestion is to amend our tax laws to permit U.S. corporations to depreciate their foreign plant investments in from one to five years at their option. This would help larger business more than smaller business but the idea is worth exploring. Still another suggestion is that foreign countries set up a guarantee fund out of their dollar earnings to assure the dollar servicing of U.S. investments in their countries. Obviously, much additional study of mechanics is required.

I lean toward the proposal that our government sell this insurance directly to business. Government would then have a stake in minimizing the non-commercial risks in other countries. It would also have a stake in giving American business interests abroad more active diplomatic support. In such a situation, I think foreign governments would be less likely than they now are to nationalize American properties or to otherwise discriminate against us. Government insurance could make the difference.

Our government, which is supported by taxes collected from a competitive enterprise economy, does have a stake in the success of American investments in other countries. This is not imperialism; it is responsible finance and nothing to be ashamed of in public. Our government needs the full contribution which business can make to the industrial strength of other countries. And business needs the full support of government in minimizing the non-commercial risks now facing it. There was never a time in our history

when government and industry needed each other more than they do right now. Neither can succeed abroad single-handed.

By moving along the five roads outlined, we should be able to transfer an increasing part of the burden of foreign aid from government to private shoulders. We should be able to increase the relative strength of the West as compared with the Soviet sphere. We can hope that a strong Western World will ultimately become a magnet to draw some of the countries in the Soviet orbit closer to us.

By broadening the area of industrial expansion beyond our own borders we shall increase the markets for heavy goods. A search for more customers is nothing that needs to be hidden. Customers are essential to our prosperity and our prosperity is the hope of the world. There can be no stability without it.

More importantly, we shall be working with the citizens of other countries to raise production and therefore the living standards of people. They will be learning new skills, both with their hands and with their heads. There will be many partnership arrangements between our business men and those of other countries. There will be a helpful exchange of ideas between our labor leaders and those of other nations. These closer working associations of a mutually satisfactory nature can furnish "the tie that binds".

The Western World needs these "show pieces" of democracy in action. To move in this direction is to take the offensive against communism rather than trying to "contain it". And it's still true that the offensive always wins.

Rickover, H. G.

U. S. S. JOHN C. CALHOUN (SSBN630)
CARE OF FLEET POST OFFICE
NEW YORK, N.Y. 09501

At Sea
North Atlantic
29 July 1964

Dear Ed:

We have just successfully completed the first sea trials of the USS JOHN C. CALHOUN, our twenty-sixth Polaris nuclear submarine. We also have in operation twenty attack type nuclear submarines, making a total of forty-six. The CALHOUN was built by the Newport News Shipbuilding and Dry Dock Company of Newport News, Virginia.

This ship is named for John Caldwell Calhoun (1782-1850). The pattern of Calhoun's life was not unlike that of the Founding Fathers. Of him and his two great political antagonists--Webster and Clay--James Bryce wrote in 1888 that they were "the ornaments" of their generation, "not indeed rising to the stature of Washington or Hamilton, but more remarkable than any save one among the statesmen who have followed them."

Calhoun belonged to the second generation of American political thinkers and public men; men who had never known life in a colony. He was born in the year when the Nation had attained de facto independence--though it took another 18 months for the treaty of peace to be signed at Paris. Like the Founding Fathers, Calhoun was well-educated, graduating from Yale with distinction. Subsequently he studied law, was admitted to the bar and practiced his profession for a brief while. But nearly all his adult life--some forty years--he spent in elected or appointed office: as state legislator, member of the Congress, Senator, Secretary of War, Secretary of State, twice Vice President and almost President. His family--of Scotch-Irish ancestry from Pennsylvania--had settled in the Carolina uplands. Calhoun thus grew up in the pioneer West; for half his life he was indeed its spokesman. But marriage into the Piedmont planter aristocracy changed his views and he became the voice of the deep South--its political theorist, master logician, impassioned orator. It has been said of him that he "welded the South and divided the Union."

Calhoun's adult life spanned almost the whole of that turbulent period in American history when, after an early era of good feeling, the young Nation had to come to grips with ever deepening regional conflicts between industrial North, pioneer West and plantation South--conflicts which time and time again brought on crises that threatened to tear the Union asunder, as indeed they did in the end. But prior to the fratricidal war that finally established this Nation as an indivisible Union, the Senate

reverberated with constitutional debates that "transfixed the Nation." Calhoun, Webster and Clay were the principal antagonists. Of their debates, Charles A. Beard wrote that they were memorable forensic contests, "worthy of a place in the annals of oratory beside the noblest intellectual tourneys of ancient and modern times." The men who participated, the "eloquence and cogency of their arguments" and not least "the results that flowed from their deliberations," make these debates a part of our history with which every American should be acquainted. Not only do we profit by studying them, for they vividly illuminate the travail that went into the building of the Union we so lightly take for granted today, but also they teach us that men of intelligence, education and integrity, alike in their deep devotion to our political Covenant, may yet differ bitterly because to each it has a different meaning.

Two important political innovations occurred in Calhoun's life: the evolution of the American party as we know it today, and the unique American system of choosing nominees for the Presidency in national party conventions. Though not mentioned in the Constitution or envisaged by the Founding Fathers, these two cornerstones of our political life are today as firmly established as any part of the written Covenant. Still worth reading is Calhoun's "A Disquisition on Government" which contains a lucid exposition of the American political party: how it is formed, how it operates. Written near the end of his life, the book reflects half a century of American experience in much of which Calhoun participated.

Of Calhoun's many quotable statements, one seems singularly appropriate today: "We are greatly and rapidly--I was about to say fearfully--growing. This is our pride and our danger, our weakness and our strength."

Sincerely,

H. G. Rickover

USS CASIMIR PULASKI (SSBN 633)

CARE OF FLEET POST OFFICE
NEW YORK, NEW YORK

At Sea
North Atlantic
29 June 1964

Dear Ed:

The USS CASIMIR PULASKI, our twenty-fifth Polaris submarine has just completed her first sea trials. With the PULASKI we have in operation a total of forty-five nuclear powered Polaris and attack submarines.

This ship is named for a man whose all too brief life was dedicated to the fight for freedom. First for the freedom of his native country, Poland, and when this fight was lost for the freedom of our own country. Born a Polish nobleman, he died an American Revolutionary War hero.

Pulaski was an active participant in the last desperate efforts of Polish patriots to preserve their country's freedom from Russian encroachment. When the Polish cause was lost he fled, his life and property forfeit. With Benjamin Franklin's help he reached our shores and joined Washington's army. He was one of a small band of foreign officers who, though of aristocratic birth, made the cause of the American Revolution their own and fought valiantly for it. Their names are part of American history--Pulaski, Kosciuszko, Lafayette, Du Portail, De Kalb, Von Steuben.

Pulaski's signal military exploits at the Battle of Brandywine won him the commission of Brigadier General from the Continental Congress. A brilliant cavalryman, he awakened American generals to the need of a better cavalry. He became a favorite of General Washington and with his approval formed "Pulaski's Legion," an independent force composed primarily of European trained cavalry and infantrymen.

Pulaski was mortally wounded leading his legion in a cavalry charge at the Battle of Savannah, October 11, 1779, a day which has been proclaimed, "Pulaski Day" by Congress.

General Washington wrote to him:

> "I assure you Sir, I have a high sense of your merit and services and the principles that influenced the part you have taken in the affairs of this country. The disinterested and unremitted zeal you have manifested in the service gives you a title to the esteem of the citizens of America, and have assured you mine."

Sincerely,

H. G. Rickover

U. S. S. JAMES MADISON (SSBN-627)
CARE OF FLEET POST OFFICE
NEW YORK, N.Y. 09501

At Sea
North Atlantic
16 June 1964

Dear Ed:

We have just successfully completed the first sea trials of the USS JAMES MADISON, our twenty-third Polaris nuclear submarine. We also have in operation twenty attack type nuclear submarines, making a total of forty-three. The JAMES MADISON was built by the Newport News Shipbuilding and Dry Dock Company of Newport News, Virginia.

In naming this ship the JAMES MADISON, we honor the memory of one of the founders of our Nation and its fourth President.

Each member of the small band of gifted and patriotic men who shaped the American political system made his own unique contribution to the great Constitutional task. Madison had the brilliantly logical mind that made him the Chief Theoretician of the principles of republican government; he is rightly called the "Father" of the Constitution. He was also that rare man of intellect who knows how to persuade men by appealing to their reasoning capacity rather than to their emotions. His essays in THE FEDERALIST are as pertinent today as when he wrote them. No one has stated more clearly than he that in a democracy the people are the sole source of all political power--that a free society pivots on the autonomous citizen whose essential human rights must be forever inviolate. No more persuasive case for our system of government has been made than Madison's words in THE FEDERALIST:

> "It is evident that no other form would be reconcilable with the genius of the people of America,...with the fundamental principles of the Revolution..."

Today freedom is on trial over vast areas of the world. Even in our own midst there are faint-hearted and impatient men who question the ability of democracy to survive. Let us ponder Madison's words written when he was President:

> "...the American people...have had experience of their... Constitution, the offspring of their undisturbed deliberations and of their free choice;...it is found to be capable, without losing its vital energies, of expanding itself over a spacious territory with the increase and expansion of the community for whose benefit it was established."

Sincerely,

H. G. Rickover

H. G. Rickover

Mr. Edward R. Murrow

Rickover, H G.

USS JOHN ADAMS (SSBN 620)
Care of Fleet Post Office
New York, New York 09501

At Sea
North Atlantic
6 April 1964

Dear Ed:

We have just completed sea trials of the USS JOHN ADAMS, our twentieth Polaris type nuclear submarine. Completion of the JOHN ADAMS brings into operation a total of forty nuclear powered Polaris and attack type submarines.

This ship is named for two great Americans: John Adams, our second President, and his son, John Quincy, our sixth President. It is fitting that so powerful a guardian of our freedom be named for these American founders of that very freedom. During John Adams' administration our Navy was born. And it was John Quincy, aware of the potential of sea power, who in 1823 as Secretary of State was principal architect of the Monroe Doctrine which has provided this hemisphere with a measure of security from threats of foreign nations.

"Education," in John Adams' view, made "a greater difference between man and man than nature has made between man and brute. The virtues and powers to which men may be trained, by early education and constant discipline, are truly sublime and astonishing....It should be your care, therefore, and mine," he wrote to his wife, Abigail, "to elevate the minds of our children and exalt their courage; to accelerate and animate their industry and activity; to excite in them...an ambition to excel in every capacity, faculty and virtue. If we suffer their minds to grovel and creep in infancy, they will grovel all ther -."

John Quincy Adams taught:

"Always vote for a principle, though you vote alone, and you may cherish the sweet reflection that your vote is never lost."

A verse written in 1842 expressing his hope for the future is valid today:

"This hand, to tyrants ever sworn the foe,
For freedom only deals the deadly blow;
Then sheathes in calm repose the vengeful blade,
For gentle peace in freedom's hallowed shade."

Sincerely,

H. G. Rickover

H. G. Rickover

Mr. Edward R. Murrow

Rickover, H. G.

9503 La Jolla Farms Road
La Jolla, California
April 2, 1964

Dear Rick,

Never did I think to imagine you at sea in the North Pacific in our eighteenth Polaris submarine, wearing a Daniel Boone hat!

Thanks for your thoughtfulness in writing.

We are anchored here in La Jolla until about May 1st, when we shall be returning to Washington.

Casey, that future Yale man by the grace of Admiral Rickover, is here with us for his Easter vacation.

My entire family joins me in sending you best salute.

As ever yours,

Edward R. Murrow

Admiral H.G. Rickover, U.S.N.

U. S. S. DANIEL BOONE (SSBN 629)
MARE ISLAND NAVAL SHIPYARD
VALLEJO, CALIFORNIA 94592

At Sea
North Pacific
17 February 1964

Dear Ed:

We are returning from the first sea trials of the USS DANIEL BOONE, our eighteenth Polaris type submarine. The ship successfully completed all tests, including full power operation, surface and submerged. In addition to the eighteen Polaris submarines, we have twenty attack submarines, making a total of thirty-eight nuclear submarines in operation. The DANIEL BOONE was built by the Mare Island Naval Shipyard, Vallejo, California.

This ship is aptly named for a man who in many ways typifies our American heritage:

Of Quaker parentage, and peaceful, he was however prepared to fight when this became a necessity;

Of limited education in terms of schooling as we know it today, he nevertheless became superbly trained for life and survival in the wilderness--just as we must learn to live and survive in today's international wilderness;

He "...did not...find himself the leader of a host of armed followers, impelled by fear...to obey his commands.... His followers were his voluntary comrades; and the source of his authority was the affection they bore him and the confidence they had in his sagacity and fortitude;"

He expressed the feeling of Americans toward war: "What thanks, what ceaseless thanks are due to that all-superintending Providence which has turned a cruel war into peace... May the Almighty Goodness banish the accursed monster War from all lands."

And may Providence help this ship to be a means for answering the prayer of the illustrious American whose name she bears.

Sincerely,

H. G. Rickover

U.S.S. SHARK (SS(N)591)
Care of Fleet Post Office
New York, New York

At Sea
8 January 1961

Dear Ed:

I know you will be interested in learning that the USS SHARK our sixteenth nuclear powered submarine has successfully completed her first sea trials and is returning to Newport News, Virginia. During her trials she steamed at full speed on the surface and submerged; she also dived to her maximum depth.

With the SHARK we now have four Polaris, one radar picket, one Regulus missile, and ten nuclear attack submarines in operation.

Sincerely,

H. G. Rickover

December 20, 1960

Dear Admiral Rickover:

Since Mr. Murrow is traveling much these days, I have given him the contents of your letter by phone.

He has asked that I extend to you his belayed "Congratulations" on your return to San Francisco Bay from the first sea trials of the USS THEODORE ROOSEVELT.

Mr. Murrow has asked that the Season's Greetings also be dispatched.

Sincerely yours,

Rosemary Mullen,
Secretary to Mr. Murrow

Admiral Hyman G. Rickover
United States Atomic Energy Commission
Washington, D.C.

U. S. S. THEODORE ROOSEVELT (SSB(N)600)
CARE OF FLEET POST OFFICE
SAN FRANCISCO, CALIFORNIA

At Sea
December 12, 1960

Dear Ed:

We are returning to San Francisco Bay from the first sea trials of the USS THEODORE ROOSEVELT, the third nuclear powered submarine built by the Mare Island Naval Shipyard and the first Polaris ballistic missile launching submarine built on the West Coast.

The THEODORE ROOSEVELT is our fourth Polaris launching submarine and the fifteenth nuclear powered submarine to join the United States Fleet.

Sincerely,

H. G. Rickover

Admiral Rickover

November 22, 1960

Dear Admiral:

Please pardon my delay in answering your cordial note of October 14. As you may know, a bout with pneumonia put me out of commission for awhile.

Thank you very much for sending me the plate as a memento of the launching of the U.S.S. Enterprise - it was most thoughtful of you.

I know you never watch television, but you might care to look at HARVEST OF SHAME, our Migrant Labor show this Friday between 9:30 and 10:30 P.M. I believe you will not find it a waste of time.

Sincerely yours,

Admiral Hyman G. Rickover
United States Atomic Energy Commission
Washington, D.C.

Dear Ed:

I thought you might enjoy having this plate as a memento of the launching on September 24, 1960 of our first nuclear powered aircraft carrier, the USS ENTERPRISE.

I have heard from many people how much they enjoyed the POLARIS program. It was thoughtful of you to include me in it.

Sincerely yours,

H. G. Rickover

U.S.S. TULLIBEE (SS(N)597)
Care of Fleet Post Office
New York, New York

3 October 1960

Dear Ed:

We are returning to New London, Connecticut, after successfully completing initial sea trials of the small hunter-killer submarine TULLIBEE. With this ship the United States now has fourteen nuclear submarines in operation; three Polaris type, one Regulus missile type and ten Attack type.

The TULLIBEE is the first to be designed specifically as an anti-submarine submarine, and so is fitted out with considerable detection equipment. In order to obtain quiet operation she has electric drive instead of the geared turbine drive used in all other nuclear submarines.

Thank you for your encouragement and help.

Sincerely,

H. G. Rickover

At Sea
9 March 1960

Dear Ed:

We are finishing the first sea trials of the USS PATRICK HENRY, the second nuclear powered submarine designed to launch Polaris ballistic missiles. The ship performed her trials succesfully, both surfaced and submerged. We were at sea for two days, during which we steamed 509 nautical miles, of which 252 were submerged.

I am writing you from this ship because I know of your interest in our nuclear navy.

With best regards,

Sincerely yours,

H. G. Rickover

November 2, 1959

Judge Alexander Holtzoff
U. S. District Court
District of Columbia
Washington, D. C.

Dear Judge Holtzoff:

I am writing this letter as chairman of the national Freedom of Information Committee of Sigma Delta Chi, the professional journalistic fraternity, which has 16,000 publishers, editors, newsmen and television and radio newscasters as members.

This is to state that your decision as judge of the U. S. District Court for the District of Columbia, handed down on October 23, 1959, which upholds Admiral H. G. Rickover's plea to place copyright restrictions upon his public speeches, has disturbed the free American press no end.

Therefore, I protest your decision for the following reasons, which you did not discuss in your opinion:

1. Your decision very definitely abridges the Constitutional principle of free speech in that it permits Admiral Rickover to restrict legally the inherent privilege of the American people, who pay his salary, who pay the expenses of his research and who made possible his distinguished scientific career, to quote from, and thereby to discuss intelligently, his public utterances about the American people's business.

2. Your decision very definitely abridges the Constitutional principle of the free press in that it also permits legal restriction on the press in quoting from, and thereby in discussing intelligently for the benefit of the American people, Admiral Rickover's public utterances on the people's business.

3. Your decision very definitely abridges the inherent right of the American people to know about their government and thereby it also very definitely affects adversely the free flow of an informed public opinion, which is the very life-blood of a free, democratic society, and particularly of the free American government. The titles of Admiral Rickover's speeches - "Nuclear Power", "Metallurgy in Atomic Power", "The Challenge of Nuclear Power" and "The Naval Revolution" - support this. The very position of Admiral Rickover in the American Government, made possible only by the American people, establishes him as the one person in government who

can speak authoritatively on these matters and if he utilizes your court's decision to bar free flow of his public utterances to the people, then the people are deprived of their rightful knowledge of their government.

4. Your decision very definitely abridges the free American forum and its precedent may well be the beginning of the complete destruction of this forum. You dwell at length in your decision on Admiral Rickover's literary rights as an individual. You largely ignore the rights of the people in association with their public servants. In the matter of literary rights, there can be no reasonable comparison with the public speeches of Admiral Rickover with the public speeches of, say, a Hemingway. The American people are not employing Admiral Rickover as a literary genius. They are employing him in the scientific development of our Navy. And when he is invited to address groups of American citizens, at their expenses, he is invited as a learned public servant to speak on affairs of his particular domain of the people's business and not on his gems of literature. And when a public servant climbs upon the public oratorical stump, his aims always, based purely on the past experience of a million such speeches, are (1) to inform his audience on his department of the government, (2) to sell his department of government to the people, and (3) to sell himself as the able public servant in that department of the government. In short, Admiral Rickover's speeches belong in the realm of political oratory and not in the field of literature. His past record of ups and downs in government proves this conclusively and to say otherwise is to defy history.

It is just as farcical in free American government for Admiral Rickover to assert his claim to copyright privileges on his public utterances as it would have been for Thomas Jefferson, Patrick Henry, Abraham Lincoln and even Presidents Roosevelt and and Eisenhower to have told the American people: "I'm sorry, boys, but my literary genius demands that I restrict quotation from my speeches so that I can pick up an honest dollar."

Your decision disturbs the free press because it is one more case wherein the free American courts have acted in support of the gradual establishment of an American bureaucracy which is beyond the restraint of the American people, even though this bureaucracy, appointed to government and not elected by the people, is beholden to the people as public servants through heavy taxation. The very future well-being of the American people depends upon the exercise of restraint through an informed public opinion upon this bureaucracy.

Let me outline for you in brief this gradual development of this autocratic American bureaucracy, as follows:

1. In the last 25 years, the bureaucracy, through one means or another, has draped a thick cloak of secrecy not only over their actions and meetings but also over the records of the

expenditure of the billions of American tax dollars. Most of the information the American people receive on the actions of their Federal public servants and on the expenditure of their tax dollars is in the form of hand-out statements from some 5[illegible],000 Federal government press agents, which in many cases are nothing more than propaganda designed to prolong the political lives of their political bosses.

2. In 1958, after other devices to withhold information of government earned the righteous wrath of both the people and the press, Attorney General William P. Rogers announced to Senator Hennings' Subcommittee on Constitutional Rights his ridiculous "doctrine of executive privilege." That ridiculous doctrine, given sanctimoniously by Attorney General Rogers as the legal excuse for withholding information of government from the Congress, the people and the press, is nothing more than a self-proclaimed privilege of the American bureaucrat to do as he chooses in the domain of the people's business, without any restraint whatsoever. Gone from the Federal picture apparently is the inherent American "doctrine of the people's privilege."

3. Your decision of June 2, 1959 in the case of Mr. Vance Trimble, of the Scripps-Howard Newspapers, versus The Congress, to which you, in effect, upheld the "privilege" of Congress to withhold from the American people the record of its expenditures of the people's tax funds in Congressional business, and which also in effect, upheld the "doctrine of executive privilege."

4. The July decision of the U. S. Supreme Court, which held that the American bureaucrat cannot be sued for libel, regardless of how he may pummel the American taxpayer over the little matter of the taxpayers' business.

5. Your decision of October 23, 1959, in which you placed in the legal record the somewhat dubious right of the bureaucrat to shut up both the free American people and the free American press on the public utterances of the same bureaucrat through the legal subterfuge of the copyright.

So today we have the somewhat sorry picture of the American bureaucrat, appointed to office and not elected by the people, established in a position of glory, wherein, through the "doctrine of executive privilege" he does not have to answer to the American people in any way, even though the American people pay his salary; wherein, by edict of the Supreme Court, he cannot be held liable for his words; and wherein, by edict of your court, his public utterances cannot be quoted, or discussed by either the free American people or the free American press, regardless of the circumstances.

Need I remind that Communistic Russia is nothing more than a gigantic bureaucracy, wherein the bureaucrat is the glorified dictator, beyond the reach of anyone, and free speech a sham

and all other freedoms, so cherished by the American people, a farce.

Believe me, speaking from both the heart and the mind, I sincerely feel, as a free editor of the free American press and as a free citizen in the free American government, that all of us should discuss these matters before it is too late.

I will be grateful for a reply.

Sincerely yours,

V. M. Newton, Jr.

VIEWS OF NEWSPAPER EDITORS ON ADMIRAL RICKOVER'S COPYRIGHTS

I have never seen any justification for Admiral Rickover's copyrights.

James S. Pope, Chairman of the Freedom of Information Committee of American Society of Newspaper Editors and Executive Editor of the Louisville Courier Journal

No wonder other Pentagon officials are forming in line to copyright their brain children...It is another example of the bureaucrat's growing assumption that he is not the servant of the people so much as the owner of that bit of the people's business of which he happens to have charge.

Herbert Brucker, Editor, Hartford Courant

Judge Holtzoff's decision very definitely abridges the Constitutional principle of the free press in that it permits legal restriction on the press in quoting from, and thereby in discussing intelligently for the benefit of the American people, Admiral Rickover's public utterances on the people's business.

V. M. Newton, Jr., Chairman of the Freedom of Information Committee of Sigma Delta Chi and Managing Editor of the Tampa Tribune

The issues that your suit has raised, I completely agree, are of very great broad general importance...The case undoubtedly does have disquieting implications.

James Russell Wiggins, President of American Society of Newspaper Editors and Executive Editor of the Washington Post

Regardless of other questions I should think it might be contended that delivery of speeches to a general audience constitutes...abandonment of copyright. Aside from this there has been a recent accumulation of events to indicate the extent to which the federal government bestrides us like a colossus and enjoys freedom from judicial review.

Harold L. Cross, Counsel for American Society of Newspaper Editors

Fortunately there is a good chance that the issue of whether a public speech by a public official is public property--and not subject to copyright--will finally be decided by the Supreme Court...M. B. Schnapper, Executive Director of Public Affairs Press, deserves a citation for daring to take on Admiral Rickover.

Ted Lewis, New York Daily News

I am firmly convinced that the public utterances of any public official, relating to any aspect of public business, are not the property of the official, but of the public and should not be covered by copyright, or any other device to prevent or restrict their wide and free discussion. The reason was plainly stated by Thomas Jefferson: "If a nation expects to be ignorant and free, in a state of civilization, it expects what never was and never will be."

Gerald W. Johnson, Historian and Editorial Writer for Baltimore Sun

Washington Post:

Wild Legal Yonder

The seven Mercury Astronauts seem already to have flown into uncharted space by hiring a lawyer to protect their literary rights. M. B. Schnapper, a Washington publisher who has gone to court to challenge Admiral Rickover's right to copyright his speeches, is now questioning the propriety of the Astronauts' action. The same basic question is at issue in both cases: Is everything that a public official does in his official capacity in the public domain? We think it ought to be, even though we have no brief for those who may be attempting to exploit such work for their own private gain.

Although Government policy on this question as it affects patents has long been settled, apparently no attempt has ever been made to draw the line between public and private considerations in the publication of speeches, personal accounts or even memoirs of Government officials and employes. The Navy has tried to avoid taking issue with Admiral Rickover's unprecedented decision to copyright his speeches, obviously not wanting to challenge the controversial Admiral on a seemingly minor grievance. The Admiral's stipulation that newspapers and magazines may quote freely from his copyrighted speeches or reproduce them in their entirety does not settle the question his action has raised. The Defense Department tried to make a distinction between official reports of the Astronaut project and personal accounts of the experiences of the seven men involved, but the Department avoided a direct ruling.

A Government employe has no rights in an invention that he has developed as part of his official duties. This rule extends to devices which the employe develops on his own time but which are clearly related to his Government work. All rights in such patents belong to the Government, which is pledged to show no favoritism in the release of the patents to the public. If such regulations were extended to speeches of public officials Admiral Rickover would be unable to copyright speeches which he prepared and delivered as part of his official duties. Any writings or addresses which had no bearing on his Navy work could of course be copyrighted. As for the Astronauts, all their personal accounts will be a direct result of their official experiences and could not be copyrighted under an adaptation of the patent regulations.

The Government obviously cannot control a former employe's actions after he leaves Federal service, but any material which a person developed as part of his official duties surely is in the public domain. Should not the Government extend the sound principles of its patent rights to speeches and other material which can be copyrighted?

The Hartford Courant:

A Fast Private Buck From the Public Purse?

Vice Admiral Hyman G. Rickover, without whom we would have had no atomic subs, is a man to whom the American people owe much. Most of the time what he says, even though it may seem offbeat, makes penetrating sense. But now comes an extracurricular activity in which the Admiral has gone too far.

Last December 1, in what is believed to be the first such move in history, Admiral Rickover took out a copyright on a speech he had given. Hitherto free American citizens have taken it for granted that speeches are in the public domain. Anybody can go and listen, and anybody can reproduce them in any way he chooses from a one-paragraph news account to a full text—and why not a book thereafter? But all of a sudden the Admiral contends that his speeches are for "contemporaneous press use" only, which sounds as though they were in the public domain when uttered but thereafter mysteriously transformed themselves into the Admiral's private property. No wonder other Pentagon officials are forming in line to copyright their brain children, while a Navy official is moved to say that this practice is a little bit of all right.

What a government employe does that is the public's business, and what his private business, has always been a nice question. For a long time Presidents, Governors, Senators, and a host of lesser fry devoting their lives to the public interest (or is it dining at the public table?) have written articles or books and sold them for cash. But this business of transforming directly into private property some of the public's business is something else. It is another example of the bureaucrat's growing assumption that he is not the servant of the people, so much as the owner of that bit of the people's business of which he happens to have charge.

Clearly, if the Admiral were to write a novel, even say of life on an atomic sub, that would be his private property as much as any literary production written by any man. But what is in question here, speeches made by the Admiral as our boss atomic Admiral, look less like literary productions than part of his job. Often those speeches have been run off by Pentagon employes on government mimeograph machines, or have been printed and distributed by the government under the seal of the Department of Defense. What's private about that?

Fortunately, this issue is going to be tested in court. The Public Affairs Press in Washington was miffed when it sought, in the course of its business, to include in a publication some of the Admiral's material, only to be forbidden by him to do so. So it filed a suit that should lead the courts to trace a proper borderline. There is a growing need for such a line. Without one, first thing you know, the taxpayer will be left with no rights at all in the government he pays for.

Navy Says Federal Officials May Copyright Speeches

By RICHARD FRYKLUND
Star Staff Writer

Vice Admiral Hyman G. Rickover, father of the atomic submarine, has a full right to copyright his speeches, according to the opinion of a Navy spokesman, made public today.

Admiral Rickover is being sued by the Public Affairs Press of Washington, which challenges his right to copyright the speeches. The suit claims the Rickover speeches were public acts by a public official and therefore public property—and not subject to copyright.

But the Navy's opinion, written by A. H. Helvestine, of the Office of Naval Research, by direction of the Chief of Naval Research, is that a Government employe retains rights to his "original written or spoken material" and may copyright it if the material "is not prepared at the direction of the official superiors of the author or as a part of his official duties."

Others Request Right

Since Admiral Rickover took the unusual step of copyrighting a speech last December 1, other Pentagon officials have asked the U. S. Copyright Office if they, too, can register their speeches. The Copyright Office has said it has no power to rule on this subject.

But obviously the Navy opinion can be regarded as a go-ahead for the copyrighting of more Pentagon speeches.

The last word will not be heard, however, until the Public Affairs Press suit is decided in the courts. For no solid body of law exists to define which words of a public official are public and which are private.

M. B. Schnapper, executive director of the Public Affairs Press, says he intends to find out if he has to take the case to the Supreme Court. Admiral Rickover says he owns his own "brainwork" and will defend it to the last ditch.

Many Questions at Issue

If the case is carried through to a final ruling, it can answer many arguable questions:

If a public official writes or speaks on the subject of his official specialty, are his words public or private property?

How far can an official go in restricting the use of his writings?

To what extent can a newspaper, magazine or book publisher reproduce an official's pronouncements without his permission?

Copyright Office officials cannot recall an instance where a Government worker tried to copyright his speeches before Admiral Rickover did it.

How Case Began

Why did he take this step?

It goes back to October 29 of last year when Mr. Schnapper wrote the Admiral, asking permission to quote from his speeches in a book to be prepared by the Public Affairs Press. Mr. Schnapper said he had published the speeches of several public officials in the past, including Presidents Roosevelt and Truman, on the assumption that the speeches were public property.

But Admiral Rickover said, "No." He refused to permit quotation of any kind. The speeches were his private property, he said, and he had made arrangements with another publisher to have them printed.

"If he had merely turned me down because he wanted a different publisher," Mr. Schnapper said, "I would have dropped the matter. But he said I had no legal right to even excerpt from them. He even ordered me not to use them.

"I decided this was a clear test of a practice I have seen before in Washington—of a Government official selling rights to his official writings. So I set out to prove that Admiral Rickover's speeches were public property."

Mr. Schnapper said he had some hestitation about appearing to "attack" a respected and valued public servant, such as the Admiral, but he said he thought it was necessary to establish the principle. So he went ahead with plans to publish a group of Rickover speeches without permission.

Controversy Develops

Then there followed a public controversy in which Admiral Rickover said the speeches were not official or public. They were prepared on his own time and at his own expense, he said, and were mostly on the subject of education. Mr. Schnapper, he charged, merely wanted to profit himself from the publication of someone else's speeches.

"Appropriating people's brainwork is the worst crime you can commit," he said. "There is too little brainwork as it is. People who try to help this country should not have their work taken away from them. The copyright and patent idea was intended to protect people who do brainwork."

Mr. Schnapper, however, charged that the speeches were prepared on Government time, printed on Government materials and were largely on subjects Admiral Rickover is assigned to work on: Atomic power, submarines, education of Naval personnel, etc.

Copyrights Two Volumes

But the Admiral applied for a copyright on the next speech he delivered. At the same time he collected together 22 other speeches made over the previous four years, wrote a preface for the bundle and copyrighted the "preface and compilation."

Then, last month, Admiral Rickover copyrighted some of those same speeches—mostly the ones relating to education—in the book published for him by E. P. Dutton & Co. of New York.

This book carries a warning that the entire contents are copyrighted and that no quotation may be made without the permission of Admiral Rickover. In fact it takes the unusual step of including two copyright notices.

Now Mr. Schnapper has in galley proofs his own collection of the Rickover speeches—mostly those on technical and naval subjects. He said, however, that only the preface, which he will provide, will be copyrighted. "You cannot copyright the speeches," he insists.

Mr. Schnapper says that if the Admiral sues him for infringement of the copyright on the E. P. Dutton book, then that will make just one more good test case.

Asks Court Ruling

Not waiting to be sued, Mr. Schnapper filed suit himself in District Court January 16, asking for a "declaratory judgment" from the court that the Rickover speeches cannot be copyrighted and asking for a determination of just what restrictions can be put on a public official's writings.

Admiral Rickover was to have replied formally last Monday, but he said he had to leave the city on official business, so the date of his appearance was postponed 60 days.

Seeks Navy Reaction

Meanwhile, Mr. Schnapper had asked the Navy if it approved of Admiral Rickover's action in coyprighting the speeches. The first formal reply, from Secretary of the Navy Thomas S. Gates, jr., said that "Admiral Rickover has obtained his copyright as a private citizen, not in connection with his official capacity. Therefore I do not deem it proper for the Department of the Navy to render a legal opinion as to its validity."

Mr. Schnapper asked for more information in a letter of January 24. He told Secretary Gates that he had received an anonymous letter raising questions about one Rickover speech. The letter read:

The sptech was written during Government time, on Government paper, on a Government typewriter, and reproduced on Government mimeograph machines. All clerks, including one warrant officer employed in that office, have served notice that they would tell the truth about the entire matter if required to do so in court."

Two Differ on Claim

The reply to this Schnapper letter came from Mr. Helvestine, a patent expert in the Office of Naval Research. He did not go into the question of the anonymous letter and confined himself to the one speech copyrighted separately by the Admiral.

Mr. Helvestine said Mr. Schnapper had "in effect" claimed that "no Government official or employe has the right under any circumstances ever to acquire proprietary rights in his original written or spoken material.

"No theory could be more detrimental to the recruitment or retention of competent personnel than to advise them that all their time and thought are the property of the public and no conceivable mental effort on their part can be rewarded with any recognition of their rights under any circumstances."

Mr. Schnapper said that in his suit and his letters to Admiral Rickover and the Navy—he had made no such extreme claim. He contended only that the Rickover speeches in question were official acts and that their use could not be restricted.

It will be up to the court to decide whether the acts were official, and if so, whether the material can be copyrighted.

There will not be much legal precedent for the court to ponder. Copyright specialists can recall only three cases testing a Government worker's right to copyright material. In one, in 1929, an Army officer was ruled within his rights to copyright a drill manual prepared on his own time, even though the Army had reproduced and used the manual.

In 1942 a court ruled against an Interior Department employe who tried to copyright a map he had drawn while on duty. And in 1914 it was ruled that a booklet prepared from Government material could not be copyrighted.

So there will be an important question of whether the Rickover speeches were prepared on Government time with Government facilities. The subject matter could also be an issue. Could the speches on education be copyrighted? How about those on nuclear undersea propulsion, Admiral Rickover's official speciality?

Law Not Specific

The law itself is not specific in this case. The only reference found by one copyright specialist said, in Section 8, Title 17 of the U. S. Code, that there can be no copyright "in any publication of the United States Government."

Most of the Rickover speeches were printed and distributed by the Government before he delivered them. Some carry the official seal of the Department of Defense and the words: "News release. Department of Defense, Office of Public Information." Was this "publication" by the Government?

Interestingly enough, the Admiral might have caused his suers more legal trouble by copyrighting his speeches as "lectures." A lecture is an unpublished work and does not therefore come under the copyright ban placed on a "publication" of the Government.

WASHINGTON, D.C.

U.S.S. GEORGE WASHINGTON (SSB(N)598)
Care of the Fleet Post Office
New York, New York

16 November 1959

Dear Ed:

I am writing you from the USS GEORGE WASHINGTON, our first of nine nuclear powered submarines designed to fire Polaris ballistic missiles. We are presently returning from her first sea trials during which she operated at depths greater than 400 feet and successfully passed her full speed trials, both surface and submerged.

The GEORGE WASHINGTON now joins our nuclear submarine fleet which gives our Navy anti-submarine, Regulus missile firing and fast radar picket capability.

Best regards.

Sincerely,

H. G. Rickover.

October 23, 1956

Dear Admiral Rickover:

I have not yet had an opportunity to see all of the film we exposed in your office the other day, but I have seen enough to know that we have in the making one of the most effective comments on American education that I have ever seen. We are all most enthusiastic about it and we are deeply grateful to you for taking time to do it.

Would it be possible for you to have someone send me an advance copy of the speech you are to deliver at the Hotel Suburban in Orange, New Jersey on November 20th.

Respectfully yours,

Rear Admiral Hyman G. Rickover
Assistant Chief of Bureau for
Nuclear Propulsion
Bureau of Ships
Washington 25, D.C.

rh

Rickover, 4

THIS SPEECH REFLECTS THE VIEWS OF THE AUTHOR AND DOES NOT NECESSARILY REFLECT THE VIEWS OF THE SECRETARY OF THE NAVY OR THE DEPARTMENT OF THE NAVY.

FOR RELEASE AT 8:30 P.M. (EST)
MONDAY, MARCH 16, 1959

Remarks prepared by VADM H. G. Rickover, USN
Assistant Director for Naval Reactors
Division of Reactor Development
U. S. Atomic Energy Commission
and
Assistant Chief of the Bureau of Ships
for Nuclear Propulsion
Navy Department
for delivery at
Joint Meeting of
The Yale Club of Washington, D. C.
and
The Yale Law School Association of Washington, D. C.
Washington, D. C.
and also at meeting of
The Yale Club of New York City
New York City, New York
March 16, 1959

ILLUSIONS COST TOO MUCH

When athletes enter a race, they come prepared to the best of their ability; as near to physical perfection as native endowment and rigorous training can make them, their bodies lean, their dress adequate but light. Each has assessed his own strength and weakness and measured them against his opponents'; few indulge in illusions about their own or their competitors' competence.

The world today has become a gigantic stadium where races for supremacy in economic, cultural, scientific, political, and military competence are run every day. Since the end of World War II, power has polarized in two giant combinations constantly competing with each other. In the foreseeable future there is little prospect for permanent lessening of tension between the two; hence the race promises to continue for years, with now one side, now the other ahead. This is an unhappy prospect for us who wish only to live in peace and tend to our national concerns, but one we cannot evade. The contest is a fact of international life which we must face intelligently and courageously so that we may make the right decisions and take the proper actions.

The first prerequisite is that we look at ourselves and at our opponents with the eye of an athlete who wants only to know the truth so that he may profit from it. This is assuredly not a time when we can afford to give ourselves over to complacent satisfaction with our present wealth and power. What we need is critical self-analysis so that we may detect any weaknesses we may have and rectify them-- any traits or attitudes which might have been appropriate in the

past when most Americans lived in rural communities and the United States was isolated from world events. Now that we occupy the center of the stage in world affairs such traits and attitudes may have turned into disabilities. The present is an age of lightning change in the fortunes of nations; when one major scientific discovery could alter long established power relationships; when one wrong step could upset the present equilibrium and plunge the world into nuclear war. In these parlous times we cannot afford to indulge in illusions about ourselves or allow our judgment to be clouded by the distaste we feel for our opponents' way of life. Illusions are a form of excess weight that hampers action and diminishes fitness. At this moment in history, when every ounce of strength is needed, illusions cost too much. They could cost us survival.

An illusion may be defined as a belief that has lost contact with reality. Illusions persist because they are ready-made substitutes for thought and, as James Bryce remarked, "to the vast majority of mankind nothing is more agreeable than to escape the need for mental exertion". All nations have illusions. Some cannot bring themselves to face the fact of their political and military weakness, and delude themselves about their real power; thus deluded they may then be tempted into aggression. Other nations underestimate the difficulties of managing a modern technological society and imagine it can be bought or begged from abroad and imposed ready-made upon an ancient and archaic way of life. When this fails, as it nearly always will, a disappointed and frustrated people may find solace in the illusion that it is being grievously wronged by other nations and, thus deluded, embark on disastrous foreign adventures. Our own illusions at least do not endanger the peace of the world, though they are harmful enough to ourselves and to our friends who depend on us for wise and strong leadership.

One does not have to be particularly perceptive, or exceptionally well-informed, or unusually intelligent, to discover, after some research into this matter, that certain of our national beliefs do not accord with reality. By clinging uncritically to these illusory beliefs, we needlessly handicap ourselves in the race that is being forced upon us by the totalitarian bloc. We persist in our illusions because as everyone else, we dislike having to rethink matters which we believe to have already been settled once and for all. The inertia of matter is no greater than that of the human mind — with both, the natural condition is rest; to move either produces friction and heat. With us, this general dislike for change is reinforced by a national trait that is becoming a liability — our habit of subjecting critics to opprobrium because they violate our unwritten convention that everyone ought to stick to his last and not "butt into the affairs of others."

This convention was not unreasonable when our country was sparsely populated and everyone depended upon himself alone, except in emergencies which were handled by voluntary community assistance rather than by government action; the citizen was then hardly conscious of his government. But today most of us live in crowded urban environments; our society depends increasingly on a well-ordered meshing of all human activities and hence on more and more government

controls and services. These are consequences of technology and human crowding and have little to do with political theory. In the manner we live today, many activities once considered private are now involved in national issues. I need hardly say that in democracies all citizens are legitimately concerned with such issues. They have both the right and the duty to criticize what they consider harmful to the national interest.

What we sometimes forget is that the critic in a democracy occupies a position that is quite different from the place he would hold in authoritarian countries. The minority that rules there without the consent of the people cannot tolerate any social criticism for this amounts to censure of its conduct. Criticism, if allowed, would in time undermine the power of the minority. The ruling minority therefore appropriates for itself the majesty of the sovereign state and brands all criticism as lèse-majeste. Its personal desire to escape censure is thus camouflaged by making the voicing of popular discontent an unpatriotic act. At times something of this kind is attempted in democracies by groups claiming to speak for the nation — a false claim on the face of it for it is we, the people — all the people — who are the sovereign nation. In consequence, all social criticism in democracies is in essence self-criticism. Criticism and controversy do not endanger democracy; they are inherent in the right of a free people to discuss national issues; hence they are an essential part of the democratic process. The process is weakened if we are intolerant of those who question our beliefs; if we retain toward the critic an attitude that may have had its place in pioneer societies but that is no longer appropriate.

This attitude makes it particularly difficult to dislodge illusions in which various pressure groups have acquired what one might describe as a "vested interest". In such cases, the lonely critic confronts powerful and wealthy organizations who fight unscrupulously for their favorite illusions. Illusions obfuscate national issues; they prevent the people from seeing the issues clearly. Were the issues fully understood, action might be taken to put the national interest above the particular group interest. But one of the main objectives of pressure groups is to prevent this from happening. Seldom do these groups realize that ultimately everyone suffers if the national interest does not prevail. Their eyes are fixed on the short-run advantages to be gained at all cost for themselves; not on the country's long-term interest. The most difficult problem in any democracy, as Madison clearly saw, was how to "break and control the violence of faction". And Theodore Roosevelt, greatest teacher of democracy this country ever had, reserved his most biting censure for special interest groups who tear the nation apart by their determined effort to prevent the people from putting national above special interests.

In the long history of mankind, short and rare have been the periods when people were privileged to govern themselves. Most of the time, man has been subject to government by the few who claim to possess superior knowledge of how to govern. Even now that democracy is accepted by many countries and has the secret allegiance of millions who are still suppressed by self-imposed

minorities — even now democracy's friends are not certain that in any real emergency, when great knowledge, wisdom, and self-sacrifice must be demanded of a democratic people, they will justify their privileges and rise to the challenge.

Today democracy is being put to the test — perhaps the final and decisive test. An old authoritarianism in new clothing now claims that it alone can handle the problems of this technological and scientific age. The uncommitted world watches the contest. Upon us, as the strongest democracy, rests the responsibility of proving that a democratic people can govern wisely, act promptly, and voluntarily accept necessary sacrifices. In the contest between totalitarianism and democracy, we defend our Western way of life and not only our own freedom but that of all free peoples in the world.

In the hope that it will serve a useful purpose, I should like to explore with you some beliefs that — in my opinion — have become costly illusions. No more can be done in a short speech than to probe around the circumference of this large subject and essay a partial and tentative statement. It is not as important to list all our illusions as it is to recognize the need to take stock periodically and, if necessary, to readjust beliefs, habits, and attitudes to the realities of a rapidly changing world. I shall limit myself to a discussion of illusions that arise from what I believe to be misconceptions about our high standard of living.

To raise this standard year after year appears to have become our nation's highest objective. It is widely believed that we have answered every question one might raise about the progress, power, or international position of the United States if we can but show that this year's Gross National Product exceeds last year's — never mind that this year's dollars have depreciated in value! I should like to state emphatically that I regard the belief that our high standard of living guarantees political and military supremacy — automatically, as it were — as potentially our most dangerous illusion.

The inference we draw is in the nature of a non-sequitur, or at least one that needs to be qualified in important respects. The proper conclusion to be drawn from the premise is that a high standard of living guarantees an exceedingly pleasant and agreeable life. It may also, provided proper action is taken, insure political and military supremacy. It all depends on how the nation's industrial productivity is utilized. Of course, without such productivity no nation can today be powerful, for power depends upon ability to produce large amounts of complicated military hardware. But there the relationship between productivity and power ends. When industrial production is largely devoted to consumer goods and services, even a very productive country may find itself outpaced militarily by another whose over-all productivity is smaller but concentrated in the military sector. It is now no longer possible quickly to convert manpower and industrial plants from civilian to military production when war threatens or has already broken out. Not only will there not be time enough to do this, but today's armaments must be produced in plants designed specially for the purpose. This is a

consequence of a revolution in military technology that has enormously increased the complexity of armaments.

The nature of modern war gives an edge to totalitarian countries since they need not persuade their people to forego comfort for preparedness. The decision to do so is made by the small group who have arrogated to themselves the lifelong job of ruling over their voiceless compatriots. It is natural for this group to look upon their country as a personal possession to be carefully developed so as to enhance its value. Given their avowed aim of world conquest, the development of military and political strength will necessarily take precedence over all other developments. Only insofar as it contributes to this strength will the desire of their people for goods and services take on importance. Ordinarily, modern methods of propaganda are sufficient to keep the civilian standard of living at a low level, for propaganda can delude people into believing that they are better off than others, or that sacrifice is necessary to defend the fatherland against imminent attack. Thus deluded they will work obediently for small personal gain.

We used to think that a totalitarian economy could never be as productive as a free one. We must now revise this belief. Such an economy can be more productive in items that enhance political and military power; it will probably never be as productive in items that enhance the people's comfort and well-being. It is the former, however, that counts most in the race for world supremacy.

In democracies the people decide--through their voting power--how much of the national product shall be collected in taxes and invested in the public sector of the economy; how much retained to support a high material standard of living for themselves. Except in periods of national emergency, it is hard for all the people to feel that their personal fate is inextricably involved with that of their country and that in any conflict between personal advantage and national strength, enlightened self-interest must choose the latter. On the other hand, for a small group of totalitarian rulers this sense of involvement with their country comes without conscious effort. Then again, it requires self-sacrifice of a high order for a democratic people to decide voluntarily that they will forego some of the fruits of their own productivity in order to safeguard the right of future citizens to live in freedom and decency, whereas it is easy for totalitarian rulers to demand sacrifices of their people since the rulers themselves do not share in these sacrifices. This is only another way of saying that in a democracy the state exists for the people, whereas in a totalitarian country the people exist for the state. This fundamental difference must be factored into all our attempts to compare the technological and productivity levels of democratic and totalitarian societies.

What counts then is not productivity per se but how a nation's productivity is used. Strange as it may seem to us, at the present state of technological development, our high civilian standard of living may prove an actual liability in the contest with the totalitarian powers. And for the following reasons:

First, by combining a high technological level in the scientific and military sector with an almost preindustrial standard of living for the mass of their people,

modern totalitarian countries in wartime get the best of both types of civilisation—the technical advantages of an industrial nation with regard to ability to wage war, and the hardihood and resilience of a preindustrial society with regard to ability of the civilians to fall back upon their own resources if need be, and to survive under hardships that might break a more civilized people accustomed to modern amenities.

Self-sufficient communities, used to a simple and frugal life, give a country at war great civilian strength. To illustrate, let me refer to a book on Soviet Strategy in the Nuclear Age by Raymond L. Garthoff. He reports that, although Russia in but a few months during 1941 lost control of 40% of her population, 60% of her coal, iron, steel and aluminum production; 40% of grain production; 95% of key military industries; 4 million soldiers and nearly two thirds of her tanks and aircraft, she was not beaten but survived and eventually returned to the attack. This is not to minimize the importance of the help she received from us. It is merely to point out that Russia was able to bear destruction comparable to that of a nuclear war and rally again. We must not underestimate the military advantage that totalitarian countries possess because they combine advanced levels of technology in the public sector with frugality in the private sector of their economy.

It is true that people used to an affluent life have individual possessions on which they can draw when war cuts off or reduces the supply of civilian goods. But they have also become so used to comfort that they may have trouble maintaining morale and efficiency if wartime shortages lower their living standards too drastically. It would seem prudent to play it safe and count the low civilian standard of living in totalitarian countries as a plus factor for them which we must counterbalance in some way.

A second reason why our high standard of living may prove a liability is that the intricate system of interlocking economic relationships that maintains our affluent society can easily be disrupted by the breaking of but a few links. To illustrate this point, take the family car, a key item in the American standard of living. Because we prefer to ride to work in our own car, mass transportation is not commercially profitable and has therefore not been adequately developed. Obviously, transportation by private car costs a great deal more in oil and service than mass transportation, especially transportation by rail which utilizes fuel far more economically than automotive transportation. If the oil supply were shut off or limited by the enemy in wartime, some American communities would find themselves without adequate means to transport workers from home to plant or office.

Most Americans now live in huge metropolitan belts which are spreading across the countryside. When population density reaches a given point, there is simply not enough room within the modern megalopolis to accommodate both man and his private car. Flight from urban centers into the suburbs is no solution; it merely aggravates the morning and evening rush. Transportation by private car becomes increasingly costly in time and money. In peacetime this can be borne but in wartime our dependence on private transportation by automobile could prove a liability.

So far we have not drawn the conclusion that when mass transportation becomes a vital necessity it must be provided, if need be at public expense. Certain national attitudes, abetted by those interested in the status quo, prevent our facing this very real problem and dealing with it effectively. A return to public mass transportation would indeed lower the standard of living somewhat but more on the side of prestige than on that of real comfort and efficiency. Yet this lowering of a single prestige factor would give the economy greater strength to meet emergencies.

It is advisable that we study the subject of transportation in the light of the population shift to urban centers. The totalitarian countries appear to have solved the problem in their usual ruthless but efficient way. We cannot copy them. We must devise our own solutions. The urgency of our problem is high lighted by the totalitarian solution of the problem for it gives them presently an advantage. Russia's industrial complexes are spread all over the country whereas ours still remain centralized, though we are conscious of the vulnerability of this centralization and are trying to disperse. Each Russian complex is designed to be self-sustaining, with workers living close to the plants, and farms further out. This eliminates, or at least reduces, the cost of transporting the workers to and from their places of work. If need be, they can cover the distance on foot.

An even more decentralized, self-contained system of industrial-farm-residential communities is now being established in China whose rulers are planning to go much further than Russia along this line. China's 650 million people are being organized into "people's communes" in which absolute communism prevails and everyone works at his assigned industrial or farm task—even family kitchens are being replaced by communal mess halls. This anthill existence must surely be the lowest standard of life to which any human society has ever sunk. But the advantage to the state is obvious. Each of these communes will be small enough to need little in the way of mechanical transportation, but large enough to be agriculturally and industrially self-sustaining.

So much effort and so large a part of a country's natural resources must go into modern transportation systems that the housing of workers close to their places of work gives Russia and China an advantage. One can readily see that their communities are less vulnerable in wartime than the American metropolis surrounded by its bedroom suburbs, with the worker linked to his place of work by a car moving along highways that become inadequate almost the moment they are built.

The third reason why our high standard of living may become a liability is inherent in the nature of today's technological civilization. Ours is the first civilization in the history of mankind which rests upon utilization of resources that do not renew themselves; the first that consumes its very foundations and does this faster the more it succeeds in raising the material standard of living of all its people.

Everything nonliving is finite unless it is recreated by the power of the sun's rays. This we have trouble believing, for in all his past experience man

was a puny Lilliputian whose impact on nature was insignificant and who felt lost in what seemed to him a vast, empty world. Previous civilizations were based on consumption of renewable resources—crops, trees, wind, water, and muscle power. They used nonrenewable resources either not at all or in such minute quantities that hardly a dent was made in nature's store of these treasures. Seventeenth century England, for example, consumed but 360 tons of steel annually! It is only in this latest second of man's hour on earth that a small percentage of the world's people have ceased living entirely off income and have begun using up resources capital.

Few of us are willing to accept the consequences of this revolutionary change in man's dependence on nature. We twist and squirm to avoid admitting that we must accommodate ourselves to a world finite in size and limited in resources. And so we delude ourselves by dwelling with satisfaction on the recurrence of raw material gluts on world markets and profess to see in them proof that resources exhaustion is a fable. Temporary surpluses are of course irrelevant to the basic fact that sooner or later even the largest store of capital will be exhausted if one keeps drawing from it. Market surpluses merely show that we have been overactive in scooping raw materials out of the earth, and have therefore collected them faster than we were able to transform them into machine-made goods.

Realists that we imagine ourselves to be, we have nevertheless invented a modern American fairy tale: The Curves that Never Cross. One is our population curve mounting upward in geometric progression—presently doubling in forty years, tripling in sixty-five, quadrupling in eighty years; the other is our nonrenewable resources curve, descending even more rapidly. We believe that in science we possess a genie in the bottle who will keep these two curves from ever crossing!

I am constantly astonished to what extremes intelligent people will go to avoid facing the limitations of mankind. I have seen it seriously proposed that the United States at one stroke solve its problem of population growth and resources exhaustion by packing ten thousand people a day off into space, there to dig for minerals which will then be sent back to earth. Like the suggestion that we can feed an infinite number of human beings on seaweed--which personally I find a most distasteful prospect!—this "solution" to resources exhaustion disregards man's biological needs and limitations. He does not, after all, live on bread alone, or excuse me, on seaweed alone. He needs enough space around him to retain a sense of individuality and freedom; he needs contact with nature, and he will deteriorate as a human being if these necessities are denied him.

Even should we decide that man is to be reduced to but two functions, tending his machines and consuming their products, the "space solution" overlooks the fact that to supply the army of space-borne emigrants with enough food, oxygen, water, and fuel and to clothe them in the proper space suits would make such tremendous inroads into our resources capital that the whole thing strikes me as a highly fanciful venture. I don't believe we know as yet just what we must provide to make sure these latter-day pilgrims will safely land on their space targets and be able to return to earth, should they wish to do so, but we can get an inkling when we remember that merely to get them into orbit will require about 100 pounds of fuel per pound of pay load!

We cannot realistically appraise our position relative to that of our totalitarian opponents unless we eschew science fiction and accept the fact that we live on a finite earth; unless we are fully aware of our dependence on nonrenewable raw materials and understand that these resources are like uninvested capital—capital which draws no interest. We must fully comprehend that the rate at which this capital is used up is an exponent of population growth and the increase in living standards. Under these circumstances, the rate of capital consumption is obviously an important factor in the relative position of competing nations. For when national rates of capital consumption differ significantly, the nation that uses its capital faster than its opponent will in time be in a less favorable position; the long-run advantage lies with nations whose austere standard of life conserves their resources capital.

Our high standard of living makes such heavy inroads into our capital of nonrenewable raw materials that, because of it, we bequeath to future generations of Americans a diminished national inheritance, thus placing them in a weakened position in the contest with the totalitarian powers. Of course, we have a perfect right to do this for we are a free people. There is nothing to prevent us from emulating Madame de Pompadour and shrugging off responsibility with the frivolous phrase: After us the deluge. But let us not delude ourselves. Let us face up to the fact that when we use up the nation's capital in nonrenewable resources we mortgage the future for the sake of the pleasures of today.

Russia and the empire over which she exercises control now possess all the fuels and minerals needed for their industries. Our own raw materials position has been worsening in the last few decades.

From an exporter of copper, lead, zinc, petroleum, iron, oil, and lumber we have become an importer of these materials. Though two world wars have made great inroads, the main reason for this change from exporter to importer has been our lavish consumption of resources to sustain a continuously rising standard of living for our rapidly growing population. At mid-century we consumed annually 18 tons per person in materials; including 14,000 pounds of fuels and the metals winnowed from 5,000 pounds of ores. According to the Paley Report, "there is scarcely a mineral or fossil fuel of which the quantity used in the United States since the outbreak of the First World War did not exceed the total used throughout the world in all the centuries preceding." Not only are we consuming our own resources capital, we are also making heavy inroads into the resources capital of the rest of the world. Robert C. Cook in the symposium Perspectives on Conservation remarks: "we appear to have grievously impaired the rights of the people of many lands. The fantastic increase in the levels of living in the United States has been at the expense not only of our own resources, but of those of the rest of the world as well. The gargantuan scale of this drain of the world's resources was set forth by the Twentieth Century Fund in 1955." According to the Fund, with but 6% of the world's population, the United States consumes today as much of many raw materials as all others combined. This means that per capita we deplete irreplaceable natural resources eight times faster than the rest of the world.

Of course, we pay for these resources but this may be small consolation for the more thoughtful citizens of backward countries who watch this drain on their national resources. It cannot be halted because the money it brings is needed to keep the wolf from the door. But logic and reason have little impact on strong emotions. The native reaction is apt to be that here go the resources that might in the future have supported a higher technological civilization in their own country; they go to enrich still more what is already the richest country on earth. In a world where the majority of the people are undernourished and ill-housed, where most of them own fewer possessions than the average American family discards, the spectacle of our affluence is more likely to win us enmity than friendship. Our loss, of course, is Russia and China's gain. Their own standard of living is not so high as to cause envy, yet high enough relative to conditions in most backward nations that it can be made to seem effective proof of communism's alleged efficiency.

One might say that our very success in realizing man's age-old ambition to escape poverty and backbreaking toil works to our disadvantage because it arouses envy. This is true but it is not the whole picture. Our material wealth is also resented because we seem to have carried it to excess. But most of all, perhaps, because we have been using our high material standard of living to support a claim that Americans are more intelligent, better educated, and all-around more competent than other people. As a nation we thus take an attitude that is quite similar to one that used to prevail in class societies where the handsome, the rich, and the wellborn looked complacently upon the misery of the masses, firmly convinced that the misery was well-deserved and that their own favored circumstances were but the just desert due superior human beings.

In our personal lives, few of us would take this attitude. It runs counter to everything America stands for. The ancestors of nearly all Americans came here because they were certain that poverty was no sign of inferiority, nor wealth one of human excellence. It is strange that in judging nations we now tend to feel that superiority is proved by ownership of more cars, telephones, or TV sets than are found elsewhere. We pay lip service to American ideals, but what has us virtually mesmerized is the sheer quantity of all the material objects we possess. It is difficult for us not to be smug about this and to urge the poor countries of the world to do as we do so that they too will become as rich and advanced as we are!

Yet when one seeks for the causes of our affluence one is struck less by our alleged superiority than by our extraordinary good fortune. Three factors are mainly responsible for our standard of living—ample natural resources, a mass market, and modern technology.

Our wealth in resources is a fortuitous circumstance for which present-day Americans can take little credit. No other emigrants from Europe, setting forth across the seas, found so large and rich and virtually empty a land as those coming to the United States; nor one so favorably situated geographically and climatically. In taking the country from the Indians we concluded the most advantageous real estate deal in the history of mankind.

Our mass market comes through population growth and the historical accident that 17th and 18th century relations between England, France, and Spain were such as to preclude the carving up of this continent in the manner that Africa was carved up in the 19th century. When we won independence, this was already a huge country. The ease with which we expanded across the continent was a result of the weakness of the countries whose colonies we absorbed.

The third factor which produces our rich society—modern technology—is of European origin. To be brought to maximum use, technology needs a resources-rich area with a mass market. We were the first country large enough to make maximum use of technology. The European countries were too small to benefit fully by their own technical inventiveness. Not until Russia began to apply technology to the exploitation of her own vast land were we faced with competition on something close to equal terms. I need not remind this audience that for some years now Russia's industrial productivity has grown at a rate faster than our own. It remains to be seen whether Western European productivity will not catch up with ours once the European coal, iron, atom, and common market community is fully established.

Modern technology is thought by many Americans to be a unique American achievement. This illusion is nourished by our mass media, advertising having made of bragging a fine art. To look at the splendid color layouts and the jubilant reports of new discoveries, inventions, gadgets, and nostrums, one would never guess how much we owe to Europe in basic research—that fountainhead of technology—or how impressive is Europe's scientific creativity —the most important human talent in this scientific age.

What would you consider the single most important modern technical development? It is utilization of electric power. Our present way of life would grind to a halt if electricity ceased to flow. We have no other energy that could take over all the functions performed today by electricity. Europeans developed it. What are the other principal forms of energy we use?—steam, internal combustion, atomic energy. The first two were invented and developed by Europeans; in nucleonics they did nearly all the theoretical work. What are our most important modern weapons? The list is long but let me remind you that the tank, the jet fighter, and the guided missile originated in Europe; the atomic and hydrogen bombs were developed here, it is true, but largely by European-educated scientists. Or take transportation. Steam and diesel-driven locomotives, refrigerator cars, and the automobile—all came from Europe. Among means of communication, wireless, radar, and sonar were invented abroad. Most of our great medical discoveries came from there—more vaccines and inoculations are European than American; more antibiotics, too—such as the sulphas and penicillin. Reading the list of Nobel prize winners in physics and chemistry is a sobering experience. During the first half-century that these awards were made, England received in proportion to population 2½ times; Germany, 3 times; Holland, 4 times; and Switzerland, 5 times as many awards as we. In the field with which I am most familiar—physics and nuclear power—nearly all the important theoretical work has been done by Europeans. In theoretical physics, Europe has produced some 15 to 20 men of high originality in the last hundred years against one American; of twelve important discoveries

that contributed to our understanding of the atom and nuclear fission, eleven were made by Europeans, one by an American. Between 1934 when Fermi published his epoch-making report on fission and 1940 when war closed down many European universities and laboratories, 133 major scientific papers on atomic fission were published--only half a dozen of these by Americans.

Our contributions to basic research and invention have been relatively small because we have concentrated our efforts on applying modern technology to the production of more and better goods. We have done this so successfully that poverty has ceased to be the lot of the mass of our people. It survives among persons who have had exceptionally bad luck or who are mentally, emotionally, or physically handicapped to such an extent that they cannot meet the problems that normal people are able to handle. Having accomplished this, we ought to cease our intense preoccupation with production of material things and turn to other unsolved problems. There are many of these.

A good case could be made for using our surplus productive capacity and leisure to develop a mass culture on a level as high as any previously attained by privileged minorities. It seems doubtful that this can be accomplished on a commercial basis alone, even if private help is added. We may have to follow the example of other Western democracies where public support of cultural activities, notably universities, theatres, art galleries and music, has long been accepted as the only means of supporting high level cultural activities.

Oscar Wilde once remarked: "Civilization requires slaves. The Greeks were quite right there. Unless there are slaves to do the ugly, horrible, uninteresting work, culture and contemplation become impossible." Modern technology supplies each of us with hundreds--even thousands--of mechanical slaves to whom we are shifting more and more of the world's dirty, debilitating, and routinely boring work. This gives us the means and the time for a vast upgrading of our nonmaterial standard of living. Instead we keep on collecting--squirrel-like--more and more goods. And so we miss the marvelous opportunities modern technology could give us, perhaps because of ancient fears rooted in centuries of human want and insecurity. It is as if we were the Sorcerer's Apprentice who forgot the word which would stop the magic broom.

Our machines keep grinding up the nation's capital of irreplaceable resources and turning them into a flood of goods which overwhelms us. We no longer produce to supply what we need; we now consume in order to clear away what the machine produces--a topsy-turvy state of affairs. To dispose of the flood of machine-made goods we have had to create a new industry; a ten billion dollar industry to service the machine by persuading us to buy its products. We have the strange situation where gifted men devote all their time and their considerable talents in the art of communication to creating artificial discontent in others and to stilling the voice of prudence so that we will mortgage our children's and our country's future to buy more than we need. By investing articles designed to be of practical use with a spurious prestige value, these talented people induce us to discard what is still perfectly satisfactory and buy new models--planned obsolescence is the term for this bit of modern witchcraft.

Today thrift has become not only old-fashioned but antisocial; disinterest in material possessions is made to seem a kind of treason to the American way of life because it puts a brake on the speed with which we use up our resources capital and throw last year's models on the scrap heap. To do both as rapidly as possible has come to be considered a major objective of our native genius. Thus have we carried the noble aim of plenty for everyone to such excess that men become the servants of their machines.

Meanwhile two vitally important tasks are neglected; tasks that in my opinion are far more important than producing new gadgets, new models of existing gadgets, better packaged goods, and more and still more material things. These tasks are conservation of the material foundation of our civilization and development of our human resources. The first involves less wasteful utilization of raw materials and the invention of substitutes for vanishing resources; the second better education for our children. We must not delude ourselves into believing that because we were able to create the wealthiest society in history, we shall have no trouble solving these two other tasks as well. Quite different human qualities are needed and must be encouraged.

Today we still overvalue the producers of material goods and undervalue the preservers of the materials base of modern technology and the developers of our children's minds. Respect and wealth go to men who make their living using up our limited resources capital; we even favor them by tariffs and special tax benefits. But meager rewards go to men who by reason of their intellectual endowments and their long and arduous course of higher studies are able to help us find substitutes for exhausted resources. We support those who flood the market with unsaleable goods and neglect the institutions which train future scientists and engineers who may discover how to prevent future shortages of goods. The manipulator of our intricate machines is usually better paid than the inventor who built the machines. It is significant that we were one of the last great nations to join the International Copyright Union because for a long time we saw nothing wrong in a practical businessman making a profit by pirating the intellectual output of others. We have always favored those who know how to make money by <u>using</u> ideas and material over those who think up the ideas or create new materials.

Conservation, too, is something that rarely excites our interest. We shall not really buckle down to conserve efficiently and intelligently what is left to us until we face the fact that even this huge country is not limitless. Conservationists have been marshalling an abundance of facts to prove that we are running out of space and getting poorer in resources. But various groups who find that conservation measures make utilization of our resources less profitable to them have the contrary interest of perpetuating the illusion that we shall always have much space and vast resources.

Because we tend to measure everything by size rather than by quality, it is easy to convince us by quoting statistics. A good case in point are forestry statistics which are often cited to prove that we now manage our forests so well that we actually have a surplus of new growth over what we cut annually. Let us

not rejoice prematurely. What these statistics do not show is that our forests are still declining qualitatively—half a century after Theodore Roosevelt and Clifford Pinchot launched the Great Campaign to Save our Forests. The real test of scientific forest management is the softwood saw timber account. This remains well in the red. Moreover, it is still true that what we harvest is predominantly high quality saw timber cut from our few remaining virgin stands, while much of what we grow is the scrubby stuff that reseeds itself on cutover land and has little commercial value.

Nor do the statistics show the very large losses suffered by forest fires, insects and the like—at least partly a result of less than perfect forest management. True, some forests are well managed today but many are in poor condition. We have a long way to go. Statistics which leave out the element of quality prevent our recognizing how far we still lag behind forestry standards that have long prevailed in Europe. There is a forest in Leiria, Portugal, that was planted seven hundred years ago and has been cut, and carefully replanted ever since. It is as beautiful and valuable today as it was in the thirteenth century.

All statistics are tricky and must be used with caution lest we be misled. Outgo and input statistics on timber are better today than fifty years ago partly because we now use only half as much wood per capita as we did then. This reduction is a result of a shift from wood to fossil fuels and synthetics, that is from renewable to nonrenewable raw materials. It is part of a general trend that is symptomatic of modern technological societies. Similarly we have shifted from natural to synthetic rubber; from silk and cotton to "miracle" fabrics. These shifts to nonrenewable materials contribute to the rapid exhaustion of these resources and must be regretted from a long-range point of view, much as they may add to present comfort and pleasure.

Our tendency to disregard quality when we make comparisons has helped to perpetuate another illusion—the illusion that only this country educates <u>all</u> its children beyond grade school. Until recently, the deterioration of the quality of American public education has been hidden by statistics showing huge numbers of youngsters in their late teens still going to school and more of them obtaining diplomas and degrees every year. Had we given thought to the <u>quality</u> of the schooling they received and to the kind of scholastic performance represented by these diplomas and degrees, we should long since have stopped deluding ourselves that we have "the best schools in the world."

This has been an unfair and one-sided speech. There has not been time to give a balanced picture of our own and our opponents' strength and weakness. I have dwelt only on <u>our</u> illusions not on <u>theirs</u>. It has always seemed best to me to correct our own weaknesses rather than to look complacently on those of our adversaries.

I am convinced that our single-minded preoccupation with production and consumption of ever larger numbers of material things is a liability in the race that the totalitarians have forced upon us. I realize that the sanctity of the American standard of living is fiercely defended by a formidable array of groups

and organizations whose economic well-being depends on the continuation of today's frenetic production and consumption of manufactured goods. To question the validity of a philosophy of continuous material growth is not popular. Of course, no sensible man will go counter to opinions held by the majority of his fellow citizens unless he believes that the reasons that once justified these opinions no longer exist; that persistence in holding on to what has now become an illusion is detrimental. It is not admiration for our opponents that induces me to bring out their strong points, but simply the desire to seek the truth; in searching for chinks in our own armor, I do not advocate that we copy slavishly what our adversaries do.

There are different ways to express devotion to one's country. For some people, love expresses itself solely in fulsome admiration of every aspect of the American way of life; for others critical analysis is part of all true devotion.

I have criticized our illusions because, in the present period of intense rivalry between democracy and totalitarianism, they prevent our making the fullest use of all our potentialities. But, in closing I should like to affirm my conviction that our potentialities are so great that, if we would but divest ourselves of illusions, seek out the truth no matter how displeasing it may at times be, and set our goals high, there is literally nothing we could not accomplish. Let us take full advantage of the opportunities offered us by this great land of ours and by our democratic institutions that enable us to develop what is best in us. Let us make full use of our greatest asset—the free human mind—which can work wonders if it is permitted to embark on voyages of discovery beyond the frontiers of knowledge.

Rickover H. G.

March 16, 1959

Dear Admiral:

You are more gracious than most men and all Admirals.

I write to thank you for your letter from the Skipjack. Casey has already applied for permission to have it framed and put alongside the picture of the Nautilus you were good enough to autograph.

I am just off for a quick trip to Europe, but will hope to give myself the pleasure of coming to see you in late April. Please convey my warm regards to Mrs. Rickover.

As ever yours,

VADM Hyman G. Rickover
Assistant Chief of Bureau for
Nuclear Propulsion
Bureau of Ships
Washington 25, D. C.

EBM/hl

U. S. S. SKIPJACK (SS(N)585)
Care of Fleet Post Office
New York, New York

At Sea, Submerged
10 March, 1959

Dear Ed.

We are returning to New London, Connecticut from sea trials of the U.S.S. Skipjack, our first nuclear powered, streamlined, single screw attack submarine. The ship successfully met all her trials, surface and submerged, and attained the highest speed ever made by any submarine.

I am writing you because I know how interested you are and in gratitude for the fine friend you have always been to me. I want you to know ~~that~~ your help and understanding contributed to the creation of this revolutionary submarine

With warm regards

Cordially

H. G. Rickover

Rickover, Adm H.

FOR RELEASE AT 8:00 P.M. (EST)
THURSDAY, DECEMBER 11, 1958

Remarks prepared by VADM H. G. Rickover, USN
Assistant Director for Naval Reactors
Division of Reactor Development
U.S. Atomic Energy Commission
and
Assistant Chief of the Bureau of Ships
for Nuclear Propulsion
Navy Department
for delivery at
The Harvard Club of New York City
New York, New York
December 11, 1958

EDUCATION - OUR FIRST LINE OF DEFENSE

Since you invited me to discuss my views on American education, I take it for granted that you share my anxiety over its present state and that you believe with me that what goes on in the nation's classrooms is a matter of legitimate concern to every American which he has a right to discuss in public. Robert M. Hutchins warns that "an uncriticized culture will not endure," and Aristotle, writing in the twilight of Athenian democracy, reminds us that education is every nation's most important business. The education of youth, says this most famous of Plato's pupils, is not merely one among the many concerns to which the lawmaker must "direct his attention," but the primary one, "for the neglect of education ruins the constitution of the state."

Hutchins and Aristotle are separated in time by more than two thousand years but their thinking is close because they are both firmly rooted in Western civilization. Their two statements sum up the theme of my speech.

It took the shock of Russia's Sputniks to bring us to full realization that today the rate of a country's technological progress depends on the quality of its educational system. Not until this shattering of our complacency did we face up to the reality of America's educational deficiencies and talk freely about them in public. We are only beginning to fully grasp the fact that education is our first line of defense which we neglect at our peril.

We might well ask ourselves why an external stimulus was needed to scare us into giving serious thought to the education of our children. Why had we previously paid no attention to those--and they were not a few--who deplored the deterioration of scholastic standards in our schools and warned that Russia's massive upgrading of her education presented a real danger to our position of world leadership?

I submit that we were caught by surprise because we did not accord education the place of importance it deserves in our private lives and in public affairs, and because we did not keep ourselves informed on current educational theories and practices through public debate of this all-important national issue.

Of course, in times of widespread material well-being, people tend to be apathetic about matters which do not seem to affect their personal comfort and security. This is natural. When things run smoothly, nobody goes around looking for trouble.

I believe, however, that we in this country are particularly loath to make national problems our personal business and that we are abetted in this--if not actually pressured into it--by diverse special interest groups which would like us to leave to the "experts" all matters that specially interest them.

We are easily intimidated by pressure groups. Some important issues are not freely discussed in public for fear of displeasing such groups. This is not a new thing in this country. As long ago as 1831, DeTocqueville remarked with astonishment that "freedom of opinion does not exist in America," and Theodore Roosevelt--the greatest teacher of democracy this country ever had--spoke in forceful language against minority groups and warned that we could not tolerate being torn apart by selfish group interests. Despite Roosevelt's warning, I doubt we have fewer minority groups today than existed in his time. Some have disappeared, but new ones have taken their places; many have shown great hardihood and seem to live on forever. Common to all these groups is dislike of public discussion of their particular interests; they realize they cannot win public approval by persuasion. Some groups seek to obtain selfish advantages which run counter to national interest. Others sincerely believe that they know best what is good for the people. Among the latter are to be found groups of professional experts whose work is of a specialized nature or who <u>think</u> that it is. Knowledge increases so rapidly today that extreme specialization

is inevitable. This could easily raise a barrier between the mass of the people on one side and numerous small groups of experts on the other; each little group of specialists seeking to silence public criticism on the grounds that the people are too ignorant to have a valid opinion. We ought not allow such undemocratic viewpoints to prevail. One does not have to be an expert himself to be able to judge whether the expert has done his job satisfactorily.

The American people are now thoroughly aroused about our schools and are forcefully expressing their concern, but powerful educationists are determined to maintain the Chinese wall which they have built around American education. The educational isolation of this country has no counterpart in other advanced nations of the West. Both official and non-official surveys of the educational systems of other countries are published regularly in European countries. We have a federal agency which is charged with disseminating educational data, but I am not aware of similar surveys being put out by them. The only exception seems to be the "Report on Education in the U.S.S.R." which was published by the Department of Health, Education and Welfare in mid-1957. At that, the report was unaccountably delayed, according to its author. Disquieting evidence of Russia's educational progress had been accumulating for eight years prior to its publication.

Wholly erroneous views of the educational standards and

practices of other countries are unfortunately widespread among American educationists. Lack of interest in education abroad--which is dismissed as being aristocratic and hence unsuitable to this country--prevents our schools from benefiting by the educational experiences of others. What is done in schools elsewhere may be well worth our attention since it can often be adapted to specific American needs. Educationist parochialism becomes a positive danger to the country when it prevents the leaders of American education from keeping abreast of developments in Russia. Indeed they have been slow to perceive the challenge of Russian education and even slower to admit the threat it represents to our country. In no other way can one explain the amazement and shock publicly expressed by prominent professional educators who finally went to Russia this year to check for themselves.

As far back as 1954, people outside education had warned of the tremendous educational development in Russia and had urged that we put our own educational system in order. These warnings were airily dismissed as "hysterical" and the warners were told not to interfere in affairs about which they could know nothing--not having taken the prescribed credit courses in "education," one must presume! I suppose we should be thankful that at last there has now been a change of viewpoint among some of these recent travelers. "We were simply not prepared for the degree to which the U.S.S.R., as a nation, is committed to education as a

means of national advancement," said one of them. But not every member of this group came in quest of truth. Unfortunately there was present the type of truculent attitude which is represented by statements such as: I'm here to collect evidence that will prove American schools are superior to the Russian. This reflects the all too common educationist view that the schools are their private business which no one can be permitted to criticize. We have the right to expect of educators that they seek the truth and have the courage to face it. Once the truth is known, there is nothing to keep this country from surpassing any foreign educational system.

The attempt of leading educationists to keep public education a preserve of the "professional" educator lowers the tone of the great educational debate which has been going on since Sputnik. I believe one may fairly say that most critics of American education argue on a level of ideas and facts. They point out where the public, the parents, and the educators have gone wrong, for obviously there would be no educational crisis if there had been no human failures. But rarely do the critics make the educator the sole scapegoat. They do, however, point out what specific educational theories and practices must be changed if we are to bring excellence to American public education; and where educational reform has been blocked by educationists, they bring out this fact. How else are we to make a change for the better?

On the other hand, all too many educationists stoop to the level of personal invective in order to discredit the critics of American education instead of answering the specific criticisms. I have yet to see a well-reasoned, well-documented counterargument which takes up every point raised by the critics and attempts to prove them wrong. Instead, the whole issue becomes a duel between educationist and critic in which the educationist is concerned solely with his amour-propre and his job, and the critic is accused of being an ignoramus out to make a lot of money by irresponsible sensationalism. The rights of our children are lost in this undignified attempt to silence criticism at all cost.

What horrifies me is the apparent inability of many educationists to conceive the possibility that one may criticize American education for no other reason than because he is sincerely concerned with the future of our youth; that it is possible to criticize because one believes in American public education, not because one hates it, as educationists imply; that one may feel there are better educational philosophies than John Dewey's without necessarily being a crackpot or a reactionary. For me, our educational crisis is a matter of such gravity that the heavy-handed vulgarity, the clumsy jocularity to be found in some educationist repartee trouble me greatly. The future of our children is not a fit subject for dialect stories. What manner of men are these who degrade a serious

discussion into tasteless burlesque? There are fortunately not many who speak in this vein but it is surprising that no voice is raised from within the fraternity to castigate this deplorable levity. Debates serve a useful purpose only when they are conducted on the level of ideas and facts; then they help clarify the issues. Debates are useless when one side offers no reply to the arguments of the other, except to impugn the qualifications and motives of its opponent.

To an educationist, a person who is not a "professional" educator can offer no valid criticism since education is not his metier. This is not a sincere argument, for the leaders of American education are extremely intolerant of criticism by members of their own profession as well. A teacher jeopardizes his job if he exercises the right of free speech in a manner implying even mild criticism. I myself and most other critics have received many letters from teachers expressing their deep dissatisfaction with American education but begging not to be quoted by name. Virginius Dabney, Pulitzer prize winner and editor of the Richmond, Virginia Times-Dispatch commented editorially in 1954 on this tacit censorship by the educationist top command: "It is highly disturbing," he said, "that teachers in good standing feel that they cannot constructively criticize things that are happening in the schools...without risking their jobs. For such thought-conformity to be forced upon teachers, of all people--the very members of society who are supposed to be

promoting intellectual freedom and the healthful interchange of opinion--is doubly shocking."

Educationist interpretation of the term "professional educator" is extremely narrow. Criticism by colleagues on college and university faculties, for example, is not regarded as "professional!" The reason is not hard to find. The best-documented, most clearly reasoned and most interestingly presented--as well as the harshest--criticism of our public schools has come from the pens of academic scholars, and no wonder. To them the inadequacy of the public schools is daily made manifest by the educational deficiencies of students who must be given remedial courses in high school--sometimes even elementary school --subjects before they can be taught at the college level.

As one works his way through mountains of educationist literature one is impressed with the determination of public school men to be independent of the colleges. In this, they differ greatly from secondary school educators abroad. There, the universities set the standard for all education. The academic secondary schools must prepare students to pass the examination for the "leaving-certificate," without which students are not admitted to universities; in turn, the high scholastic standards of the academic secondary schools influence those of the non-academic secondary schools. In consequence, scholastic standards are higher all around than in this country. We should soon see marked progress if American colleges performed for

public education the standard-setting service which is performed by universities abroad, and if the men who run our public school system accepted these standards. At least our academically talented children might then receive a secondary school education which would not be wholly out of line with what is now being offered in European schools.

Educationist disparagement of criticism by college professors has rubbed off on some news commentators. For example, the remarks of one of our eminent scholars were recently reported by one commentator solely in terms of the shape and color of the scholar's socks! A debate on American education between one of our "professional" educationists and a college professor of unimpeachable scholarship was reported as follows: eleven lines were alotted to the professor; these slyly hinted that he had no doubt found criticism remunerative, but made no mention of what the professor had said in the debate. But the argument of his opponent was presented in great detail and with ample quotes. Since I have great admiration for the professor, I shall now stoop to personalities myself and say that I found the argument of the educationist extremely boring since it merely echoed the old party line. You know how it goes: There is nothing fundamentally wrong with our schools that could not be instantly remedied by more money; the public must supply this money but keep out of such "professional" matters as curricula, teacher certification, educational aims and objective, and so on.

Practically every educationist pronouncement contains the stereotyped claim that our schools are the most democratic and the best; that they are the envy of the world.

Parenthetically, it should be said that there is some evidence that the critics have not been entirely ineffective, in that this particular bit of bragging has of late not been heard quite so often. We are now merely assured that "our best schools are unsurpassed in the world." I wish I could bring myself to believe that continual invocation of these phrases, in the manner of a solemn incantation, will make them come true.

A favorite gambit used by educationists to discredit lay criticism deserves mention. The critic is asked: "Would you presume to tell your doctor how to do his job? Why then do you presume to tell the 'professional' educator how to do his?" This argument has superficial persuasiveness and seems to have won friends for the educationist viewpoint. Although the press as a whole eschews the type of biased reporting which is to be found among some commentators, it has not been entirely unaffected by educationist propaganda. Witness the monotonous repetition of the words "blast," "lambast," "rant," "lashes," and "attack" used by journalists when reporting the arguments of critics--no matter how even-tempered, reasonable, and factual these might be. This is a sort of semantic hitting below the belt which ought to be outlawed by new "Marquess of Queensbury Rules for Public Debates on Education!"

Most critics are pretty tough skinned because they are motivated by a deep concern for our children's future. Even so, making criticism unpleasant, even risky, can sometimes silence it.

In his essay On Liberty, John Stuart Mill tells of an interesting way in which this was accomplished by an ancient people--the Locrians. Being as fond as the next man of maintaining the even tenor of familiar customs and ways of life, but desirous of giving lip service to the noble concept of free speech, the Locrians devised a splendid method which allowed them to eat their free speech cake and have it too. At public meetings anyone could argue for a change in the laws and customs but not before a halter had been placed around his neck. The instant anything he said met with public disapproval, the rope was pulled tight. Thus were the frivolous faultseeker and the reforming crank kept in hand. There are times when I personally have felt a sense of kinship with the Locrian critic!

Since it has been effective in discouraging public debate, let us examine the educationists' "doctor gambit." The analogy between the "professional" expertise of our public school men and that of our physicians is so tenuous as to render the gambit pointless. One of our great educational deficiencies is the meager professional qualification which suffices in this country to admit anyone to employment in public education below the college level. It is, in particular, quite inferior to that

required of secondary school teachers in other Western nations who are almost as thoroughly trained as are members of other "learned" professions. In this country, the "professional" knowledge possessed by secondary school officials and teachers cannot be compared with the "professional" knowledge possessed by a licensed physician.

There is indeed a wide gap in medical knowledge between physician and layman. But the required courses in "education" which make up the American educator's professional study program are not such as to create a wide gap between him and the layman; not, at any rate, if the layman has taken the trouble to inform himself on educational theories, practices and objectives; not, if the layman by reason of being an employer has had practical experience with the products turned out by our schools! The subject at issue is not so difficult to understand as we are led to believe. Nor do we need to be overawed by academic degrees in education for, alas, many are granted for intellectual achievements which are not impressive.

Flexner, one of our most perceptive critics in the field of education, once made a random selection from the Chicago and Columbia University list of theses for M.A. and Ph.D. degrees in education; a devastating conglomeration of inane trivialities having no connection with true scholarship. There was little to choose ~~between~~ among the theses on his list but for some reason one in particular stopped Flexner in his tracks. "I pause for a moment,"

he writes, "to contemplate the thesis 'An Analysis of Janitor Service in Elementary Schools.' Why Elementary? There are reasons: first, obviously, the title suggests other theses--and new subjects are in demand, as students multiply--the duties of a junior high school janitor, of a high school janitor, of a college janitor, etc. 'Are these really different subjects?' I once asked a professor of school administration. 'Oh, yes,' he replied, 'the lavatory problem, for example, is with small boys quite different from the same problem at the high school level!'" Lest I be accused of talking about what happened in the past, let me give you a few samples of theses for which the degree of Doctor of Education was awarded last year: "School Camping in New Jersey," "The Predication of Baseball Ability Through an Analysis of Selected Measures of Structure and Strength," "A Study of Boating and Boating Education in Selected Schools, Colleges, and Universities in the United States."

Let us not be intimidated by the "doctor gambit." Public education is a subject well within the grasp of the layman, especially the educated layman. Moreover, it must be remembered that in this country--as in most advanced Western nations--education is for the most part a tax-supported enterprise and everyone in it is a public servant. One of the important differences between citizens of a democracy and subjects of authoritarian states is that the democratic citizen has the right as well as the duty to check and evaluate the performance

of public officials, and to express his dissatisfaction when they do not carry out the mandate of the people or when they discharge their functions unsatisfactorily. Sovereignty lodges in the people, and public servants--whether elected or appointed; federal, state, or local; career or civil service--are all agents of the people. They will be judged irrespective of whether or not the critic possesses vocational competence equal to that of the public servant. We criticize the police when it is derelict in its duties though we may have no criminological competence. We need not be tax experts to publicly--and loudly--express our views on taxation. My own work is of a highly technical character, but as a government servant my work is at all times subject to public scrutiny. It would be calamitous if things ever came to pass in this country where every self-styled "professional" expert could silence public discussion of his work, simply by claiming that no layman can understand what he is doing. That way lies censorship which in the past, also, arose from claims to infallibility, but which in civilized countries has had to make way for the right of free men to speak their minds.

The importance of free speech in a democracy cannot be overstated. It is a privilege which may be lost if it is not used. But more important, it is a necessity for insuring good government. In democracies public servants are not born to high office, nor do they hold it by dint of possessing absolute power; they are elected. They will be good or bad, depending on whether

the people who elect them are well-informed, independent in their judgment, and patriotic enough to put the national interest above personal or group interest. In some countries the national interest prevails by fiat of the few; here it must be maintained voluntarily.

Public debates on national issues are an important part of the democratic process. Through them the citizen is enabled to familiarize himself with facts which he might not have had the time or ability to dig up for himself. By hearing opposing "experts" give their interpretations of these facts and their solutions to the problem under discussion, the citizen discovers all aspects of the issue and is helped to make wise decisions. In any public debate, the more varied the viewpoints that are aired, the better. Let us disregard the "professional" qualifications of those who wish to talk about education and concentrate on <u>what</u> they say rather than on <u>who</u> they are.

Though I have never taken a course in "education," I have been running schools for years. Everyone in my atomic power group has taken a hand at some time or other at teaching what he has first had to teach himself about the new science of nuclear engineering. We have set up schools for our own engineers and for industry people, as well as for the officers and men who will operate our nuclear ships. In our post-graduate program we teach the exacting requirements of reactor design, construction, and management. We, too, have come across

deplorable lacunae in the education of our students; like so many colleges, we have had to give them "remedial" courses! My concern with education predates the Sputniks by several years and sprang from my dissatisfaction with the products of our schools. My work keeps me pretty busy and I am not looking for more things to do. Only a strong motive could have induced me to give up the little leisure I have in order to familiarize myself with our educational problem. I speak on education only because I am anxious about the future of our country, should present educational practices continue.

As any engineer would, I noticed many years ago that Russia, with her tremendous new educational program and her single-minded determination to outpace us in science and technology, was gaining momentum at a time when we were losing momentum. This ~~showed~~ SHOWS up in the constant lengthening of lead time in this country--from 2½ years during World War II to about ten years today--while in Russia lead time for military hardware ~~had~~ HAS been cut drastically and ~~was~~ IS now about half ours. Lead time as you know is the time which elapses from inception of a new idea to its utilization in the finished product coming off the production lines. As an engineer, engaged in pushing through a new engineering project, it has long been obvious to me that we cannot shorten lead times as much and and rapidly as we must to keep ahead of Russia, unless we find ways to remove the many roadblocks, both technical and non-technical, which delay <u>all</u> our attempts at technological breakthroughs. My own work in nuclear propulsion is merely <u>one</u> such instance. The same roadblocks hinder every one of our new development projects,

be they in jet engines, rockets, missiles, satellites, or attempts to obtain energy from hydrogen fusion.

Nearly all these roadblocks are caused by people whose education has not prepared them for the extremely difficult problems which arise when we seek to progress beyond present levels of technology. At bottom is to be found a too facile faith in the miracles of science which permeates our national mores and causes us to be overly optimistic. I believe it is necessary that we become somewhat more realistic; that we revise our thinking in this respect: a high standard of living is not a gift dispensed by a scientific fairy godmother but something which must be earned by upgrading of the total human personality. Whenever we make an advance in man's age-old effort to utilize the forces of nature, we must simultaneously raise our education, our techniques, and our institutions to a higher plateau. The civilized man has always had to meet higher demands on his total humanity than the primitive man living in an archaic society. Let me illustrate this by an example of past upgradings in a field with which I am familiar.

If you obtain your power from human muscle, wind, or water, you need almost no technical knowledge. To drive a gang of galley slaves, to manage a windmill or water mill does not even require literacy; but putting Faraday's invention of the dynamo to practical use in a central station power plant needed fifty years of engineering effort by well-trained people. The men

who run such plants use their minds a great deal more and they need much better minds than the quondam miller or slave driver. Similarly, from the splitting of the atom in the 1930's, to the bomb in 1945, to the first practical nuclear reactor in 1953, a vast amount of intellectual effort of a high order had to be expended. Everyone involved in research, development, construction, and running of nuclear power plants has had to raise his thinking and his performance to technical and administrative levels well above those required in conventional power plants. Our nuclear engineers had to be more broadly and more thoroughly educated; better grounded in basic engineering principles, in particular, than the average engineer. And, since our reactors were not laboratory models, since they were expected to propel ships and supply energy to central station power plants, our work also involved many people outside my own group--people in industry and in other government agencies--on whose cooperation we depended. The categorical imperatives of atomic energy demanded that they too raise their thinking and their actions to higher levels of competence. In particular, what was needed was an upgrading of administrative procedures and of standards of accuracy in industrial production.

It is no exaggeration to say that a major part of our time has been taken up with fighting for higher levels of performance which are resisted because their necessity is not understood. We have had great difficulty convincing outsiders that more

rigorous standards are essential if nuclear power is to be harnessed safely and efficiently. Resistance arises from what one might call an intellectual toryism--an inflexibility which has its roots in an educational system that does not prepare young people for life in our constantly changing world; a world subject to recurrent bouleversements which rapidly make old attitudes and procedures obsolescent and demand that we have flexible and versatile minds. If and when we obtain energy from hydrogen fusion, still greater demands will be made on the scientific, engineering, and administrative abilities of everyone involved with this new source of power.

It is obvious that the kind of American who thoroughly mastered his environment on the frontier, in a muscle, wind, and water state of technology, would be totally ineffective in the atomic age which is just around the corner and the fusion age which is still a way off. Even today, social workers in big cities into which people from our last frontier regions have been pouring are fully aware of the inadequacy of these human beings in an urban environment for which their simpler life has not prepared them.

One consequence of technological progress is that man must use his mind more and his body less. We still think in terms of a more primitive era; we tend to overvalue physical prowess and we most certainly undervalue intellectual competence. This has a profound effect on our attitudes toward education. The kind of

schools that once prepared young people adequately for life in a less complicated environment are of little use today. Nor do we now need schools which concentrate primarily on adjusting the children of immigrants to a new country; on helping them become Americans quickly and painlessly. Today we must have schools which develop all children--talented, average, and below average--to the highest level of intellectual competence which they are capable; schools which help young people to understand the complex world of today and how it came to be what it is. This means that our schools must return to the traditional task of formal education in Western civilization--transmission of the nation's cultural heritage, and preparation for life through rigorous training of young minds to think clearly, logically, and independently.

My personal experience in developing nuclear power has convinced me that our schools do not produce enough qualified people to run our complex technological society. We have a chronic shortage of trained professionals which is not limited to scientists and engineers but is all-pervasive. Nor do we have enough broadly and liberally educated people with qualities of leadership to administer the work of trained professionals. Because of these shortages, our most competent people often are greatly overworked, which is not a good thing. Worse still, a less qualified man must often substitute. The result is either unsatisfactory performance or costly delay. Our educational

system is simply not geared to the requirements of this scientific age. Much more education is needed today, not just by the future professional person and by leaders in government and in industry, but by everyone. All our children need education far superior to anything we in this country have ever had or have ever needed in the past. Only massive upgrading of the scholastic standards of our schools will guarantee the future freedom and prosperity of the Republic.

I began work on nuclear propulsion by setting out to find men of independent mind and venturesome spirit to make up my reactor group. From the start it was evident that no experienced men of this type were available. Before we could seriously tackle our work, we therefore had to find young people showing potentialities of growth whom we could then ourselves train intensively for work on reactor design. I have interviewed more than two thousand young men in the last twelve years, all top men in their college class. My naval reactor engineering group presently numbers about 150. Since the men who came to see me had already passed through a number of previous interviews where all but the best were eliminated, it is evident that those who could not meet the requirements of the nuclear power project--and hence inferentially of any new development project--vastly outnumbered those who qualified.

This experience made a deep impression on me. It led me directly to a study of why our educational system produces so

few men who are qualified to do the work which we must do if we are to progress. I found that our schools are the greatest "cultural lag" we have today.

When I read official publications put out by the men who run our educational system--booklets such as "Life-Adjustment Education for Every Youth" or "Education for All Youth" --I have a strange feeling of reading about another world, a world long since departed if it ever existed at all. I sense the kindly spirit, the desire to make every child happy, the earnest determination to give advice on every problem any young person might ever meet in life--and withal so complete a misunderstanding of the real needs of young people in today's world that it frightens me.

If I speak out against a mistaken concept of what twentieth century American education should be, I do so out of no desire to find fault with those who misread the demands of the times but from anxiety for the future of our children. I am worried about the chances which young people--who are so poorly equipped to deal with modern life--will have when things become more complex and difficult, as they surely will before very long. Today's big problems for young people are not how to choose the proper necktie, or how to be socially popular--these are minor problems which any mother can easily teach her children; which children can in fact pick up themselves as they associate with others.

It is quite incomprehensible to me why so much emphasis is put on teaching children to "adjust" to their "peer" group. A child's best learning time is short and should be put to better use. Let us help him to absorb real knowledge and not waste his time teaching him something that comes naturally to all children. Every parent knows that immature youngsters almost slavishly conform to the mores of their contemporaries. They certainly need no courses in how to become little "organization men." The danger is rather that they may grow up without learning to think for themselves. Overstressing group adjustment may lead children to pick the wrong group and join a juvenile gang. Members of such gangs are probably the most perfectly group-adjusted youngsters you can find anywhere!

If education is to have any value it must help the youngster to reach maturity; to develop his reasoning power; and, through the discipline of rigorous study, to strengthen his character. No one can predict what problems he will meet in this uncertain and changeable life. The only way to prepare him so he can deal with whatever challenge life may bring is to make sure that when he graduates high school, he will be a truly "educated" young person. By that I do not mean the same thing as some of our educationists. Witness the statement of a teachers college dean, quoted in John Keat's revealing book "Schools Without Scholars:" "An educated man is one who is well adjusted and helpful in his community." When the dean was asked "whether a man who was well

adjusted and helpful could be considered educated without also being able to count his fingers or write his name," the dean said, "Yes."

Our schools have done a fine job making Americans out of youngsters with diverse backgrounds and doing this in record time. But this job is finished. The schools must now tackle a different job. They must concentrate on bringing the intellectual powers of each child to the highest possible level. Even the average child now needs almost as good an education as the average middle and upper-class child used to get in college preparatory schools. The talented child needs special schooling to move him rapidly through the period of absorbing knowledge into the period when his fine mind can turn this knowledge into new ideas, new discoveries, new ways of life. We need creative thinkers in the humanities no less than in the sciences. Living in crowded areas demands more of us in tolerance, in consideration, and in acceptance of necessary rules than life on the frontier. Perhaps our grandchildren will have to live with fewer material possessions. It is not too early to turn to inner resources, which are limitless: to art, music, literature, good conversation; to cultivation of a more contemplative way of life.

Other countries have successfully carried through the most drastic of educational reforms. So can we once we recognize the need. There is much we can learn from the advanced nations of Europe which have always stood in the forefront of education.

By any pragmatic test, their education has proved its value. Crowded, resources-poor Europe still wields influence out of all proportion to its relative size; it still has the highest living standard, excepting only that of North America. These are results of her remarkable intellectual achievements. I invite you to read the roster of Nobel prize winners in physics and chemistry; the number of original thinkers produced in the last hundred years; the number of basic inventions for present-day technology; the discoveries in medicine which have made life happier and safer--in all these you will find Europeans outnumbering Americans several times over, measured in per capita performance.

At the other end of the human intellectual scale, you will find that the leading nations of Europe started to wipe out illiteracy long before we did, and have lower illiteracy rates than we. Free compulsory elementary education was established in several European countries before we achieved this goal. It is today cheaper in time and money to become a professional person in many European countries than in America. The impressive figures on school attendance of American teenagers lose their impressiveness when we compare the time actually spent in classroom studies here and abroad--theirs being 1/4 to 1/3 longer each year than ours; hence our longer schooling is merely a sort of stretch-out. We have nothing scholastically comparable to the European academic secondary school which is either free

or charges small fees tailored to the income of parents. Our youngsters have to get this kind of liberal education in college, losing precious time and having to spend more money to boot--even in the state universities, where incidental and boarding expenses exceed the cost of the secondary day schools of Europe.

Many of our school problems spring from erroneous conceptions of democracy and equality; from our unwillingness to recognize the vast differences in mental endowment and determination which are to be found in any representative group of children. We must not make shibboleths of "democracy" and "equality." National ideals are not realized in a set way which remains unchanged forever. Democracy is a growing force. It never reaches perfection. It ever finds new objectives. To achieve it in a small, homogeneous farming community is one thing. Where land is abundant and a man's success depends primarily on his physical strength and courage, inequalities of mental endowment are not very important. To maintain democracy in a highly industrialized urban society is far more difficult, for here man must use his mind more, and hence mental inequalities become manifest. We cannot eliminate mental inequalities by running our schools in a way which hides them, as when we admit students regardless of their qualifications, or hand out diplomas and degrees to everyone irrespective of scholastic achievement. We pride ourselves on being democratic when we thus eliminate

competition and reward from the most important activity a human being can engage in--brain work. But all we accomplish by protecting the lazy and stupid child and neglecting the talented is to impede technological progress.

This we could do with impunity so long as the choice was left to us whether to advance, stand still, or progress. Today we no longer have any choice at all. We are confronted with a country whose leaders have openly declared that "they will bury us;" a country that is larger and more populous than we; that possesses all the necessary minerals for a high level technology, many of which we must import; that is putting much greater effort and proportionately more money into producing well-trained scientists and engineers; and whose rate of industrial progress is greater than ours. In this situation, ability to progress technologically becomes an important element in relative military strength.

Our present situation is such that survival as a free and prosperous nation depends upon our being able to progress more rapidly. This we shall not be able to do unless we bring excellence into the schools; unless intellectual achievements are properly rewarded so that competition will again come into play. I doubt we can do this unless in some manner we set educational standards. The only practical way at present seems to be for American colleges to take on this responsibility. They are in a position to pick and choose among applicants.

If they got together and agreed to keep increasing admissions requirements year by year, they would gradually force higher scholastic standards on our public schools. The private college occupies a strategic position today. It is engaged in the nation's most important activity--developing citizens who can maintain our complex civilization and push it forward. Unless we have such citizens and enough of them for our needs, our country is in danger. For in truth and quite literally, education is our first line of defense.

I should like to close with a well-known quotation from Whitehead with which you must all be familiar but which is so prophetically true that it cannot be repeated too often: "The rule is absolute, the race which does not value trained intelligence is doomed. Not all your victories on land or at sea, can move back the finger of fate. Today we maintain ourselves. Tomorrow science will have moved forward yet another step, and there will be no appeal from the judgment which will be pronounced on the uneducated."

NOTES ON RICKOVER INTRODUCTION

Admiral Rickover is a man who loves to do battle with lethargy and barnacled tradition. He will occasionally admit that he is pleased with the performance of an individual or a piece of hardware but, so far as I know, he has never confessed to being satisfied.

I first met him in the course of doing a television program called REVOLUTION IN THE NAVY. This involved porpoising about for three days on the Nautilus, shooting an interview with Admiral Arleigh Burke on the Forrestal, the missile cruiser, Boston, the submarine Albacore and various shore installations. Near the end of the filming, I went to Washington to interview Admiral Rickover and began putting to him the usual questions about nuclear power and weapons and the effect of these on naval strategy and thinking. Early in the interview, the Admiral interrupted my questioning and said, "Why don't you ask questions about the really important things?" He then declared that "education is the most important problem that faces us today. It is even more important than atomic power or the Navy because if our people are not properly educated in accordance with the terrific requirements of this rapidly spiralling scientific and industrial civilization, we are bound to go down. The Russians apparently have recognized this." More than any man I have known, Rickover respects nothing but ability. Neither rank nor wealth nor tradition impress him. The only thing he appears to fear is that the Ship of Stqte will founder, as a result of an excess cargo of ignorance and from the rust and barnacles of indifference and waste of manpower and resources. He once said to me in another interview, "Another thing that possibly deludes us is the current belief that we can do everything better than everyone else in the world. We also have a tendency to do quite a bit of bragging. Other people are just as good as we are. I have seen no patent from the Lord saying that Americans are better than anyone else or that they have more brains than anyone else.

We do have more wealth than other people. We have greater opportunity to become better than other people. But I am not so sure that we are taking advantage of that opportunity as much as we could."

I certainly agree with your main contention, which is that Rickover reached his conclusions about education as a result of using, or trying to use, its products in developing a crash program in peacetime. I do not read him as having the scientist's contempt for the humanities. Basically, what he wants is to make intelligence and the disciplined mind respectable.

There is, as you know, no institution in the world that quite parallels the shop he runs. It is perhaps the best example of his respect for ability and his insistence upon the acceptance of responsibility.

Rickover

NOTES ON REAR ADMIRAL HYMAN G. RICKOVER'S DISCUSSIONS OF PROPOSED BOOK WITH BWK WASHINGTON, D. C. SEPTEMBER 2, 1958

Subject of book

It should be an expose which will touch the public. To be about the people involved in the government and how the government really works. It should be written in the third person, by a writer who must write about what he sees, not what people tell him, and it should set forth his and Rickover's conclusions. The book would be a source book, a case history, which would influence industry. The writer must be cleared in order to gain access to the most important facts.

Rickover feels that the exploitation of weapons is the main element in defense today. It would take very little exploitation to bring about the enemy's defeat. We must get on top of the situation through men of science and through cultural sources. A lot of "baloney" is going on today in Washington along educational, scientific and technological lines. We cannot alow the present danger of false premises to continue. If the truth is brought out something might be accomplished. At present there is too much publicity to the point that no one really knows what is going on. Defense is not getting enough money from the government. There are too many people involved in government operations. Rickover thinks personnel should be pared to a minimum, with the top people really doing the work. We must try to stop the draining of profits by eliminating unnecessary people and jobs. In our efforts to gain maximum efficiency there must be people involved who have imagination, artistic temperament in every phase of operations and the thinking must not be narrow. If we value our opportunity to be free we must be selfish and prevent our destruction. Our industry is not efficient. Everyone is fooling himself and the public through over-optimistic advertising.

Time involved in writing the book:

Rickover thinks it might take three years to do it successfully. He could time to a writer depending on how much time the writer could allow. Rickover feel the subject involves many subtilities and that much insight is needed on the part of the writer to look into the complexities. Government agencies are usually misleading in saying that projects take a short time. As a result of a writer's necessary research there would be many repercussions. For example, when Raymond Gram Swing talked to Rickover about doing a book he began to see it was a far vaster project than he, Swing, had expected.

Money involved in this book:

Rickover thinks this project will take more money than is ordinarily involved in a book. He will surely help in raising funds. Because of the technical aspects involved, Rickover thinks cost of book might be around $100,000.

Writers suggested by Rickover:

1. Max Lerner: First choice, although Rickover thinks a novelist would be idea, as he is apt to have more insight into people.

2. Robert Wallace: Did Life article on Rickover for Sept 6, 1958 issue.

3. John dos Passos: Suggested by Rickover aide, Rockwell.

Rickover, R. Ad

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON 25, D. C.

August 20, 1958

Rear Admiral H. G. Rickover, USN
Chief, Naval Reactors Branch
Division of Reactor Development
U. S. Atomic Energy Commission
Washington 25, D. C.

Dear Admiral Rickover:

I hereby spontaneously volunteer to lose twenty-five (25) pounds by February 1, 1959 and not to regain any of this weight for at least three (3) years.

If I do not carry out this agreement I will contribute $1,000.00 to the United Nations Children's Fund.

Sincerely yours,

Fred Friendly

Eighty-Sixth Annual Commencement
Stevens Institute of Technology
Hoboken, New Jersey
June 14, 1958

THE MEANING OF YOUR PROFESSION

We are here to celebrate the coming of age of a new generation of engineers and to wish them Godspeed and best of luck in their chosen careers.

With the travail of final examinations behind you and the challenge of your first job still ahead, you now have a moment to reflect, assess your prospects, and set your goals. Stevens has given you an excellent engineering education. What you make of it depends on your individual temperament and ambition and on your object in life. You may decide to use your engineering degree as a springboard for a career in business management, or you may choose to practice engineering as a profession. In the first case, your work will be administrative; in the second, creative. Before deciding for which of these you are best qualified, and which will offer you greatest satisfaction, it seems to me important that you have a clear understanding of what it means to practice a profession, particularly your own profession of engineering.

To practice a profession one must have acquired mastery of an academic discipline as well as a technique for applying this special knowledge to the problems of everyday life. A profession is therefore intellectual in content, practical in application.

The first definition of the term I could find goes back to the time of the Renaissance when Europe's universities became in essence training schools for professional men. The Oxford English Dictionary of 1541 says that a profession is "a vocation in which a professed knowledge of some department of learning or science is used in its application to the affairs of others."

Traditionally, professions have been held in esteem because their esoteric content has been impressive - their usefulness patent to everyone; because of all callings, they required the longest and most costly period of preparation; and because they were usually practiced by persons of above average intelligence, education and character.

Until well into the nineteenth century, only members of the three "learned" professions, that is theology, law and medicine, and of university faculties were called professional men. But as human knowledge expanded, new fields of learning developed which could be turned to practical use through new professions or through subdivisions of old professions. Engineering is one of the newer professions.

Engineering had been a skilled craft since remote antiquity and necessarily remained a craft as long as no other sources of power except human and animal muscle, wind, and water were known. It developed from a craft into a profession when it acquired a body of systematic knowledge, that is, when scientific advances opened up vast new and complex sources of energy in nature for the

use and convenience of man. Today we have a body of organized knowledge and procedure which - as you well know - requires a long course of professional study. In consequence engineering now has professional status in most civilized countries.

The term "profession" today has a well-defined and widely accepted meaning. One might therefore expect that no vocation would lay claim to this appellation unless it had in fact become an intellectual pursuit monopolizing some department of higher learning. However, we live in a time of growing equalitarianism in all spheres of life. This has brought about a gradual blurring of the distinction between crafts, trades, and professions. Similarly, the indiscriminate granting of diplomas and academic degrees has tended to obliterate the traditional distinction between vocational training and higher education. Many people engaged in useful but nonintellectual or routine activities now call themselves professionals.

For example, you can attend a university and study the new academic discipline of "cosmetology," obtaining in due course a bachelor's degree in techniques for beautifying the ladies - God bless them. This is a thoroughly worthy undertaking and I am all for it. But does it become a profession merely because interested parties have endowed a chair in cosmetology?

Recently I heard of a university which offers courses in television and radio advertising and in gourmet cookery and which has now added to these pseudoacademic subjects a four-year course in trailer manufacturing, dealership, and trailer park operations. Upon completion of the course, students are awarded the B. S. They may also take postgraduate work in this fascinating field of higher learning and eventually receive a master's degree, in this way presumably becoming members of a brand-new "learned" profession.

The traditional hallmark of the professional person - his doctorate - may now be obtained by writing theses on subjects such as "Optimum Window Area for a Classroom of Twenty-Five Pupils in the Junior High Schools." A doctoral thesis, you remember, is supposed to climax advanced study in an academic discipline by making a contribution through original research in the subject!

These are examples of what some may consider merely a harmless aberration; one which happens because people like to acquire the symbols of status yet hate to do the hard work which the symbols are supposed to represent. But to my mind it is something more serious. Are we not all extremely indignant - and justly so - when a certain foreign power uses good old words like "freedom" or "democracy" and twists them around to mean their opposites, thus fooling some people into thinking they are what they are not?

One may even wonder whether institutions which mix salesmanship with science, fly-casting with philosophy, and homemaking with history can properly be called "universities" - a term which has a more restrictive meaning, as you will discover if you look it up in Webster.

Indiscriminate appropriation of words which traditionally have meant excellence of some sort is stated to be democratic. I myself cannot accept this view. Carried to its logical conclusion, each American baby ought then to be supplied at birth with a combination birth certificate, high school diploma, B. A. and Ph. D.! Actually, we are not consistent in this matter. We do not consider it "undemocratic" to respect and reward excellence in athletics, in art, or in business. It would, therefore, seem only just to reserve the honored word "profession" for vocations maintaining the traditional standards of the well-established "learned" professions.

These standards apply both to the content of a profession and its practice. The intellectual content of a profession, the field of knowledge it monopolizes, must of course be mastered before a man may begin to call himself a professional person. But it is not something learned once and for all in a prescribed course of study. Knowledge increases and a man must keep up with it, so he is never done with learning. In fact, he himself is obligated to carry forward the knowledge on which his profession is based and to insure that it is handed down to new members. In a very intimate sense, his own specialty is a professional man's personal concern and responsibility. Its continued advance can be brought about only by the efforts of present members of the profession who themselves are indebted to the contributions of past members. A professional man who cannot make original contributions to his field of knowledge, can at least enhance the prestige or standards of his profession. Above all, he can and must support the institutions which train future colleagues.

If professional standards of competence are demanding, so are the standards concerned with professional behavior - with the practicing of a profession. Traditionally, the professional man follows certain tacit or explicit rules of conduct which vary in detail as between different professions. Basic to all of them, however, are two rules: first, the obligation to reject lay direction in the performance of professional work - that is the duty to maintain professional independence; and second, the obligation to use professional knowledge and techniques solely for the benefit of their clients. A clear understanding of these two rules of professional ethics is particularly important for members of the newer professions.

Since engineering is a newcomer among the "learned" professions, its ideals and principles are not yet firmly fixed nor are they adequately stressed in engineering education. For this reason I felt that a discussion of the standards of professional practice in general and their application to engineering in particular would be a suitable subject at this graduation ceremony. Moreover what you yourselves conceive your calling to be and the way in which you practice it may exert no small influence on the conduct of future engineers.

As regards the obligation to maintain professional independence, Flexner - himself an outstanding expert on the nature of professions - remarked: "The essence of ... professions resides in the application of free, resourceful, unhampered intelligence to the comprehension of problems."

Service ceases to be professional if it has in any way been dictated by the client or employer. The role of the professional man in society is to lend his special knowledge, his well-trained intellect, and his dispassionate habit of visualizing problems in terms of fundamental principles to whatever specific task is entrusted to him. Professional independence is not a special privilege but rather an inner necessity for the true professional man, and a safeguard for his employers and the general public. Without it, he negates everything that makes him a professional person and becomes at best a routine technician or hired hand, at worst a hack.

To maintain this freedom, the professional man may have to refuse a lucrative case or relinquish a position with a good salary. In one profession - theology - independence has at times cost the professional his very life. Clergymen of all faiths have shown great courage in resisting the attempts of

ruthless governments to dictate to them in matters of religious belief and church administration. These are part of the clergyman's profession - if I may use the term - in which he cannot brook lay control.

Resistance to lay interference is of course easier when a professional man charges fees than when he works for a salary. For this reason, English barristers are professionally prohibited from becoming salaried employees; they must take each case for a separate fee, even if it is tacitly understood that they will accept all the cases of a particular client. British solicitors are under no such constraint, but then it is the barristers who are the top men in the legal profession and it is from their ranks that English judges are chosen.

Of the various professions which are indispensable in a civilized modern society, that of members of university faculties ranks high in importance. Professors and researchers are salaried professionals: in most European and in some American universities, they are paid by the state. The professional independence of these persons has long been recognized as vital to a nation's intellectual growth. I am speaking, of course, of the principle of academic freedom which is the term applied to the professional freedom of the scholar and the scientist to pursue knowledge wherever it may lead him - even if it leads to conclusions which are politically unpopular. Even so autocratic a country as Prussia understood that without academic freedom her universities would not be able to perform the scientific functions expected of them. Thus we have the strange phenomenon of an express grant of academic freedom in the Prussian constitution of 1850 - the only such incidence I have encountered. Sometimes authoritarian governments can recognize the inner need of the

scholar for this freedom more readily than democracies where egalitarian thinking may consider this to be an unwarranted special privilege.

We have evidence that Russian scholars and scientists are given some academic freedom in strictly limited fields which the government considers politically neutral. Since the Russian people as a whole enjoy no political, economic or social liberties, even such limited academic freedom apparently suffices to spur the creative abilities of their scientists and engineers. Freedom is a relative thing. The men who push beyond the frontiers of the known are seldom interested in any other freedom than their own driving need. Despite many restrictions, Renaissance scholars, for example, were able to launch a scientific revolution, highly destructive of much that had been implicitly believed for a thousand years and, therefore, bitterly resisted by the authorities. A famous Bolognese philosopher summed up how it was done: "We must speak as the many do, we must think as the few."

Each new profession must fight to gain this freedom for itself. Unless it wins this fight it will not be a real profession. Engineers must be particularly careful not to lose their recently acquired professional status inadvertently. This will usually happen when they accept managerial positions. In such positions the engineer-manager becomes a member of an administrative hierarchy where he must submit to lay superiors. His engineering knowledge then becomes incidental, on a par, let us say, with proficiency in a useful foreign language. He functions as an administrator and is no longer a professional engineer.

Even when he takes a straight engineering position in a corporate or governmental organization he has no guarantee that his professional status

will be respected. For the engineer often has more difficulty maintaining his professional independence than say a physician employed by the same organization. Yet both are experts in their respective fields - both are professionals. The difference lies in the determination of the medical profession to brook no lay interference. The engineering profession does not resist lay interference with equal ardor. Towards the physician, the layman is suitably humble in matters medical. Not so, as yet, towards the engineer. This is something for you to ponder and to work on, so that eventually your status may become as unquestioned as the doctor's.

Officials in governmental and corporate complexes wield power commensurate with their rank in the organization. They are accustomed to directing the activities of subordinates and they are convinced that their own rank is clear evidence of their superiority over those with less rank. But professional personnel are in a sense outsiders to the organizational hierarchy. Only rarely do their positions accurately reflect their professional abilities. There is in truth no such thing as rank among professionals. Each is "master of his fate"; he stands alone, and by his performance demonstrates his own worth; no organization can give him his true rating.

Professional persons are a rather troublesome anachronism in organizations although they are indispensable in a technological society. An executive honored by high position and impressive emolument will naturally find it extremely hard to admit - even if only to himself - that in certain matters he knows less than a young engineer to whom he pays but a fraction of what he himself earns. Such dispassionate assessment of one's own limitations is rare and calls for large-mindedness and imagination; for humility in the face of the vast powers with

which modern technology deals; for a great deal more understanding of science than is possessed by most laymen.

Perhaps the present scarcity of outstanding engineers and the keen competition for their services by government, industry and the universities may firm up the status of your profession.

A frank and perceptive editorial in a recent Dupont publication, entitled "The Great Talent Search," remarks wryly that in competing for qualified professional men, business is handicapped since the only incentive it has to offer is money whereas professional and academic life provide many intangible incentives. It is but a short step from recognition by business that there are other than monetary incentives to the realization that it, too, can provide such incentives.

American businessmen are noted for their ingenuity. They could, I am sure, educate their management people to understand that it isn't good business to pay for professional services and then downgrade all one's bright young men to routine technicians. In this connection, it is gratifying to observe the growing practice in industry of engaging engineers to manage engineering projects.

Today, most engineering is done in association with colleagues on joint projects. Supervision of such groups of engineers by a fellow engineer is professionally indispensable. As long as the man who calls the shots is a colleague, teamwork does not infringe on professional status. This sort of working together is practiced in other professions besides engineering. During surgical operations, for example, one man must be boss and the rest carry out his orders. But you can see what I am driving at if you try to visualize a surgical team working under a lay hospital administrator!

Eventually, I hope that the absurdity of putting an engineering team under a lay administrator will become equally obvious to those who run our huge corporate and government complexes. Its like setting a blind man to lead the seeing.

Creating conditions which will attract engineers and stimulate their productivity is important. But productivity is not the sole consideration; safety is even more important. There is great need for awareness in management of the nature of the forces which science and engineering are now harnessing for the benefit of mankind. These forces are far too complex and too hazardous to be manipulated by technological amateurs.

Long ago, a Greek physician sighed: "The life so short, the art so long to learn!" I commend this sentiment to all who supervise complex scientific and engineering projects without themselves possessing professional competence in these matters. It takes a long time and hard study to become a scientist or an engineer. How then can even the ablest executive expect to know and understand the details of technical work? Native wit, talent for leadership, even experience in running large organizations - none of these valuable qualities are substitutes for "the art so long to learn."

Perhaps as a people we lack respect for the laws of nature and hence for those who know most about these laws. In popular esteem, the manipulator of men outranks the manipulator of abstract laws and facts, and thus we tend to overpay the administrator and underpay the creative professional man. We then compound this error by evaluating the worth of a man's advice by the size of his salary. This lopsided scale of values can stand readjustment. Insistence on professional independence for scientists and engineers may eventually bring this about.

Of course, the professional person's insistence that he cannot accept lay control over the methods he uses to perform his tasks cannot be twisted into an excuse for incompetence or for blunder. To use the example of an operation again: the patient's relatives obviously cannot be permitted to lean over the surgeon's shoulder and direct where and how he is to make his incision. He must be completely independent of lay direction in the performance of the operation. However, he will most certainly be judged by the results of the operation. If too many of his patients die, the public will render judgment on the surgeon and he will soon have much spare time on his hands.

This distinction between dictation of method and judgment of results is not always clearly understood, particularly in callings which are still in process of developing into professions but have not yet achieved this status. At this stage, the prerogatives of professional status may loom larger than they actually are - they may even be visualized as a sort of divine right to escape all public censure for error or failure because of the layman's alleged inability to judge professional work. This would be a pretty nice setup if it could be put across to the public, but I am afraid people won't buy it.

Because the individual who seeks a professional service lacks the esoteric knowledge possessed by the man whose help he needs, he finds himself in an inferior position in his dealings with professional persons. Society has sought to offset this by requiring a license to practice and using its licensing power to control educational qualifications of professional people. Professional associations have done much to reinforce this protection of the client by setting up codes of ethics. Besides equalizing the client's position vis-à-vis the professional, these measures also protect the professional person against competition by quacks.

The practice here varies from country to country, depending on the degree of social importance ascribed to any given profession by the public. Thus in continental Europe, the title "engineer" is commonly restricted to persons who have proved their competence to the authorities; in Anglo-Saxon countries it is not so restricted. The professional person's standing in the community depends, in final analysis, on the public's insight of his work, that is, on the educational level of the man in the street. When specialized knowledge of professional people is incomprehensible to the average man, he is apt to flounder between frustrated suspicion and excessive awe, leading him either to interfere unduly with professional independence or to accept naively every claim made by anyone who calls himself a professional. The relation between the expert and the public is one of the central problems of our day.

This problem has been aggravated by a spectacular accumulation of specialized knowledge in the last four centuries. Since rediscovery of classical thought in the Renaissance, knowledge has been increasing rapidly. In part, this has been a result of the liberation of man's intellect. This has come about through acceptance of Greek intellectual techniques and eventual expansion of these techniques into our modern scientific methods. In part, it has come about simply as a result of the enormous expansion of population, particularly among the people of western civilization who have grown at about double the rate of the world as a whole. Since the people of the West also outdistance all others in scientific productivity, the sum of human knowledge has grown phenomenally. According to available estimates, it now doubles every fifteen years. In contrast, the doubling of population, even in such fast-growing countries as the United States takes forty years at today's rate of increase.

The outpourings of this intellectual horn of plenty are overwhelming. No longer can anyone "take all knowledge as his province."

Unfortunately, the average person is touched only obliquely by most of this new knowledge, as when he benefits from some new commodity or service which has grown out of an addition to scientific knowledge. These new things he usually accepts as just another gift from his fairy godmother Science, and he gives little thought to the manner in which they have been brought about: the chain of human effort which began in a remote laboratory where the germinal idea originated; the long process of applied research to verify its practicability; the detailed engineering to transform it into something useful; and the final step taken by industry and commerce to make it available to the consumer.

While the practical results of increased knowledge thus merge into our way of life, the knowledge itself seldom becomes part of our general culture. It remains the possession of small groups of experts, each owning that part which pertains to his specialty. This is so not because the experts are selfishly keeping knowledge to themselves but because most people simply have no taste for knowledge and do not want to spare the time for learning about this potent force in their lives. Thus we observe a widening gap between the experts and the public who depend for their well-being on the work of these experts. This disturbing cleavage exists in the humanities no less than in science. Thus most people are not well informed in such vital matters as the languages and cultures of the various peoples who share this earth with us; the historic, geographic and economic background of current events; the place of American civilization in the estimation of the world; and the real strength of our country in the shifting sands of power relations.

Speaking of the need to improve the physical fitness of our youth, the director of the President's Council on Youth Fitness, aptly described us as a people addicted to "spectatoritis." We have both physical and mental spectatoritis. We sit in the bleachers and let the game of life unfold before us. We accept the delightful rabbits which science keeps pulling out of its magician's hat without bothering to investigate how it is done. We accept our country's power and strength without worrying too much whether as citizens we are always conducting ourselves as the world expects the people of a great nation to act. We gladly accept all the benefits America has to give us but leave to others the responsibilities that go with them. We measure our own personal worth by the number and quality of material possessions we are able to buy, not by what we make of the God-given capabilities with which we were born.

This passive acceptance of life's benefits and unconcern for the great problems of our day could undermine our freedom subtly and almost imperceptibly. As citizens of a democracy, we are all rulers of this country and rulers cannot afford to be ignorant of everything beyond the narrow confines of their own small personal world. This was well understood by the upper and middle classes of past societies who knew that their rule depended upon comprehension of the world in which they lived. It was the reason why they made certain that their sons were broadly educated. Intelligence is not the special preserve of any particular class. Learning is hard for everyone. If the middle classes of old were able to push most of their sons through tough schools and universities where they received the liberal education which fits men for leadership, this was not because their sons had superior intellectual capacities but because

they were strongly motivated, determined to improve their inherent abilities by training mind and body to their utmost. This motivation came from home and school environments which fostered respect for excellence and emphasized the need of competence in whatever position one occupied in the world. Determination can offset average endowments, but without the desire to improve oneself, the highest native capacities count for little.

Today most Americans have more leisure than the middle and upper classes had in the past. Our country is rich enough to provide the same tough education for all our children which once only middle class parents required of their sons. But neither our leisure nor the obvious need of democratic citizens to know a great deal more about their world today than they needed to know in a simpler past - neither of these urgent reasons for giving every child a tough education have greatly influenced popular ideas about education. We have adopted middle class standards widely in our manners, our homes, our taste in clothes - in all the externals of life. But we have not as yet adopted traditional middle class standards in regard to education. In fact, Americans were more ambitious to better themselves through improving their minds when we were all poorer; when self-improvement meant going to night school after a long day's hard work. The desire for an education which will really stretch our minds is not yet dead but it is almost smothered by our soft and pleasant life. No longer is our national goal a life of adventure, of risk, of a chance to reach for the stars; instead it is a desire for comfort and security.

A high price must be paid for this comfort and security if the cost is ignorance of the powerful forces which control our destiny. Science is now

able to change our environment in ways which have never before been dreamed of. It is disturbing to watch the relentlessly widening gulf which separates the minority who understand and make use of science from the uninformed majority who passively accept whatever comes to them from the hands of the experts. That this gulf has not led to conflict or deep alienation - at least not yet - is due to two phenomena, unique to western civilization: political democracy and professional ethics.

Political democracy vests ultimate power in the average citizen - regardless of his intelligence, education or sense of responsibility; and professional ethics forbids professional men from taking unwarranted advantage of their own superior knowledge. Both of these safeguards we owe to the Greeks. Both were evolved by the Greeks in response to the then prevailing situation where knowledge was concentrated in small groups of experts and spread thinly over the mass of the people. We today are faced with somewhat of a similar situation. Let me explain:

At the dawn of western civilization, the general pattern of life in settled communities was one in which a small group, versed in esoteric knowledge, ruled over the rest of the people to whom access to such knowledge was denied. The legends of many peoples reflect the propaganda of the elite that aspiration to knowledge above one's own station is sinful and will call down the wrath of the Gods. Practical knowledge of the kind needed by the peasant, the artisan, the shopkeeper - yes, these the masses might learn. But knowledge of law, medicine, theology, astronomy, the ability to read and write and to govern, these were a sort of magic possessed only by the divinely ordained few.

Guarded jealously and handed down only within the group, this knowledge provided its possessors with power, wealth and comfort. In some parts of the world one can even today find people enslaved to experts who use their special knowledge to enforce subordination to their will - shamans, medicine men and the like.

The Greeks were the first to put the expert in his place. They tore away his mantle of mystery; they denied that knowledge was a special dispensation reserved by the Gods for particular groups of people. They threw open the door to knowledge and made its acquisition the supreme civic and human virtue.

They looked upon the universe and man's relation to it as a proper object of study for all men. They believed that everything could be understood by the right kind of intellectual technique. To know, man first had to observe, then to collect and order his observations; finally to discover what were the underlying, the basic principles in the mass of information on hand. Hard thinking was necessary, but it brought its reward; for once known, these principles could then automatically be applied to new problems. The result might be described as an intellectual chain reaction. It goes far to explain the amazing accomplishments of the ancient Greeks.

Their approach to learning was secular and intellectual; it was rigorous in its insistence on logical deduction from verifiable facts. All that was needed to transform this intellectual technique into our modern scientific method was ability to experiment, and the necessary tools. Experiments merely widen the sphere of human observation; they permit pin-pointing inquiry on specific objects and they bolster deduction through verification by "controlled" tests. Without laboratories and accurate scientific tools, the Greeks yet

were able to create sciences out of conglomerations of unrelated bits of knowledge which had been long possessed by many other peoples. Thus they founded a science of mathematics, of astronomy, of medicine, of history. They gave the West a scientific habit of mind.

Having thought their way out of the then universally prevalent custom of confusing knowledge with divinely sanctioned magic, the Greeks were bound to reject any claim by experts that their special knowledge justified a privileged position. In the political field, this meant rejection of the claim that certain persons had a divine right to be rulers. And so the Greeks were the first civilized people to establish popular rule. Their type of democracy was based on the belief that average Athenians, for example, were quite capable of governing themselves. Not only as legislators, but even as government officials. Greek democracy required direct participation in government by all adult males. Each was a member of the Assembly and took turns for set periods of time at serving his city as soldier, magistrate, judge and priest. The smallness of the Greek city-state simplified the art of governing, and the absence of a priestly caste in Greek religion permitted lay performance of religious functions.

But this would not have been feasible without a relatively high level of education. And indeed the Greeks were a literate people. For after all, free access to knowledge was the basis of their way of life which differed so radically from that of the people surrounding them; people who were enslaved by their own ignorance of any except purely practical knowledge. Though a Greek city-state such as Athens did not provide free schooling, the obligation of parents to provide for their sons' education was well understood and

accepted. Solon is credited with having hit on a clever device to give sanction to this moral obligation. He released sons from the filial duty to take care of their fathers in old age, if the fathers had not made provision for their sons' education!

Athens in 400 B. C. appears to have had fewer illiterates than many "advanced" nations in 1800 A. D. Moreover, almost anybody could broaden his mind by attending the theatre which in Athens had distinctly educational aims besides that of entertainment. "Recreation for the spirit" was available in abundance; one could listen to the philosophers as they wandered about with their pupils, discoursing learnedly and wittily on practically every question or problem known to preindustrial man; in this pleasant manner one could absorb ideas about truth and beauty which have inspired men ever since. Athens was permeated by a love of learning which most of us would consider excessive. There were eggheads galore and oddly enough the Athenians respected them. They even put up with a man like Democritus when he uttered the following weird sentiment: "I would rather discover one scientific fact than be King of Persia."

Perhaps the most remarkable aspect of Greek democracy was that it did not lead to a cult of mediocrity. On the contrary, education of the young was designed to bring all their faculties to fruition - the suppleness and beauty of their bodies through athletic games, the perceptivity and sharpness of their minds through dialectics - what we would call "public speaking." As Pericles expressed the Athenian ideal, government is in the hands of the people, the law secures equal justice for all and "as for social standing, our practice is that a citizen who has recognized ability in some field gets public preferment - IT IS A QUESTION OF HIS ABILITIES, NOT OF HIS RANK."

It is the fashion today to deprecate the value of classical civilization for modern man; but I myself am constantly struck with the lasting validity of so much of what the Greeks and Romans thought and wrote. These thoughts are at the origin of many of our most treasured traditions. Greek political ideas greatly influenced the founding fathers and helped them to devise for us a most marvelous constitutional framework. The Greeks paved the way for modern science, while the Romans still influence the law under which all the people of the West live to this day. It is not too fanciful to consider a modern engineering college such as Stevens a remote descendent of the Greek medical school at Cos or the Roman legal school at Beirut, or even Plato's Academy and Aristotle's Lyceum in Athens. If I had the time, I could make a pretty good case for this distant relationship.

It is true that Greek and Roman civilization was based on slavery and that some of their habits and practices were rather odd. Much is made of this by anticlassicist "progressives." And it is also true that outwardly, a modern technological society seems to have little in common with Rome - still less with the tiny preindustrial Greek city-state. Yet human problems have a way of persisting unchanged through the most revolutionary permutations of man's environment. The product of clear, logical thought has permanent value. It is, as Thucydides put it, a "possession forever."

Nowhere is this more clearly evident than in the lasting validity of Greek thought about the role of the expert - the professional man - in society. The Greeks evolved the concept that, far from entitling him to a position of power, the possession of specialized professional knowledge actually imposed on the expert a special obligation, namely to use this knowledge solely for

the good of others. This concept is foreign to most other civilizations, except when they have deliberately adopted it from the West. It is, of course, basic to the position of the professional man in western civilization.

The Greeks founded the first true profession and the science which belongs to it - medicine. They formulated the professional ethics of this profession in the famed Oath of Hippocrates which we have not been able to improve upon. Young doctors embarking on their careers still swear this oath. Its fundamental creed of obligation and responsibility is basic to all subsequent professional codes. All are adaptations on what the Greeks originated.

In this country we have gone far towards cutting ourselves off from the broad stream of western culture. Rome and Athens are not for our children. Ancient history is supposed to bore them. So they are taught the essence of democracy by joining "smoke abatement campaigns"; they are shown the utility of simple arithmetic by paying a visit to City Hall to watch the clerks at work. As for learning the languages of the founders of western civilization, Heaven forbid! Far more useful is it to teach our youth how to drive an automobile and take its motor apart.

I am going to fly in the face of the opinions of all sorts of self-appointed experts on the needs of modern man by urging that in your spare time you make the acquaintance of the ancient Greeks and Romans - remarkably stimulating people and good company, I assure you. And as a guide to engineering ethics, I should like to commend to you a liberal adaptation of the injunction contained in the Oath of Hippocrates that the professional man do nothing that will harm his client. Since engineering is a profession which affects the material basis of everyone's life, there is almost always an unconsulted third

party involved in any contract between the engineer and those who employ him - and that is the country, the people as a whole. These, too, are the engineer's clients, albeit involuntarily. Engineering ethics ought therefore to safeguard their interests most carefully. Knowing more than the public about the effects his work will have, the engineer ought to consider himself an "officer of the court" and keep the general interest always in mind.

Since the engineer deals with metals and fuels of which the earth has but a limited supply, it will make a great difference to future generations whether or not he is fully conscious that every ounce of metal or fossil fuel he uses means a diminution of nature's capital stock we bequeathe to our descendants.

Engineers build structures which alter man's supply of pure air and water, of food and soil. A poorly designed factory may poison air and water; a dam or highway may needlessly rob our grandchildren of good farm land which by then may well be in short supply. Almost everything the engineer does has an effect on our materials base. His work is seldom purely an engineering task, though he sometimes acts as if it were.

For example, not long ago a bridge was being built across a body of sea water with valuable oyster beds. A small change of location would have saved the oysters. When this was pointed out by a marine biologist, the engineer in charge of building the bridge rejected the advice out of hand with the contemptuous remark: "What do you know about building bridges?" An irrelevant and rude reply. More to the point would it have been to ask the engineer: "What do you know about building bridges in this particular locality?" In this instance the livelihood of a number of people not in any way involved with the bridge or with hiring the engineer was adversely affected.

To give you another example I am familiar with: the design and operation of nuclear power plants. These involve questions of public health and safety which go far beyond those encountered in conventional power plants. For this reason we use every conceivable talent that can help in the design. And when the design is completed, it is gone over in detail by a committee composed of outstanding specialists in many technical areas. These men who are full-time professionals in their respective fields advise the Atomic Energy Commission on the safety of proposed reactor plants. Since reactor safety is a broad problem requiring knowledge of many subjects the members of this committee are selected not alone for their knowledge of reactors but because of their demonstrated competence in relevant areas such as meteorology, oceanography, nuclear physics, mechanical, electrical and chemical engineering, sanitary engineering, design of pressure vessels, explosives, industrial insurance, and so on.

Consultation with other experts ought to become as common in engineering as it is in medicine. A Venetian medical code of about 1500 A. D. made it mandatory for a physician to consult a colleague before prognosing a serious disease. Yet medical mistakes affect only one person, the patient; engineering mistakes can affect multitudes.

Within your own lifetime a profound transformation has taken place which has gone almost unnoticed by most Americans but which must strike any engineer forcibly. It is that we have ceased being one of the world's richest countries in mineral and fuel resources and a great exporter of raw materials. Indeed, we are now importing many vitally needed materials; we are, in fact, truly self-sufficient only in molybdenum and magnesium of the thirty-two indispensable minerals.

While our resources base has shrunk, our population has soared. In 1750 there were but 1.6 million Americans. During the next two hundred years we multiplied one hundred fold. Even with immigration substantially ended we are now growing at an annual rate of 1.8 per cent which, if you know your geometric progressions, would bring us to 5.3 billion by the year 2150 - a thirty-five fold increase in the two hundred years after 1950.

As I see it, the most important aspect of the engineer's code of professional ethics ought to be the obligation to do nothing that will unnecessarily aggravate future resources deficiencies. To my mind his greatest task is to do everything he can to preserve opportunities for a good life to coming generations who will not be as rich in land and resources as we are today. This means, in particular: no needless waste of irreplaceable materials; no permanent destruction of good soil or of our shrinking water resources merely for the sake of immediate advantages; it means utmost ingenuity in substituting abundant materials for scarce materials, renewable resources for irreplaceable resources. For example, in our nuclear propulsion program we are currently working to eliminate the use of a scarce gas, helium, for testing purposes by substituting a more abundant gas. When one is alert to the problem, many ways to save our resources capital will suggest themselves.

Greatly improved education for all and ingenious use of technology will help to offset diminishing land, mineral and fuel resources. We have only to look at Europe to see what can be done. There a high standard of living is being maintained on a modest resources base.

Switzerland, for example, has only one-fourth as much land per capita as we have, yet she manages to produce a per capita gross national product more

than half ours - and only one-third smaller than that of rich and empty Canada. Or, to put it another way. Switzerland has the same population density as India, and she has only rocks, water and scenery, while India has rich natural resources. Yet the individual Swiss citizen is seventeen times as wealthy as the individual Indian. Improved technology brought about by educational investment in people is the secret of Switzerland's productivity and high standard of living. And technology is the engineer's metier. His is potentially the most important profession because the future well-being of all people may well depend on the manner in which he practices it.

In closing, I commend to you that you think of every engineering task assigned to you as one involving many side effects, some possibly damaging to your fellow citizens, perhaps even to future Americans. Once you have attained habitual awareness of the possibility of unforeseen damage in your work you will find ways to avoid this.

As you embark upon your careers I would wish that you did so in the spirit which animated young Athenians when they entered upon the duties of citizenship. At the end of two years of preparation and service these young men, called ephebi, became full-fledged citizens of Athens. The Greeks being rather addicted to oaths - remember Hippocrates! - the ceremony concluded with the solemn ephebic oath, each young man promising that he would so conduct himself as to leave his city "not less but better than he had found it."

A promise to leave your country not less but better than you found it would seem to me a most appropriate beginning for an engineering career. God bless you and good luck.

TO: Raymond Swing

FROM: Sally

SUBJECT: RICKOVER BOOK

As I mentioned to you over the phone, Bill Frye, current head of Unesco's Mass Comm Unit here in New York, appears to me to be ideal candidate for the Rickover Book assignment.

Firstly, he is thoroughly familiar with the history of military policy -- not tactics, strategy or campaigns, but American military policy. I am enclosing a copy of his biography of General George C. Marshall, which came out before much of the material needed to write a definitive biography had been released, but which I believe to be a competent job.

Bill worked for fourteen years for Associated Press, and from 1940 to the autumn of 1944 covered the War and Navy Departments for AP. He was a special consultant to Secretary of War Patterson in 1946, and in that job was charged primarily with the historical research and writing to bolster the War Department's "statements in testimony" for congressional committees on unification and universal military service. He was consultant to Mr. Forrestal when he became the first Secretary of Defense, and researched and wrote many of the speeches Forrestal delivered as Secretary of Defense. As his Who's Who biography will show you, he became assistant to the Secretary of Defense and Director of Public Information for the Defense Department in 1949.

He was commissioned by the Carnegie Corporation of New York to write a history of American Military Policy from the American Revolution to the present day. This project has been in suspended animation since 1950, because the grant of $7,000 was not sufficient for the primary research Bill believed necessary. He managed to research the book up to the War with Mexico and hopes to finish this project when new funds become available. He has written extensively on historical matters dealing with the military for magazines, including a two-installment review of the Billy Mitchell case which came out in "Flying" Magazine in 1941.

To give you an idea of his writing style, I am enclosing a copy of a draft article Bill wrote on Alphonse Penaud, who invented a flying machine BEFORE Wright did, and which I think is absorbing and interestingly written.

I'd be glad to supply you with more details if you need them.

Please be sure and return the Marshall book and the manuscript as Bill needs them back.

Thanks.

Sally.

ALPHONSE PENAUD

Forgotten Genius of Flight

By William Frye

- - - -

In June 1878, Bishop Milton Wright of the United Brethren Church returned to his home in Dayton, Ohio, from a trip to Europe on church business.

Like most devoted husbands and proud parents who leave their families at home while they travel, he returned bearing gifts for the household. One of the last presents to come out of his luggage was a toy for his two sons, Orville and Wilbur.

They were playing on the floor of the living room when he brought it to them.

"Look here, boys!"

He tossed it towards them. Instead of dropping, it began to flutter and rose to the ceiling.

It was a tiny flying machine -- merely two light propellers on a lightweight frame, powered by twisted rubber bands. It was the invention of a young Frenchman named Alphonse Penaud, who also invented the name "helicoptere" for it, and invented as well the motor of twisted rubber bands to power

this and other aeronautical models.

That toy helicopter aroused in Orville and Wilbur Wright the interest in aeronautics and aerodynamics that was to take them 25 years later to Kitty Hawk and man's first flight in a power-driven, heavier-than-air machine.

But on that June day in 1878, if they even heard the name of Alphonse Penaud, they promptly forgot it. And the rest of the world forgot or ignored it even more thoroughly. A little more than two years later, ill and broken in spirit at the age of 30, this unknown Frenchman who was one of the greatest geniuses of man's long search for the means of flight was dead.

By observation, experiment and brilliant calculation, he had arrived alone at more knowledge of aerodynamics than would be known or discovered by <u>all</u> the other experimenters in the field (the Wrights included) for another 40 or 50 years.

"Alphonse Penaud", says Charles Dollfuss, Director of the Musee de l'Air in Paris, "was the greatest mathematician of the Nineteenth Century from the point of view of aviation, and as a theoretician who saw immediately the practical application."

That's a lot to say for a man whose name doesn't rate an independent paragraph in any encyclopedia. Who was he?

In 1865, Alphonse was a normal 15-year-old French schoolboy, with a distinguished ancestry, a widowed mother,

and a brother in the Navy to whom he wrote, on June 18, with justifiable pride in a school prize:

"I've just taken a Third. In mathematics also I hope to come close to a prize at the end of the year. I am entering the ~~contest~~ concours also in mathematics and in everything else except history, which puts me to sleep ... We went to the swimming pool Thursday at 5 o'clock in the mroning, the air was glacial and the water detestable, everybody was blue...I would like to learn to swim quickly.

"Your brother who loves you,

"Alphonse".

On that date, Alphonse's mother was certainly still in deep mourning, but Alphonse was chattering in happy forgetfulness of a father dead just 13 months before. And why not? Grief ricochets off a healthy teen-ager, and in any case the late Vice Admiral Charles Eugene Penaud, brusque and irasicble descendant of a long line of Breton sailors, had spent so much of his life at sea that his son knew him more as an occasional and respected visitor to the apartment in the Rue Caumartin than as a pater familias.

After the Admiral's death, Madame Penaud and Alphonse moved to a more modest apartment at 14 Rue de Castellane. Then, as now, a widow's pension did not support the same scale of

living as the full pay of a Vice Admiral. But Madame Penaud appears to have had some private means, and while they lived quietly and modestly, they remained in the same neighborhood, they had many friends, and they were an affectionate and happy small family, with occasional visits to be anticipated from Alphonse's older brother, Eugene, and the annual holiday to be spent in the country at the estate of her family not far from Chartres.

Meantime, there was school, and plenty of it, for young Alphonse -- he had to pass those Naval Academy examinations! The widow Penaud, nee Charlotte Huard de la Marre, came of a bourgeois family of ample means if not modest wealth, of intense royalist sympathies in politics, and with a certain social-climbing interest in the "old nobility"-- they were the kind of people who, the English say, "dearly loved a lord". But the Penauds were a Navy family. Not only Alphonse's father, but the father's brother as well, was a Vice Admiral. Alphonse's older brother Eugene had already followed them into the service, and would end his days a Rear Admiral. The family came from Brest, in Brittany, and had always followed the sea. Alphonse's career was cut out for him before he was born.

Nor is there any indication that he ever wanted any other career. Whether he knew a deep affection for his father, there is no record to show; but Alphonse certainly did his

level best to follow him to the quarterdeck, although he never imitated the old man's terrible manners or violent bursts of temper. Despite a delicate and even sickly appearance, Admiral Penaud had been a man of brusque and harsh manner and speech, given to such spectacular explosions of anger that he was known throughout the French fleet as "L'Enrage" -- the Madman. Rage seems to have run in the family, for his brother, also a Vice Admiral, earned in the Navy the nickname "Le Rageur", which translates much the same; and there is a family tradition that once, when the two brothers had a difference of opinion, they got out their sabers and fought the matter to a decision.

It was none of this that showed up in the Admiral's son Alphonse, in whom the old man's milder side was reproduced and developed. For "The Madman" did, indeed, have a milder side -- he was an unusually humane and thoroughly respected commander of his men, thoughtful of their needs, solicitous of their welfare, in a day when kindness was not a usual attribute of command authority. Also, the elder Penaud was a very pious Christian and faithful Catholic -- a quality which neither he nor his even more pious wife succeeded in passing on to Alphonse.

The boy was growing up with a passion for mathematics and the physical sciences, as his letter to Eugene showed when he was only 15. The beginning of his interest in flight and

the problems of aerodynamics occurred not much later, because before he was 17, he was writing to his brother about an unsuccessful experiment with a hot-air balloon.

"My balloon enterprise was not very successful", he wrote in April 1867. "The balloon was well made. By heating it to 300 degrees I made it rise 50 centimeters, but it fell immediately; it's a melancholy result. My next effort will be bigger -- two meters high by 1 meter 80 centimeters diameter, more or less."

This fooling around with balloons, however, was no more than the current hobby of a teen-age boy, just as many a boy in the United States today is tinkering in the basement or the garage workshop with home-made space ships and satellites. When Alphonse was growing up, in the middle of the Nineteenth Century, the word "aeronautics" was confined to flight with balloons and dirigibles, since nobody had yet succeeded in making a heavier-than-air machine fly (except some lightweight, counter-rotating two-screw models of the type later more fully developed by Alphonse himself as the "helicoptere").

But of ballooning there was a plenty -- fire balloons, coal-gas balloons, hydrogen balloons. Henri Giffard had even managed as early as 1852 to fly a "dirigible" balloon, dangerously powered by a special light-weight steam engine driving an air-screw, or propeller. (It was dangerous because of its open

flame close to a hydrogen filled bag!). He couldn't buck even a medium wind with his contraption, but he did succeed in controlling it enough to get some deviation, and that was sheer triumph. He kept at it, and went on to further triumphs, particularly of a commercial kind at world's fairs and public exhibitions, so that he died a wealthy man.

The triumph that Alphonse was aiming at, however, was still those Naval Academy examinations. and he was bucking hard. In the Spring of 1867, with the Easter vacation less than a week off, he was writing again to his brother about his progress at school; but he was also eager about the prospect of romping with his cousin Edouard in the fields of La Beauce near "Le Nuisement", the de la Marre estate at Illiers near Chartres, and he was laying in a supply of lead pellets and rubber bands for slingshots.

Le Nuisement gathered the whole de la Marre family and all their Penaud kin together under its roof for at least one month of holiday every year, and sometimes for other vacations as well. It stood in the picturesque village of Illiers, with its great Fourteenth Century gothic church with a painted timber roof, and the ruins of a medieval castle to explore and learn to know by heart. At the foot of the village ran the little River Loir, for sailing boats, or -- better -- for fishing.

"My dear Eugene," wrote Alphonse to his brother, "I am wonderfully happy, we leave Saturday for Le Nuisement.

Edouard will be there also, I'll have fun with him. If I get bored, I'll work a little bit, because I'll carry along a few old mathematics books...I'm looking forward impatiently to the end of the week, and I'm laying in my supply of rubber bands and lead..."

Then came the usual report on the schoolwork.

"The compositions for the prizes are about to start. From now to the end of the year I'll be making an extra push. By the summer vacation I will know: my algebra as far as logarithms, inclusive, my plane geometry, plus about 15 lessons in solid geometry. All the physics they require at the Naval Academy, and even a little more, I think. A little bit of chemistry. And I think we'll be starting plane trigonometry. Goodbye my dear brother, I'll leave you now, we're off to class. Your brother who loves you well..."

To the average American, that sounds like a fairly rugged course of study for a 16-year-old boy, but French boys are still put through just such academic paces, and anyhow, Alphonse Penaud loved it. He seemed to be healthy enough, although he was quite slender, and the family sometimes commented on his "delicate" appearance. He was growing into a young man of medium height, with fine and regular features. He had auburn hair, and a quiet voice which he rarely raised except when he got interested in taling about mathematics and, later, aeronautics.

He was quiet and gentle in manner, and very affectionate with his family, all of whom returned the affection, although as time went on they understood him less and less, and wound up not understanding him at all.

That year of 1867, Alphonse not only went down to Le Nuisement for the Easter holiday, but he probably went back again later. The month-long, end-of-summer, beginning-of-autumn family reunion at Illiers was a well established tradition in the de la Marre-Penaud clan, and they usually saw to it that the get-together coincided with the beginning of the hunting season, which Alphonse was no more willing to miss than any other man in the family -- or any other child, for that matter, because the whole family, young and old, ordinarily moved into the countryside with full picnic baskets for the first day's shooting, and the event was one of the major celebrations in the family calendar. If Alphonse had a successful shoot that year, it was well, for the hunt came at the end of the last carefree summer he would know.

The holidays over, he plunged into the final year of pre-Naval studies, and did so well that the next year, in the Summer of 1868, he passed with triumphant scores his Naval Academy entrance examinations. But despite his success, for the first time in generations here was a Penaud son who would fail to enter the naval service.

Alphonse had been complaining of pain in both knees, and the family diagnosis probably was that he had caught a slight cold, or maybe had a little rheumatism -- he had simply been working too hard, and a rest would clear everything up. But rest did not clear it up, nor massage or hot applications or analgesic balm.

He began to run a temperature, to toss restlessly at night, muttering in his sleep. Doctor Laugier, the family physician, was called in by the worried Madame Penaud, but nothing the good doctor did seemed to help, either. The pain became worse, the fevers higher, and Alphonse at times was delirious.

As the summer wore on, Alphonse's tortured legs would no longer support his weight. Then ugly abscesses began to form on his thighs, and as bits of decayed and splintered bone showed up in the discharge from these sores, the poor doctor knew at last what he was up against, and knew also that his science didn't reach that far. There wasn't much he could do, except open and clean the abscesses, scrape the bones, perhaps open the bones and scrape inside, and if worse came to worst, amputate. Alphonse had inflammation of the bone, as it was called the - - osteomyelitis.

It never progressed to the need for amputation, but for the eight brilliant and four bitterly unhappy years remaining

to him, Alphonse would jerk around on crutches a pair of almost useless legs. And at fairly frequent intervals, a flare-up of the malady would put him in bed with fever, intense pain, and another bout with the hideous abscesses.

His mother looked after him, efficiently but also affectionately and tenderly -- for the next 12 years she would devote herself to the care of this son she adored, although as the years passed his interests and attitudes both baffled and wounded her. She never showed even a glimmer of understanding where Alphonse's tremendous aeronautical studies were concerned. And, pious woman that she was, she could only be hurt by Alphonse's increasing agnosticism, which grew quickly into a flat and absolute refusal to set foot inside a church.

This, to a mother whose de la Marre family counted proudly three sons who were Jesuits and a daughter who was a nun, was both pain and bewilderment. Alphonse detested the Jesuits -- the order, and anyone who had anything good to say about it. At Le Nuisement, when one of the cousins who happened to admire the Jesuits once kept the whole family waiting for lunch, Alphonse was certain, and spoke his mind about it, that the tardiness was deliberate, and had no purpose except to vex the lot of them.

But that was later, when with the rejection of the family's religious habits came a rejection also of their political attitudes. For the time being, there was just the searing disap-

pointment about the naval academy, the desperate pain of the illness, the treatments, the hope that maybe a cure would be found. If each day Madame Penaud -- sweet, charming, unimaginative, completely conformist -- walked sedately in her widow's weeds the two blocks down the street to the Church of the Madelaine to say another prayer for the recovery of her son, to light another candle before the altar of a shrine, Alphonse may not have thought it was likely to help much, but he probably didn't protest, or even comment.

If she prayed with firm and touching faith for Alphonse's restoration to health, Madame Penaud was far too sensible and practical a French mother to let it go at that. She nursed him with skill and efficiency, listened to what Doctor Laugier had to say and followed his instructions expertly, and in June 1869, acting on the worth physician's advice, took the crippled youngster off to "take the cure" at the spa of Bourbonne-les-Bains in the Vosges.

"You have no doubt received Alphonse's letter of the 9th," she wrote to Eugene from the spa on June 12, "which reported that we are installed in the house of Madame Gavot at Bourbonne...We got a ground floor apartment, a wonderful thing for Alphonse, since it lets him go in and out as he pleases....

"The Chief Medical Director, M. Renard, to whom

M. Laugier recommended us, seems to take an interest in Alphonse. He has already had him take three baths, and three glasses of the water of a half-liter each. Tomorrow he will give him the first irrigation. He hopes very much that Alphonse will recover the use of his left leg; as to the right, he is certain of a considerable improvement...

"Alphonse still has a wonderful appetite, and he still sleeps well...

"This doctor has a nephew in the Navy, M. Gauvin...He has known at various times Admirals Baudin, Duperre, Despointes, so we find ourselves almost in a neighborhood of old friends...

"Alphonse has pulled a stunt by himself; he went out, without saying a word to me, and walked to the top of the hill nearby from which there is a beautiful view; I scolded him for not letting me know, I would have preferred to go with him. I had gone there the evening before with Mlle. Kurz and I thought the climb was impossible for Alphonse. I misjudged his strnegh...

"Now he has just gone out into the garden, after lunch, no doubt to smoke his cigar. He doesn't stop going the whole day, going and coming between the house and the garden...

"We go to bed right after the evening promenade, and listen with pleasure to the sounds from outside as the pianist of the establishment plays polkas and quadrilles..."

Meantime, Alphonse, with the Navy and all other nor-

mal careers closed to him, plunged into his mathematical studies with enthusiasm whenever his illness allowed it. He now took up in earnest that interest in aeronautics which a year or so earlier had been merely playing with home-made fire balloons. Even when he was confined to bed, he made little paper airplanes, launched them in the room or through the window, observed their flight with a critical scientist's eye, and scribbled down his observations in notes that little by little increased to prodigious volume.

There was plenty of activity in France at that period to turn his attention to aviation. Giffard and his captive balloons, his experiments with dirigibles, was the popular rage of Europe, and at the Exposition of 1867 in Paris the Empress Josephine herself had made an ascent in one of the Giffard balloons. In 1863, at the urging of a photographer named Nadar, a group of enthusiasts had organized La Societe Francaise de Navigation Aerienne (French Aerial Navigation Society), and they met regularly in the conservatory of the apartment of Dr. Abel Hureau de Villeneuve, at 95 Rue Lafayette, to discuss and study aviation questions. In both France and England, for decades, eager theorists had been inventing queer contraptions which were supposed to fly, but didn't. The epoch even produced the first great master of science fiction, and Alphonse's 'teens and the

period of his illness was precisely the period in which every year or so saw a new Jules Verne novel hit the bookstands.

For whatever reason, Alphonse Penaud turned his mathematical enius to a solution of the problems of mechanical flight,and since it was genius which he brought to bear on the problem, and since he had nothing else to do, he began to make a noise in the world of aviation enthusiasts before he was 20.

To theorize was all very well, but to test a theory one needed to experiment, to experiment one needed to use models, to use models one needed something to make them go -- voila! The first invention of Alphonse was the little motor of twisted rubber bands, so obvious that somebody should have thought of it a long time before. But nobody had, so Alphonse Penaud invented it in March 1870, at the ripe age of 19. Then he promptly put it to use on his second invention -- or maybe it was really the first, which merely had to wait for the rubber-band motor to become a true invention -- the little "helicoptere" of flexible fabric wings stretched on light frames.

Penaud made dozens and scores of the little helicopters -- different wing sizes, different wing angles, different weights. (One of the early ones can be seen in a glass case at the Smithsonian Institution in Washington). The file of observations noted, of complex mathematical calculations based on them, piled higher

and higher. Next, the Paris clockmaker, Antoine Breguet, had his interest aroused, and began to make to Penaud's specifications little helicopters with propellers of aluminum, then a rare and costly metal, with the other parts constructed of lightweight metal instead of wood or bamboo. With these truly efficient small machines, the Penaud studies moved with increasing speed.

And, finally, the toy manufacturer Dandrieux saw the possibilities in these gadgets, and began to manufacture them in quantity as toys for children. That's how Bishop Wright happened to bring one back to Orville and Wilbur. But poor Alphonse Penaud, whose family knew and said that he "had no business sense," never profited by so much as one sou from this toy business -- Dandrieux kept whatever profits were made. So far as is known, Alphonse never in his life earned any money, but lived always as his mother's dependent.

In August 1870, the war with Prussia began, and the crippled Alphonse suffered agonies of patriotic remorse that he could not join the defense of his invaded country. But he came to the conclusion that the best way for him to serve was to continue his researches -- an eminently wise conclusion, since there was nothing else to be done -- and he redoubled his efforts with a zealous intensity and an unshakeable faith in his ultimate brilliant success.

The once slender youth had become a terribly thin young man as a result of his illness, and the clear complexion was now unmistakably pale. But the expression on the handsome face was still gentle, and he was about to run the frame of soft auburn hair all around it by growing a beard.

The theories multiplied, and so did the experiments. And it was sometime during 1870 that he found a congenial group of friends and joined the French Aerial Navigation Society. Despite his youth -- he was 20 in 1870 -- he very quickly became the center around which this group of ardent amateurs revolved.

Even during the holidays in the country, the study and experiment went on with no slackening of pace. In August 1871, his brother Eugene had leave from the Navy, and the two young men spent the time together at Le Nuisement. How? Day after day, Alphonse dragged Eugene out into the fields to help him fly a succession of tailless kites, which both embodied everything he had learned up to that time about airfoils, and taught him more.

He wasn't altogether happy, even with an adored brother to help him with his experiments. To begin with, even the brother did not take the kites and the other aeronautical enthusiasms very seriously, or try very hard to understand what Alphonse was about.

As for the rest of the family -- and the whole clan of mother, aunts, uncles, cousins, and all was there -- they were incapable of understanding, even had they tried, the staggering sum of calculations and researches which those kites represented. They teased Alphonse about playing like a child, treated him with amused contemptuous affection as a small boy, and ended by making him cruelly unhappy.

But not discouraged. Before that month of August 1871 was over, he had gathered his friends of the Aerial Navigation Society in the gardens of the Tuileries, to demonstrate to them a contraption he called a "planophore". The Prussians had triumphed and seized Alsace and Lorraine, Napoleon III was gone, the Paris Commune had burned the Tuileries Palace, the Third Republic had just been launched precariously, the statue of Strasbourg in the Place de la Concorde was wearing the black crape it would wear until Alsace returned to France in 1919, but something more important was about to happen. Alphonse Penaud was about to prove that an airplane with fixed wings was capable of sustained flight.

The planophore consisted of a slender shaft of wood, with a large "aeroplane" or wing attached to it about midway, and a much smaller wing of similar design but set at a somewhat sharper angle at the rear. Power was provided by

Penaud's twisted rubber bands, which spun a "pusher" propeller. Other experimenters had actually made models fly, but the flight had been erratic. With the smaller rear wing, later referred to as an "automatic rudder", Penaud achieved the longitudinal stability that the others had missed; and by warping or weighting the wings, he overcame the effects of torque and gained enough lateral stability to control the flight direction.

With this first demonstration, in front of the ruins of the burned Tuileries Palace, Penaud sent his planophore along a pre-selected route in a flight which lasted 20 seconds. The members of the Society were impressed. A few children playing nearby were perhaps excited and amused. Nobody else saw it, and certainly the newspapers paid it no attention whatever. To their contemporaries, these aviation enthusiasts were just a bunch of screwballs, amiable and harmless, no doubt, but subjects more of amusement than of serious interest. To any ordinary citizen who thought seriously of flight, the balloon was the obvious means, and those who played around with ideas of flying in machines heavier than the air were idle dreamers.

The demonstration with the planophore was repeated many times before the members of the Society, and the flights of the little model demonstrated incontestably the possibility of

sustained flight. The planophore at times flew a straight distance of more than 200 feet. And all these flights, as well as the many others he used the little machine for, were employed by Penaud in his studies of longitudinal stability.

By an ironic twist of history, the experiments with the planophore became well-known around the world to aviation enthusiasts, who remained in complete ignorance of Penaud's later and more significant studies. The result was that many students of aerodynamics, and later many actual designers of aircraft -- the Wright brothers among them -- though that Penaud had engaged only in some fairly primitive studies of longitudinal stability, but had never even recognized, much less solved, the problem of lateral stability.

He had. He had recognized and solved that and many other problems, including those of lift and drag, but it was his final tragedy that the astounding importance of his later work was to go unrecognized by his comtemporaries, and the work itself to be forgotten as soon as he was dead.

Meantime, he was archivist of the French Aerial Navigation Society, and a member of the editorial board of its publication, L'Aeronaute. In 1872 he published his laws governing gliding in the air, and in 1873 proposed a mathematical basis for the study of air resistance. The year 1874 brought

him the Grand Prize of the Academy of Sciences for a paper on "The Mathematical Theory of the Flight of Birds."

The manuscript of this prize-winning paper is still in the possession of the Penaud family. It is beautifully written in a clear script, but scrawled all over with subsequent notes and jottings. Among them is this, altogether characteristic of Penaud and of the principles which guided his study:

"Motto: Theory must take account of facts. Progress is the child of Truth."

Having written a paper on the theory of bird flight, Alphonse then set out to prove that he knew what he was talking about (he hadn't waited for someone to take up his suggestion of December 1873 that a Zoetrope be used to study photographically the actual flight of birds).

He built a mechanical bird.

Powered like his other models with twisted rubber bands, his bird would not take off from the ground; but released in the air, it would fly, by flapping its wings, for a horizontal distance of 50 feet or more, rising to a height of 7 to 9 feet as it flew. It was 32 inches wide, wing-tip to wing-tip, and the whole thing weighed about 2 1/2 ounces!

About the same time, his friend and colleague in the Society, Dr. Hureau de Villeneuve, also built a mechanical

bird, only he shaped the wings like those of a bat. Unlike Penaud's, Villeneuve's mechanical bird would take off from the ground, and fly a horizontal distance of 24 feet or more at a speed of about 20 miles an hour. Also unlike Penaud's, the Villeneuve bird became the darling of its inventor's heart, in whose eyes it held all the promise of the future.

So far as Penaud was concerned, the mechanical bird with the flapping wings was an interesting problem and an amusing project, but the matter ended there. He had long since determined that the promise of mechanical flight by man lay in structures with more or less rigid and fixed wing surfaces, powered by devices -- he used airscrews in all his designs -- which would move the wing through the air, or, to put it another way, move the air over the wing. Because he had also long since figured out that a wing got most of its lift from air moving over an upper convex surface, instead of from air moving <u>under</u> it. And he had begun work in 1873 on the great aircraft design which was to embody everything he knew about flight.

But Dr. Hureau de Villeneuve, having built a mechanical bird which flew, became convinced that the whole future of human flight lay in machines with flapping wings. It was first a subject of friendly discussion between Villeneuve and Penaud, then of discussion somewhat more heated, then of

disagreement, and finally of estrangement and, on Penaud's part, of deep bitterness.

Since nothing that flew, in any way, was outside the scope of Penaud's studies, he did a thorough job in 1874 on the boomerang, and not only reported his studies in a learned mathematical paper which he read to the Society, but made and demonstrated a device that duplicated in every respect the flight of that aboriginal Australian weapon.

In 1875, Penaud posed the three central problems to be solved for the flight of man in heavier-than-air machines: the resistance of the air, the strength of materials, lightweight engines. The third, for the time being, he left to others. He had long been at work on the first wo.

The aircraft design began in 1873 to embody definitely all the results of his enormous research was nearing completion. His collaborator in the design was a mechanic and engineer, Paul Gauchot, like himself a member of the Aerial Navigation Society. Gauchot was not a man of distinguished intellect, but he was interested in aviation, and above all, he knew materials -- their strengths and weaknesses, their weights and structural qualities, their use in combination. This was the knowledge Penaud needed to supplement his own theoretical calculations, to reduce his mathematical formulae to practical ends....."Motto: Theory must

take account of facts..."

Finally, he filed the design with an application for a patent, and the Minister of Agriculture and Commerce, on April 8, 1876, granted the patent to Alphonse Penaud and Paul Gauchot, 14 Rue de Castellane.

In retrospect, in the full knowledge of all the theorizing and experimenting still to come, of the slow struggle towards reasonably efficient machines to make the age of flight a practical reality, that design of Penaud's is almost incredible.

The craft was to be a high delta-wing monoplane, virtually tail-less except for the vertical fin with balanced rudder and the horizontal stabilizers -- the tail assembly still standard on aircraft, and known for many years to designers who knew nothing else about him as the "Penaud tail."

The twin propellers, set near the fuselage and forward of the wings, were counter-rotating, with variable pitch. The body of the craft was a streamlined fuselage, containing an enclosed cockpit to carry two men, with dual controls of elevators and rudder. It was an amphibian job, with retractable four-wheel landing gear.

The wings were double-surfaced, with the upper surface of the rear portion reverse cambered, and with balanced

elevators in the trailing edges. Elevators and rudder were controlled from the cabin by concealed fables.

The design and Penaud's specifications spelled out such matters (although he did not call them by these names) as cantilever, stressed-skin wing construction, wash-out, lateral dihedral. And for power?

There, indeed, was the rub! Various methods were foreseen hopefully, but none was specified, because there wasn't an engine in existence in 1876 which was both light enough and powerful enough to lift such a plane into the air. Penaud calculated that the plane, carrying two men, would weigh 1,200 kilograms, and would need 20 to 30 horsepower to fly. It probably would have needed more -- the four cylinder engine used by the Wrights weighed about 200 pounds, and developed about 24 horsepower.

But this is speculation. True enough, Dr. A. N. Otto in Germany invented in 1876 a four-cycle gas engine which came to be widely used commercially, and was a notable precursor of today's gasoline piston engines. But Otto's engine literally burned gas -- coal gas-- and moreover it was heavy enough to sink the Penaud plane. Some of the steam engines available were light enough to supply a dangerous source of power for dirigible balloons, but they were far too

heavy for an airplane. The plain fact was that Penaud simply did not have an engine.

What kind of engine did he want?

"I have faith," said he, "in the hydrocarbon motor, above all and before all others."

Hydrocarbon -- petroleum, or gasoline. In other words, Penaud, still way ahead of his time, was betting on an engine that wasn't even going to be invented for another 12 years. If he had been able to get hold of a little money, maybe he could have collaborated with another engineer and pushed that research on internal combustion engines ahead a little bit faster.

But he had no money of his own, and his mother's small income would not stretch over any such research as would be involved in engine development. He tried to interest Giffard, the balloonist, who had money, but Giffard was discouraging -- after all, the future really lay with the lighter-than-air machines.

Nor did he get much encouragement from his old friends in the Society. Gauchot was killed in a train accident, and the two others who were most active and had been most interested, Hureau de Villeneuve and Charles du Hauvel d'Andreville, had

convinced themselves that the flapping-wing aircraft had no competitors in the future of aviation.

Penaud began to grow bitter and morose. He had gone as far as he could without that necessary engine, and he could not arouse the interest or gain the sympathy of those who should have been most interested.

"If I had a motor, that thing would go," he would say frequently to his mother, pointing to the plane design.

And the poor lady, who didn't understand what he was talking about and didn't believe a word of it anyway, would pat him reassuringly on the head, and walk away with her brows knitted in worry over this son who seemed to be losing his mind.

Maybe he was, in a way. For eight years, years in which he had accomplished a prodigious amount of work, he had never been free of pain, and at frequent intervals the recurring crises of his crippling bone disease would incapacitate him completely. He had gotten into the habit of taking laudanum to relieve the pain enough to let him keep working, and that, too, worried his mother -- almost every letter she wrote to her son Eugene, at sea with the Navy, expressed her frantic concern about the way Alphonse kept "drugging" himself.

With the disappointment about his aircraft plans, and the increasing burden of disease, Alphonse became more and more irascible. He could no longer brook contradiction, or even disagreement, among his fellow aeronauts, and the split between him and his friends Villeneuve and Hauvel became wider. There was no open quarrel, apparently -- Penaud simply drifted away from the Society, and as early as February 1876 resigned as archivist and as a member of the editorial board of L'Aeronaute. Eventually he resigned his membership in the Society itself. In both cases, he blamed his ill health. The truth was that he found his colleagues unsympathetic to his theories.

Moreover, as his illness and his temper worsened, Alphonse's differences with his family over religious and political attitudes became more bitter. His mother's immediate family were Legitimists -- adherents of the direct line of the Bourbon kings of France. The rest of the family were mostly Orleanists, followers of the younger branch which had been represented on the throne by Louis Philippe. All were pious Catholics. Alphonse agreed with none of them on any of these points.

He became neurotic, developing what amounted to a persecution complex. Even during the holidays at Le Nuisement, he would not leave the house without a revolver in his pocket.

And yet he never abandoned his studies and his research. Long after his death, his family found tucked away

in a wardrobe a portfolio of his papers -- notes, calculations, sketches, drafts, designs. One of these sketches, dated January 1877, envisaged the flight of aircraft weighing six to nine tons -- sheer fantasy to anyone else at that time.

Still studying, still worrying about the practical knowledge of the problems of flight, he took off in 1878 on a major balloon flight, speeded by a high wind. His frantic mother insisted on loading the basket with enough food and wine to last him a year. The balloon took him up more than 12,000 feet, but came down with more speed and agitation than he could manage, and as the basket bounced along the ground Alphonse was thrown unconscious, suffering severe internal injuries.

And there was still the bone disease, still the chance of curing it, still the hope that if the mountain air of a spa didn't help, the sea air of a beach resort might do some good. In July 1880, Madame Penaud was writing to Eugene from Fecamp that the days were hot, but the evenings fine, and that she and Alphonse were enjoying their walks on the jetty and the beach.

"He is much better, and the little crisis cleared up a few days ago," she reported to her older son. "... I am happy when your brother relaxes and finds a little pleasure.

He doesn't work much here. That eases my mind, for I believe that exercise and a change of view do him a lot more good than his incessant labor."

Alphonse and his mother returned to Paris for the last week of August, and Madame Penaud wrote again to Eugene that they were leaving the 30th "in order to be at Le Nuisement for St. Giles Day." Poor mother! She knew perfectly well that Alphonse would not go to mass with her that day, but she could go alone to the old church of Illiers on September 1 and say a special prayer to the patron saint of lepers and cripples for the recovery of her son.

"I keep urging Alphonse to attend to his gun permit," she went on. "I'm afraid he won't be able to get it before we leave....I'm up to my neck in boxes and packages..."

She needn't have fussed -- Alphonse got his permit. The next week Madame Penaud was writing to Eugene from Le Nuisement that she hoped he would get at least a couple of hares or a brace of partridge when the shooting season opened the next day.

"But I don't want him to fatigue himself too much. He has been suffering a little since we arrived here; but I hope the good air of Le Nuisement will get him in shape. If only he wouldn't <u>drug</u> himself as he does, I'm sure he'd be

much better. But, just the same, when I see how well he eats, I feel better..."

And so the month of September 1880 passed pretty much as other months had at Le Nuisement except that fewer people than usual were there. Uncle Victor borrowed Alphonse's dog Belle to go hunting with. The juvenile nieces and nephews and cousins complained that the opening day of the season was no opening at all, because the family decided against the usual picnic. Aunt Louise agreed, and longed for the noise and bustle of an Opening Day when all the family was there. Pierre had grown a lot, the little girls were devils, Louis romped in the open the whole day with Desiree's little daughter. M. and Mme. de Layre were rabid Orleanistes, they received and were received by the Princes of Orleans in Paris, they were very rich, and M. de Layre was said to be of the nobility ...

"Alphonse gets along not badly, but he continues to drug himself to my great despair." This to Eugene on September 18. "There's nothing to say. He eats well and occupies himself with a lot of little things; he has made a sundial, a boat for Pierre, etc..."

Alphonse's last holiday was drawing to a close. It is clear from his mother's letters that he had been a little moody during the month. Still and all, it had been a pleasant enough

vacation, and she had one last gay expedition to report to Eugene when she wrote on September 25 that she and Alphonse would be returning to Paris on October 2.

"I'm not sorry to be getting back to my own home, from which I wiol have been absent for three months this year...the other day, they went -- Louise, her children, and Alphonse -- to fish for crawfish. At Montigny, Victor and Edouard joined them on foot. They came back with two crawfish, but also with two hares, one of which Alphonse had shot..."

Back in Paris, the moodiness increased, and this changeling son seemed stranger and stranger to the worried Madame Penaud. He made a final appeal to the balloonist Giffard for financial help, and got a formal refusal -- there was no future for heavier-than-air machines, and the old man would spend his money only on the practical balloon.

Alphonse made, or had made, a little box in the shape of a coffin -- one of those melancholy, six-sided coffins rarely seen now in America, but still common in Europe. Into this he put his designs, his reports, his calculations, the outlines of his theories. On October 22, 1880, dragging along on his crutches, he took the box to the home of Giffard, and left it with a note:

"I leave to you the task of carrying out my projects."

Then he swung himself home again, to the apartment of

his mother at 14 Rue de Castellane. He was 30 years old, sick and discouraged. The painful and useless legs dragging, he hunched along on his crutches to his own room, and there, with the revolver he had been carrying for years, he put a bullet through his head.

The despair of that last, irrevocable act is the more appalling because it was so deliberately calculated, so carefully contrived. The almost devilish attempt to shock Giffard into doing something about the all-important studies and designs by presenting them to him, in a coffin-shaped box, as the last gift and plea of a self-destroyed man; the will which cried out finally against his family's blindness to his work by cutting even his mother and his brother out of any share in the small estate he left -- these are the macabre measure of the utter loneliness in which this embittered genius lived out his last few days, and planned his own death as a melodramatic gesture to get for his work that attention and support which, living, he had been unable to win.

The gesture was a failure. Giffard was an old man, who did nothing about Penaud's papers, and was himself dead within two years. The grieving mother and brother were merely hurt and bewildered; but, at Madame Penaud's insistence, they did not contest the will, because to do so would be to publish what she had been "at such pains to conceal"--the scandalous fact that Alphonse was a suicide.

Ironically, a letter apparently written about the time Penaud killed himself contained an expression of respect and confidence by fellow-scientists which might have bolstered his collapsing morale if it had arrived in time. It was written

by M. Darboux, a professor of the Science Faculty and Director of Conferences at the Ecole Normale Superieure in Paris, and invited Penaud to present"one or several papers on subjects of your choice" at the forthcoming Conference of the French Association for the Advancement of Science.

"We attach the greatest importance to your participation," said M. Darboux.

But the usually efficient French postal service mislaid or misdirected the letter, and it was finally delivered to Alphonse's mother four years and four months after his death!

Penaud's suicide was a confession that he judged himself a failure. The judgment, of course, was in error. True enough, his later and most brilliant work was lost to his contemporaries and to those who came after, to be rediscovered only after many men had found independently, in many places, bits and pieces of the knowledge of aerodynamics which they might have found in toto in his papers, had they known them.

But some of the earlier experiments and their results -- the helicopter, and the planophore -- were known to many of his contemporaries, who profited by them. And a toy pirated from Penaud's design fired the interest of Orville and Wilbur Wright. They achieved flight, and men flying airplanes was what Alphonse Penaud wanted.

Rickover, Admiral

UNITED STATES
ATOMIC ENERGY COMMISSION
WASHINGTON

March 19, 1958

Mr. Edward R. Murrow
485 Madison Avenue
Room 1701
New York 22, New York

Dear Ed:

I am enclosing two copies of the talk on education which I mentioned to you on the telephone.

Please let me know when Mr. Paley and you are going to be in Washington, and I hope we can get together then.

With best regards to you,

Sincerely yours,

H. G. Rickover

H. G. Rickover

FOR RELEASE AT 4:00 P.M. (EST)
SUNDAY, MARCH 23, 1958

Remarks Prepared by RADM H. G. Rickover, USN
Chief, Naval Reactors Branch
Division of Reactor Development
U.S. Atomic Energy Commission
and
Assistant Chief of the Bureau of Ships
for Nuclear Propulsion
for delivery at the
Fiftieth Anniversary Celebration
St. Albans School
Washington, D. C.
March 23, 1958

EUROPEAN AND AMERICAN SECONDARY SCHOOLS

A COMPARISON

I am delighted to speak here on a subject which I find as absorbing as my work in atomic energy. Indeed, I find the two so intertwined that I would have had to be most unobservant not to have gotten myself involved with American education.

In my constant search for competent people to work in the naval nuclear power program, I was inevitably driven to the conclusion that something is radically wrong with our educational system. I have given this much thought and I believe it is possible to pinpoint where educational inadequacy causes a bottleneck and why this is so.

The specialized education offered in American colleges and universities for future professionals is - with some significant exceptions - pretty good. But professional education in America is

severely handicapped by the weakness of our public elementary and secondary education. Traditionally, 12 years of schooling were thought sufficient to enable students to read and to write correctly, to obtain a solid foundation in history, geography, mathematics and the sciences, and to acquire competence in reading at least one foreign language. Upon this foundation, the professional schools then built programs of about 4 years' duration, designed to equip an already broadly educated young man or woman with the vast fund of specialized knowledge required by a modern professional person.

Now if the underpinning is weak two things must happen: either the future professional must lengthen his period of schooling by 2 to 4 years in a liberal arts college, so that he may acquire sufficient general knowledge to perform his professional duties in a wise and socially responsible manner; or his course of professional study itself has to be overloaded with remedial courses - as in English or mathematics - and with hastily concocted general humanities courses to patch up the gaps in his pre-professional schooling.

In the first case, the time required to attain professional standing is lengthened beyond what is tolerable to many talented young people - they simply will not wait that long to establish themselves and become economically independent. Moreover, the need to attend college before starting professional school is costly for the student as well as for the college. Tuition alone runs to about $1000 - $1500 annually but this is only half what it costs the college to educate the student.

In the second case - where professional schools attempt to make up for previous educational deficiences - the student has a heavy work-load

and achieves only a most sketchy sort of liberal education. For engineers, the first 2 years of professional school lean heavily to basic courses in mathematics and sciences - in addition, many freshmen must take remedial courses. The result is that too much of the engineering course has to be squeezed into the last 2 years. The study load then becomes too burdensome - about 60 hours a week of classroom, laboratory and homework for 4 long years. Such cramming is not the best preparation for a profession.

The chronic shortage of good scientists, engineers and other professionals which plagues us is the result of inadequate pre-professional education - of time wasted in public school which somehow must be made up later on.

But, it is said, our public education must concern itself more with the average student who does not wish to become a doctor, lawyer or engineer. For these average students the situation is, if anything, worse. They must depend for competence in dealing with life's problems on what they have learned in the 12 years from age 6 to 18.

Now this is the time in a youngster's life when he can most easily absorb large numbers of facts and when his curiosity can most readily be stimulated to want to do so. This is the time when young minds should be filled to capacity with impressions; when they should be stretched to their maximum. Only the school can do this. It can do it for children of most varied natural endowments, if it frankly recognizes these variations and devises curricula tailored to the capacities of the talented, the average, and the below-average child. Each group can then develop best at its own rate of speed. For each the same basic process of storing the mind with knowledge can be adapted.

Since the above-average pupil is 2 to 3 years ahead of the average pupil in mental age, he can complete the curriculum in a shorter period, or he can absorb more academic subjects or study them more deeply. But the same type of mental food which the above average pupil needs is needed also by the less gifted. Even the below-average child who may be 2 to 3 years behind the average in mental age and whose maximum capacity may be limited to the 6th grade - even he ought to be taught the same basic course of study given in the first six elementary years, though at a much slower rate. It may take him until 15 or 16 to complete the 6th grade. But if he can be motivated to want to, he can at least be taught the 3 R's.

For all children, the educational process must be one of collecting factual knowledge to the limit of their absorptive capacity. Recreation, manual or clerical training, etiquette and similar know-how have little effect on the mind itself and it is with the mind that the school must solely concern itself. The poorer a child's natural endowments, the more does he need to have his mind trained.

We should not have to support schools if we want no more than "adjustment" of children to life as it is. Children learn this in simpler societies just by "living" and by the incidental training they receive from the grown-ups around them. A child is being properly educated only when he is learning to become independent of his parents. We have schools because we know that in today's world everyone is daily called upon to make decisions for which he needs a background of general knowledge, not obtainable merely by "learning through living." To acquire such knowledge, fact upon fact, takes time and effort. Nothing

can really make it "fun." If we try to spare our children mental effort and to protect them against disappointments or personal failures through flunking exams, we send them ill prepared into a competitive world. This is most dangerous in a democracy for, as Jefferson warned us: "If a nation expects to be ignorant and free, in a state of civilization, it expects what never was and never will be." Note the qualification "in a state of civilization." Formal school education was not as vitally needed in American pioneer society as it is in 20th Century America. The degree of ignorance which a democracy can tolerate varies in inverse ratio to the advance of the nation toward higher cultural and scientific levels.

Our elementary and secondary education must, thus, provide first, for the average and below average student, a sufficiently broad terminal education to fit him into a modern technological society; and second, for the talented student, it must provide a solid underpinning for subsequent professional education. Neither of these two objectives is achieved in the majority of American public school systems. Unlike all other Western countries of similar civilization, we lack a national standard for curricula, for school leaving examinations, for diplomas, or for teacher qualifications. There is a wide variety in the school systems of different states, even for different cities in the same state. We have some excellent school systems but many more poor ones.

Why do most of our public schools fail in the objectives I have mentioned? Basically, I think, because today these two purposes are <u>not</u> the objectives of our schools. We are reaping the consequences of the destruction of traditional education by the Dewey-Kilpatrick

experimentalist philosophy. While we have fortunately been spared wide application of progressive teaching methods in the schools themselves - thanks primarily to the heroic resistence and good judgment of our teachers - the spirit of Dewey permeates our teacher colleges and our state boards of education. It makes its pernicious influence felt in the steady deterioration of secondary school curricula, the overlong prolongation of elementary schooling, and the denial to teachers of professional status.

We must give credit to Dewey and his followers for having improved what once was altogether too autocratic a relationship between teacher and pupil, and for bringing a relaxed and friendly atmosphere into our classrooms. But we must also, on his own pragmatic terms, reject Dewey's claim that experimentalist education "adjusts" the child to life in a changing society such as ours, and that it does this better than traditional education.

Dewey's desire to alter curricula so as to teach subjects which will be of use to the child in life can be accepted only <u>if</u> we interpret the term "use" in its broadest sense. Unfortunately, his ideas have led to elimination of many academic subjects on the ground that they would not be "useful" in life, and to substitution of trivial, recreational, and vocational subjects alleged to be of more practical value. The student thus receives neither intellectual training nor the factual knowledge which will help him to understand the world he lives in, or to make well-reasoned decisions in his private life or as a responsible citizen in a modern democracy. He is instead handed a bag of "know-how tricks":

he is helped to become a pleasant, nicely mannered young person, able to get along with whatever group he joins. Even for the average pupil, these subjects are not mentally stimulating - they barely touch his mind.

Our schools once had the important task of Americanizing large numbers of children whose parents arrived here from diverse cultures, and whose first need was to "adjust" themselves to a new country. This the schools have done magnificently. But today, ours is a pretty homogeneous country, a country where the majority no longer live in poverty, where most families consider themselves middle-class and enjoy a material standard of living much higher than that of the middle-classes of the past. Traditionally, training of children in manners, appearance, poise, and consideration for others has been a distinctive function of the middle-class family. Nowhere have the schools to which middle-class children go been expected to take over this function which belongs to the home. Formal school education has always and everywhere been concerned solely with development of mental powers, with due attention also being given to physical exercise for purposes of safeguarding the pupil's health.

Intellectual training can be combined with home training only when schools are residential - as are the famed English "public" schools. In a short school day there is not enough time to do both. I suggest we turn back to the home what is properly the function of the home and permit the public schools to concentrate on what is properly their function - the education of young minds.

To that end, we must break the experimentalist hold on curricula and teacher certification. Pedagogy is an important skill in a teacher's professional equipment but it is less important than thorough and deep

knowledge of subject matter. Teacher colleges are now almost totally given over to pedagogy, school administration and psychology. Teaching cannot become a true profession until, like all professions, it demands of its practitioners that they pursue a lengthy course of study in the special field of their choice. You cannot make of "pedagogy" as such or of "school administration" as such a field of academic study comparable to law or medicine. They are in a sense the minors in a professional course of study; the major must always be the specific subject to be later taught - a teacher must be a true scholar in his own field. His scholarship will, of course, differ depending on whether he teaches history, let us say, in elementary or secondary school, or in college. Different degrees of depth and breadth of knowledge will be required; also different methods of presenting the subject to the pupil.

Today, our teachers are, in effect, denied the opportunity to make themselves such scholars, because their right to teach and their professional advancement are tied to required courses in pedagogy which few of them would choose, if they were given the freedom to plan their own course of study. Teachers do not have unlimited time to complete their professional training. If they are forced to waste much of it on pedagogical trivia, they have that much less time for serious study, and the losers are our children, of course.

Dewey's denial of absolute values; his insistence that learning leading to growth must be based on the experience of the child; and that the aims of education must be to modify behavior rather than to impart knowledge - all this gives American education a transitory flavor, ties it closely to the society into which the child is to be fitted. It also

provides an effective smokescreen preventing comparison of American education with that of countries having similar ways of life. Indeed, we have long lived in educational isolation and it is time we look around and see what is being done in other countries.

To get the necessary data is quite difficult - there seems to be no agency in the United States collecting such information. Through the great kindness of Mr. Philippe R. Scholten, a graduate of the University of Leyden now residing at Middlebury, Connecticut, I have been able to obtain considerable data on education in the Netherlands. The Dutch system resembles that of most European countries. Education in the various countries of Europe has always been surprisingly uniform in standards and even in the details of school curricula - the unifying factor being the traditional demand of European students to have access to the universities throughout the continent. The universities themselves have always had fairly uniform standards. These go back to the unity of Europe in the Middle Ages under a Universal Church which was the Educator of the people.

In Holland, all education from kindergarten to university is almost entirely financed by the government. The 6-year elementary school is free; the secondary schools charge small fees which are adjusted to family finances. University fees average about $75.00 per year.

After completing the 6-year elementary school at age 12 the Dutch child can enter one of six types of secondary schools. Entrance to these schools depends almost exclusively on the aptitude of the child as determined by examinations, but there is flexibility which permits later switchover from one type of school to another.

Three of these secondary schools are non-academic types:

(1) The trade school which lasts 4 years and which compares favorably with our vocational high school;

(2) The advanced elementary school which also lasts 4 years and which offers a program about the same as the average American high school;

(3) And finally, the secondary school Type "A" which lasts 5 years and may be compared to our better public high schools.

In addition to these three non-academic secondary schools there are also three academic secondary schools. One, the secondary school Type "B", lasts 5 years. Its graduates are qualified to study medicine and technical subjects at institutions of university rank, but not law or theology. The second one is the Latin-grammar school, Type "A" which emphasizes the humanities; the third one is the Latin-grammar school, Type "B" which emphasizes science and mathematics. Both of these Latin-grammar schools last 6 years and their graduates may study any subject at the universities. All three of these academic secondary schools terminate with a long and comprehensive government-supervised examination covering the entire school program and lasting several days. And there are no multiple-choice questions.

I have made some calculations to compare the curricula of the Dutch secondary schools with our own 6-year junior-senior high schools. The Dutch school day is 10% longer than ours; the school week lasts 6 days or 20% longer; the school year lasts 240 days or 33% longer. The Dutch class period is 50 minutes and the homework required is a minimum of 4 hours daily. Further, no subjects but academic ones are taught, except gym, art, and music.

I have also tried to make a comparison of the credit points required in our secondary schools with those of the Dutch secondary schools. As far as I can determine, the student must take 16 points of solid academic subjects in the last 4 years of our junior-senior high schools, or 4 points per year. And these 16 points are all that are required to enter college. If we were to give equal weight to the first 2 years of our junior-senior high schools, the student ends up with a total of 24 credit points in academic subjects for 6 years. The Dutch student ends up with 30 credit points for the 5-year school. And for the 6-year school, he ends up with 40 points, or 66% more than we.

To give you an idea of how these credits are obtained, let me run down the figures for these two types of Dutch schools:

First, the 5-year school: 4½ points for the mother tongue (Dutch); 10½ points for three modern languages: French, English, and German; 3 points for history and political science; 4 points for economics and accounting; geography 2½ points; mathematics 3 points; physics, chemistry, and biology 3 points. I think you will agree that by the end of his 16th year the Dutch student at a 5-year school such as this is at least as well versed in basic subjects as the American high school graduate a year later. Even so, he will not be admitted to a university since he is really not considered to be an "educated" person!

Now as to the 6-year academic Latin-grammar school. Let us take Type "B", the one which specializes in mathematics and science, since it is closer to American education than the purely classical one. The mother tongue (Dutch) 4 points; the usual three modern languages 8½ points, Latin and Greek 11 points; history 3 points; geography 2 points; mathematics 5½ points; physics, chemistry, and biology 6 points.

Europe has always demanded more of her children than we of ours, and for a very good reason. To attain a high standard of living, given a similar level of technology, a country must either have a favorable ratio of people to land and resources, or its people must work harder and more intelligently - they must acquire more competence. In other words, poverty of land and of natural resources can be offset to a degree by better development of human resources. Ours has been the classical example of a high standard of living based primarily on favorable ratio of people to land but in the last 180 years we have wasted much of our natural wealth and multiplied our population more than 40 times. Though our ratio of people to land is still much better than that of Europe, it worsens each year and the day is not too far off when we shall be no better off in that respect than Europe. We must not let ourselves be impressed by total acreage figures. There is much desert and semi-arid land in our West whereas Europe has carefully preserved its land and forests and has no deserts or arid lands.

As we approach European conditions, we may find that we shall have to make a choice: educate our children better or downgrade our standard of living. We still have a margin of safety but it is none too soon for all of us to think this matter over carefully so that we may express our wishes clearly and in the proper democratic way to those who run our schools.

Few of us have been aware of our worsening situation, for thus far science has been able to keep up with diminishing resources and a population growing 3 times as fast as Western Europe's. If we develop all our human resources, we shall still be able to insure a high standard of living to our children and grandchildren. But it cannot be done with 180-day school years, driver training courses and print shop in high school.

All along the line we are paying for neglect of secondary education in mathematics and science, yes, but also in English, history and geography. To maintain scientific and technological leadership and the modicum of culture necessary in a civilized society, we must get to work on the long-range task of reorganizing our public schools so that they may give us the kind of people needed today where few problems can be solved by common sense and hard physical work alone, but where the need above all is for well equipped minds, "adjusted" to this scientific era in man's history.

March 6, 1958

Dear Mr. Murrow:

Thank you for your letter of March 5th, straightening me out on Admiral Rickover. It appears that there may be two books centering on this extraordinary man -- one on his ideas on education, and the other on the case history you mention. I'll do a little more investigating of the second, and I hope you will let me know if a possible author comes to your mind.

Thank you again for your help.

Sincerely yours,

William Clifford

Clifford, W.

March 5, 1958

Dear Mr. Clifford:

I am afraid Mr. Schuster must have misunderstood my remarks about Admiral Rickover.

I never imagined that he would be willing to undertake any writing himself. What I suggested was that there was a fascinating case history to be written on the authorization and construction of the Nautilus -- how bureaucratic red tape can be cut through in the course of a crash program in peacetime. I do not know who could write such a book, but I am convinced that it would be an interesting and important contribution.

Sincerely yours,

Mr. William Clifford

February 24, 1958

Dear Mr. Murrow:

Mr. Schuster has told me that he spoke to you about Admiral Rickover some time ago and that you might be able to give us some helpful advice on the possibility of getting a book from him. I wrote to the Admiral about two weeks ago and have received a letter in reply saying that he has some definite ideas but has no time to write. I have also talked on the phone with George Probst of the Edison Foundation, who, I gather, is quite close to Admiral Rickover. He assures me that the Admiral is not a man to let anyone else do any writing in his name and that unless he is retired from the Navy, which now seems unlikely, he will not have enough time to write more than an occasional speech in the foreseeable future. Mr. Probst is sending me the speeches that Admiral Rickover has delivered under his sponsorship and we shall see if there is a possibility of making a book from them.

If you have any new light to throw on this picture, I should deeply appreciate hearing from you.

Sincerely yours,

William Clifford

Murray, Don
Adm. Rickover

February 7, 1958

Dear Mr. Murray:

I have your letter of January 29th.

I appreciate your taking the time and trouble to write me about your suggestion for a television program, but I have no control or authority over programs other than my own.

If you care to pursue this, I suggest you write to Mr. Irving Gitlin, Director of Public Affairs' programs.

Sincerely yours,

Mr. Donald Murray

January 29, 1958

Dear Mr. Murrow:

The enclosed article clipped from a recent issue of "U.S. News & World Report" outlines Adm. Rickover's views on the shortcomings of the American system of education. Of all the recent speeches and articles this one of Rickover's seems to me to best sum up the situation...and at the same time he proposes certain innovations which I think would go a long way toward improving scholastic standards on a national basis.

Unfortunately, "U.S. News & World Report" only has a million readers. It is my conviction that this material should be brought before the entire American public. Its main points should be headlined in every tabloid and weekly newspaper across the country, instead of just being allotted an inch or two in the big city dailies. Every parent should be forced to interest himself in the problem. Every parent must be made to understand that the smallest European country has an educational system with higher standards than our own. Everyone must be made to understand that national pride, patriotism, chauvinism, secularism, and a prejudiced insular outlook have too long veiled the truth about our scholastic shortcomings.

Perhaps you could interest CBS in doing a "special" on this subject as a public service...or better yet a series of exposes. Individual schools could be selected and compared (without mentioning names). Diplomas could be compared. An "average" European high-school graduate could be compared with his American counterpart, etc. It could have lots of impact. I'm sure that the grass roots public will be shocked when we see how stupid we are when compared with "backward Europe...the old country". This is important, timely and vital, and I am sure would redound credit to CBS.

Sincerely yours,

Donald Murray

EDUCATION

A SIZE-UP OF WHAT'S WRONG WITH AMERICAN SCHOOLS

What's wrong with U. S. schools is examined here by a leading nuclear scientist, Rear Adm. H. G. Rickover. He makes these points—

• Schools do not motivate enough youngsters to enter science, other professions.

• Children get too much leeway to pick and choose among a large number of subjects.

• Teaching of "essentially extracurricular" activities, going back to a time when one job of the schools was to Americanize immigrants, overburdens the schools now.

• There is no national standard for the high-school diploma—or most college degrees—which can indicate good training, or none.

by Rear Adm. H. G. Rickover, U.S.N.
Assistant Chief for Nuclear Propulsion, Bureau of Ships

Sputnik may well be the catalyst which brings about drastic and long-overdue reforms in utilizing this nation's intellectual capacities. It may thus do in matters of the intellect what Pearl Harbor did in matters industrial and military. Then as now a dramatic occurrence suddenly revealed that we had failed to develop our capacities to their maximum potential. But, as we found then that in a national emergency we could take prompt and vigorous action and perform industrial miracles, so I am convinced we can now take similar action and perform educational miracles.

* * *

The Sputnik was a lost first, and that is regrettable. It is particularly regrettable that we apparently lost it not in military weaponry but in what looks to many people like pure scientific adventure of a kind which appeals to their imagination as no weapons supremacy could. Russia indeed chose shrewdly where to concentrate for a blow to our scientific and technological prestige. It fits nicely into the International Geophysical Year, too. In actual fact, Sputnik is, of course, of great significance because of its relation to missile weaponry and because of the potential military advantages of outer-space control.

* * *

In the long run, the more disturbing fact which emerges from the Russian satellite program is her success in building in record time an educational system which produces exactly the sort of trained men and women her rulers need to achieve technological supremacy day after tomorrow.

Russian education is, of course, deplorably utilitarian and authoritarian. But it has virtually wiped out illiteracy, today estimated to be only 2.5 to 5 per cent, which does not compare badly with our own rate: 3.7 per cent in 1940 and about 2.5 per cent today. Russia has put a *larger* percentage of her *smaller* national income into public education than the United States. She has made the rewards of intellectual accomplishment so attractive that her children are working their heads off to keep up with an extraordinarily tough curriculum, often at the cost of their health, which is beginning to worry Soviet doctors.

Russia has as great a shortage as we in school buildings—she merely doubles up and so gets twice the benefit we do out of each classroom and school laboratory. I feel sure she would use her schools on a three-shift basis if this were necessary. Russia has no teacher shortage, no substandard teachers. She has set their scholastic standards very high, given them a heavy work load; but she also honors them and pays them exceedingly well.

Russia evidently has no difficulty getting highly intelligent people with solid education in their chosen subjects to work devotedly and without worrying too much about lack of political freedom. This has been a surprise to us, an unpleasant surprise.

Had we looked at the matter from the point of view of the peasant children earnestly studying in classroom, laboratory and library, we would not have been so surprised. The low standard of living and the memory of a past, meager in culture, are assets to the Soviets. It is difficult for us to understand the intense longing for education—any kind of education—of underdeveloped people. This is one bond that unites Russia—no longer underdeveloped but close enough to the immediate backward past—with all the underdeveloped people of the world.

Moreover, it is far easier to awaken in children a sense of personal achievement, of victory, in mastering the intellectual challenge of tough curricula if there are no competing attractions, such as those which claim the attention of our more fortunate children: no comfortable homes, playrooms and back yards to play in; no jukeboxes or phonograph records; far fewer movies, hardly any distracting radio or TV programs; no senior proms, dating, long telephone conversations, and, of course, no hot rods.

If they could have them, these pleasant things would greatly delight Russia's youngsters and probably cut into their study time; witness their avid interest in American "jive" and "rock 'n' roll" records, to the dismay of the authori-

. . . "We must awaken America to the danger facing the nation"

ties. Russia does have a problem with unruly so-called young hooligans who are—and this is significant—not the children of the poor, but the pampered offspring of Russia's elite. Eventually, there may be more of these disturbing youths, but for the moment they hardly make a dent in the picture of an earnest, well-disciplined, polite and studious school population.

It has surprised us to find that Russia's intellectual elite does highly competent work despite authoritarian control in all, even the highest, educational and research institutions. Russia appears to have found a way of allowing superior minds freedom in the field of their special competence while denying them the right of political criticism. It has apparently been possible to develop the critical capacity of superior minds to the high degree needed for scientific work while fettering it in all other fields.

There is evidence that the fetters are well hidden, and that discontent with Russian life is largely prevented. This seems to be done by shrewdly catering to the needs of these people both as scientists and as ordinary men and women. They are allowed to let their minds roam undisturbed in quest of knowledge; they are given superb laboratory and research facilities; the best thoughts of foreign scientists are gathered quickly by large staffs of abstracters from scientific magazines and books the world over and presented to any Russian scientist who needs them.

Honors are heaped on them for superior achievements, although they do not as often get their names in the papers as do their colleagues in the free world, for this would smack of "personality cult."

Rewards for Russian Scientists: Country Homes, Chauffeurs, High Pay

Scientists also have needs of the kind common to all mortals. So Russia gives them attractive living quarters, country houses, vacations, maids, chauffeurs, cars. Their pay is in the top income bracket; in fact, the highest salary in Russia is paid to the president of the Soviet Academy of Sciences.

Why should these men concern themselves about the lack of political freedom or the grim and dreary life of most of their compatriots? They probably reason that these are temporary abuses, and that their own scientific work will contribute to the wealth and power of their country and thus ultimately to a better life for everyone. Quite possibly, too, totalitarian states may have a built-in incentive for attracting gifted minds to science: the desire to escape to a safe and comfortable ivory tower.

It is an unfortunate accident of history for us that today the military and political power of a country depends so largely on having a highly developed technical civilization. This, in turn, calls for vast numbers of scientists and engineers. The subjects which these men must master are mathematics, physics, chemistry, astronomy, all apparently regarded as politically safe by Russia's rulers. It is difficult to see how even the most fanatic Marxist could interject the party line into these sciences.

It is different, however, with other sciences. Take biology: This is a science which heretofore could not be freely pursued. Scientific truth had to be sacrificed to the Lysenko-Stalin theory of genetics.

Other than party-line limitations may also restrict free scientific inquiry. For example, Russia does not presently consider it necessary to excel in medical research. Chemists are therefore diverted from inquiries which might cure diseases of man to inquiries which can improve metals. The results of costly foreign medical research are instantly available to Russia, so she can shift appropriations from the medical to the engineering faculty and save money and manpower.

Enough has been said to give an inkling of the methods by which the Soviet manipulates its skilled manpower. It might be noted in passing that the fields in which they have done outstanding work have been precisely those where they allowed maximum intellectual freedom. Little that is new and original has come out of Russia in other fields. But second-rate theater, literature, art and so on are not of great importance in today's international power relationships.

Faced with this formidable and ruthless adversary, who has openly promised "to bury" us and who grows daily in industrial and military might, what are we to do?

—Harris & Ewing

ADMIRAL RICKOVER: "Trained manpower can only come out of a thoroughly reorganized educational system"

First, I think, we must awaken America to the danger facing the nation, making public all the facts, and without soothing the impact of unpleasant truths. I have no doubt that as a people we have enough patriotism, let alone enlightened self-interest, to recognize that we must put greater effort into the things which will make America strong, even if this may require a reappraisal of cherished convictions and ways of life—even some material sacrifices, which I doubt would be large.

Ours is an enormously productive economy, the first in history which produces a large surplus over and above reasonable necessities of life. The flood of goods coming off our production lines is so tremendous that some 10 billion dollars must be spent annually to encourage disposal of them. I speak, of course, of advertising, which costs us as much as all of our

. . . "Educational system with totally different aims" is needed

primary and secondary public schools put together. This is money with which advertisers finance our mass media and through them ceaselessly hammer at the need for ever more and better goods and services.

People must be made to buy things for which they feel no need; they must be induced to replace possessions still entirely satisfactory for new ones which, it is promised, will make them up-to-date and keep up the family's prestige. Their subconscious is probed in order to find ways to stifle the still voice of conscience and induce the American people to go into consumer debts of over 3 billion dollars annually—42 billion standing on the books as of now. Often young children are conditioned to act as unpaid boosters for higher consumption.

The automobile industry alone must spend 1.5 billion dollars each year to design and bring out new models in order to insure that American families keep spending 10 per cent of their income on cars. This 1.5 billion dollars is about three fourths of what the nation spends on all its colleges and universities, both public and private. I mention these figures to show that sacrifices to give America strength in the race with Russia would be insignificant in view of our enormous margin of luxury spending.

"We Must Reverse Our Treatment of The Scientist and Trained Professional"

Second and equally important, I believe, we must reverse our treatment of the scientist and trained professional. It is easy to make a good living in this country without much serious education. Hence the temptation to do this is so great it can only be offset by deliberate actions to elevate the status of the trained professional in terms both of prestige and of material reward.

We had better stop calling scientists "longhairs," "egg-heads," "little men with beards." In the present mood of chastisement, scientists have been speaking up and telling us that such disparaging remarks hurt and may discourage many a young man from choosing the hard intellectual road to science rather than the easy and pleasant road to business success and country-club living.

But merely spending a lot of money on scientists, scientific research and new military projects will not be enough.

In final analysis, trained manpower can only come out of a thoroughly reorganized educational system with totally different aims and considerably higher scholastic standards. To carry through such drastic reforms is a formidable undertaking, but reforms of similar magnitude have been carried out elsewhere in the past.

Much could be learned from Europe's experience in education, in particular, for Europe is old and wise at educating the young. Some of her famous universities have been in the business for a longer time than the white man has been in North America. Formal education itself is a European invention and probably the main factor in her phenomenal success, first in colonizing the world and then, so to speak, setting it on its feet, with the mark of European civilization so deeply imbedded that it may well prove ineradicable. Nowhere else has there been a spontaneous, native growth; wherever institutional education exists today, it was brought by European settlers or colonial administrators.

* * *

Europe's most important educational achievement is that, despite pressures not unlike those exerted on the schools here, she has limited democratization of the educational process to the reduction or abolition of school fees and refused to be stampeded into lowering the quality of secondary and university education. This remains, as it has for 150 years, the highest in the world.

European schools are neither social clubs nor finishing schools. Their objectives are limited and clearly defined: They seek to equip the child with all the intellectual tools he can handle; they nourish his mind with as much general culture as he can absorb; and they give his body all the exercise it can take. When a point is reached where pupils can absorb no more mental food, they quit school and go on to institutions which give vocational training of one kind or another.

* * *

In Russia there is only one basic school preceding higher education: the 10-year school. The curriculum is identical in the same grade in every school throughout the country. Students are permitted to advance only so long as they can master the curriculum. Various types of vocational schools are open to those children who desire to or who must leave after completion of the fourth grade or the seventh grade. Children are thus under great pressure to study hard, since completion of the 10-year school exempts them from military service and, of course, opens the higher professions to them, provided they can get past the examination hurdle, which bars from the universities all but 30 per cent of the 10-year-school graduates.

By stripping down to what the Soviets consider the essentials, secondary schooling can be completed in 10 years, instead of the usual 12 to 13 years in the rest of Europe. These two years saved enable the Russian student to begin training for his profession at 17. No effort is stinted to give him the best grounding in the subjects he needs, especially for study of science and engineering. The university courses in this field are of highest caliber; we can see today the results of all this effort in Sputniks, hydrogen bombs and other similar achievements.

If we discuss education with a clear understanding of the distinction one must make between the *methods* used to impart knowledge and the *purposes* for which each society educates its young, then it is easier to rid oneself of emotional bias against the *methods* simply because one abhors the *purposes*. We can then learn something from Russian education.

What we can learn, I think, is that we made a grave mistake when we disregarded Europe's experience in educating the young, just because many of us have had strong emotions about authoritarianism in European schools and their rigid multiple-track system. We continue to reject nineteenth-century European education, and we refuse to look at its twentieth-century offspring, which is far less authoritarian, far more flexible, and far more open to the gifted of all classes than most of us realize.

"Russia Has Been More Realistic Than We in Education"

Russia has been more realistic than we in education and less dominated by political dogma, strange as this may sound. She was able to use the European educational system because she could readily see that methods of teaching a subject like French or physics were basically nonpolitical; hence it was wise to copy the best methods, no matter who had devised them.

That Russia has been enormously successful in what she set out to do when she reorganized her educational system is now

plain to all of us. In the fields where she wants to excel, her education is certainly of the best. In other fields this seems doubtful. But a nation survives today more by reason of having excellent scientists and engineers than good doctors and lawyers. I have ventured to do a little figuring, and, by comparing population with attendance at universities, I have come to the conclusion that Russia, in proportion to population, is now training twice as many professionals as we. In addition she has 30 million more people and her population percentage in the age group under 25 is considerably greater than ours.

If these figures are correct, and we have no reason to doubt them, the meaning is obvious. In just over 20 years she has succeeded not only in reforming a school system all but in ruins, but in carrying to adequate academic levels so large a proportion of her school children that she can enroll twice as large a proportion in her universities as any of the Western nations.

It is interesting that the proportion of university students in Europe is about the same as in America, just as the proportion of national income devoted to education is about the same. Most European countries put 2.5 to 3.5 per cent of their national income into education. The United States invests in public education just over 3.5 per cent but, if all of private education is added, the percentage rises another point. The proportion of youth studying professionally in institutions of university rank is about 5 to 6 per cent here, as it is in Western Europe.

One Reason Red Schools Are Better: Russia Spends More on Education

What then are we to think of Russia, where 8 to 12 per cent of her youth are studying professionally in universities? Does it not reflect the fact that she spends over 6 per cent of her national income on education? When a country with a much lower living standard than ours spends a greater percentage of her income on education, it is time we paused and reflected.

The rate of progress or decline of a country is so closely tied to the education it gives its children that one might call this rate a function of education.

* * *

It should be evident to everyone that our schools do not motivate and educate enough youngsters to become professionals, and that the resultant shortage in trained manpower is a warning signal which we must not disregard. As a people, we have been caught napping. The Scientific Revolution is upon us and we have not prepared to meet its ever-spiraling demands. Our attitudes toward education are often uncritical holdovers from the past, having no validity today. The launching of the Sputnik was a providential warning; we will disregard this warning at our peril.

There was a time long ago when our country needed hardy pioneers to conquer a continent, rather than educated men; our anti-intellectualism which colors so much of our thinking about education has its roots in this pioneer past. At another time our greatest need was to assimilate the avalanche of immigrants pouring into the country; American emphasis on nonacademic school objectives, notably on teaching children manners and social graces, the efforts we make to maintain a uniform level of behavior and accomplishment—all the essentially extracurricular burdens we put on our schools—go back to a time when the school was our best instrument for Americanizing millions of foreigners as rapidly as possible.

For a long time the welfare of the country has been intimately tied up with its industrial growth, and so the businessman's outlook was predominant; this accounts for a certain

(Continued on page 90)

SOME "UNPLEASANT TRUTHS"

From the accompanying article by Admiral Rickover—

- Russia doubles up, and so gets twice the benefits we do out of each classroom.
- It is far easier to awaken in children a sense of victory, in mastering tough curricula, if there are no competing attractions, such as our children have: playrooms to play in, jukeboxes, movies, TV, proms, dating, hot rods. If they could have them, these pleasant things would greatly delight Russia's youngsters—and probably cut into their study time.
- The highest salary in Russia is paid to the president of the Soviet Academy of Sciences.
- Results of costly foreign medical research are instantly available to Russia, so she can shift appropriations from the medical to the engineering faculty, and save money and manpower.
- Europe has refused to be stampeded into lowering the quality of education.
- Our schools do not motivate and educate enough youngsters to become professionals; the resultant shortage in trained manpower is a warning signal we must not disregard.
- The nonacademic burdens we put on our schools go back to a time when the school was our best instrument for Americanizing millions of foreigners as rapidly as possible.
- Few American students at age 21 to 22 know as much after a four-year college course as most European secondary-school graduates know at age 18 to 19.
- Education in America has deteriorated in quality for lack of standards. It matters not whether you take courses in calculus, medieval history, women's styles or interior decorating. Everything is grist to the American educational mill. "You, too, can have a degree."
- We must not soothe the impact of unpleasant truths.

. . . "We have always overvalued the high school"

inclination to judge education by its dollars-and-cents value, its immediate usefulness. This probably has had something to do with our tendency to equate teaching the tricks of a trade with cultivation of the powers of the intellect.

We now have a proliferation of educational institutions but with no national standard of academic excellence. The elementary and secondary public schools are controlled and largely financed on the local level, and any kind of outside influence has always been stoutly resisted; even State control is tolerated with ill grace. There is therefore no national standard for the high-school diploma. It is granted for educational efforts so dissimilar as to be valueless in judging a graduate's competence.

Some U. S. Colleges "Hardly Deserve To Be Rated as Secondary Schools"

Equal diversity prevails among our colleges and universities. Some hardly deserve to be rated as secondary schools, while others are excellent; among the best in the world. The B.A., M.A. and Ph.D. degrees which they award are as dissimilar in value as are the diplomas of our high schools.

Only the professional degrees—those given to lawyers, doctors, engineers and so on—maintain a fairly uniform standard, and it is good. The reason for this unexpected respect for excellence in professional degrees is usually to be found in some form of outside pressure, such as the need to meet State qualifications for licenses to practice the profession.

* * *

The greatest confusion in any comparative study of education comes from the misconception of the worth of the American high school. We have always overvalued it. Merely because its graduates are approximately of the same age as European graduates of secondary schools, we keep thinking of the two as being, if not identical, at any rate comparable. This would only be true if you equate possession of social poise, good citizenship and pleasant disposition with solid academic knowledge such as even few colleges in the United States impart in a four-year course.

In recent comparisons of American and Russian education we have, for example, compared the number of graduates of the Russian 10-year schools with those of American high schools and found the result not too disheartening. Similarly, we lump together United States college and university enrollment—only 11 per cent of which is postgraduate—and compare it with enrollment in Russian universities and professional schools. Again, though not good, the figures are not actually frightening. We carefully count the hours our children spend in elementary and high school and find that in 12 years they've sat in class about the same length of time as the Russians in 10 years.

We then say sadly that the Russians do seem to get more sciences than our children and that something should be done about it.

We follow the same procedure when we make comparisons with European schools. It comes out that we have many more children in high school and in college than they have in secondary schools and universities, and this makes us proud. But all of these comparisons are meaningless because the European secondary-school graduate has learned more than most of our college graduates; and as to the high-school diploma, the less said about it the better.

How can you make a meaningful comparison between the American high school and the Russian 10-year school or the European secondary school? The latter two can be compared with each other, and the Russian comes out the worse, though not in things which his Government considers essential. But one cannot compare the number of hours spent in our high schools with those spent in any European or Russian secondary school, for even the hours are not qualitatively the same. There an hour at school means an hour of uninterrupted serious work; here there are assemblies, errands to be run, special assignments—like collecting milk bottles for lunch—and the teacher must spend a great deal of time helping the dullards who would so much rather be on the outside earning money than trying to study "language arts."

It takes almost a week to get work started at the beginning of each semester and another week to tidy up at the end. Then there are trips to survey various adult activities, checking on the fire department or the bakery, and much time goes into preparing for the school play.

It isn't even possible to compare one hour of French or physics in the average American high school with one hour of these subjects in a European or Russian secondary school, and for this reason: Over there they have a continuous program of instruction which advances from the moment the subject is first introduced. As the child grows in understanding, the presentation of the subject by the teacher becomes broader and deeper, more information is added and more facts are discussed, until in the end the pupil masters the subject thoroughly and it is his for life. In such a well-planned program each hour carries the pupil's knowledge a step forward.

But we, in this country, in a mistaken idea that the child should exercise free choice, give him much leeway to pick and choose among a large number of subjects. He may take French in the ninth grade, drop it for two years and take it up again in the eleventh. Meanwhile he will have forgotten most of what he learned and time will be wasted reviewing in the second year what he was supposed to have learned in the first year.

A point is reached where quantitative diversity becomes so great that comparisons are meaningless. The Russian 10-year school, for example, gives each and every student 1,353 hours of classroom and laboratory instruction in the sciences. Many of our high schools teach no science at all; only one third of our high-school graduates have even studied science, and the maximum obtainable, with a few exceptions, is 756 hours.

"Many of Our High Schools Teach No Foreign Languages at All"

Take foreign languages: Every pupil in a European science-mathematics secondary school has nine years of one foreign language and six years of another. Yet many of our high schools teach no foreign languages at all, and there are few graduates who have had as much as three years of even one foreign language.

Some American high-school graduates never get beyond quadratic equations, but every graduate of the European science-mathematics secondary school must be familiar with differential and integral calculus, analytical geometry, application of mathematics to physics, and spherical trigonometry.

It is time we face up to the fact that few American students at age 21 to 22 know as much after a four-year college course as most European secondary-school graduates know at age 18 to 19.

There is much dissatisfaction with our schools today. Parents feel vaguely that the local high school is below par, but they have no way of proving it. In some fashion, we must

. . . "Education has deteriorated for lack of standards"

devise a way to introduce uniform standards into American education. Since there is widespread distrust of the Federal Government in matters educational, and education is under our Constitution within the province of the States, it would be best to set up a private agency; a council of scholars, financed by our colleges and universities as a joint undertaking; or perhaps by foundations.

This council would set a national standard for the high-school diploma, as well as for the scholastic competence of teachers. High schools accepting this standard would receive official accreditation, somewhat on the order of the accreditation given medical schools and hospitals. Teachers would receive a special certificate if they completed the requisite course of studies.

A PLAN TO IMPROVE AMERICAN SCHOOLS

Admiral Rickover, in the accompanying article, suggests that—

- A council of scholars should set a national standard for the high-school diploma, and for the competence of teachers. Schools meeting this standard would get official accreditation.
- If a local school continued to teach such subjects as "life adjustment" instead of trigonometry, French and physics, its diplomas would not be accredited by the council.
- Colleges, faced with rising enrollments, would tend to admit only those with accredited diplomas. Taxpayers whose children got "inferior" high-school diplomas would demand better schools.
- The council of scholars should foster a plan to shorten American general education to 14 years; 12 or 13 years for brilliant children.
- Industry, labor and foundations should endow about 25 model high schools, open to children who are able to pass rigid entrance requirements.

Community pride would be a potent factor in inducing high schools to obtain accreditation. For the first time, parents would have a real yardstick to measure their schools. If the local school continued to teach such pleasant subjects as "life adjustment" and "how to know when you are really in love," instead of trigonometry, French and physics, its diploma, for all the world to see, would be inferior. Taxpayers will begin to wonder whether they are getting their money's worth when they see other schools receiving accreditation, and when their children find admission to college difficult because theirs is an inferior diploma.

Schools would soon discover that, to obtain the coveted accreditation, they would have to have teachers with a thorough knowledge of their subjects.

This would put pressure on educators and State authorities to bring their teacher-certification requirements into line with today's need for teachers thoroughly grounded in the subjects they teach. Another most desirable effect would be the enviable position in which council-certified teachers would soon find themselves. There would be lively bidding for their services, with the near-automatic result that their salaries and prestige would rise. More intelligent people would then be drawn into teaching, thus starting an upward spiral and giving teachers at last the true status of professionals, which they most surely deserve.

As part of what I feel must be a concentrated effort to introduce quality education into the high schools, I again urge that industry, labor and the foundations endow some 25 model high schools which would be open to all children, but only upon passing rigid entrance examinations.

What Is Needed: "A Plan to Shorten General Education to 14 Years"

Once scholastic standards are firmly set, the council should concern itself with a plan to shorten American general education to at most 14 years; and to 12 to 13 years for brilliant children. It ought to work out a plan for all high schools to graduate at age 16 those children who are able to learn fast and who plan to become professionals; colleges would probably accept the 16-year-olds if they came with a council-accredited diploma.

Within the next 15 years, 6 million youngsters will clamor for admission to our institutions of higher learning. Colleges and universities are now being exhorted to prepare for the flood, and they are severely criticized when they refuse to expand in order to become mammoth high schools where overgrown children must be taught to spell or write a simple essay; where hardly anyone really knows a foreign language, and many are mathematically illiterate yet confidently expect to become engineers because this is a profession where much money is to be made.

We are in our present predicament because education in America has deteriorated in quality for lack of standards. You can send your boy to college to study fly casting or advertising layouts; your daughter to study etiquette and how to be a hostess. After 12 years in elementary and high school; four years at college, and three years of postgraduate study, the crowning achievement may be a Ph.D. thesis on "A Study of School Postures and Desk Dimensions."

It matters not whether you take courses in calculus, medieval history, women's styles or interior decorating. Everything is grist to the American educational mill. "You, too, can have a degree." Every American child has the God-given right to march in a commencement procession, clad in mortarboard and academic gown, the rolled-up parchment degree clutched in his hot little hand. What for centuries was a solemn moment, crowning long years of arduous mental discipline and hard work, has now begun to mark the end of high school and may some day reach our little sixth-grade scholars.

Let not men of little vision with their soothing words hold back our righteous anger. We must sweep clean the temple of learning and bring back quality. For, as President Sproul of the University of California warns us: "If we fail in our hold upon quality, the cherished American dream of universal education will degenerate into a nightmare."

Let us each make a beginning, however small. It takes but the moving of a single pebble to start an avalanche.

Foregoing are excerpts from an address by Admiral Rickover in Detroit on Nov. 22, 1957.

FOR RELEASE AT 10:30 AM
FRIDAY, DECEMBER 6, 1957

Remarks Prepared by RADM H. G. Rickover, USN
Chief, Naval Reactors Branch
Division of Reactor Development
U.S. Atomic Energy Commission
and
Assistant Chief of the Bureau of Ships
for Nuclear Propulsion
Navy Department
on the Occasion of the Dedication of
Nuclear Power Training School
United States Naval Submarine Base
New London, Connecticut
December 6, 1957

EDUCATION IN THE NUCLEAR AGE

We are celebrating an event which seems at first glance fairly routine: a stone has been laid upon which in due time there will arise a new school building. The school itself has been functioning for two years. Now it is being given appropriate shelter, indicating that the period of trial and experimentation has come to an end and the need for a school of this kind has come to be accepted, albeit not with enthusiasm nor with unanimity.

The school will cost a lot of money; the students will be expected to put in hard intellectual work of a kind which may seem unusual for men whose life is essentially one of action, not of reflection. It may well be asked: why need we select this group of men from among many and send them to a special school not open to the rest of their colleagues? The answer is simple: we have no choice.

We have no choice but to develop a new kind of navy man to run a new kind of naval ship. The school provides the kind of education needed by the officers and men of a nuclear navy.

Whether or not to have a nuclear navy is not really a matter of choice either. I need not stress the military advantages of nuclear power. But there is another reason. Within a generation or two we shall be short of oil. Without oil for propulsion, we must go backwards, first to coal, then to sail. These have been the energy sources for naval propulsion in the past. Or we can go forward with new and infinitely more complicated types of energy, such as nuclear power. For our liquid fuels resources will not last too long. So far we have been able to maintain a proven reserve on hand, about ten years supply. Not a wide enough margin you might say. But to maintain this margin the oil industry will have to drill 1,200,000 oil wells in the U.S. during the next ten years. It has been estimated that during that period it must spend about $115 billion in the U.S. and abroad to maintain and expand its facilities. This is a prodigious effort. But even this must in the end fail. For man works out his destiny within the limits of a finite world, which in the end checkmates human expansion in things material.

Only in the realm of the spirit is there still room for enormous expansion, limited only by our mental capacities and our will to develop them to their utmost. Here we have hardly begun to scratch the surface, and vast treasures remain to be brought forth.

The past weeks have been a period of rude awakening for us. Our eyes and ears have been assaulted by the most distressing sort of news about Russia's giant strides in technology, based on the extraordinary success she has had in [illegible]

[illegible] i-

transforming her educational system - all but in ruins twenty years ago - into the most efficient machine for producing highly competent scientists and engineers - many more than we can hope to train through our own educational system which we have so long regarded with pride and affection.

We are slowly thinking our way through a thicket of bitter disappointment and humiliating truth to the realization that a nineteenth century educational philosophy is as hopelessly outdated today as the horse and buggy. Nothing short of a complete reorganization of American education, preceded by a revolutionary reversal of educational aims, can equip us for winning the educational race with the Russians.

Let me digress a little to go into this matter, though it is seemingly remote from today's event. I should like to do this because I think it is a matter of vital importance to the Navy, no less than to the country as a whole.

Ours is a democracy. We cannot move forward faster than the majority of the people will permit us to go. Today the people are aroused because they sense that something is fundamentally wrong with American education when a country - three fourths illiterate a generation ago - can in twenty years catch up with us in so important a field of knowledge as science and engineering. The mass of well-reasoned criticism which is currently filling the air and the news columns is, however, so large as to be almost indigestible.

Let me condense it to a few major points. For greater details, I can think of no better source of information than the Hearings on the "Shortage of Scientific and Engineering Manpower" held before the Subcommittee on Research and Development of the Joint Committee on Atomic Energy of the Congress of the United States. These Hearings were held in April and May 1956, under the Chairmanship of the Honorable Melvin Price of Illinois. There, deft

interrogation and high integrity and honesty brought forth all the facts which are needed to understand the problem; as well as enough good suggestions for practical reforms to undo in a reasonable length of time all the damage done our children and our future by fifty years of educational stagnation. Similar help will come from the Preparedness Investigation presently being conducted by the Senate Armed Services Committee. No American can consider himself a conscientious citizen who does not take the time and trouble to read these documents and to think them through. I, myself, have found them most helpful in formulating my own views on American education.

In my work in nuclear energy, the defects of our school system forced themselves upon my attention as long as ten years ago. Since then I have had occasion to interview more than a thousand young college men and officers. The design and development of nuclear power plants is a difficult scientific and engineering project encompassing the most advanced concepts in physics, mathematics, chemistry, metallurgy, electrical engineering, electronics, and mechanical engineering. Young men with sound fundamental scientific and engineering knowledge and proper motivation are needed to carry the project forward. Despite the numbers who apply, I have never found more than a very small percentage who had the necessary qualifications. I could not but come to the conclusion that something was radically wrong with the schools and colleges to whom the education of these young men had been entrusted.

I think we have come to the pass we are in today because our mass media wrap us in a cocoon of soothing "Coué-ism" along the lines of "everyday, in every way, things are going to be better and better". Few of us read serious books. We are therefore singularly defenseless against the continuous flood of optimistic predictions of a future with delightful superabundance - just

around the corner - which American Science will provide. We are equally defenseless against the clichés of our folklore which assure us that America is and always will be the most technically advanced nation. Or that ours is the most marvelous system of education in the world since more teen-agers are in school in the United States than anywhere else. This silky cocoon has kept us in isolation from the educational practices of even our closest allies in Europe. A few hours' check of their curricula, teaching standards, and of the end results of their educational system would disabuse us speedily of our illusions.

It seems to me that the first step in tackling the American educational problem is to collect all the pertinent data concerning education in other Western nations and to present it to our people clearly and with dispatch. I am thinking of the sort of thing done by the Department of Health, Education and Welfare when it published its recent useful "Report on Education in the USSR." We need all the information and we need it now.. At little cost much help for planning educational reforms could be made available.

Some may say that one cannot make valid comparisons between the educational systems of different countries since - to paraphrase a famous saying of Lord Haldane - it is in its education that the soul of a people mirrors itself. Even so there are other ways to measure education besides the soul.

Take spelling, for example: elementary schools in Europe seldom fail to teach their pupils how to spell, yet American high school graduates are notoriously bad spellers. Or take educational efficiency: The American student is two to three years older than youngsters of equivalent education abroad, at

every age from nine to completion of his professional education. Or, to take a more elevated level:

Through 1955 the Nobel Prize Committee in awarding prizes for original work in physics and chemistry granted, in proportion to population, three times as many to Germany as to the United States; two and one half times as many to England; one and one half times as many to France. Most astonishing perhaps, Holland with a population one sixteenth of ours received four to our 22 prizes; Switzerland with one fiftieth received five prizes; Austria with one twenty-fifth got three. Or take the field of nuclear fission alone. Twelve basic discoveries in physics, chemistry and mathematics brought atomic power into being. Of these, three each were made by German, English and French; one each by Danish and Italian scientists; and only one by an American. Yet the population of France, Germany, England, Denmark and Italy combined is only one third greater than that of the United States; their total national wealth is far less than ours. But in this particular field of trained brain power they were 11 times as rich as we.

Or again, take the successful development of the atomic bomb. We provided excellent direction, extensive facilities, unlimited funds; but the major contribution in brain power came from such men as Italy's Fermi and Segré, Denmark's Bohr, Hungary's Teller, Von Neumann, Wigner and Szilard, Germany's Hahn, Strassmann, Bethe and Einstein, England's Chadwick and Cockcroft - to mention but a few of the top men. In fact, it was of no small concern to the Joint Congressional Committee on Atomic Energy that, as the late Representative Hinshaw put it, the very topmost of our scientists is 60-70 per cent foreign born and educated. Even some of our own foremost scientific contributors received their university training abroad.

Of course, no educational system can guarantee that it will bring forth genius at any given rate; all it can do is to make it easy for genius to be discovered early, nurtured and encouraged, and allowed to flower according to its own inner motivations. Can we truly say that our education does this? I think not. Nor does it even seek out, nurture and develop mere talent - as contrasted with genius. It fails to develop in our most intelligent youngsters the desire to make the best use of their good minds. Hence we see 200,000 of the top quarter high school graduates lost each year to higher education while the nation suffers the most acute shortage of trained professionals in all fields, and a disastrous shortage of vitally needed scientists and engineers.

It is estimated that industry and the defense establishment urgently need at least twice as many scientists and engineers as we are currently graduating. Even more disastrous in the long run is the severe shortage of properly qualified teachers of science and mathematics in high schools and in colleges. It will take many years merely to bring the present corps of 60,000 junior and senior high school science teachers to the level of competence required to give our youngsters sufficient education so that they can enter engineering colleges properly prepared. As it is, only one third of our high school graduates are really qualified; the remainder must take remedial work which puts a heavy burden on the colleges' scant number of teachers. No wonder most engineering schools lose 50 per cent of those who enter. In 1955 we actually gained only 125 physics teachers. This works out to one for every 225 of the country's high schools.

One of the great defects of our educational system is that it does not respond to changing national needs for specific kinds of professional people. Because of the considerable latitude allowed to the student in selecting subjects, not only in college but even in high school, he may be so unprepared to study for a given profession as virtually to bar him from it unless he has begun deliberately to prepare himself for it in high school. For example, we need a great many physicists now. But a youngster who has taken no physics and little mathematics in high school, as is true of most of our high school graduates, and who then takes the usual two years of liberal arts in college is, in effect, precluded from becoming a physicist. And yet in today's rapidly changing technological civilization it is absolutely essential that the educational system be sufficiently elastic to permit students to shift quickly into study for those professions most needed at any given moment.

This inelasticity of our school system is the direct result of the sentimental attachment we hold for the concept of a comprehensive school in which all children - stupid, average, talented and bright - march sedately up to the 18th year, absorbing so little real education that it takes another four years at college before the preprofessional stage of education is completed. In order to make some small allowance for different mental capacities we allow junior and senior high school pupils considerable leeway in selection of subjects. Electives are a necessary consequence of forcing the educational strait jacket of the comprehensive school on all children in the name of educational democracy. We thus thrust upon our teen-agers decisions which may

adversely affect not only their own professional careers but also the country's ability to obtain the professionals it needs.

I have long felt that we erred grievously when we set up our own public education system without first making a thorough study of what at that time were the best foreign educational systems; that is, those of continental Europe. England whose educational experiences have in many ways paralleled our own showed greater wisdom. Though then the premier nation of the world, she was not too proud to profit from the experiences of small countries like Holland or Switzerland; or potential enemies like France and Germany.

Matthew Arnold, the poet, equipped with that curious versatility so noticeable in England's educated men, spent most of his life as a government school inspector; and in that capacity he wrote several reports on European educational methods which proved most useful when England finally established her own public secondary school system. We might profitably study those reports ourselves today.

The significant aspect of the continental educational system is that it is efficient and inexpensive when measured against the results obtained. That is not surprising when we consider that in its basic form it was invented by Prussia after her defeat by Napoleon in 1806. At that time, the country lay prostrate under the heel of the conqueror; her richest lands torn away; her treasury empty. Poor though she was, Prussia had to bring the entire country rapidly from the 17th to the 19th century, or forego all hope of ever rising again. A small band of devoted men did the country over from top to bottom, including a thorough and rapid reform of her educational system which had deteriorated badly.

Prussia was one of the first countries to recognize that a modern state must have a citizenry with at least an elementary education; that she must have leaders sufficiently educated to deal with the problems of the coming industrialization. She was one of the first to make elementary education compulsory and free, and to put all of education under state control. Being a poor country she could not afford the leisurely, luxury education for her leaders which wealthy England had developed in the closed circle of (privately endowed) "public school" - Oxford and Cambridge. "Public school" students were taught by Oxford and Cambridge men and then themselves went to Oxford and Cambridge if they wanted more education. This closed high quality educational circle was run by Anglicans, and non-Anglicans were barred from it by law. It was confined to the old upper-classes and to the newly rich middle classes on their way up into the upper-classes; others were excluded by the high fees.

Prussia, too, had privately endowed boarding schools for the nobility, resembling somewhat the 18th century English "public schools". But when she set up public secondary education she realistically cut out all features not necessary for education per se. Because the people were poor, fees had to be kept low; so a large part of the cost of education fell to the state. Hence the carefully thought-out businesslike way in which she worked out a two track system, one track designed for the mass of children, the other for those destined for the higher professions.

The rapid rise of Prussia to industrial and military power and the excellence of the scientific research done at her universities - to which students flocked from all over the world - led to widespread adoption of her basic educational system by most of Europe. Her lightning victories in 1864, 1866 and

1871 - a mere half century after she had been soundly beaten by France - were recognized everywhere as a victory of the Prussian schools and universities. To defeated France the lesson was plain; she took energetic measures to modernize her own educational system.

Other European countries also adopted the basic principles of this system. These were:

First, that elementary, secondary and university education be devoted solely to developing the intellect of the student to his greatest capacity. All vocational training must be done in special schools set up for the purpose.

Second, that the secondary schools give a broad general education in the shortest possible time, so that professional study can begin no later than age 18. This was necessary both for reasons of economy and in order to find time for compulsory military training.

Third, to get youngsters ready for professional study at age 18, serious study of foreign languages, higher mathematics, literature, geography, and history must begin no later than age nine, at which time the fast learners begin to be separated from the slow learners.

Fourth, to complete this broad general education in nine years requires carefully thought-out courses for each subject, advancing in logical sequence, year after year, from the simple to the complex. Thus, elective subjects can have no

place in such a comprehensive and well-balanced program. Only at the university level is selection of subjects left to the student.

Fifth, three basic types of secondary schools gradually evolved and are now provided - the classical, the semiclassical and the mathematics-scientific. Each of these three types provides a broad enough general education to permit the student to take almost any professional university course. For example a graduate of the classical secondary school can become an engineer by taking additional mathematics and science courses.

Sixth, considerable latitude was allowed in each school as long as national standards were met. These standards governed the qualification of teachers and the competence of the graduates. Tests of graduates to prove their competence were conducted by authorities external to the school itself, through very comprehensive examinations without which no diploma or degree was granted.

Because of the class distinctions dividing 19th century Europe, this educational system tended in all countries to separate the lowest class - which sent its children to the elementary school - from the middle and upper-classes whose children went to secondary school and thereafter to the university. The class character of this system made it anathema in the United States. But it is usually forgotten that Europe, too, has moved towards greater democracy, and that application of the six principles I have mentioned can be varied in many ways.

The European educational system has now been democratized by abolishing school fees and by subsidizing the education of able students through scholarships. This is done extensively in England where, for example, three fourths of the students at Oxford are on government grants. Russia has gone furthest in this respect by paying complete living expenses to able students. Opportunities have also been developed which permit the late blooming child to catch up or shift from one educational track to another.

Also European secondary schools now have so-to-speak junior partners, i.e. schools giving the same type of education but stopping at age 15. These prepare for various subprofessional careers.

This whole system is flexible and can be adjusted to different national aims. It has the great advantage that it allows children of diverse mental capacities to move forward at their own speed in classes which are homogeneous in intellectual requirements. While she has opened all her educational institutions to all children, Europe has held fast to the fundamental requirements of good education: a high standard of professional competence for teachers, and a firm adherence to the principle that the secondary school educates; that it develops the powers of the mind; that vocational training or the teaching of social graces must be obtained elsewhere.

Moreover, democratization has not meant the lowering of academic standards. Examinations weed out those who cannot absorb further education. And yet the system is, in fact, less rigid than ours when circumstances require emphasis on certain professions. Thus, it permits changes in the demand and supply of the several professions to be effected rapidly.

It is this continental European system which the Soviets reintroduced 20 years ago and which has enabled them to forge ahead at an astonishing rate. There is nothing specifically Russian or communistic in their system, except that they have stripped all the "nonessentials" from the European model - they have stripped everything that develops independent thought and a cultivated mind - and that they have introduced as much political indoctrination into the curriculum as they consider necessary. By paying the living expenses of most students, by putting large sums into construction and equipment of superb laboratories and libraries, and by offering their children no other road to success but education, the Soviets have been able to get a larger percentage of their students - almost twice the number in Europe and America - into professional university level study.

It is this tremendous increase in Russia's professionals which threatens our technological supremacy today.

The method is simple. Combine the European educational system with adequate funds, and motivate children by offering the highest material rewards for hard mental study and you can get the same result anywhere in the world. There are the beginnings of this in China, too.

The greatest single obstacle to a renovation of our education comes from the fact that control, financing and direction of education is, in the U.S., in the hands of many thousands of local school boards, whose members seldom qualify as educational experts. State control is slight and federal assistance is rejected. We therefore are at an impassé. It is exceedingly difficult and time consuming to convince thousands of school boards that they must change the curriculum of the local high school; to persuade 48 states that their

colleges and universities ought to confine themselves to education and not to vocational training and service activities which have no place in institutions of higher learning; or for that matter to win over thousands of alumni on whose bounty our privately endowed colleges and universities so largely depend.

In no other Western country are educational institutions so precariously placed financially, so dependent on local politicians, on the whim of small communities where few have ever had a higher education. Half our colleges are continuously threatened with bankruptcy. The future looks bleak unless in some way federal assistance can be made acceptable and some sort of national standard can be established to which diploma and degree-giving institutions must conform.

England which was faced with a tradition of private education and of control by thousands of local school boards finally worked out a compromise by which government and local school authorities were able to cooperate. The local school boards had to go however, and were replaced by a small number of county councils. Government aid remains voluntary but is conditioned on acceptance of uniform standards of excellence in curriculum and in teacher qualification. Moving slowly step by step, England has been able to overcome her own political obstacles to good public education; but it took her over a hundred years and she has been that much behind continental Europe. Might this not be one reason why, despite her far-flung Empire, her enormous head start in industrialization, England was rapidly overtaken by Germany, both industrially and finally militarily? Education is too vital for a nation's welfare safely to be debated overlong.

In our own country, the schools have been primarily engines for Americanizing children of diverse backgrounds; for teaching all children to get along with others whose economic and cultural standards might be different; for developing the qualities which citizens in a democracy need in order to carry out their political responsibilities. These tasks our schools have accomplished excellently. As long as the country devoted all its energies single-mindedly to development of the highest standard of living for the greatest number of people, the kind of education received by American youngsters was entirely adequate. But in the pursuit of this aim, we have neglected two things:

First, we have not counted the cost to us of our high standard of living in terms of rapid exhaustion of irreplaceable mineral and fuel resources; and

Second, we have failed to recognize the damage done to our talented children by squeezing them into the strait jacket of the comprehensive school.

We must devise better ways to educate our talented youth. We cannot spare a single child who has the capacity to become a professional. In science and engineering we need many more trained people to help us develop substitutes for diminishing natural resources and to keep us ever advancing technologically.

Faced with the task of expanding the aims of American education we must yet not lose its great qualities of humaneness and its ability to lay the spiritual foundations for harmonious democratic life among people of varied capacities and cultural standards.

Change, of course, is always painful. Too often those whose way of life is dependent on the old and familiar routines resist fiercely, counting their own interests above those of the nation, though never conscious of this. Nothing is easier than to convince oneself that what is good for him is good for the country.

I can perhaps make more clear what I think of the health of our educational system by reminding you what is done in a hospital when a patient is seriously ill. He is placed on a critical list. Those who are concerned for him are notified. If he is an important man, bulletins are issued hourly. A continuous watch is maintained and extraordinary measures are taken to revive his health so that as soon as possible he may again become a useful member of society.

Once the American public realizes the desperate consequences of our great shortage of trained man power in terms both of national well-being in a resources-poor future, and of our very existence as an independent and strong nation; once the connection is made in everyone's mind between education and lack of vitally needed scientists and engineers - there will I hope be action to undo the educational harm of the past half century. But we in the Navy cannot wait for this to happen. For we dare not fail our responsibility always to have ships and men at their maximum technological potential, so that we may be able to protect the freedom and liberty of our country in any war, hot or cold.

At present we have in nuclear energy the only immediately practicable alternative to energy derived from dwindling fossil fuel resources. We may, and I hope we shall, find other energy sources. But as of this moment

transition from oil to nuclear power is the only way we know which frees us from dependence on an energy source threatened with extinction within the life span perhaps of the next generation.

To build and man a nuclear navy demands a higher order of administrative and technical competence, as well as new concepts in matters of personnel, of tactics, and of strategy. A nuclear ship is not merely powered by a new fuel; it is a ship potentially far more useful for a greater variety of tasks than is the conventional ship. A nuclear submarine, for example, can stay underwater indefinitely at high speeds, while a conventional submarine can do so for only one hour. A nuclear submarine is a true submersible, at home in the depths of the ocean. It remains indefinitely in its element; it can go under the ice pack where no known device can locate it; in fact, it may be likened to an underwater satellite moving rapidly through the vast oceans - almost as hard to detect and destroy as a satellite orbiting the earth's atmosphere. Changes in strategic thinking will be needed to take full advantage of the increased military potential inherent in ships driven by atomic power.

Experience has shown that old-established, routine methods - while adequate for building and manning conventional ships - are not adequate for constructing and operating a nuclear navy. We are still experimenting, feeling our way. Atomic power calls for a higher plateau of engineering and administrative competence. We are constantly coming up against barriers built of lack of understanding for the specific requirements of this new energy source. To take just one example: lack of basic theoretical knowledge in the whole field of metallurgy forces us to waste time in ad hoc experiments, simply because we do not yet know why metals act the way they do when exposed to radiation.

radiation. Much time is also wasted while industry gears itself to the greater precision necessitated by the greater demands for accuracy in all parts of a nuclear plant, not merely the atomic core itself. These technical problems call for a high degree of initiative, of creative and independent thinking, of essentially nonroutine procedures.

Again, the requirements of this new fuel force upon us a revision of traditional personnel policies. More and more, ship's crews must become highly trained technicians; the ship itself becomes primarily an intricate industrial plant. These new qualifications must be superimposed upon and brought into harmony with the strictly military demands on the character of officers and men. This again calls for imaginative thinking of a sort quite new in military organizations. And here I would like to pay special tribute to Vice Admiral James L. Holloway, our Chief of Naval Personnel who has from the first had the vision to see the new personnel and training policies which this new force required.

As the nuclear ships begin to come off the ways in quantity, ad hoc training of crews cannot keep up with the demands for ever larger numbers of men to run them. The task has now been entrusted to this school. We all hope that this will hasten the Navy's transition from oil to atomic power.

What we are doing today is not unlike what we had to do when steam superseded sail. Then, too, a new fuel called for a different technical competence in our officers and men. Then, too, we had no real choice. Either we accepted the new technological order and progressed, or we rejected the inherent imperatives of the new order and declined as a naval power. The navy of sail evoked a deep-felt affection for a way of life which had its glorious moments,

its familiar and comfortable routines. But to have clung to sail when the trend of the time was toward steam would have been folly and national suicide.

We have the same problem today. The changes which nuclear power bring are not always welcome, but do we have any choice?

Today, unlike a hundred years ago, we no longer have a wide margin of time. We no longer live as on an island, spiritually and geographically removed from the power politics of the world. A hundred years ago, Europe was the cockpit of power struggles, and we stood on the side lines, protected by friendly oceans and free to choose whether to refrain from or join the battle.

Today, it is we who are in the center of the arena; and how well prepared we are will determine whether there is to be a battle and, if so, whether we will emerge victorious.

H. G. Wells remarked that civilization is a race between education and catastrophe. If this school throws its weight into the scale on the side of education - small though this weight may be in the total mass of educational effort our country requires - it may yet be the little bit which will guarantee survival of civilization.

FOR RELEASE AT 12:00 NOON
THURSDAY, DECEMBER 5, 1957

Remarks Prepared by RADM H. G. Rickover, USN
Chief, Naval Reactors Branch
Division of Reactor Development
U. S. Atomic Energy Commission
and
Assistant Chief of the Bureau of Ships
for Nuclear Propulsion
Navy Department
For Delivery at the Meeting of
Overseas Press Club
New York, New York
December 5, 1957

REVOLUTION AT SEA

I greatly appreciate this opportunity to appear before the Overseas Press Club.

We know that we are living in a period of great changes. At times we forget how fast changes have come about that we now take for granted. To understand what is happening and will happen in the future it is useful to reflect on the current rate of change.

For instance, our first steam-propelled warship, the Demologus, was designed and built by Robert Fulton in 1814, but it was not until the 1880's that the Navy completed conversion from sail to steam.

It has often been said that the steamship revolutionized naval warfare, and so it did. However, as conversion of the world's navies from sail to steam took three quarters of a century, the changes wrought were evolutionary rather than revolutionary, and therefore less drastic in their impact than might have been expected.

Today our Navy is in the midst of another change -- conversion from oil to nuclear power. This change is taking place so rapidly that it is, in truth, a revolution.

Let me give you a brief timetable. The idea of an atomic submarine was conceived in 1949. Four and one half years later the land-based prototype of the propulsion plant for this submarine was operating, and a few months later the NAUTILUS was at sea.

The SEAWOLF, our second nuclear submarine, was launched in 1955; the third one, the SKATE, is presently conducting her sea trials. The SWORDFISH and the SARGO, our fourth and fifth nuclear submarines, were launched this year. And 14 additional nuclear submarines are now under construction or authorized. Further, we are designing or constructing nuclear power plants for a guided missile cruiser, an aircraft carrier, and a frigate.

By the mid-1960's we should have in being the first nuclear powered task force -- complete from submarines to carriers. Thus, a technological and military revolution, which in the past would have taken the better part of a century, will be completed in a decade.

We can predict with reasonable accuracy what effect conversion to nuclear propulsion will have on future naval warfare if we keep in mind that a naval ship, whether it be propelled by wind, coal, oil, or the atom, is simply a mobile platform which may be used for any or all of the following purposes: It can transport men and supplies; it can receive and transmit intelligence; it can be a base for launching firepower against an enemy. This firepower can come from shells, torpedoes, rockets, missiles, or bombs. These can be shot from a gun, released from a launching device, or dropped from an airplane which is launched from the ship. In the last case, the naval airplane merely extends the range of the mobile platform.

The history of naval engineering is a record of our efforts to design and build better moving platforms. Our aim has been to develop ships which have these ideal capabilities:

First, the capacity to go at full speed anywhere at any time; that is, unlimited cruising radius.

Second, the power to carry war to the enemy, which means that our ships can stop the enemy from approaching our shores while striking successfully at targets within the enemy's territory.

Third, the ability to keep their exact location secret, either through great mobility or through use of the ocean to shield themselves against the enemy's intelligence.

An ideal, by definition, must remain unfulfilled. All we can do is to try constantly to approach it. The sailing ship had unlimited cruising radius, but it was bound to the surface of the ocean, and depended on wind and weather. It could go anywhere, but not at any time.

Coal freed the surface ship from dependence on the weather, but this freedom was bought at a price. Ships could no longer cruise indefinitely; they had become tied to coaling stations. Conversion from coal to oil extended the cruising radius, but did not eliminate the fundamental dependence on refueling.

Meanwhile, progress had been made in another direction. Naval engineers had learned to build ships that could go below the ocean's surface. The battery-driven submarine was the first mobile platform to use the ocean as a shield against enemy detection. But it could do this for just a few hours; it could cruise underwater for only short distances and at low speeds. It was not, in fact, a true submersible, despite its name. It had to do nearly all

of its cruising on the surface. To recharge its storage batteries it had to raise its snorkel or come to the surface for necessary oxygen. A snorkel can be detected by radar, and a submarine on the surface is no real match for a destroyer or an airplane.

To transform the battery-driven submarine into a true submersible its dependence on oxygen had to be eliminated. This came with nuclear propulsion. The propulsion plants of the NAUTILUS and her sister submarines require no oxygen; therefore they can stay under water indefinitely. They can circle the earth submerged and need not refuel for long periods of time. In fact, the NAUTILUS has been designed to operate better and faster under water than on the surface.

The consequences are clear. All antisubmarine warfare has heretofore been based on one basic premise: The storage battery of a conventional submarine quickly exhausts itself -- in about an hour at high speeds, and in 40 to 50 hours at low speeds. When this happens, the battery submarine must snorkel or surface, revealing its location and exposing itself to attack.

No ordinary submarine has ever run submerged at its top speed for more than one hour. The NAUTILUS on a single trip has run fully submerged at high speed for 5007 miles. She then surfaced only because she had reached her destination. Further, the NAUTILUS steamed 62,526 miles, over half of them completely submerged, on her first charge of uranium fuel. She has gone closer to the North Pole than any other ship, breaking a record held by the Russian icebreaker SEDOV.

The daring of Captain Anderson and his crew in undertaking this polar voyage under thick ice is not fully appreciated. I venture to say that it will go down as one of history's greatest feats of exploration.

The NAUTILUS cruise to within 180 miles of the North Pole was true pioneering. No submarine had ever before gone more than 20 miles under ice. The NAUTILUS traveled 1383 miles under the ice in 5½ days.

We had no idea what conditions would be found. No one knew accurately what the depths of the water might be, the thickness of the ice, or what currents might exist. There was no assurance that the gyro-compass would work that far north where the force holding the compass in line is so low. As for the magnetic compass, it never works too well in a submarine, built as it is of magnetic materials. Near the magnetic pole we could expect trouble.

As it turned out an electrical power failure to the gyro-compass was one of the reasons preventing the NAUTILUS from reaching the Pole. We have learned that we can go anywhere in the Artic basin in a nuclear powered submarine.

This exploration has provided our scientists with over 16,000 bottom soundings, as well as other data so extensive it will take about a year to evaluate it all. This was the first quantitative study of sea ice ever made. It includes continuous records of ice coverage, profiles and thickness; sea water temperature and salinity; and ocean depths and contours.

The way is now open for exploration of the Arctic basin by our submarines. The rate at which a submarine can chart the Arctic is incomparably faster than it can be done by landings from aircraft on ice. We must learn all about this new sea operating area as quickly as possible in order to be able to counter any threats which may develop in that region.

There is no longer any reason why nuclear submarines cannot go to the North Pole and beyond, or transit between the Atlantic and Pacific through the Arctic Ocean. And I trust that in the not too-distant future Captain Anderson and his intrepid NAUTILUS crew will be the first men ever to voyage under the North Pole.

What nuclear power can do for the submarine has already been demonstrated. For the surface ship it will provide virtually unlimited cruising radius. Our aim is to design nuclear propulsion plants which can last for an entire war without being refueled. The nuclear task force will not have to return to shore bases for more oil, or require an endless chain of tankers. All the replacement fuel needed for the nuclear-powered navy of the future can be stored in a few large buildings. It is not radioactive and does not deteriorate.

In surface ships, nuclear power multiplies the distance an aircraft carrier can travel at full speed without refueling about 20 times, and the distance a frigate can travel at full speed without refueling about 50 times.

Now, although power plants change, the principles of naval strategy do not. In the future, just as in the past, our Navy will have two tasks in the event of war. It will have the defensive job of helping repel the enemy's armed strength, and the offensive job of helping carry the war to him.

The Soviet Navy is the second largest in the world. The Soviets have concentrated on submarines; they have about 500 against our about 110.

At the outbreak of World War II, Germany had 57 U-boats. Of these, only 22 were ocean-going submarines. Yet, before that war was over, the German submarine fleet killed over 40,000 men and sank 14 million tons of allied shipping. And it is well to remember that it took four years before the German submarine menace could be controlled. The Russian submarine fleet is ten times as large as was the German submarine force when World War II started. They have more submarines today than the Germans had at any time during that war.

As far as we know, the Soviets do not yet have a nuclear submarine. But we must assume the day is near when they will.

The science of antisubmarine warfare has, of course, not remained static. But neither has the offensive power of submarines. For instance, the Soviets now have the capability of launching from their submarines missiles with a range of at least 200 miles, presumably with nuclear warheads. It would take but a single such missile, accurately placed, to cripple any of our seaboard cities. And it should not be too long before submarine-fired missiles can reach anywhere in the United States.

Clearly, the task of containing the Soviet submarine menace in the event of war will be formidable. In fact, this is the Navy's most vital and most difficult defensive mission.

The heart of the problem would be to destroy the enemy's submarines in or close to their home bases -- before they reached the open seas, if possible.

Air strikes by our nuclear carrier forces might destroy the enemy's submarine bases. But, we must assume that some of his ships would survive initial attacks and break out into the open seas.

We are now developing a nuclear-powered submarine specifically to cope with this threat.

We are also designing a nuclear power plant for another type of ship which will be very important for antisubmarine warfare, a frigate. We hope to be able to start construction of this frigate in the near future. It will be needed to protect our naval task forces against submarine attack.

The nuclear task force will be unlike its closely knit counterpart of World War II. In order to reduce vulnerability to hydrogen bomb attack,

the nuclear task force will be dispersed over an area as big as the State of New York. No ship will be within H-bomb radius of another.

Spreading the task force out makes it harder for a conventional destroyer or frigate to give the nuclear task force adequate antisubmarine protection since its cruising radius is so small. Too much of its time would be spent tied to a refueling ship rather than in searching for enemy submarines. It would be a part-time protector.

But the nuclear frigate would be a full-time protector, the kind of ship required for the full nuclear task force.

Of course the nuclear task force would also have to guard itself against air attack. I have never yet met a man in our Navy who claims that a carrier is absolutely invulnerable to enemy air attack.

In a nuclear war everything is vulnerable, including airfields and missile bases ashore. But a mobile sea base has a far greater chance of survival than a fixed land base.

The enemy would know the exact location of our land bases in advance; but could know only the general location of our sea bases. Our system of task force defense-in-depth would limit enemy reconnaisance and he would find it difficult to determine the precise location of any particular unit of the task force, to say nothing of pressing an effective attack home through the many concentric rings of defensive firepower that would surround the carrier for hundreds of miles in every direction.

The unprecedented mobility and striking power of the nuclear powered and armed task force can be used to stop enemy attacks at their source -- that is, the enemy's bases -- by using the overwhelming concentration of airpower available to the task force.

The nuclear-powered task force built around the atomic carrier will give the Navy unprecedented mobility and striking power.

The 1500 mile ballistic missiles being developed will be able to travel at high speeds, making effective interception difficult.

The Navy is developing such a missile, the Polaris. The nuclear propelled submarine capable of launching such missiles with nuclear warheads can make our Navy an even more effective deterrent force. There is no reason why Polaris cannot be launched from floating platforms, surfaced or submerged.

Armed with this missile, the nuclear-powered submarine will become an underwater satellite. It will be large enough to store, maintain, and fire intermediate range ballistic missiles, and it will be able to move anywhere at any time, completely submerged.

These underwater satellites will launch their attack from far out in the Atlantic, the Pacific, or the Arctic Ocean. They could be placed anywhere within 1,500 miles of their targets. They could be dispersed over literally millions of square miles of ocean.

The problem of locating and destroying such an underseas fleet will be tremendous. Search radar will be helpless against it. The enemy would be in the position of a man trying to find a black cat on a vast and empty plain on a moonless and starless night.

The underwater satellite marks the closest approach now foreseeable to the ideal mobile platform. It could go anywhere at any time. It could remain well hidden from the enemy. It would draw the enemy's missiles and bombs away from our cities and factories and farms, and draw them toward the uninhabited seas. An aggressor could not escape destruction as long as this missile fleet

remained in existence. He would be forced to attack it, thus greatly reducing the number of missiles available to him for hitting our territory or that of our allies.

The mere existence of this underseas fleet would create a tremendous military and economic problem for a potential aggressor. He would know the location of our fixed land-based missile sites. He might calculate that so many of his missiles launched in a surprise attack could destroy our land-based counterforce before we could effectively retaliate.

But many enemy missiles might be needed to destroy just one of these submerged launching platforms. He could make no rational calculation for such an attack.

I should make it plain that this weapon cannot be built by the day after tomorrow. It is a scientific and engineering challenge, comparable in difficulty and magnitude to the first nuclear submarine.

In other words, the NAUTILUS did not mark the end of a technological road. It marked the beginning. It should be compared with the first airplane that flew at Kittyhawk. It marks the beginning of a technological revolution at sea.

The ships, the submarines, and the missiles I have talked about are very expensive. But many of you may remember the famous picture taken that day in 1940 when the Germans occupied France -- the picture of the man standing on the sidewalk crying. To what avail were the savings by millions of individual Frenchmen as the conquering troops tramped by. All of these savings and much more were wiped out.

It is our national policy to control the seas. For us to fail to do so could be national suicide.

Our country is rich enough so that we do not have to take chances with insufficient or second class weapons of war. Particularly when our potential enemy is hardheaded, ruthless, and has no compunctions whatsoever in the amount he spends for military purposes. Our freedom is worth whatever price we must pay.

The development of nuclear power conforms to the same laws which govern all great steps forward in science and technology. Underlying these laws is the fact that there is no short cut to technical excellence. It is not dramatic "break throughs" which spell the difference between success and failure. Rather, it is painstaking attention to a thousand and one details, a willingness to accept responsibility, and, above all, long years of hard work by many dedicated people who refuse to be discouraged by obstacles.

All our experience to date shows that you cannot develop operable nuclear power plants on the basis of a 40-hour work week. Our experience also shows that you cannot solve unusual technical problems of the kind we meet daily in our business with routine management methods -- or with routine people.

At the very outset of the program we discovered that the usual type of military organization which matches officers with jobs on the basis of rank or seniority simply did not work. Our jobs are not assigned on the basis of age, rank, seniority, or classification grade. There is only one yardstick: Who can do the job best?

We discovered also that normal management practice which draws a sharp distinction between technical and administrative people did not work. It proved impossible to make sensible administrative decisions without thorough familiarity with the technical aspects of our program. As a result, every one of our people is required to work on technical problems.

Yet all the efforts of the hard working people in our program would have been in vain were it not for the wholehearted support, both moral and financial, we have received at the very highest levels of our government. I would like to pay special tribute to the Chairman of the Atomic Energy Commission, Mr. Lewis L. Strauss; to our Secretary of the Navy, Mr. Thomas S. Gates, Jr.; and to our Chief of Naval Operations, Admiral Arleigh Burke. We also feel greatly indebted for the full support we have received from the Congress of the United States, and from its Joint Committee on Atomic Energy in particular. Whatever we have accomplished could not have been done without the help from all these quarters.

There has, of course, been great satisfaction for all of us in this effort. We have been privileged to contribute to the defense of our country. We have really been doubly fortunate since all of our work on naval nuclear power plants can be used to help develop civilian atomic power stations. The Shippingport central station nuclear power plant near Pittsburgh, now BEING TEST OPERATED [redacted],

is a direct outgrowth of our work on the NAUTILUS reactor.

The world's supplies of fossil fuels, coal and oil, are rapidly being depleted. At the same time the world's requirements for energy are growing at an explosive rate. In the generations ahead, what we are learning today in the development of nuclear power for the Navy will become a storehouse of knowledge for an energy hungry world.

One final thought I would leave with you: the rapidity of change in our modern world. There are many examples, of course, but two, one industrial and one military stand out in the context of what I have said.

The industrial one is Near East oil. In 1901 an Englishman named D'Arcy obtained a concession to drill for oil in Persia. Everyone considered his venture to be highly speculative, and events soon proved this to be true. By 1908, after many unsuccessful drillings his resources were exhausted and it had been decided to discontinue further drilling. Just then oil was struck on the site of an ancient fire temple.

It was this chance discovery which, in the short span of 50 years had a more profound effect on the industrial life of Europe and on world international affairs than had perhaps, the events of any similar period in modern history. The Suez crisis of last year has amply demonstrated this.

The second example, the military one, is our own Air Force. On August 1st 1907, the War Department created an Aeronautical Division under the Chief Signal Officer. This Division consisted of one officer and two enlisted men. Only 40 years later that three-man organization had expanded to become the predominant military arm of the United States. Never before in all history has so tremendous a military change taken place in so short a time.

The lesson from these two examples is plain. We must expect even more rapid changes and displacements in the future. Predominance in any field today is no guarantee of position tomorrow. In light of the ever-spiralling scientific and technological revolution we must be alert; we must anticipate change; we must recognize that no institution is so hallowed that it must not be examined periodically; we must even bear in mind that the law of life for organizations as well as for nations is: "Adapt or Perish".

Rickover, Hyman

December 7, 1956

Dear Mr. Probst:

Unfortunately, I could not do justice to Admiral Rickover's speech because the hard news of that day was rather voluminous. However, you may be interested to know, brief though my summation was, it produced more mail response than anything I have done in many weeks. Maybe this only proves that the Admiral is a better reporter than I am, which I am happy to admit, but at least the result was gratifying.

Thank you again for permitting me to attend the session.

Sincerely yours,

Mr. George E. Probst

Dear Mr. Murrow:

We have received the transcript copies of your broadcast on Tuesday evening, November 20, during the last half of which you discussed Admiral Rickover's address on "The Education of Our Talented Children." It is encouraging to know that the Admiral's thinking has the benefit of such wide dissemination. The Foundation has had many requests for copies of Admiral Rickover's address and I believe it will elicit editorial comment for some time to come.

We are very happy you could attend this luncheon on the second day of the Seventh Edison Foundation Institute on "Strengthening Science Education for Youth and Industry."

I look forward to seeing you again.

Sincerely,

George E. Probst

Rickover, Hyman

December 5, 1956

Dear Admiral Rickover:

I have ordered the book by Stanley Hyland and fortunately already possess the one by Gunnar Myrdal.

I felt truly privileged to travel to New Jersey with you. It was indeed a stimulating experience. Unfortunately, I could not do justice to the summary of your remarks; but you may be interested to know, inadequate as they were, they produced more response than any radio program I have done in many months.

I am writing to Admiral Strauss about the television report on the peacetime uses of atomic energy.

I continue to concern myself with the matter of the book we discussed.

Respectfully yours,

Rear Admiral Hyman G. Rickover
United States Atomic Energy Commission
1901 Constitution Avenue, N.W.

November 26, 1956

Dear Mr. Murrow:

When we were together last Tuesday I mentioned a book which discussed some interesting parliamentary reports. The book is "Curiosities from Parliament" by Stanley Hyland, London, published by Allan Wingate.

Another book which I am sure will be of interest to you in view of your broad interest in international affairs is "An International Economy, Problems and Prospects" by Gunnar Myrdal, published by Harpers. Although the subject matter of the book is not too clearly presented, it nevertheless points out the difficulties the world is being faced with by the desires of the "underdeveloped" nations to attain a high standard of living.

I enjoyed very much our stimulating discussions, and I appreciate what you did in broadcasting the essence of the Edison Foundation education speech.

With kindest regards,

Sincerely yours,

H. G. Rickover

ON RESPONSIBILITY
Taken from A DEFENCE OF PREJUDICE and Other Essays
by
John Grier Hibben, Ph.D., LL.D.
Published by Charles Scribner's Sons
New York : : : : : 1911

There is much loose and confused thinking about the nature of responsibility. Not only are there innumerable instances of persons holding positions of trust who are evading evident responsibilities, but also more particularly, of those who would seek to justify themselves in such a course. The latter are like the figures in Nast's famous cartoon of the Tweed Ring, who are all standing in a circle, and each one pointing aside with his thumb to his neighbor as the responsible person. It is the old story of the other man. There are many circumstances in life where it is convenient to shift the responsibility upon some one else; and whenever one sets himself to defend a convenient course of action, he does not always see straight and think clear. Even though he may succeed in convincing himself, nevertheless if in this process there is any element of self-deception, he is perilously near the danger line.

There are no fallacies so subtle as those which insinuate themselves into our reasoning at a time when our interests are involved. To play the rôle of judge and of special pleader at one and the same time is an impossible task. Therefore when we seek to free ourselves from the burden of responsibility in any situation, we must be peculiarly on guard, that we do not allow ourselves to become ensnared in the toils of those artificial distinctions and plausible explanations which when stripped of their verbal dress appear in their nakedness as contemptible subterfuges.

One of these convenient ideas which serve as a kind of natural anaesthetic to conscience is the belief that any responsibility which is divided is thereby lessened. Responsibility, however, can never be dissipated by diffusion. The director of a corporation may content himself with the comforting thought that where many are jointly responsible, his share of the common obligation after all cannot be regarded as very serious. And in this idea there lies a very fundamental error. For responsibility is by its nature something intensive and not extensive. It can be divided among many, but it is not thereby diminished in degree. When by the ordinary processes of arithmetical division, however, one number is divided by another, the result is only a small part of the original amount. It is always a lessening process. But the idea of responsibility cannot be expressed in any such quantitative terms. Dividends can be divided into separate parts, but not responsibility. Responsibility can never be conceived in the light of a magnitude. It belongs to the class of things which, when divided, each part is equal to the whole.

Responsibility in this respect is like pleasure which, when shared, is not lessened, but the rather increased, as Bacon long ago pointed out. The same quality, also, we find in the rewards of honor, or of fame it may be, which come to the many who have served in a common cause and rejoice in a common victory. Thus the glory of the whole is each one's share. It can be divided among many without loss. So, also, the appreciation of beauty in nature or in art shows no diminishing returns, although the number who experience the joy of it may be increased without limit. This, also, is the characteristic feature of responsibility. Parents share the responsibility of their children, but the complete responsibility and no half measure of it rests upon each. The director of a bank or an insurance company shares the responsibility of his position with his colleagues on the same board; but the shared responsibility is not a per capitum portion, but the whole.

This is not a new doctrine; it comes to us with an immemorial sanction. But it seems to have been forgotten in recent years. "My share of the responsibility is but slight," is a common phrase which may be heard on all sides at the present day. If one would thus seek to minimize his sense of obligation as regards that which may be placed in his keeping as a trust, he should not forget that his share of responsibility is not a part, but the whole, undiminished and untransferable. He may have others associated with him, it is true, but his individual responsibility cannot be shifted upon them. He must meet it in the full rigor of its demands, and regard himself as though alone in the discharge of his duties.

There is also the fallacy of the delegated responsibility. It is impossible for one at the head of large business interests, for instance, to give his personal attention to every minute detail. He finds himself naturally compelled to delegate much of the work of supervision and of administration to others who act in the capacity of his deputies. Otherwise the business of life would be impossible. This is indeed a commonplace of every-day business routine. But because some one else may assume the responsibility, he who deputizes it is not wholly relieved of it. He passes on the duty of actually performing some specific work, and yet the obligation still rests with him not to do the task, it is true, but at least to see that it is done. We cannot afford to ignore the common-law judgment that the act of the agent is the act of the principal. We cannot take it for granted that the mere transfer of responsibility to another assures a satisfactory discharge of all the duties which it involves. We do not dare to shut our eyes to the fact as to whether such duties are fulfilled or not, on the ground that the responsibility now rests upon another and not upon ourselves. It is his responsibility, but it is also ours. A person who is at the head of a large business enterprise cannot be omnipresent or omniscient; but he is responsible for the kind of men who are his partners in responsibility, and also for the atmosphere which pervades his business, for the general morale of the service, for the discipline that is enforced, for the prevailing policy and method pursued, and for the spirit and tone which characterize all departments, however various they may be. Division of labor is not a dissipation of responsibility. He who is responsible for a particular task is relieved of that responsibility only when there is

evidence that the given work has been done. The head of a corporation should devise certain methods by which such evidence can be regularly forthcoming, so that when any cog in any wheel may chance to slip, the fact may be at once apparent at the central seat of responsibility.

There is, of course, such a thing as a serial responsibility, as I would style it, that is, where a number of persons in turn assume the responsibility for a certain task, each contributing his share to its accomplishment, and then pass on the full responsibility to some other. This is illustrated in the sending of a registered package. Each one in the series does his part in the process of forwarding it, and receives a signed acknowledgment that another has relieved him of his particular duty and of all responsibility con-connected with it. The ordinary business of life, however, cannot always be so nicely adjusted. Responsibility appears more often in an indefinite and diffused form, in which many persons are involved, and no one at any time carries the full burden alone. There is no way of escaping responsibility of this kind as long as we remain within the area of its pervading power. We dare not hang about the outer edge of this region, hoping to reap the possible rewards, and yet think to evade all blame or loss in the event of untoward results. There are many who thus endeavor to hold their course along some such imaginary line, so that they may shrewdly keep within it to share the honor or dividends which may accrue, and yet be able to swerve to the outer side of it whenever the area within may become the storm-centre of indignant protest and recrimination.

Again it is often urged that we are in a measure relieved of the responsibility of an act, when such an act is a customary procedure in the business, professional, or social circles in which we may happen to move. "Everybody does it," it is said, "it is the usual practice; then why should I be over-scrupulous concerning that which general usage has sanctioned as permissible?" Such is the argument. And yet responsibility at the last analysis must be recognized as an individual matter. No man's responsibility can be judged in the light of another's. Custom does not make right. The low level which the morale of a guild or of a profession sometimes reaches is due to this very fact, that no individual sees his peculiar responsibility in such a light that he is willing to break the bond of custom by protest or by practice. It is not easy to be independent under such circumstances, but that does not make it any the less imperative. Responsibility is not lessened merely because it may entail extraordinary courage and sacrifice. We do not justify ourselves in the failure to meet evident obligations by the plea that circumstances and conditions are too much for us to cope with. The convenient, the comfortable, and the easy-going are not the symptoms which usually form the diagnosis of responsibility.

There is another fallacy which many fall into of securing freedom from responsibility by the assumption of a convenient ignorance. A candidate, for instance, may not choose to know the detail of method and of policy pursued by a campaign committee in charge of his interests. The members of the committee in turn deem it wise to have him kept in ignorance. It is generally understood

that whatever happens, he is to know nothing about it. The comforting theory is that no responsibility can attach to a person concerning an act of which he is ignorant. This is doubtless true, provided he is not purposely ignorant. A person may not be held responsible for failure to see some obvious circumstance when his eyes are shut; but he is responsible for his eyes being shut when they ought to be open.

There are men who know that certain results cannot possibly be accomplished without certain definite means being used, and yet consent weakly to profit by these results on the ground that they do not know explicitly the character of the means used to attain them. It is a lame excuse. We are responsible not only for that which we see and hear, but also for that which may be implied in the things seen and heard, and which we are compelled to recognize as the necessary consequence of them. It is not merely the actual situation in which we find ourselves, but also the logic of such situations that must be interpreted and judged by us as to the measure of our responsibility for them. It must be remembered that the very ground of our responsibility is the presupposition that we are in complete possession of our reason. How absurd therefore to narrow the range of responsibility by excluding the obvious inferences which the reason of any man of ordinary intelligence must surely recognize. If a campaign committee, for instance, expends large sums of money, it stands to reason that the one in whose interests it has been raised must know that revenues are not created by magic. Merely to choose not to know is to ignore a definite responsibility and thereby assume an indefinite one. It is like signing a blank check to an unknown order and for an unknown amount. The man who would rather not know what his friends are doing in his behalf should be held to strict account for his voluntary ignorance. No one can afford to have things done for him which he would scorn to do or be afraid to do himself.

There is also a very common feeling that any one may repudiate all responsibility in a given situation, if he will only declare forcibly and loudly enough that he does not regard himself as in the least responsible for the same. He may insist that he will wash his hands of the whole matter; but there are certain stains that cannot be thus removed. The hands may be washed; but they may not be made clean by the process. There is a ceremonial purity which does not penetrate beneath the surface. How often men justify themselves, when feebly yielding to the prevailing opinion of the many associated with them in some position of trust, by the ready excuse that after all the majority must rule. It is true that the majority must rule; but it is equally true that the minority often must fight. A mere verbal protest followed by a quiet acquiescence is not sufficient when honor or honesty is the issue. An uncompromising attitude of opposition may have to be maintained until the court of last appeal is reached; that court may be a board of directors, or the stockholders, or public opinion, or in the regular course of legal procedure even the Supreme Court of the United States itself. Responsibility often demands a fight to the finish. In that case, compromise is cowardly.

We are responsible for our silence, for our inertia, for our ignorance, for our indifference--in short, for all those negative qualities which commonly constitute the "dummy" directors--those inconsequent personages who would enjoy the honor and the perquisites of their office without allowing themselves to be unduly burdened with its duties and cares. The president of a corporation or a superintendent does not assume the responsibility vested in its board of directors; he merely represents that responsibility. And when they would implicitly assign all sense of their personal obligations to his keeping, they not only put themselves in a position to be easily fooled, but actually offer a ready temptation to him to fool them. They are thus doubly reprehensible; for the neglect of duty on the one hand, and on the other for extending a virtual invitation for some one to use them as tools for unlawful ends. Not only the wreck of a business, but the wreck of a human being must be laid at their door, who by a splendid capacity for negligence do thus expose another to the play of the most subtle temptations which can be conceived.

There is also the mistaken notion that we may escape certain responsibilities simply by not assuming them. There are some obligations, however, which we do not dare to refuse, and which indeed it is not possible to refuse. We have no choice in the matter. We cannot say in truth that we have no responsibility, for instance, for the general decency and good order of the community in which we live merely because we have chosen to keep out of the village politics, and therefore, not being on the borough council or the board of health, it is none of our business if the laws of nature, of man, or of God are violated. It must be remembered that responsibilities of such a kind are not assumed by definite choice, but belong to us whether we will or not. Certain responsibilities we do not choose; they choose us. If at times they seem to us vague and indefinite, it becomes our duty to make them definite through some effort on our part. We are held to account not merely for doing the obvious duty that circumstance may urge upon us, but also for creating the circumstance which may give rise to a wholly new set of duties. We are not only responsible for lending our service to the cause which has a rightful claim upon us, but also we may be responsible for the establishment of a cause to serve. We are responsible for the very fact, if indeed it be a fact, that our responsibilities in life are so few and so slight. If we choose to carry the lighter burden, it is not a matter of felicitation, but one for our most serious personal concern; for an irresponsible person is always defective in some respect, either in body, mind or character.

There are those moreover who imagine that in certain relations of life there can be devised some natural substitute for the sense of responsibility. It is possible, of course, to establish a set of automatic checks upon an employee's activities of such a nature as to reduce his personal responsibility to a minimum. Any failure in the performance of his duties is at once mechanically discovered by the various systems of time-clocks, bell-punches, cash registers, and the like. This is very well in all cases where the labor is that of simple routine. Mechanical activity can be checked by a mechanical device. Not so, however, as regards those duties which demand a higher

order of capacity--such as that of sound judgment, a fine sense of discrimination, and the power of resourceful initiative. In all such matters there can be no substitute for the responsible personality. Man is a responsible being because of this very element of free activity in his nature which no mechanical contrivance, however ingenious, can ever gauge. We are all so completely dependent upon the integrity, fidelity, and efficiency of our fellow-men in the more complex relations of life that we must at times, and often the most critical, trust them implicitly. We do not proceed far in any undertaking without being aware that we are holding another responsible, or that some one is holding us responsible for those inevitable duties which arise out of the relations of man to man the world over. If a man would escape all responsibility he must place himself wholly outside of the relations of life, for life is responsibility. As we have seen, responsibility remains with us even though we may ask others to assume it; we share it with others, but our portion is the same; when we turn our backs upon it, we find it still facing us; we flee from it, and however far it may be, we behold it waiting for us at the journey's end.

1.50 pm Rickover, H.

Murrow from Swing

Swing

Admiral Rickover telephoned hoping to reach you, and told me to tell you he called to express his thanks for getting him on the program last week. He had received a lot of mail which praised his contribution at the dedication. "I was the only person who mentioned families as having done something" he said. "The trouble with America is that when something gets accomplished the businessmen stand up and shake hands with each other as though they had done it all." He said a lot of the families were present when he paid them the tribute. He said that he hoped you didn't put him on the program just to please him, for if you did you would end up by getting into trouble. I said he was used because you believe in him, as I do. And he said he was glad to know "they" had made an impression on me during my week. He sounded all in all most courteous and cordial.

H.

Elmo Roper

ELMO ROPER AND ASSOCIATES

TIME & LIFE BUILDING · 111 WEST 50th STREET · NEW YORK 20, N. Y. · PLaza 7-4900

June 1, 1960

Mr. Edward R. Murrow
Columbia Broadcasting System
485 Madison Avenue
New York 22, New York

Dear Ed:

I must admit that I felt somewhat nostalgic about the prospect of moving out of the RCA Building, where we started our business--and in a sense helped start a whole new profession--twenty-seven years ago. But now that we have moved and are in our new quarters, I am more than pleased. We've got substantially more room than we had before, we are completely air conditioned, the layout and furnishings are ideal and even the view is better.

My son, Bud Roper, has been in complete charge of the architecture and furnishing of the new offices, and we're all quite proud of them.

We've decided that, as one way to assuage my feelings about "leaving the old home," we should have a little party, to which we are inviting all the clients, past and present who made the whole thing possible; some of our competitors whom we respect; and some of our own "alumni group" who have gone out of here into their own business or elsewhere--and, not least of all, some good friends.

It isn't going to be a massive party, but we will have plenty to drink! The cocktail party will be in our new offices on the 37th floor of the new Time-Life Building between 50th and 51st Streets on the Avenue of the Americas, from five to eight o'clock on Tuesday, June 28. We greatly hope the enclosed card will come back saying that you will join us, even if only for a short time.

Cordially yours,

Elmo

Elmo Roper

Roper, Elmo

MEMO TO: Members of the Society of Profound Thinkers

DATE: April 8, 1959

FROM: Elmo Roper

As I told you, we were unable to get together a quorum of Profound Thinkers for the April date when Don Nelson was sure to be here, but I have now ascertained that at least two of us--Frank Folsom and I--are free for the evenings of May 6th or 7th, when either one of us will be glad to play host.

Both of us are saving these evenings, but we'd like to know as soon as possible whether a quorum is going to be available. I do hope you can come, and I would appreciate your letting me know if both dates are all right and, if so, which one is preferable.

Rather use the telephone

N.B. quorum not available postponed till fall

New York, New York

Dear Ed:

I am enclosing the results of a recent survey of American attitudes toward General de Gaulle. It indicates that the fears of de Gaulle's possible dictatorial tendencies, which have been expressed by a number of observers, are largely discounted by the American public. This is especially true of those with the most formal education.

If you should wish to use these findings in any way, I should be glad to have you do so. Will you please credit the source as Elmo Roper and Associates.

Yours sincerely,

Elmo

THE PUBLIC PULSE

By Elmo Roper and Associates

(For Immediate Release)

AMERICANS HOPEFUL ABOUT DE GAULLE

When General Charles de Gaulle acceded to power on the first of June, the reaction of our State Department was restrained. Some influential segments of the press viewed the event with misgivings. Not so with the American public, however.

Americans apparently remember de Gaulle as the heroic leader of the Free French forces during World War II, when he, more than any other man, kept alive the pride and spirit of a nation then doubly humiliated by German oppression and the existence of the French Vichy government. When we asked them the probable impact of his leadership on the French nation, here was the answer:

> Some people say de Gaulle's leadership would be bad for France because he would turn out to be a dictator. Others say he would be good for France because he would provide political stability. Do you think de Gaulle's leadership of France would probably be more good than bad, or more bad than good?

More good than bad	52%
More bad than good	11
Express no opinion	37

The American public's inclination to expect good results from de Gaulle's ascendency may come in part from the feeling that things in France could hardly get worse. Things could, in fact, get much worse, if de Gaulle failed to establish his authority and ended riding the tiger of Algerian dissidence along a path leading to civil war or military dictatorship. The evidence, so far, is that de Gaulle prefers moderation in North Africa and a strong, but clearly constitutional government at home--something France has long needed. Whether

these preferences will prevail against the passionate partisans of more extreme courses of action is the crucial and unanswered question.

While today's answers do not imply a faith that de Gaulle can solve the all but overwhelming problems that beset him and his cabinet, they do show there is little fear that his leadership is itself a threat to French liberty. Among groups traditionally most interested and informed about foreign affairs, such distrust is at a minimum. Among college-educated people, the ratio in favor of de Gaulle is ten to one:

	Grade school or less	High School	College
De Gaulle's leadership of France would probably be:			
More good than bad	34%	52%	73%
More bad than good	13	11	7
Express no opinion	53	37	20

De Gaulle gets a confidence vote of nine to one among Independents, six to one among Republicans, and four to one among Democrats. But in no political group does the negative vote exceed 12 per cent; it is the "don't know" answers that rise the most among groups less enthusiastic about the General. (In fact, the "don't knows" were high for most groups, which probably reflected the difficulty of passing judgment on, and for many, the low level of interest in such a distant and uncertain situation.)

Once de Gaulle led a government without a country; he has now been called to lead a country without a government. The hopes and best wishes of the American people are with him in his efforts.

Roper, Elmo

MEMORANDUM

TO: Ed June 2, 1958

FROM: Elmo

The reactions to Issue No. 1 of The Public Pulse were far more widespread than even we had hoped and included a good many critical remarks about type size, etc.

I hope that in this issue we have corrected at least some of the mistakes, and again, I would welcome your criticisms of this issue.

Research Behind the Iron Curtain

A communist country is experimenting—cautiously—with public opinion surveys

Professor Paul Lazarsfeld, Executive Officer of the Department of Sociology, Columbia University, and a consultant to the firm of Elmo Roper and Associates, recently returned from a foundation-sponsored investigation in Europe. Part of his time was spent in Poland. What he discovered was surprising. Herewith, excerpts from his account for readers of The Public Pulse.

That a government should want to know the thoughts and wishes of its citizens would seem to Americans a matter of course. That a *communist* government should solicit public opinion through American-style research in the social sciences is quite another matter—but that is what is happening in Poland today.

This may seem a strange and contradictory state of affairs, but there it is. In the course of two weeks spent advising Polish social scientists on research problems, I encountered questions about interviewing and sampling methods that might well have been asked me by the most knowing American research group.

During the Stalinist period in Poland —before the revolution of October 1956 — the teaching and practice of social and opinion research was under a total ban. But the Poles have always shown a strange reluctance, not always shared by other satellite countries, to assassinate citizens thought useless or dangerous to the state. So instead of being executed or jailed, Poland's social scientists found themselves pensioned off—at full salary. They used these years of enforced leisure to bring themselves up to date on American research methods.

When the Gomulka regime came to power it made several radical new decisions. The most radical of all was that so far as possible the government should tell the people the truth. The October 1956 revolution had made it clear that publishing stories of economic feats of strength did not heighten morale or increase socialist prosperity but simply deepened the bitterness bred of chronic economic lack. Only through releasing honest statistics about the condition of the country, the Gomulka regime felt, could people's willingness to work toward bettering that condition be gained.

A second decision was *to measure the people's discontent*—as well as their hopes and demands—through scientific survey methods. The old method of a strictly one-way flow of communication and control had failed; the government would now try to start at least a limited flow in both directions. The social scientists who had been pensioned off were put back into harness. Social research in Poland is now growing so fast there aren't enough men to teach or direct it.

"Daddy, who is that . . ."

[See SHERMAN, page 4]

One survey under way during my visit aimed to discover the degree of tension existing between bureaucrats who had gotten their posts through their academic qualifications, and those who had risen from the proletarian ranks through natural ability and/or Party participation. The strange alliance between Communism and Western social science now existing in Poland was dramatized in the discussions of this survey, when seminar students raised the technical question: "Would it be better to use Party members or non-members as interviewers?" They discussed, in calm, realistic terms, whether use of the Party's official status would be more likely to produce honesty or deception. (The debate ended with the question to be tested further.)

Other surveys at present under way deal with the living conditions of textile workers, the political attitudes of students, the "power structure" of rural communities. While I was there, a series of surveys had just been completed which revealed that factory workers were feeling increasingly disappointed and resentful toward the Workers Councils, which seemed to have lost interest in the workers' problems to which they were supposed to be devoted, and had become involved instead with management. Since then the Workers Councils have been abolished, and I suspect the reason lies in these surveys rather than in a government clamp-down on workers, as the American press has speculated.

Polish researchers are proceeding cautiously, uncertain of the government's reaction to findings that might be unfavorable toward the regime. Yet

professors in Europe have much more prestige than in the United States, and I am inclined to expect that—barring Russian interference—the freedom of social research will continue.

Just before I came to Warsaw the government-controlled radio system had set up a division for listener research. The young social scientists set to work there expressed a desire to make general opinion-sampling studies and not be restricted to studying attitudes toward programs only. The director of the radio system explained to me that he would let them go ahead because Poland needed to use all its intellectual resources; if these young people were so keen on public opinion sampling, let them show what they could do.

It is even possible that consumer research might develop. The Gomulka government favors a considerable decentralization of Poland's economic planning machinery, explaining this in terms of the need to adapt economic policy to regional conditions. From there it is only a small step to begin surveying consumer preferences. But the small step might take a long time. Poland is still so poor that the needs for clothing and simple household goods are too obvious to require surveys.

We of the West should follow the results of the Polish studies with great care. A new generation of Poles is growing up which must be expected to hold beliefs very different from ours regarding private property and the role of government in economic and cultural policy-making; we have no grounds for assuming this to be mere lip-service. Whether we like it or not, we should know about such developments.

Poland at present is in effect a social laboratory in which an attempt is being made to adapt some Western techniques to further socialist goals. One Polish social scientist put it this way: "In Russia, there is plenty of government action and no opinion research. In America you have plenty of research and little government action based on that research. We in Poland are in the unique circumstance of having power to do research *and* translate its results into policy. This is quite an opportunity for people like me."

Motivation *Plus* . . .

. . . or, how to have more Tea with less Lemon

Quantitative research, often erroneously dismissed as "nose counting," has its virtues—and its detractors. In part, it determines "how many," and the sex, age, economic level, etc., of an actual or potential market. *Qualitative* research, to find out why people do as they do or think as they think, also has its virtues, and some earned enemies.

These two approaches are not alternative ways of doing the same thing; both actually are at their best when jointly directed at the same problem. When they are, the advantages can be significant. There is, for example, a cost advantage—one study instead of two. But an even more important advantage is the ability to obtain sound psychological results on a statistically reliable base.

In a study for the Tea Bureau in 1948, long before the word "motivational" had become a research adjective, qualitative or image-finding techniques were incorporated into what was essentially a statistical measure of the markets for tea and competitive beverages. This study revealed the existence of a number of negative concepts about tea, plus some positive concepts that were not any too strong.

The results of some of the answers to a word association question will serve as an illustration of how the study was made. Respondents were presented with a list of 32 words and phrases and were asked to name all they regarded as descriptive of tea. These were the most commonly given answers:

	%		%
Englishmen	26	Thin drink	19
Mild	22	Delicate	17
Relaxing	22	Satisfying	16
Light	21	Invalids	13
Soothing	19	Peps you up	12

People had a strong tendency to characterize tea as a thin, pallid, effete kind of drink; the per capita consumption of tea was consistent with this concept. The tea industry then engaged in a vigorous campaign to change the public image of tea and increase tea sales. Unlike many clients, they were not in a position to change the product itself; hence their efforts were necessarily restricted to changing attitudes—a formidable task but one in which the research results pointed out some necessary steps. Shortly after the campaign began, tea consumption started up.

Several years after this, essentially the same study was repeated, including its motivational aspect. While the same ten out of 32 words and phrases were again most frequently named, the emphasis had shifted markedly:

	New %	Old %		New %	Old %
Relaxing	26	(22)	Mild	16	(22)
Soothing	21	(19)	Thin drink	14	(19)
Satisfying	18	(16)	Peps you up	14	(12)
Light	18	(21)	Delicate	14	(17)
Englishmen	18	(26)	Invalids	12	(13)

In these new answers the more positive concepts which the industry had been promoting—"peps you up," "satisfying," for example—registered gains, while the more effete connotations—"light," "mild," "thin," "delicate," etc.—declined.

The second study tended to validate the conclusions drawn from the first—that the image of tea needed changing. It also indicated that the campaign had been effective in causing this change:

FROM OUR WASHINGTON CORRESPONDENT

Contrary to widespread rumors, it can be stated authoritatively that the Subcommittee on Monopoly and Anti-Trust Legislation of the Senate Judiciary Committee will not investigate the aluminum industry this year. Reason: recent price reductions. The newsprint industry, some of whose members have been worried about an inquiry into its affairs by this same Committee can also relax—for the year 1958, at least.

during the period between studies, per capita consumption of tea rose by 19%.

This was pleasing to the tea industry. From the point of view of research, this pair of studies had added significance: they successfully combined qualitative or projective techniques with quantitative studies, and by so doing, they produced motivational results on a trend basis. The original study showed the nature of the changes that *needed* to be effected. The second study revealed the nature—and the amount—of the changes that *had* been effected.

Nixon: Rocks & Roses

After Latin America, what?

The effects of the shocking threats and violence offered to Vice-President Nixon on his recent Latin American tour—called a "good will tour" before it began—have yet to be fully assessed. On this unhappy journey, Mr. Nixon bore insults addressed much more to the U. S. than to himself, and his conduct under fire will certainly win him some new friends. But there will also be those whose long-standing dislike of the Vice-President will express itself in a sort of "see-what-I-told-you" attitude that will have more emotion in it than reason.

Since the middle of May the eyes of many have been focused on Richard Nixon in a way unpredictable before the episodes of Lima and Caracas. Those detractors who have labeled him "an opportunist" must now explain how he could have walked so incautiously into such a hazard not only to his reputation but to his life and limb. Those who regard him as a man of principle will speak of his bravery under the heaviest international fire directed at the person of an American in high office during this century. A lot of dust will have to settle before the view of Richard Nixon becomes clear again.

What was the view of Nixon before this stinging dust arose? Survey figures gathered in the early spring of 1958 can now well serve as a benchmark for trends later to be reported. As of then, 20 per cent of a national cross section said of Mr. Nixon *"He would probably make a good president"* and 20 per cent said *"He definitely would not make a good president"* thus cancelling each other out. That left:

While Nixon has some weaknesses, he might make a good president *31%*
While he has ability, he probably would not make a very good president *19%*
Express no opinion *10%*

(Continued on page 4, column 2)

STUDIES IN THE MARKETPLACE

When studies are conducted for industrial clients, the client must approve the information for release to anyone but himself. Sometimes the client will understandably grant his approval only when the material is suitably disguised

Problem Behind Skirts

Brand X, an inexpensive item nationally marketed and widely consumed, "enjoyed" an unusually low share of the market in New England. Before embarking on a special New England campaign, the manufacturer of Brand X needed to find out why. A study was undertaken to explore the strengths and weaknesses of Brand X as New England saw them—but for control purposes the same study was conducted in all other parts of the country, too.

Brand X proved to have no New England problem at all. Brand X instead had a Woman problem—everywhere. Women turned out to be a disproportionately large segment of the market for such merchandise in New England and a smaller segment of the market everywhere else—and women didn't much like Brand X. The problem thus became not one of finding out what peculiar factors motivated New Englanders, but rather one of determining how to change the product for greater appeal to women *everywhere*. Brand X's problem was less difficult once it was identified as being clad in skirts, not granite.

Bank Statement

This is the story of Bank A—a successful bank in a middle-sized Midwestern community. It did more business than all its competitors combined; on the surface it had nothing to worry about. Because it was not *quite* satisfied that things were as serene as they seemed, it commissioned a survey among the local townspeople.

Most of the survey results surprised no one. Sixty per cent of the people who used any bank, used Bank A. People called it safe, sound, reliable, and convenient. Its customers appeared satisfied. But that was not quite the end of the story.

Three other pieces of information turned up which flawed the picture of Bank A's unchallenged dominance. *First:* although Bank A led the field in all traditional banking functions, Bank B was ahead in some newer and fast growing forms of borrowing—personal loans and auto financing. *Second:* although people had unquestioned confidence in Bank A, they were less impressed with the speed and courtesy of its service. Customers of Bank B, on the other hand, saw theirs as a friendly bank providing quick, efficient service. *Third:* Bank A was the clear choice of people over 50, but the younger generation was distinctly cooler to it.

All three "flaws" pointed to the same conclusion: that yesterday's formula for success may throttle tomorrow's growth. Although the old established banking institution faced no immediate threat to its position in the community, its policies weren't fully taking into account the changing patterns of saving and borrowing in a population becoming less interested in banking dignity and more interested in a quick flow of money from banking source to consumer goods.

Bottled in Bonds

A company which had fallen on bad financial times for a number of years in a row had an issue of 8 per cent bonds outstanding on which it could not pay the interest. The company came out of the red and began making money, but the accumulated interest on the bonds was by now greater than the bonds' total value. Dividends on the company's common stock could thus not be declared despite new profits.

The company developed a reorganization plan which involved redeeming the bonds, partly in cash and partially by the issuance of new common stock. But the company was concerned lest the bondholders would voice strong objections.

Research revealed quite the reverse. A study made among a number of the larger bondholders, who were identified to be *also* large common stockholders, showed that in many cases their stockholdings were of far greater importance to them than their bondholdings. They were delighted with any plan which would permit the common stock to pay dividends.

A sample of the smaller bondholders was also interviewed. These, too, not only did not oppose the plan, but were delighted with it—for an entirely different reason. They had pretty much given up hope and written the bonds off as valueless. The stock was of no interest to them—they just wanted to get out. And 40 cents on the dollar in cash was a lot better than their previous hopes.

Armed with the facts, the company put its plan into effect. Its financial strength was ultimately and happily re-established.

FRAMES OF MIND

The Overseas Press Club is an organization of some 1900 past and present foreign correspondents. At its request, Elmo Roper and Associates recently conducted a mail survey of its members' opinions. Highlights from the resulting (25%) responses:

Is America doing the right things to prevent another war? No. 65% of correspondents say we are falling short of all we might do.

*

Will there be a war, then? Yes. 71% say there will, whether limited or unlimited. "Begin in Middle East," 61%; "North Africa," 18%.

*

Where are we weak? In the Administration's handling of foreign affairs. 60% of correspondents give it a "failing grade" (compared to only 15% of the public answering the same question).

*

What is the Administration doing wrong? Main criticism, by 26%: "inadequate, unimaginative leadership; lack of a firm, creative foreign policy."

*

Where is the Administration doing best toward war prevention? 37% say economic and technical assistance abroad.

*

Future Russian successes in foreign policy? 13% say United Arab Republic will be next country to fall under Russian control; 6% say Indonesia.

*

Future Russian troubles in foreign policy? Poland, say 26%, will be place of next anti-Russian revolt; 19% say East Germany; 6% say Czechoslovakia.

*

Trade with Red China? 32% say go ahead and trade; 39% are for "limited trade." (Against this 71% total, the public at large musters only a corresponding 32%.)

*

Admit Red China to the U.N.? Yes, say 51%, while 20% say "not now" and 25% are opposed. (Only 27% of public thinks the bars should be let down, now or ever.)

*

Greatest man ever interviewed? F.D.R. and Churchill tie for first place with 9%.

*

Most overrated man ever interviewed? Eisenhower in first place with 12%. MacArthur and Harold Stassen tie for runners-up with 3%.

*

Most disliked person? India's Krishna Menon at 3%; followed by MacArthur, McCarthy, Hitler, Nehru, De Gaulle, Dulles, all 2%.

*

Most dangerous man and greatest force for evil? Khrushchev, at 32%. Nasser, with 15%, is undisputed runner-up.

So within the political temperate zone as opposed to the poles, the Vice-President got a three-to-two ratio of approval from the public of all political shades. When Democrats were separated from Republicans, a more vivid pattern appeared:

Nixon as President:	Reps.	Dems.
	%	%
"Good"	40	10
"Maybe good"	41	25
"Probably not"	9	26
"Definitely not"	4	29
"Don't know"	6	10
	100%	100%

A year before his Latin-American tour, a new receptiveness toward Richard Nixon began to be apparent in the U. S. A nationwide survey then showed that 18 per cent of the public had revised their opinions of the Vice-President favorably, compared to views held around 1955, whereas only 3 per cent became cooler toward him during the same period. Nothing could better illustrate the necessity for the constant evaluation of public opinion in a democracy than the need now to see, as soon as possible, what Latin America has or hasn't done to the political fortunes of a man from California.

Who is Sherman?

It all depends on where you start

Adapted from an article in the Public Relations Journal, *April 1958, by* G. D. Wiebe, *Partner, Elmo Roper and Associates.*

Among the monuments in Central Park, there is an equestrian bronze of General Sherman. A father had been in the habit of taking his son for a walk each evening "to Sherman and back," and the little boy became intensely attached to Sherman. It was not until after many visits that it occurred to the little boy to ask, "Daddy, who is that sitting on Sherman?"

If father and son, who presumably understand each other very well, could focus on such wholly different aspects of the same object, it is hard to overestimate the size of the communications problems that can exist between a corporation and the public. In an increasingly complex society, it is increasingly dangerous to assume that a company is known and judged on what it thinks are its evident merits.

As soon as we face up to the obvious fact that people are enormously complex, that they are beset by thousands of past memories and present stimuli, and that they accept new ideas that fit most comfortably with their older ideas, the center of interest of public relations research shifts from the corporation to how people perceive the corporation. A message, regardless of its authenticity, is likely to be rejected or twisted into a more "fitting" shape when it doesn't make sense in terms of what people already think they know.

Even in matters where people have much at stake, and know it, old memories, prejudices and quirks of personality creep in to compromise their thinking. When people don't see much at stake, their thinking will be even less clear and disciplined. Most people are casual—to the point of shallow carelessness—about the company that means so much to you. So it is natural that PR men are often faced with strange but nonetheless real tangles of irrelevant and mistaken notions that get hooked up with their companies in the perceptual processes of the public. The problem is to chart not only the rational elements but the irrational ones which provide the context in which people perceive what they think they are looking at.

A study for a large company, recently completed by Elmo Roper and Associates, showed that a factual information theme regarding the company and its services was getting little serious attention. It was simply not believed by enough people. Additional data showed why. Prejudice, folklore, gossip and a consensus of old misinformation combined not only to outweigh the authentic public relations message but to discredit it.

The solution to the problem was many-sided. But in part it was to select a theme in an area uncontaminated by popular misinformation, as a means of persuading people to try the company's service and thus to expose their misconceptions to the corrective influence of personal experience. The tactic was 1) chart the "perceptual context in which the public sees the company"; 2) with these findings as basic intelligence, tailor constructive and authentic messages which would gather strength from, not clash with, people's preconceptions of the company.

Mr. Edward R. Murrow
485 Madison Avenue
New York 22, New York

Dear Ed:

You were very nice to write me as you did on March 19th about The Public Pulse, and naturally I am very reassured to find that you thought it passed muster. It was really the brainchild of Bud Roper and Eric Hodgins, and if it comes off and succeeds in its purpose, it's to their credit.

I may very well be doing something in television soon--but in this case, "soon" means 1960. I am meeting with Sig Mickelson soon to try to resolve an "agreement in principle" into the specific details of having something to do with the 1960 elections.

If this happens, I think you and I ought to agree to do a little advance planning as to what we should do with those hours that are free to us after the convention sessions in whatever convention cities there are!

Cordially yours,

Elmo

Elmo Roper

Roper, Elmo.

March 19, 1958

Dear Elmo:

If only you would do something in television rather than in print, then I could write you a critique. The only thing I can say about "The Public Pulse" is that I think the format is most attractive and the content of the first one altogether interesting.

I will even pay for subsequent issues!

As ever yours,

Mr. Elmo Roper
30 Rockefeller Plaza
New York, New York

MEMORANDUM

TO: Ed

March 17, 1958

FROM: Elmo

The publication of this four-pager, "The Public Pulse," is a new sort of activity for us. I'd certainly be grateful for your comments on this maiden effort as to looks, contents, and general appropriateness--as soon as you've had time to look it over--so that all of us here can have the benefit of your comments or criticisms before we publish a second issue.

ELMO ROPER AND ASSOCIATES

The P[redacted]

The "Subliminal Advertising" Controversy

Or, who is getting conscious of his Unconscious?

Right under the word *sublime* in the dictionary is the word *subliminal.* They are not natural neighbors. The Latin *limen* means threshold. So whereas sublime is another word for exalted, subliminal means that which lies under the threshold. And a subliminal approach to the consumer is at present stirring up a dust which is not going to settle right away. The threshold involved is that which guards the consumer's conscious mind.

Late last year, James M. Vicary and his Subliminal Projection Corporation staged a demonstration for the press. "We have attended many a history-making hoedown in New York," wrote *The New Yorker*, as soon as it could get its breath, "but this jig was the creepiest." The demonstration was to show an application of subliminal projection techniques to advertising. At the same time that reporters viewed a motion picture, "Secrets of the Reef," a message suggesting that they drink Coca-Cola was flashed on the screen at a light intensity lower than the rest of the film, and for periods of one three-thousandth of a second per flash. The message, although invisible to viewers, presumably reached their unconscious minds.

According to Mr. Vicary, a test of the effectiveness of this subliminal advertising over a six-week period in a theater in New Jersey had reached approximately forty-five thousand persons, conveying two messages: one suggesting recourse to the Coca-Cola bottle, the other suggesting that the audience eat popcorn. During the test period, it was reported, popcorn sales increased 58 per cent, and Coca-Cola sales 18 per cent. (One cynic disparaged these figures on the ground that so high a popcorn increase should have created more thirst for Coca-Cola.)

Despite this recent stir, there is nothing new about subliminal projection. Psychologists have been experimenting in this area since 1900, and techniques of subliminal application have been widely studied. The actual machine now being used to project subliminal messages on a movie or television screen is described as being contained "in a box about the size of an extra-fat attaché case." Chances are it contains some variety of *tachistoscope*, a device long used in experimental psychology laboratories to regulate the exposure of an image. By gradual reduction of the time of exposure it is possible to determine the point at which the threshold of conscious perception is reached.

There is little reason to doubt the effectiveness of subliminal influences. All of us spend a good part of our lives responding to stimuli of which we may never be aware. Consider, for example, an electric-spectacular sign in mid-Manhattan exhorting people to buy a Fedders air-conditioning unit. This sign flashes off and on every few seconds. The company spends many thousands of dollars every year to maintain it—and undoubtedly has no idea how many air-conditioning units it sells thereby. Some people in the vast throngs that mill up and down Broadway each day probably never even see the sign. Others aren't aware of seeing it, yet its image flashes across their vision and gets stored among the sights and sensations of the day. Still others may consciously see and read. But few, if any, of these people will rush to their dealer and buy a Fedders air-conditioner then and there. And among those who do make a purchase within the next few years, few, if any, will be aware of the influence a particular sign had on their purchase. There is nothing subliminal about an electric-spectacular sign on Broadway, but its *effects* can be subliminal just the same.

Sometimes the "subliminal" may be simply a matter of creating the right atmosphere. Take the case of the well-educated and well-heeled political candidate stumping in a rural area. His wardrobe may consist heavily of items from Brooks Brothers, but on this occasion he removes a rumpled coat to display a pair of loud red galluses. How many farmers will be motivated to think kindly toward our candidate at least in part because the galluses may have reassured the farmer without ever reaching his conscious attention?

There is, however, a specific difference between the subliminal approach and other indirect methods of advertising appeal. You can see the galluses of the political candidate, *if you look*—and decide then, if it occurs to you, whether they are a "device." And you can see—and stop to examine, if you wish—the billboard. You decide for yourself whether the picture of a ballplayer smoking a cigarette provides a good reason for you to smoke one of the same brand. One strong opponent of subliminal advertising makes his objection that "it isn't available to rational scrutiny by the person exposed to it." Clearly, this is the

difference. The extent to which this may make subliminal advertising an evil is one of the matters now under discussion.

The answer offered by the Subliminal Projection Company to the "not available for scrutiny" charge is that the Company invites some form of regulation for its technique. The Federal Communications Commission was looking into the whole business during early 1958 —at a time when it had other and more pressing worries on its mind. "We want positive Federal or industry regulation," says Mr. Vicary. "We are actively seeking it." So far as TV broadcasting is concerned, he scarcely needs to—Section 317 of the act under which the FCC makes its rulings requires that all advertisers be identified.

But what form regulation of the subliminal pitch might take is still uncertain. A second big question about subliminal projection is that, with the exception of the somewhat skimpy tests in New Jersey, very little is known as to its actual effectiveness. It certainly does not produce a hypnotic trance effect such as some of its opponents ascribe to it. Mr. Vicary sees it only as "reminder" advertising and envisions it as serving in a new but small role in the over-all advertising complex. As he presents it, subliminal's value will be in getting the Coca-Cola drinker to consume a little more. He does not contemplate converting beer drinkers into Coke drinkers, or WCTU members into bottle-a-day girls.

Presumably, if the subliminal sell were attempted in political broadcasts, a mighty stink would arise. And there is certainly a danger here, even if of unknown size. The subliminal technique might prove so weak as to be not worth any real expenditure of advertising dollars. On the other hand, it *could* develop into something so powerful that people's minds could be invaded and manipulated in the realm of morals and ideas.

Late last year, the major television networks announced their own ban on subliminal advertising. The National Association of Radio and Television Broadcasters has requested its membership not to use it. These safeguards seem appropriate for the moment, no matter where one stands on the larger issue of whether subliminal advertising is "good" or "bad." Before any more positive steps are taken, more clinical study is clearly called for. Only then can a complete assessment be made of subliminal's future. Until that time there can be nothing but conjecture whether we have here a useful —and possibly less annoying—new advertising tool, or a dangerous lunge toward Big Brotherism.

Why were we out-Sputniked?

The public has many answers from penitent to unconcerned

Why the Russians were *really* able to launch more and bigger artificial satellites sooner than their American counterparts may prove, in the long run, to be a question as unanswerable as why it was an Englishman who formulated the law of gravity or a Polish woman who discovered radium. But where facts are obscure opinion can be revealing—and the dictum that opinion, right or wrong, is as socially important as fact is one that can never be forgotten.

Asked to express opinions why the U.S. had been out-Sputniked, the American public responded with alacrity. More people named American-Soviet educational differences than any other factor. Here is the way a national cross-section ranked a list of possible reasons during the four-month period of national self-questioning between Sputnik I and the Army's small but successful Explorer I:

Our educational system has had different goals from Russia's...	36%
We haven't put enough money into our satellite program.....	28%
Our armed services have been fighting among themselves.....	26%
A democratic government doesn't move as fast as a dictatorship..	21%
We haven't had the right kind of leadership in Washington.....	19%
The Russians were just lucky in hitting on the way to do it first.	15%
Our scientists are not as good as Russia's.....	11%
We've been too busy making consumers' goods.....	10%
Express no opinion.....	11%

(*Figures add to more than 100% because some respondents gave more than one answer*)

Besides naming our educational deficiencies, a good portion of the public stands convinced that skimpy appropriations and inter-service rivalries hampered the U.S. satellite program. This comes as no surprise, considering the thorough airing of these charges in the press. The news lies in the factors the public *rejects* as contributing to the Russian coup.

Item: The public does not shrug off the Sputniks as lucky flukes. Item: Neither does it indulge in a tirade against imagined inadequacies of American science. Most significant item of all: The public does not believe that the American preoccupation with high personal consumption of goods, the like of which cannot be found in the stores of any other nation on earth, has had anything to do with our serious falling behind in the engineering of defense and national security. It does not perceive any self-imposed belt-tightening as part of the necessary repair work to the U.S. position as an international superpower.

As of the early months of 1958, guns *and* butter remain the public's confident expectation. If Professor Klaus Knorr of the Princeton University Center of International Studies is right that we must "give up a great deal of what is worth defending in order to improve the chances of protecting the rest," a shock may be in store somewhere in the future for which there seems, so far, only a minimum of public preparation.

Education, Anyone?

Some old facts, revisited, take on a new significance

Nowhere did the orbiting Sputniks jar the United States harder toward the end of 1957 than in the great, confused domain of its educational aims and systems. That Russia had developed scientists and engineers capable of doing something then still beyond the capabilities of American scientists and engineers was a bitter and gagging pill to swallow. But we had to swallow it.

Yet the Sputniks did not tell alert Americans anything they did not already know. They knew that American education, and hence America, was in trouble. There was, and is, the trouble of softness in school curricula that emphasizes how-to-get-along courses and integration-with-the-group at the expense of the hard disciplines of really learning to read, write, calculate—and hence to think. There was, and is, the trouble of inferior status and low pay for American teachers by any proper standards—and most particularly by standards in Russia, where university professors are the highest paid professionals in any walk of society, and young graduates strive for a teacher's career because its rewards in prestige and perquisites are so high. The awesome certainty, known to all educators, of a doubling of school and college populations in the United States between now and 1970 compounds all other troubles.

Notwithstanding even this last long-evident fact, the House of Representatives in 1957 killed President Eisenhower's Federal Aid to Education bill, designed to provide $1,300,000,000 for new school construction over the next four years—an action of which it will probably not boast in 1958. In doing so, it demonstrated how far behind public opinion the Congress is capable of lagging. Although even now there continues to be talk of the "dangers" of even limited Federal aid to schools, the majority of public opinion was quite unalarmed in its answers to this question:

"Our public schools are having a hard time finding funds so that they can keep up with our population growth and maintain high educational standards. Which of these statements best expresses your feelings about how this problem should be solved?"

Public schools should depend entirely on local financing	16%
Federal aid for building new schools should be provided, but teachers' salaries and everything else should be paid for with local funds	30%
Federal aid should be given for building new schools and *paying teachers' salaries*	43%
Express no opinion	11%
	100%

In short, those among the public believing in full, unrestricted Federal aid to education outnumber the "local only" believers by almost three to one—and as a buffer between these two points of view lies a substantial 30% vote that school construction funds should be provided by the Federal Government.

(*Continued on page 4, column 2*)

STUDIES IN THE MARKETPLACE

TV or Not TV?

Ignorance was less troublesome, Artemus Ward said, long ago, than "people's knowing so much that ain't so." A recent study designed to measure the simple impact of an advertising campaign recently provided clear-cut evidence of the extent to which people's memories may distort or even falsify their original perceptions.

The study took place in several test markets where a new product was being introduced. In each of these markets different media were used to announce the product. Successive waves of interviews (with different but comparable groups of people) were made to determine how fast knowledge of the new product was spreading. A primary purpose of the study was to determine how long the introductory campaign should run when the product was marketed nationally—but, as is often the case, other significant facts came to light at the same time.

The technique was to ask the respondents if they had seen or heard of "any new development or new product in [such-and-such a] field." If they said they had, they were asked to describe the new thing. Those—and only those—who successfully described it were *then* asked how or where they first heard about it or saw it.

In Test Market X, the group able to make positive identification of the product grew at a gratifying rate. On the first wave of interviewing, 7 per cent said they had heard about the product over the radio, and 3 per cent named television. Thereafter:

¶ Four weeks later, only 3 per cent said they had heard about the product on radio, but the group naming television had grown to 9 per cent.

¶ Six weeks later, the radio figure held firm at 3 per cent, but the television figure had risen to 17 per cent.

What makes such figures remarkable is this: *At no time in this market was television used to promote the product at all.* Accurate though their knowledge of the product was, and vivid though their impressions of it were, substantial numbers of people were not merely ignorant of how they had gained their knowledge—they had positive and mistaken ideas of how it had come to them.

These figures show the power of television, and also the exaggeration of that power. Television plays such an all-consuming role in many people's lives that they tend to see it as the source of experience actually gained elsewhere. But the figures also demonstrate a universal human tendency to remember, not actual experience, but experience as fitting into the frameworks people carry around with them to organize what would otherwise be an overwhelmingly diffuse collection of sensations. Here must be a major cause for the way in which people cling to old, irrelevant ideas about people, politics, and products. And it illustrates a key research point: that without an understanding of how people's *general* ways of looking at things operate on the *specific* information being imparted, communication may be so incomplete as to be worthless.

The Taste of Boxes

Before introducing the new Parliament cigarette in the blue box, Philip Morris Incorporated conducted a series of tests to determine whether the new box design should be printed in red or blue . . . or whether it made any difference. It *did* make a difference.

Smokers were given identical cigarettes in identical boxes with identical designs. The only difference in the packages of cigarettes they were given was that one package was red and white, the other blue and white.

Although this was the only difference, the difference was not pointed out, nor was it pointed out that in all other ways the cigarettes and packages were identical. In short, the matter of similarity or difference was never discussed with the respondents.

After smokers had had a chance to smoke both packages of cigarettes (in fact, several packages of each), they were re-interviewed. One of the questions they were asked was which package they preferred—"forgetting for a moment about the cigarettes in them." The red package was clearly preferred.

Why, then, did Philip Morris bring Parliament out in the blue package?

Two other questions asked on the re-interview showed that the expressed preference for the red package was not a true measure of its merits. For respondents had also been asked which *of the cigarettes* they preferred. Although the cigarettes were identical, the cigarettes in the blue package won handily over those in the red. "Everything considered," people were asked, "which cigarette would they be most apt to buy?" Again, the cigarettes in the blue package were preferred. Answers revealed that people felt convinced that the cigarettes in the blue package contained higher quality tobacco, were smoother, finer tasting. In short, the blue package, although not liked as well as the red, imparted more of the Parliament tradition of quality to the product itself.

FRAMES OF MIND

The public has opinions on almost everything that can be talked about. Herewith a sampling of diverse topics from recent survey investigations.

The public says "Yes" to the President's request for expanded military funds, and "No" to taking those funds from established domestic programs. Sixty-five per cent want to put more billions into defense, with 22 per cent opposed. But proposed cuts in domestic programs are vetoed by 59 per cent, with only 25 per cent willing to accept less domestic Federal activity.

*

Despite Soviet inroads into Asian-African neutralism through bold assistance programs, the public favors keeping U.S. aid and loans to underdeveloped nations around present levels. Only 18 per cent are convinced that more is needed to meet this newest Soviet challenge. Twenty-two per cent, on the other hand, think we are already doing too much; leaving 42 per cent who think what we are doing is well enough and should be left alone.

*

The public is not content with the present status of the North Atlantic Treaty Organization. Thirty-four per cent think NATO should be transformed into a genuine policy-making instrument of the North Atlantic powers. A smaller 23 per cent feel the present arrangement is adequate. But 21 per cent think we should worry less about our European allies and rely on a "fortress America" approach to survival in the thermonuclear age.

*

Two Democrats top a list of prominent senators in public admiration. John Kennedy of Massachusetts takes first place, thought of highly by 30 per cent of a national cross-section; Estes Kefauver of Tennessee is close behind him with 26 per cent. Third and fourth places go to Minority Leader Knowland of California (21 per cent) and Majority Leader Lyndon Johnson of Texas (17 per cent).

*

Curiously, this does not mean that exclusively Democratic voters have rallied behind Senator Kennedy; actually he gets a slightly *higher* popularity vote from people calling themselves Republicans and Independents.

*

Senator Kennedy, a Catholic, may have a better chance at the Presidency than Catholics before him. At any rate, 51 per cent of a national cross-section *say* that a candidate's religion would not of itself affect their vote for a President. But the idea of a Catholic in the White House is still heavily resisted by a politically important 21 per cent—and another 19 per cent express some doubts.

The most dramatic thing about these figures is not that they are new, but that they are already a trifle old: they were gathered by Elmo Roper and Associates in the early spring of 1957, more than half a year before the word *Sputnik* had any meaning in the English language.

Now and newly, the Eisenhower administration is proposing a four-year emergency aid program of $1 billion to education, the emphasis of which is not on school construction at all, but on scholarships for gifted students (of whom almost a quarter-million annually do not go on to college), the encouragement of training for college teachers, and the improvement of teacher-training programs generally. Doubtless this bill, too, will encounter resistance: not only from conservatives who will consider it wrong, but from liberals who will consider it insufficient. But in the light of the verdict already rendered, neither side can say that public opinion will be alarmed in the slightest by this proposal for Federal subvention in what was once considered a wholly "local" problem.

Williamstown's 7,500,000 Punch Cards

The Roper Public Opinion Research Center there is becoming a unique repository of social science data

As the infant science of marketing research and its twin brother, public opinion research, developed and came to be trusted, increasing demands developed from scholars for access to the raw material itself—the IBM punch cards which contained the answers to the questions. The scholars' point was that all of the significant cross-tabulations and correlations had certainly not been thought of; if new access were allowed to the raw material, a considerable new contribution might be made to the knowledge of why man behaves as he does.

But since much of marketing and opinion research is done for clients on a confidential basis, opening the data to others presented a difficult problem. About twelve years ago a conference of leading scholars from several major colleges and universities met with Elmo Roper (this was in the days before "and Associates" had been added to the firm's title) to see if a way could be found to solve it. When it became apparent that, to the scholar, it was not vitally important whether the information was fresh or five years old, a major difficulty was overcome. Permission was gained from *Time Inc.* to send the original data cards for all the fifteen years of the Roper-conducted *Fortune* Survey to Williams College, where there existed an active interest in establishing such a research center. This Williamstown nucleus began to grow when a few industrial clients also permitted certain specified studies to be lodged there.

During the first few years, the data collection was used largely by professors of economics, political science, and sociology at Williams, and by a few Williams students. As word of its availability got about, usage widened to include students from Harvard, M.I.T., and elsewhere.

A year ago it was decided to expand the Roper Research Center at Williams by providing the personnel to keep the facilities available all summer for scholars working for graduate degrees. The response to this step was so satisfactory that a further one became obvious: to let this center become also the repository for other research firms, so that there might come into being, under one roof and under the direction of a front-rank institution of learning, the largest possible collection of original data on political opinion, buying habits, and all other subjects covered by marketing and opinion research.

As a result twenty-one research groups (including five outside the U.S.) are currently placing their materials at the Roper Center in Williamstown. Among them: American Institute of Public Opinion (Gallup Poll); Crossley, Inc.; Crossley, S-D Surveys, Inc.; International Research Associates; National Opinion Research Center; the Minnesota Poll; the California Poll; the Texas Poll; Wallaces' Farmer and Iowa Homestead; Wisconsin Agriculturist and Farmer; Psychological Corporation of New York; Alfred Politz Research, Inc.; and Washington Public Opinion Laboratory.

Obviously, there are some restrictions on usage. The cards are not intended ever for the use of competitors of a client who originally commissioned a study—even though no study is sent there without the client's express permission and after an agreed-upon lapse of time. Only *bona fide* scholars, working under stipulated conditions of security, have access to the Collection. For these scholars, however, there is now provided at Williams College a collection which probably includes well over 75 per cent of all the marketing and public opinion research which has been done in the world to date.

Roper, Elmo

MEMORANDUM

To: Mr. Murrow

Date: Feb. 28, 1958

From Beverly Friswold
Secretary to Mr. Roper

Mr. Roper thought you might be interested to read the speech he gave at last December's Men's Career Conference at Oberlin College.

ELMO ROPER AND ASSOCIATES

In Search of a Career

We are only partially masters of our own fate, but within the limits of our choice we should know and trust our own desires

By ELMO B. ROPER, JR.

THE FIRST LIMITATION we all have to face is the fact that even the best of us can control probably a good deal less than half of what happens to us in our lives. As one writer put it, "Here and there protrude the granite peaks of the inevitable, but all about is rubble from the landslips of chance." This applies to our work lives as well as to our more clearly unpredictable personal lives. We are limited of course by the kind of work there is a demand for, or which we can *create* a demand for, and by the extent of that demand. These demands are constantly and often rapidly changing. Everyone knows what last session's Congressional budget-slashing did to the peace of mind of engineers, though I doubt if it hurt them much to get down to the plane of job insecurity on which most people are used to living. I should add that their insecurity is nothing compared to the insecurity that gripped the entire nation when Sputniks I and II spelled out our need for the better use of scientific and engineering skills.

We are limited most severely by the state of prosperity or un-prosperity prevailing in the nation. The economic cycle, once nearly as certain as death or at least taxes, is being brought, at least in some measure, under man's control. But while we hope we have built into our economy guarantees against another 1929-style crash, milder dips can still occur, with unexpected and unpleasant effects on our lives. We are seeing one now.

War is the most devastating and, unless we devise new methods of preventing international quarrels, the least preventable factor of all. No one could win another big war, and we have a kind of blind hope that that truth has sunk in deep enough across the globe to keep another big one from starting. But small wars are not especially inconceivable, and the scope of today's "limited wars" would horrify the soldiers of the unmechanized past. Apart from actual destruction, war brings about vast dislocations in our lives and sends its consequences far into the future. It can make Presidents, as well as change the occupations of lesser men.

No one can escape the impact of war or depression. But in addition to that, each of us gets sudden personal blows, each of our lives takes unexpected twists, and we find ourselves, almost without warning, in a new world, or on a new course in the old world, one that we had in no way intended. I think this fact has several lessons in it.

One is that much good can be gotten from these ca-

Keynote speaker at the Men's Career Conference was Elmo B. Roper, Jr. marketing consultant and public opinion analyst. Shown here with President William E. Stevenson, in Finney Chapel, he has just sat down to thunderous applause after delivering his speech.

prices of fortune, if we respond to them in the right way. Some of them are clearly pushes upward. Wendell Willkie came suddenly into the national spotlight through his role in congressional hearings over the sale of utility properties to the TVA, and thereupon won the 1940 Republican presidential nomination against all normal political odds: he was not a politician, but a businessman, and up until a few years before, he had not even been a Republican.

Fate can also deal cruel and killing blows. Franklin Roosevelt was dealt such a blow when he was crippled by infantile paralysis early in what promised to be a brilliant career in public life. For most men this would have put a final damper on any political ambition. Retirement to a life of letters or some other genteel form of relative inactivity would have been the easiest course for him to take. But as we all know, he did not take it. While it is still too early to evaluate his final place in history, he was unquestionably a leader of extraordinary powers and achievements, whose influence on the country has been deep and lasting. He reached the height of his powers not just despite his illness, but probably in part because of it. This is what the British writer, Compton MacKenzie, wrote about those years of illness and recuperation:

"Roosevelt was given the opportunity to spend seven years at the prime of his intellectual vigour in reflecting upon his own rich experience and in contemplating the mundane scene with the eyes of a man of the world. His creative imagination was kept continuously hard at work, while at the same time so great a reserve of energy accumulated and so deep a breath of enthusiasm was inhaled that he was able at the age of forty-seven to re-enter active politics like a man of forty; and the unkind fate which seemed to have robbed him of those seven years handed them back to him untouched by age."

Other happenings may be less easy to evaluate at the time: apparent bad fortune may open new avenues of opportunity, lucky breaks may turn out to be not so lucky. But while we can't prevent these events from occurring, we do have a broad latitude in the way we respond to them. If we hold ourselves rigid against them, fighting them as unwelcome intrusions on our well-planned course, they can defeat us. But if we keep ourselves open and receptive, we can turn the arrows of outrageous fortune into spears for our own advantage. If we are prepared to roll with the punch, and learn from it, we will probably find ourselves stronger for the experience.

Artists call this the ability to "capitalize on our accidents." Many a water color has taken shape around an accidental dribble of paint. Scientists have a fancier name for it: serendipity, which means hitting new scientific discoveries by noticing unexpected phenomena that occur, even though they may have no bearing on the work at hand. The whole synthetic dye industry began by just such a sharply observed accident. About one hundred years ago, the English chemist, Sir William Perkin, who was trying to produce synthetic quinine, succeeded in producing not a drug but a dye. The color, which became known as "mauve," was the first of the aniline dyes. It not only revolutionized the art and science of dyeing; it also created a new foundation for the whole present world of synthetic chemistry. Untold numbers of scientific advances have come about through such *un*anticipated results.

When we have accepted the fact of the control fate has over us, when we have resolved to meet the vagaries of fortune with nimble minds which search for new opportunities created by the new situation, the next thing to do is take that smaller part of our lives that *we* can control, those decisions and those activities that are squarely up to us, and do the very best we can.

Work *Can* be Fun

Choosing a career ought to be the simplest thing in the world. The way to do it, it seems to me, is to sit down and figure out what one likes to do so well that doing it would seem more like vacation than work and then go and get or make a job doing just that, whether it's teaching eight-year olds how to sail in Bar Harbor, Maine, or raising chickens in Arizona to be close to a beloved desert, or whatever. For the great French impressionist, Renoir, the question was just that simple. When, at the age of twenty, he showed his paintings to a famous Paris art teacher, the master commented drily, "You are, I presume, dabbling in paint to amuse yourself." Renoir replied, "Of

A. E. Princehorn

At the session on public administration held in Noah Lounge, Lawrence E. Imhoff, '30, staff assistant in the office of Assistant Secretary for Mineral Resources, United States Department of Interior, Washington, D. C., discusses government work. Bob Adam, '58, student chairman, is on his right.

course. When it ceases to amuse me, I will stop painting." I think that if we all found our way to our life's work that way, everybody in the world would be happier, and moreover, they would probably find themselves making more money out of what they liked, however screwy it might sound, than they would be taking a job after a long search for that industry which is going places the fastest.

But instead this decision is often one of the toughest ones a man, or woman, has to make, and one that many never make to their satisfaction. I'd like to discuss some of the reasons, in my opinion, why this is so, and why it need not be so. I think what stands in the way of clearly knowing what one's own bent is, most of the time, boils down to paying too close attention to what other people think. What other people think can often be very helpful, but used in the wrong way, other people's opinions can ruin one's own chances of a successful career, in the truest sense of the word.

Parental Pressure

The first and most influential "other people" who have ideas about what we should do are, of course, our parents. Although parents vary in degree and type of influence they exert, nowadays I guess the low pressure of "soft" sell is probably typical, most parents have some idea of what they'd like to see their children doing.

These ideas may be good and helpful, or they may be irrelevant and harmful, to the real needs and abilities of the young person. Because the love of parents for their children is a *mixed* thing. Part of it wants to help a young person along toward his own self-discovery, but often there is another part which wants the child to somehow fulfill the parent's own dreams, to make up for his own personal frustrations, or to become a carbon copy of himself. And while it is natural and good to look up to and in some ways to try to be like our parents, we are *not* our parents, we are separate and distinct human beings with our own abilities and aspirations. I am sure most of us realize this only too well. But even if we do, there is often the danger of, consciously or unconsciously, following too closely their image of us, rather than our own. There is also the reverse danger, for the rebelliously inclined, of trying too hard to become something our parents are not, simply to show our independence. Rebellion *can be* as unimaginative as conformity.

These days the normally somewhat trying relationships between parents and children are made doubly difficult by the great gap between the experience of the two generations. I don't suppose college students argue much over evolution any more, at least not about whether or not there is any, and I don't think they spend much time worrying about whether there will be enough jobs to go around when they graduate. The snowballing rate of change characteristic of our century doesn't make communication between generations any easier.

Now I don't want to do away with parents. We may be able to see their blind spots, but they can often help us to see ours, and their opinions may very well be invaluable in *helping us* make this choice of a career. But they cannot make it for us; they cannot save us the trouble of finding out for ourselves where our proper place is.

Common Prejudices

Another barrier to wise career choices comes from the persistence of common prejudices that some lines of work are inherently superior to others, quite apart from the question of how well they are suited to the individual concerned. The most common of these prejudices, and the oldest, is the prejudice against work that is done with the hands, and connected with that, work that can be done without wearing a white collar. Contrasted with such work is brain work, and its lesser adjunct, paper work. Now there is some sense in these prejudices. Really satisfying work for truly educated people demands thought and creativity from those engaged in it. A job which calls for the making of decisions, which involves the use of initiative and the acceptance of responsibility, is surely the kind of job an enterprising young person wants. A job

At Wright Laboratory, Dr. Robert L. Kroc, director of physiological research at Warner-Chilcott Laboratories, Morris Plains, New Jersey, discusses biological science. Robert Hamilton, '59, student chairman of the panel, is on his right. Dr. Kroc was featured in the March 23, 1957 issue of the *Saturday Evening Post* for "perfecting the method of extracting relaxin, of which the drug Releasin [the amazing new drug found to delay labor in premature births] was made." Last year his daughter, Alice, '57, was chairman of the Women's Career Conference.

that is merely routine deadens the faculties, and it is too bad that despite our rapidly automating economy, there are still so many of them to be done.

But *this* distinction, which is the real one, often gets obscured. Routine work often becomes acceptable *if* it is done in an *office,* rather than a *factory.* The wide range of human skills demanded of a man working on a farm, or operating a power shovel is forgotten. Another thing forgotten too, is the fact that people differ greatly, and that a natural forester may make an unhappy lawyer, and that a boy whose real passion begins and ends at working on automobile engines will feel frustrated as a sales manager.

These ideas are deeply ingrained in most of us, and we have to penetrate through them to find out what we ourselves really like to do, or we may find ourselves in a physically comfortable but intellectually empty occupational prison.

I think one of the biggest barriers of all to getting full work satisfaction is an indiscriminate pursuit of money and what passes, with too many, for "success." Now, again, I don't have anything against either. It is a good thing to do well in your efforts and to receive recognition for them. It doesn't even hurt to be well paid!

I do not go along with those who glorify failure and suggest that there is something morally dubious about success. I think that most of the time when a man does something he thoroughly likes, and does it well, real success is the natural consequence. (Not always, opportunity is not yet fully equal, but most of the time.) Nor do I believe in wearing a hair shirt. We Americans have created an impressive level of wealth, and rightly used, it can have an enlarging, liberating effect on human life.

These things are natural fulfillments for people of ability in a world where there is opportunity for its use and recognition, which ours is. However, if a man becomes exclusively absorbed in their pursuit, it is a sign that something is wrong with his feeling about himself and his work. He has begun seeking the outer symbols of something which deep inside he knows he doesn't have, the happy sense of doing well a job he likes. Without this sense, all his efforts are devoted to proving to himself, and to other people, that he is doing fine. Money then takes on a value beyond its real value; it becomes a way of buying and consuming expensively so that his success will be unquestioned. He will seek promotions for the same reasons, and the tragic thing is that such a desire is insatiable. If a man has an inner feeling of dissatisfaction and failure, no promotion, no income bracket whatever, can possibly convince him that he is happy and successful. Recognition may come from all sides, but the important recognition, the inner recognition of a really well spent life, will be missing.

In my experience, real success is more likely to come when it is not pursued as a primary goal. I have never seen a truly successful man who has gotten there simply by being very clever and keeping his eyes focused steadily on the main chance. Men may get to the middle levels that way, but that is where they generally remain. I think it is important here to define a truly successful man as one who feels successful inwardly and is thought to be successful by an important, however small, segment of the society around him.

Nowadays there is a lot of talk about the Organization Man taking over our society. It may be that there is an increase in people who do more looking than leaping, people whose watchful eyes are the sharpest things about them. I'm sure many of them "get places." But I have found that the men who have really gotten to the top places in whatever field they chose were men who have found something they wanted to do, believed in doing, and went ahead and did it single-heartedly. These men were guided not by shrewd calculation of chances, but by their own drives, their own beliefs, their own hearts.

Characteristics of Distinction

In fact, I once made a list of the qualities I had found among the most outstanding men I have personally known

E. W. (Ned) Kenworthy, '31, writer for the New York *Times,* Washington Bureau, was one of two consultants on the life of the journalist. The group met in the Center Lounge of Burton Hall.

well, quite apart from their specific talents. I have been fortunate enough to get to know quite intimately a number of men who are unquestionably among the great of their generation, such diverse personalities as Robert E. Sherwood, Wendell Willkie, Frank Abrams, "Wild Bill" Donovan, and Adlai Stevenson, and I discovered that they had a number of qualities in common.

First, that none of them took himself as a individual too seriously; all of them could lean back once in a while and laugh at themselves.

Second, that none was ever ashamed, or afraid, to say whatever he thought on any subject, never afraid that it might sound too sentimental or too religious, or too naive, or too trusting or too anything else.

Third, that none of them ever felt the obligation to conform to existing thought patterns however popular they might be at the moment or however dangerous it might seem not to conform.

Fourth, that each of them had the firm belief that one of the most important things there was to preserve in America was the right of the individual to dissent, openly, vigorously, and without any reprisals of any kind as a result of the dissent.

And last, all of them genuinely liked the work they were doing, and because they liked the work, it didn't seem so much like work to them. They had the incentive to put in what would have been long, hard, grueling hours to a man who didn't like the work he was in. Unless their work had been completely compatible with their personalities, they could not have done it. Now while I have found these to be the qualities characteristic of greatness in the great men I have known, you will notice that every one of them is, or can be, within the reach of all of us.

These men all had their faults and weaknesses as well. Perfection is not attainable by human beings, and to seek it is unreasonable and often damaging. A man who strives too desperately for the perfect achievement will inevitably fail, by his or any other standards. Only when a man accepts the *possibility* of partial, or even complete, failure does he have the possibility of at least partial success. A man afraid to make mistakes may avoid doing so, but he is at the same time sure to avoid much in the way of positive accomplishment. The only way to proceed is by a courageous, whole-hearted giving of your best, and then taking your chances. The rest is up to fate.

I think the life of Wendell Willkie is a good illustration of the approach to life, and to one's vocation, that I think is the only fruitful one. Willkie's life contained spectacular success and equally spectacular failure. Both, in a sense, followed from his unswerving following of his deepest beliefs and convictions.

Willkie devoted the last years of his life to an impassioned attempt to make Americans, and Republicans in particular, see and accept their international responsibilities. The price he paid was high, for he was at the same time engaged in a campaign to win the Republican presidential nomination a second time. He was defeated by the isolationist wing of his party, which bitterly opposed him and with which he would not compromise. In the fall of 1944 he died, still in the midst of his battles for social justice and a responsible, long-sighted foreign policy.

Some might call his life a failure, but I would not. I think he did more than any other single man to bring his party around to an awareness of the modern international world. Although his death came tragically early, he lived his life fully, gave what he had to give, and did what he had to do. In the process he gave expression to some of the great qualities of America itself, and by so doing, strengthened those qualities.

What I am saying, then, is that the way to job success and job happiness is to know what we *like* to do, what strikes us as interesting, intriguing and *fun.* Then, accepting both our strengths and the limits of those strengths, and leaving aside the expectations and demands that come from people other than ourselves, we should spend our energies doing our work in the best way we know or can learn.

A vivid example of a man who approached his work this way comes to mind. About twenty years ago, in 1936 or 1937, Eleanor Tracy Hodgins, who was then art director of *Fortune* Magazine, conceived the idea of getting the well-known painter, Charles Birchfield of Buffalo, to do the illustrations for a big article on the Pennsylvania Railroad which *Fortune* was running. It seems that Birchfield had never done anything of any kind, shape or description for any *commercial* project, but somehow or other she inveigled him into this. His pictures created quite a stir and reflected great credit on *Fortune,* so a couple of years later she called him up to suggest another assignment. He told her quite firmly that he didn't want it. Her first thought was that maybe he wanted more money, having had a taste of commercial prices, so she explained that of course their budget was flexible, to which he replied that he didn't care what she paid him; he couldn't do it. She then thought that the rather rigorous deadline she had imposed was too much and suggested that maybe there was a little flexibility in that deadline. He then said that he simply couldn't undertake any assignment for a while, for anyone. He went on to explain that years before he had discovered that it was very difficult to get the right picture frames to show off his pictures to the best advantage. Since he wanted each one of his paintings to be a gem not only of painting but of framing, he had decided to take two months off every year and work in his shop, making with his own hands a picture frame for every picture he painted that year. He had done that ever since, and found the challenge of making frames that perfectly suited each one of his canvasses a very absorbing one. This is what he chose to do with those two months, and to any suggestions or demands that he spend that time another way, at whatever profit, he was impervious.

And Keep In Mind

It may be some time before we feel as sure as Birchfield

was of what we want to do. I don't think that matters very much. There may be economic and family pressures on us to set our course as soon as possible and then proceed rapidly toward the goal of a good income. But remember that we are making a decision about our life's work and it is not a decision that can be forced or rushed. I don't think it matters terribly what our family, or society generally, thinks of the job we take to begin with. I think the important thing about that first job is not so much what kind of job society says it is, or what field it is in, as it is whether it sounds to us like fun, and, perhaps I'd better add a second, whom we are working for. If we find someone who impresses us as a really good person, wise in the ways of work and life, from whom we think we can learn a good deal, he is the person to go to work for. From there we can move on easily to find our proper place, if the first one turns out not to be it.

Along with this, we should not be afraid to change jobs. If we come to see that a job really isn't for us, we should go on to another one. Staying in a job that we aren't getting anything out of, and consequently can't be giving very much to, is not doing anyone a favor, ourselves or our employer. Staying in a job situation that is a dead end for us is not loyalty, or even prudence, it is stagnation.

I should like to warn against one more pitfall. This is the trap of overspecialization. Too often, people master one skill or one small corner of one field of learning and let the rest of the world, and the rest of man's broad knowledge, go by. It is a sad thing to awake at fifty and find that one knows how to make a perfect incision into an abdomen, and nothing else. So my last caution is against pursuing a chosen career *so* exclusively, *so* single-heartedly, that you block your full development as a human being. Yet at the other extreme is an even worse danger: that you scatter your energies so broadly, so generously, upon so many fields of endeavor, that you end up having contemplated nothing deeply and knowing nothing well. People in a field like journalism sometimes come to this realization in middle life. Having written, very likely well, on a multitude of subjects, they find that their minds are filled with odd trinkets of knowledge rather than hard-dug and hard-cut gems. With such an awareness comes a poignant regret, and often it comes too late to change one's course. However, both of these pitfalls can be avoided. There is no exact middle course between breadth and depth that can be prescribed for all; as with the other aspects of our vocational choice, we must discover for ourselves where our personal balance lies.

So, let me summarize. We are only partially the masters of our own fate. Some of the decisions we make today will be changed for us because they will have become impossible. I urge you to use the imagination God gave

you, and the ability to think which the Professors at Oberlin have helped give you, to "roll with the punch," so as to transform the arrows of fortune into slings for your own progress, in some area that intrigues you so much that you sometimes wonder why you get paid for it.

All this, I am afraid, is not a very orthodox idea, but it is really a very simple idea, the idea of knowing and trusting one's own desires. If this can be done, it can lead not only to job fulfillment but to a broader fulfillment as a citizen and a human being. The worry about increased conformity in contemporary American life boils down to the idea that we are losing faith in ourselves, and substituting other's opinions for our own. We are living in a world that is changing its shape in many ways, where a lot of old ideas seem to be losing their applicability. We are living in an insecure world, where war promises to end civilization, and authoritarianism holds sway in many parts of the globe. The only way we will survive these times with our best national qualities and personal ideals intact, is to draw deep on this trust in ourselves as free, individual human beings, who possess a generous capacity for wisdom and achievement, and may I add, for the joy and zest of living.

Dear Mr. Murrow:

All of us here at Morrow are enormously grateful to you for your kind permission to be quoted in our promotion of Elmo Roper's book, You and Your Leaders. The quotation, exactly as I gave it to you in my telegram of some days ago, will appear on the front of the book jacket and elsewhere in our advertising and publicity, and we are confident that it will be very helpful to us in gaining a proper distribution of the book.

I would be further grateful if you would convey my thanks to Mrs. Crissam, who has been helpful indeed.

With best wishes,

Yours sincerely,

John C. Willey

Dear Ed:

In view of the furor that has been created in the minds of the public, our scientists, and many of our political leaders over Sputniks I and II and the current status of our military achievements as contrasted with those of the Russians', I thought you would be interested in the enclosed discussion of the subject by Walter Millis, who is a member of the staff of The Fund for the Republic.

As is always the case of any material which the Fund publishes, there is no assurance that every member of the board agrees with every word the author says, but there is general agreement that what he says is provocative enough to warrant reading.

I hope you find it so.

Cordially yours,

Elmo

Individual Freedom and the Common Defense

WALTER MILLIS

A CONTRIBUTION TO THE DISCUSSION OF

The Free Society

FUND FOR THE REPUBLIC PAMPHLETS

A CONTRIBUTION TO THE DISCUSSION OF

The Free Society

This is one of a series of pamphlets that will be issued in connection with the Fund for the Republic's study of the basic issues underlying a free society. This study is directed at clarifying fundamental questions concerning freedom and justice that emerge when the forms and principles developed by Eighteenth Century America meet the ideas and practices of today's highly developed industrial society.

The task of clarification is being undertaken by ten distinguished Americans acting as a Central Committee of Consultants to the Fund. Among the questions under consideration is the role of the government in its capacity as an organization for the common defense. Walter Millis, military historian and journalist, is in charge of obtaining the information on this question for the use of the Consultants. Individual Freedom and the Common Defense describes the central factors to be considered in arriving at a clarification of the many basic issues involved in this subject.

The Fund for the Republic is a non-profit educational corporation established to promote the principles of individual liberty expressed in the Declaration of Independence and the Constitution. Contributors to this series of pamphlets issued under the auspices of the Fund are responsible for their statements of fact and expressions of opinions. The Fund is responsible only for determining that the material should be presented to the public as a contribution to the discussion of the Free Society.

PREFACE

The Soviet success in placing artificial earth satellites in orbit gives an added pertinence to the following monograph. This powerful feat of Russian science and technology has produced a crisis in nearly all aspects of American defense policy and defense planning quite comparable to that produced in September 1949 by the Russians' equally surprising achievement of an atomic explosion, long before most in this country believed that it would be possible for them to do so.

While this paper approaches the problem of the common defense from the point of view of individual freedom, this has necessitated a consideration not only of the justice but of the efficacy of and necessity for the broad policies which we have been following in providing for the defense of the American community. It is these policies which have been dramatically called in question by the launching of the sputniks and the accompanying events; and a calm discussion and clarification of many of the issues here presented should materially assist in the revisions of national policy which, it now seems, are imperative.

The sputnik announced, much as did the first Soviet atomic explosion, a long-range shift in the balances of military and political power to which our own policies will be compelled to adjust. The crisis with which it has presented us does not arise from any immediate threat of the missile-borne, megaton war; it will be some time before the Soviet Union can translate its technical successes into a usable weapons system with the necessary stocks of weapons and carriers, and presumably by that time the United States will have matched the Soviet achievements. The real crisis is one of current policy. Khrushchev has not in fact threatened us with inter-

continental missile war. Rather, he has utilized Russia's scientific and technical triumph to appropriate the American policy, announced by John Foster Dulles in 1954, of maintaining "a capacity for massive retaliation at times and places of our own choosing." Presumably, Khrushchev has no more intention of ever using the "capacity" than did Secretary Dulles; the point is that the policy in the hands of Khrushchev, when backed by the potential means to make it good, eviscerates the same policy in the hands of Dulles. One can accomplish nothing by merely threatening "massive retaliation" on one's own terms against an opponent who can make the same threat in even more massive form and with a wider range of choice as to time and place. We can and doubtless will step up our own threat to match that now at Khrushchev's disposal; this should maintain the existing stalemate, but will not resolve the power problem beneath it.

We have suffered a diplomatic and psychological defeat in the cold war so severe as to call in question the whole cold war strategy which we have been following. Since the first Soviet atomic explosion in 1949 we have been operating on the assumption that it is essentially a war in which we are engaged with the Soviet Union. We have required the compulsory (or quasi-compulsory) military training of all our young men, mostly in the arts of conventional ground combat. We have maintained the industrial base requisite for a conventional, World War II-type mass mobilization. We have imposed a rigid wartime secrecy upon all our military and much of our technical planning and development; we have fortified this with an elaborate apparatus for counter-espionage and for rooting out the internal seditions which in time of war might present a military danger to the state. Our diplomacy, while always clothed in the moralistic phrase, has been basically military in character—filled with "offensives," "psychological warfare," "positions of strength," "flank attacks," the "deployment" of our economic power, and so on.

The sputnik has called this whole attitude into question. Neither the practical measures taken in the interests of the

common defense nor the foreign policies based upon them have succeeded in "winning" the cold war; indeed, we are ourselves very largely the architects of Khrushchev's triumph, since, if we had not so insistently put our relations with the Soviet Union in the terms of war, the psychological impact of the Russian feat would have been far less. We now have to revise our military and our foreign policies. The military problems presented by the Russian advance in rocketry are quite obviously not to be solved by half-training all young Americans to become the raw material for infantry divisions. The cry is suddenly for manpower policies which will produce, not conventional soldiers however good, but men trained to the scientific and technical skills requisite for progress in missile warfare. It is rather suddenly discovered by responsible officials, many in the armed services themselves, that our excessive preoccupation with secrecy and "security" is an important reason for the relative backwardness of our missile program. Our pursuit of sedition at home has encouraged Russian successes with the "uncommitted nations." And the inutility of our intense concentration on military secrecy and counter-espionage is serenely announced by the sputnik's twinkle in our skies at dawn and dusk.

The sputnik demonstrates, what was already becoming increasingly apparent, that many of our policies adopted in the name of the common defense demand modification. The monograph which follows discusses some of the lines along which these policies may be re-examined and some of the ways in which modification seems desirable.

INTRODUCTION

In painting the panorama of the free society under modern conditions, those sections of the grand design concerned with the common defense cannot be neglected. To the authors of the Constitution the first responsibility of the free, popular government they were erecting was to provide adequately for its own defense, alike against military attack from abroad and against violent sedition from within. The new Federal government was empowered to raise and maintain standing armies and to regulate the state militias; it was also specifically required to guarantee to the several states "a Republican form of government."

These responsibilities, recognized as paramount in 1789, remain paramount today. As the government could not then constitutionally permit the establishment of a state monarchy, it could not now permit the capture of a state by a Communist dictatorship. Now as then one basic proposition seems beyond dispute. It is the proposition that the government of a free, pluralistic society must possess and exercise those powers — alike over its individual citizens and its constituent state and local governments and autonomous organizations — which are requisite to the preservation of the society from either military subjugation or internal violence and destruction. A major part of the price of liberty is represented by the costs, moral and political as well as economic, of its own protection.

Here there is no significant issue. It is only when one asks what powers, what restraints, what impositions are in fact essential to the safety or "security" of the free society that the problems arise. Defense by its nature must be "common," and as with all other great communal enterprises, while it may enhance the true freedoms of the individual in some ways, it must restrict them in others. There is the same fundamental

and familiar conflict between individual liberty and organized defense that one finds in other areas of social organization—as, for example, in the trade union, where the individual pays for his freedom to enhance his economic position through collective bargaining by a surrender of his freedom to take any job that offers under any conditions that may satisfy him. In other areas of our institutional life these conflicts between the demands of individual liberty and political liberty have usually been resolved, in practice, by confining the demands of organization within those limits strictly necessary to the achievement of the common purpose. The same has been generally true in respect to the problems of the common defense.

From the beginning of our government it has been recognized that while the true requirements of defense are absolute and must be met, this does not authorize any or every demand which the government may make in the name of defense. If the free society is to remain a free society, it must set limits upon what its government can ask of it for defense, otherwise security will, as has happened in the totalitarian states, swallow liberty altogether. No doubt, freedom may be an expendable quantity, and if our society were ever faced with an inescapable choice between the survival of the society and the surrender of its freedoms, it would presumably elect for the garrison state and totalitarian governance. But there is no reason to believe that anything like that hard choice as yet confronts us. It is still possible to provide adequately for the common defense while retaining the essentials of a free society; indeed, its freedoms are often a powerful contribution to its capacity for self-defense. We are not required to accept every claim which government may make over our lives and liberties in the name of the national security. It is still appropriate, and necessary, to establish limits beyond which government, in discharge of its duty to provide for the common defense, may not go. The real problem is to determine where those limits should lie.

This is an old problem. It was an old problem even in 1789. Indeed, much of the political history out of which our very concepts of free, popular government arose revolved around it;

the great constitutional struggles of the Sixteenth and Seventeenth Centuries turned largely upon the claims which the sovereign might assert in the name of the national security; and the experience which the authors of the American Constitution brought to their task was deeply permeated by the memory of these issues. Disputes over the sovereign's right to raise and maintain standing armies, to exact "ship money" in support of his fleets, to suppress dangerous and seditious utterance, to jail "enemies of the state" without trial or himself to direct the outcome of trials for treason and sedition, to utilize the self-incriminatory oath for the exposure of subversive faiths and evil beliefs and to punish men for the convictions thus revealed —these great issues, all involving the prerogative derived by the Crown from its duty to provide for the common defense, stoked the fires in which the principles of the Constitution, and in particular of its Bill of Rights, were forged.

The Constitution may be regarded as in large measure an embodiment of the solution which its authors found for the problem of defining the limits beyond which government could not go, in a free society, in its provision for the common defense. The Eighteenth Century statesmen entertained a universal dread of "large standing armies" as "ever a menace to the liberties of the people"; numerous provisions of the Constitution were directed toward limiting or controlling the development of such forces, while the Second Amendment (guaranteeing the right of the people to bear arms) was intended, in part at least, as a check upon such Federal standing armies as might have to be created. The Third Amendment's now quaint prohibitions against the quartering of troops in houses reflect the concern of the times over possible military domination of the free society. The First and the Fourth through Seventh Amendments all represent limitations upon the power of the central government to utilize, in defense of the state, those methods of suppression and thought-control which are most appropriate —if not, indeed, unavoidable—in any defense against sedition, traitorous conspiracy, and dangerous belief. In endeavoring to prohibit resort to these methods, the authors of the Constitution

had reached a double conclusion: that the methods were incompatible with liberty and justice in a free society, and that there was no visible seditious peril to the state so great as to warrant its defenders in resorting to them.

But if the Constitution represents the late Eighteenth Century's solution for the problem of defense in a free society, the solution itself was to receive a serious challenge within ten years. The language of the First Amendment is absolute: "Congress shall make no law . . . abridging the freedom of speech or of the press." Yet in the Sedition Act of 1798 Congress made just such a law. While to Jefferson it was "palpably unconstitutional," to his Federalist opponents it was no less palpably demanded by the overriding requirements of defense against the seditions and subversions fomented by the French Revolution. The theoretical issue has never been resolved. The popular verdict, which returned Jefferson to the Presidency and thus enabled him to allow the act to lapse, was unmistakable: there was no real peril from sedition in 1800; the true requirements of defense at that time did not compel this invasion of the First Amendment, and there was no more need for the Sedition Act than for the large Federal army which had been projected at the same time but which was never brought into existence. But this did not answer the question of what would have been done had the perils of sedition been generally considered both real and urgent.

The true, and unresolved, issue was not whether the Sedition Act transgressed the text of the First Amendment. It was whether the requirements of defense authorized a modification of the meaning of the text. This is the issue with which the courts have since been struggling in their varying interpretations of the free speech clause. Alexander Meiklejohn or Mr. Justice Douglas may still take the absolutist position that the First Amendment means what it says: Congress shall make "no" law abridging free speech. The court majorities, on the other hand, have been endeavoring to construct standards which will measure that degree of danger from untrammelled speech which will "justify such invasion of free speech as is necessary

to avoid the danger." All the varying doctrines in effect admit that absolute freedom of speech must be invaded. The question is how far it may be, under any given conditions.

The issues surrounding the defense of a free society were thus present in the late Eighteenth Century. They were not then resolved. The issues were to recur in every subsequent national crisis. Generally speaking, they have been answered from time to time on a pragmatic basis. The limitations which the Constitutional texts sought to draw around the claims of defense have been influential, but seldom seem to have been controlling. As with the Supreme Court's wrestles with the First Amendment, the real tests have been whether this or that claim to governmental power, advanced in the name of the common defense, has gone beyond the minimum strictly necessary to the achievement of the admittedly vital common purpose. In the process, both the "war power" and the power to protect the state against sedition have undergone enlargement, but the basic issues have remained. They are with us today in an acutely aggravated form.

The polarization of the international world; the vast increase in the complexity (and therefore the vulnerability) of our own society; the massive increase in Soviet military power and the existence of international communism as a dedicated political faith of conspiratorial and seditious character; the appalling power of the nuclear weapon systems; the increased importance of military considerations and the military factor in our normal processes of budget-making, politics and social development; the general acceptance of the idea that the common defense is no longer a matter of responding bravely to some unpredictable future "emergency" but has become a continuing burden and responsibility to be borne year in and year out—all these have created a situation which could hardly have been imagined by the Eighteenth Century statesmen and to which their solutions for the problem of the common defense seem only imperfectly to apply.

This new situation has brought with it many social, political, economic, and juridical consequences, of which only a

few can be considered here. The economic effects of the great defense budgets of recent years have, for example, affected both the structure of our society and the course of many individual lives; but these are outside the scope of the present study. It is here sought to examine only the more direct impact of defense and defense measures on the traditional concepts of individual freedom and civil liberty.

One may distinguish three broad areas in which the real or supposed requirements of defense in the modern era have either seemed at variance with the spirit of the Constitution or have imposed conditions upon freedom which to the authors of that document would have been intolerable. These areas concern: (1) obligatory military service and other features of the present system of military manpower utilization; (2) the many recent measures directed toward the control or extirpation of sedition and subversive belief; (3) the increasingly stringent measures directed toward the control of espionage, the protection of governmental secrets, the gathering of intelligence, and the development of counter-intelligence operations. In each of these areas government, acting in the discharge of its duty to provide for the common defense, has deeply affected individual lives, liberties, and careers for good or ill. One may fairly examine its operations in each area with three basic questions in mind: Have the measures adopted represented true and *necessary* requirements of the national defense; have they been *effective* in achieving the purposes which justify their claim over the lives and energies of those affected; have they been as *just*, as fair and non-discriminatory as possible, and as much as possible in accordance with the basic principles of a society of free men? If they have transgressed at any of these points, they have damaged rather than defended freedom; if they have transgressed at none they represent the price which freedom must pay for its own survival.

THE UNIVERSAL OBLIGATION

"Selective service," at best a euphemism for general military conscription in time of war, was adopted by the United States in 1917. It first appeared in peacetime in 1940 (over a year before Pearl Harbor), but it was accepted then only as a preparatory and presumably temporary war measure; and with the victory and demobilization in 1945 its draft calls sank to negligible proportions. It was not until the Korean crisis that the United States adopted universal and obligatory military service as an established principle of peacetime American life.

The Universal Military Training and Service Act of 1951 laid a "military obligation" on all qualified males between the ages of 18½ and 26. It required all to serve through a period of eight years in either the active or the reserve forces, subject to the draft in time of peace and (after passing from active duty into the reserve) to recall in time of war. Though disguised, this was in effect universal, peacetime conscription, something never known before in the United States and something which was to have many complicated implications. The expectation was that all men physically qualified would, at some time after reaching the age of 18½, serve two or more years in the active forces, either as volunteers (who provide the Navy and Air Force with their personnel) or as draftees, who still make up the bulk of the Army's ranks. Any who did not volunteer for the three-year, four-year or longer "hitches" offered by the various services would be subject to two years of draft duty. While the larger part of those on active duty would actually be volunteers, the compulsion of the draft would remain as a major stimulus to the volunteering.

On the completion of their active duty all of them, whether two-year draftees or three-year or longer volunteers, would pass into the reserve for the rest of their eight years, during which they would be subject to call. The 1951 act did not, however, require anything more of them; if they wished, they could join the National Guard or a "drilling" reserve unit to continue part-time training, but they were not compelled to do so, and not many did. The act thus failed to create an effective or in any sense "ready" reserve. It did, however, have two useful results: it ensured the supply of manpower required both by the Korean "police operation" and the accompanying massive expansion of the peacetime military establishment; and it ensured that everyone of military age would do two years or more of active duty, thus equalizing the burden and making possible the compulsion of some in rough justice to all.

THE OFFICER RESERVE

The universal military obligation helped to supply the need for reserve officers. Reserve officers fulfill a number of functions. Serving on "extended active duty" they perform specialist tasks for which regulars would be unnecessary or unsuitable; during the two or three years of active duty to which they are committed on receiving their reserve commissions they fill up the lowest officer ranks, obviating the necessity of appointing large numbers of junior professional officers for whom there would be no place as they advanced to higher ranks; from the best of them, at the same time, the services seek to recruit career officers. The major function of the reserve officers, however, is to supply the command cadre required in case of a major mobilization. Normally, reserve officers are provided either by promotion from the ranks or, in much greater number, from the Reserve Officers Training Corps (ROTC) programs instituted in most colleges.

The universal military obligation gave a powerful stimulus to the ROTC courses. If one had to render active military service in any event, the option of doing so as a commissioned officer rather than a drafted enlisted man was attractive to the student; and the courses at the same time offered advantages to many, especially the smaller, colleges. The courses vary rather widely as between the services. The Navy, under one of its plans, pays the cost of the student's tuition, and requires only summer training from him. Other programs are not so directly subsidized; in general, they require the student to complete a four-year course in "military science" along with his regular academic work, and to undertake to serve thereafter for two or three years on active duty, with, however, the pay and status of a commissioned officer, offering considerably more amenities than a two-year term as a draftee and probably greater opportunities for advancement in the civilian world thereafter.

It is said that some of the smaller and poorer colleges virtually live on their ROTC programs. They bring in students, especially from the less prosperous rural communities, who see

in them an opportunity for advancement they might not otherwise have; this swells tuition fees, even if there is no direct subsidy, while the government provides the necessary additional teaching staff without cost. The ROTC system is now a widely established feature of American higher education. As such, it raises a number of questions.

The courses vary widely in quality and in their influence on the educational structure. In some institutions they are simply superposed on the normal academic requirements; in others, they may consume as much as a quarter of the student's academic time. There is considerable doubt as to even the military value of much of the military teaching thus substituted for civilian education; there is even more doubt as to its broader intellectual utility. A few of the eastern colleges, led by Princeton, which has long taken an enlightened interest in military affairs, have tried to introduce into the "military science" department courses in such subjects as military history which are taught by the civilian faculty and offered for credit toward the regular academic degree. But the military authorities have been resistant to such efforts to combine military and academic education. They want uniformity throughout the whole ROTC system; they believe that professional officers, not professional teachers, are required to teach officers; they believe that the purpose of the ROTC teaching should be to indoctrinate and inspire rather than to inculcate that capacity for critical understanding which is the presumed object of a civilian educational system. The educational value of the ROTC system is further compromised by the fact that the services find themselves struggling against a great shortage of officers competent to staff the courses.

The products of the system often prove disappointing. Too many students accept the ROTC requirements as "gut courses," without value or interest to them; despite the "indoctrinations" the ROTC graduates often emerge with little feeling for the military service, anxious only to get their duty over with and likely only to "infect" the younger professional officers with their own attitudes.

Such considerations raise a question as to whether the ROTC system is not only a waste of the individual's time and talents but also an unduly inefficient means of producing the kind of trained and dedicated officer corps which the common defense would seem to require—in which case it would also be a waste of the nation's time and money. Like all other forms of military service, the reserve officer's active duty period represents a burdensome interruption in his professional training, one so burdensome that the intended professional education may never be resumed. How many potential scientists, mathematicians, experts in the many disciplines now vital to the national security, may be lost to the nation in this way there is no way of knowing; but the manpower system has been compelled to give the factor at least some consideration.

All medical students and a relatively few specializing in other disciplines are normally deferred until they have completed their post-graduate training and internships; they are then called to active duty in capacities which will utilize their professional skills. The defense thus acquires a supply of needed specialists, while military duty imposes little or no retardation of their civilian careers. It may often help to advance them. But most college seniors must face, as they approach graduation, two or three or more years of military service—of almost no value to them and, there is increasing reason to believe, of hardly more value to the national defense – before they can resume their professional training or begin to establish themselves in other pursuits.

THE RANK AND FILE

The military obligation has thus introduced significant distortions into the processes of American higher education. They are often severely restrictive of individual liberty; it is not clear that they have made any countervailing contribution to political liberty—which is to say to the common good or, in this case, to the common defense. As to the justice and efficacy of the uni-

versal obligation as a whole, the answers are less obvious. In the first place, it has made several striking contributions to individual freedom. Universal and compulsory military service provided both the mechanism and in large degree the rationale for one of the major advances in individual freedom in recent years—the advance of the Negro minority toward equality under the law. The desegregation of the armed forces was probably the one most influential single step toward the increasing recognition of the Negro citizen's right to full status as a human being. The rationale was plain: if he could be compelled, as a citizen, to face death on the battlefield, he could not be denied the rights of the citizenship which he was defending. And the example was persuasive: the relative ease with which Negro and white soldiers and sailors were commingled in close quarters or Negroes raised to command positions over whites was an object lesson which not even the South could wholly disregard.

The universal obligation has contributed to individual freedom by opening opportunities to many individuals for self-development, training, and advancement. It must not be forgotten that military service in peacetime, with its chances of foreign stations, new contacts, new interests, can widen a young man's horizons as well as limit them. Military service offers extensive opportunities for training in civilian skills. The services themselves are always lamenting the way in which a man will enlist, spend most of his three- or four-year "hitch" acquiring training as a mechanic, an expert in electronics or other technologies, and then, just as he is becoming of value to the military system, depart for the lucrative jobs which such skills command in civil life.

Unfortunately, those who find these opportunities in military service are doubtless overbalanced by those for whom it is, in peacetime, only a stultifying routine, with little visible meaning. And while all the services make an earnest effort to fit their men into capacities where they will be of most value—to the services and to themselves—there are not enough interesting "slots" to go around; someone must do the hard and dirty

and occasionally dangerous jobs, and the benefits and the burdens are in the end distributed with a pretty rough justice.

One other consequence of the system for individual freedom may here be briefly noted: in effect, it results in screening nearly all physically qualified young American males for "security"—which in practice mainly means screening them for Communist opinions and associations. Those in the ROTC must, as prospective officers, be screened when they enter the senior course. This not only helps to induce caution and conservatism in them; it also brings the security officers to their civilian teachers as the readiest source of information on their opinions and attitudes. This tends to make the teachers cautious in turn, and must at least affect the confidence which should exist in the student-teacher relationship. Those not in the ROTC will undergo screening of a perfunctory sort on enlistment or induction, but, for all, dossiers are established; the peril of being caught later in some misrepresentation or falsification on their Personnel Security Questionnaires or "PSQ's" will hang over their heads for years. But this is only a small part of a personnel security system which now covers millions of others; and it is doubtful whether its specifically military aspects are of much independent significance.

In one way, the universal military obligation did introduce glaring injustice into the personnel security system. The government would draft a man; it would then use its draft power to compel him to reveal under oath any past subversive beliefs or associations; if he did so (or if it was later discovered that he had concealed any) it would put him on menial duties, deny him the usual opportunities for promotion, and separate him from the service at the end of his term with less than an honorable discharge even if his conduct had been exemplary. This amounted to using the power of compulsion as an instrument for detecting subversive associations and then using the two-year service term as a kind of jail sentence for punishing this (non-criminal) prior activity. The government's power to draft a man in the first place rested only on the assumption that his military service was necessary to the national defense. If he

was so much of a risk to the national security that it could not fully use his skills and must deny him equal treatment with his fellows, then it seemed that he should not have been drafted at all or, when the circumstances were discovered, he should have been released from servitude. But the Secretary of Defense opposed this with the argument that it would make it too easy for anyone to escape the draft simply by claiming to have been a Communist. More than ever this made the draft appear, not as a means of securing required military service, but as an instrument for punishing subversives. The position was so untenable from the point of view either of defense or of internal security that it has been greatly modified in subsequent regulations and the issue is probably not now of major significance to freedom.

THE RESERVE ACT OF 1955

Despite the imperfections noted, the manpower system established under the Universal Military Training and Service Act of 1951 represented a reasonably successful combination of individual with political freedom under the conditions of 1951, when the demands both of the Korean War and the accompanying partial mobilization required the services of virtually all physically qualified young men. Even at the time, however, the act seemed unsatisfactory as the embodiment of a permanent peacetime military policy. During 1953 and 1954 the Eisenhower Administration and the Congress spent a great deal of time and effort in working out a revision of the manpower system. The chief objection to the 1951 act lay in its failure to deal adequately with the reserve problem. The Korean crisis had necessitated calling back to active duty a large number of World War II veterans, who were virtually the only source of trained manpower. Many of the veterans and the nation generally felt acutely the injustice of this form of "double jeopardy." So far as Korea went, there was no help for it; but it was believed that a permanent peacetime military

system should generate its own trained reserves, so that in the event of another "emergency" veterans of a previous war would not have to be used. The first aim of the proposed revision was to create a "drilling," mobilizable reserve into which all (with the exception of some specialists essential for civilian war industry) would pass on the completion of their active duty.

But by this time the conditions of 1951 were beginning to change; already the problem of both providing the requisite military manpower and equitably distributing the burdens of military service ran deeper than the mere creation of a drilling and genuinely "ready" reserve. With the end of the fighting in Korea, the chance that active duty would also involve *combat* duty fell rapidly toward zero; the chance that those serving in National Guard or other ready reserve formations would be called to active duty dwindled likewise. The pressures of economy were beginning to reduce the numbers of the active forces; the development of the new weapons systems was at least threatening drastic changes in the need for military manpower and the nature of reserve requirements. All these factors tended to complicate the problem of equitably distributing a military obligation which Congress had declared to be universal.

It was considered impossible to maintain the active, or regular, forces at the levels thought necessary without the compulsion of the draft, which was at that time renewed for another four years. But even at the 1955 levels, there were not enough places in the active forces to absorb all the young men coming of military age. The projections indicated that over the next few years some two or three hundred thousand more men would enter the "manpower pool" each year than would be withdrawn from it by all forms of military service. The result would be a rising mass of men who could not be enlisted or drafted because there was no place for them, and who in the result would escape military service altogether. If the draft ceased to be the certain fate of the non-volunteer, volunteering would probably collapse. Theoretically, any such decline in volunteering could be made good by expanding the draft calls, but the result would be less desirable personnel brought in on

less desirable terms. And meanwhile, the basic difficulty would remain. The country would still be imposing compulsory service on only a part of those eligible, while hundreds of thousands of others, for whom the military establishment had no place, would be going free. No compulsory system which is not universal and non-discriminatory in its impact can long survive in a free society. The Reserve Act of 1955, which was originally a part of the act renewing the draft and, like the latter, was to run for four years only, was in large measure an attempt to solve this problem.

One form of reserve service, the National Guard, had already been used to keep down the ominously-rising "manpower pool." A youth who, before reaching draft age, enlisted in the National Guard would be deferred from the draft so long as his Guard service continued to be satisfactory. This meant that in return for release from two or more years of active duty, he would engage himself to take two weeks of summer training and up to forty-eight evening drill periods a year throughout his eight-year military obligation. This option was offered partly to maintain the strength of the Guard, but partly to reduce the surplus in the manpower pool. It was in any event an option freely offered by the government, and to call those who availed themselves of it "draft dodgers," as Defense officials often did, seemed hardly just. In 1955 the principle was extended to the reserves as a whole.

The bill proposed to meet the need for a genuinely ready reserve by requiring varying periods of "drilling" reserve service from all those passing out of the active forces at the expiry of their terms. This would doubtless have met all real requirements for trained reserve personnel. But the imposition of this onerous additional burden on those who had volunteered or been drafted for active service would only heighten the glaring injustice of an obligatory system which threatened to leave large numbers altogether free of any military service at all. Provision was consequently made for receiving up to 250,000 young men a year as enlistees directly into the Federal reserve. They would be given six months' active duty training and

thereafter serve out their military obligation in weekly and summer drill periods comparable to those of the National Guard. There was no real military requirement for this particularly useless form of reserve training; it was, rather, simply a device for insuring that there would be enough military places, active or reserve, to absorb substantially all those reaching military age and thus to maintain the universality of a system which, to be just and to survive, had to be universal in fact. The House Committee report explicitly stated that the new system would provide a "control factor" over the manpower pool.

What evolved out of these considerations was a manpower system which seemed primarily designed to insure that every American of military age would do some roughly equal form of military duty in peacetime, rather than to insure that the United States would in the event of war have available the kind, quality, and numbers of trained manpower that war would demand. The American male approaching military age was offered by his government a complicated series of options. He could volunteer for reserve officer training, contributing considerable time and energy to it during his college career and two or three years' active duty as an officer thereafter. He could volunteer as an enlisted man for four or three or two years' active duty. He could "volunteer for the draft," giving him a chance of getting his two years' obligatory service over with promptly, thus permitting an earlier return to his civilian vocation. He could wait to be drafted. While waiting, no professional or settled career was open to him, though there was an increasing chance (which the government could not conceal) that the draft call might never come. The bill proposed that under any of these options the individual would pass at the end of his active duty into part-time training with the Ready Reserve. After a combined total of six years in both active and Ready Reserve duty, he would pass into the Stand-By Reserve for the last two years of his obligation, required to take no further training and liable to recall only in event of a Congressionally declared war. If he took none of these options

he could enlist directly in the reserve (six months' active duty training and seven and a half years thereafter in an onerous course of part-time training). Or he could enlist in the National Guard, with much the same result except that the initial six months' active duty training was not originally exacted.

There were some variations of detail, not noted above, while the bill itself underwent considerable modification before enactment. In fairness to those who had already made choice of their military careers, the compulsory drilling reserve duty was required of none already in active service; it meant that this feature was automatically postponed for two years in the case of drafted men and for longer in case of the volunteers, from whom the most useful elements in the reserve system might be expected to come. Not until August 1957 were the first compulsory recruits for the drilling reserve available, and by that time the problem of what to do with them was more acute, by far, than it had seemed in 1955. The proposed compulsory assignment of time-expired men to the National Guard was dropped on the insistence of the Southern states; for this would have permitted, if not required, the Defense Department to assign Negroes in due proportion to the still lily-white Southern Guard units. One possible lever for justice and equity in our military manpower system was thus lost.

In the meanwhile, the creation of the mobilizable, trained, and ready reserve has depended on the influx of volunteer reservists, the least useful of material for such a structure. It may be said that in time, with the compulsory feature now first coming into operation, this situation would cure itself. But the necessity for balancing out the various options into a rough equality of sacrifice—not only in the interests of justice but in order to prevent undue competition between them—has distorted the military utility of the system in other ways. National Guard and volunteer reserve training had to be kept at eight years, since, with a much shorter period, these options might have become so attractive as to undermine volunteering for the regulars. But eight years is a much longer period than can be usefully spent in a form of part-time training that has never

yet succeeded in producing anything approaching combat-ready formations (one excepts a few specialized air, anti-aircraft, and technical units) on the approach of war.

On the other hand, the three- or four-year enlistments of the regular forces are too short to produce the technically expert personnel required in modern war. They cannot be lengthened, however, so long as the draft term is for two years only; otherwise, service under the draft would become too attractive, and volunteering would fade. The two-year draft term is militarily unsatisfactory. Too short to produce the requisite highly-trained personnel, it is too long for instilling the kind of basic training with some rudimentary specialist education which is all the average two-year man gets out of it. Much of the two-year man's time comes close to sheer waste. But the two-year term is now popularly accepted, and it is hard to change it. If shortened, it would again imperil the long-term volunteering on which the backbone of the services is built; if lengthened, it would threaten the whole system with being swamped in the rising manpower pool with which it even now cannot keep up.

THE PROBLEM CHANGES

The manpower system was thus thrust into a curious form of calculation much more like those of the economists than those of the personnel manager. The problems were those of supply and demand, the manipulation of human responses rather than the utilization of human resources. The solutions arrived at in 1955 had their defects, from the military no less than from the human point of view, but, under two assumptions then tacitly accepted, it may be that no better solutions could have been devised.

These two assumptions were: first, that the problem was to prepare the United States for a more timely repetition of a massive general mobilization on the Second World War pattern; and second, that to do this would require much larger

regular, standing military forces in peacetime than could be obtained without the spur of the compulsory draft and the universal military obligation upon which it rests. Both assumptions have since come increasingly under challenge.

The general introduction of nuclear weapons into tactical as well as strategic warfare—in part a response to the pressures for economy in combat manpower—has changed our concepts of war and of the requirements of a modern peacetime military establishment. No one knows what a future war would be like —or even whether there will ever be one on a major, global scale —but it seems most improbable that it could call again, as in 1917 and 1942, for a maximum mobilization of infantry or armored divisions as the basic instruments. If we ever mobilized the thirty-seven infantry and armored reserve divisions envisaged by the 1955 Reserve Act it seems most unlikely that we could transport or supply them over railways, through ports, and across beaches smoldering and radioactive from the nuclear fires. The ground soldier is thought of today principally as an instrument for limited or "brush-fire" wars; as such, he is scarcely any longer a ground soldier, but must be air-transportable, which limits his numbers severely. Military men now pretty generally believe that any major war will have to be fought to the end with whatever was ready at the beginning—and that means combat-ready—and even those who foresee a period of what the British have called "broken-backed" war, after the great bombs have all been expended, do not foresee that it could utilize the big and massively equipped divisions, with their exorbitant logistic demands, of the two world wars. Even if we should again be required to mobilize great masses of manpower, comparable to the 15,000,000 raised in 1941-'45, most of them would have to be trained to complex technical skills not usually acquirable from the kind of training one gets in boot camp or in National Guard and reserve divisions.

Meanwhile, under the relentless pressures for economy, the Ready Reserve and its training tend increasingly to lose what little realism they ever had. Existing reserve units have been cancelled; it is impossible to provide armories and weapons for

the expansion of the reserve which was to result from the 1955 act. There is no longer enough room for ROTC graduates; increasingly, the active duty terms to which they were obligated have had to be curtailed or eliminated. This adds to the imbalance of the system. While some men are relieved of duty, others are compelled to waste long periods of their time in training of little use to the nation or to themselves. At the same time, the dwindling draft calls, consequent on the continuing reduction in active strengths, leave more and more young men to escape the call altogether, even though the unfilled obligation hangs over their heads and their careers.

Taken as a whole, it may be said that the universal military obligation and the manpower system which has been built around it fails to meet the real requirements of national defense today, is inefficient in fulfilling the supposed requirements, and is increasingly unjust and discriminatory in its operation. It thus fails all three of the tests suggested in the introductory section of this paper. But on the second of the above assumptions—that we must maintain active forces larger than can be supplied by volunteering alone—there seems no good alternative. If we cannot relinquish the draft, then we cannot relinquish the universal obligation, and a universal obligation, if it exacts duty from some, must try to exact it from all. Some such manpower structure as that established in 1955 is the unavoidable result.

But the necessity for continuing the draft has been directly challenged, notably by Ralph J. Cordiner, president of General Electric, who headed a special committee of the Defense Department on the military pay structure, and who insists that if the committee recommendations were adopted it would be possible to reduce the active forces by a further 10 per cent and abolish the draft. What this implies is a fundamental reconstruction of the military system itself, its conversion to a long-service, highly-trained professional force, free to take only those men whom it really needs and can use in genuine military duty, free to design a reserve system which will meet the actual requirements, and no more than the actual requirements.

A REDESIGN OF THE MILITARY SYSTEM

Many Defense Department officials question the Cordiner conclusions, though most military men would doubtless like to return to a professional, long-service (and better paid) volunteer system if it could be done. To do it, however, would certainly call for more than a revision of pay scales and the elimination of military personnel from the many civilian-type jobs that are now performed by men in uniform. It would seem, in the first instance, to call for a firm military determination that it is no longer necessary to consider or plan for a Second World War type of military and industrial mobilization. The actual military requirements of the next twenty years would seem to include: a strategic air force, powerful enough and sufficiently backed by air defenses to deter the outbreak of any major war; relatively small but highly trained and elaborately equipped conventional forces, supported by comparatively small reserves, also highly skilled, to fight such limited and local wars as cannot be avoided; a disaster relief system, manned and trained for its task, to deal so far as may be possible with the consequences if the deterrent fails to deter. But unless military opinion comes to have full confidence that this is correct, it will be very difficult to redesign the existing military structure.

A fundamental re-design would also require a widespread change in popular attitudes toward military service. We are still deeply imbued with the idea that the man entering military service is offering himself as a young champion who will face death on the battlefield to preserve the lives, liberties, and comforts of the vast civilian majority; and, while we have the right to compel him to do so, we cannot exact so great a sacrifice from one youth without requiring it of all. But this overlooks the realities of today. Peacetime military service is, except in a few branches, no more hazardous than civil life. Even in the Second War civilian workers in war industries or inhabitants of large cities in the combat zones often withstood more hazards than many in uniform. The large "tails" of administrative and service troops which the combat forces dragged behind them,

the great numbers of administrative posts of a basically civilian character which kept uniformed personnel far from any war zones, were even then tending to make military service more civilian in character just as civilian service was becoming more military. If we ever do see a nuclear strategic war, the civil population will bear the brunt, and the man in uniform may well be in the least hazardous position of any. In terms of a major war, the hazards imposed on men who are now, as trainees or reservists, subject to call seem hardly greater than those accepted by all. This would not be true in the event of another Korean operation, though of all those liable to call the chances of actually reaching combat would not really be very great. Some forms of peacetime military service, such as flight training, parachute jumping, and other activities, are considerably more hazardous than are most civilian occupations; and if we seriously redesigned our forces on the principle that any future military action would have to be concluded with what was combat-ready at the beginning the men in the active forces would of course be exposed to a special risk. But so are those in many other dangerous trades.

It might be found that if the nation revised its estimates of what kind and size of military force was actually required by the conditions of today; if it revised its attitude toward military service to accord more with the real hazards of war; if it then gave to military service the special dignity and recognition of a profession, and put more meaning and reality into the military training, it might be possible to secure from volunteering all the men really required. We could then rely on longer service terms, save the heavy costs of repeatedly training new men to meet the turnover, improve the efficiency of the active forces, and avoid wasting the time and talents of the others. If a reserve were needed, it could be built up from the requisite technicians and specialists without compelling them to go through long periods of infantry training.

The question is one on which we must doubtless look to the professional soldiers for decisive answer. We may, however,

insist that at least they study it with greater imagination and greater earnestness than they have yet given to it. They are not unaware of the problem—indeed, they cannot escape it, since both the draft and reserve acts terminate in mid-1959, and so must be reviewed next year. But we cannot expect the military to solve the problem unless the popular mind, also, is freed from old traditions and old military concepts not really applicable to the situation before us.

THE CONTROL OF SEDITION

In May 1930 the House of Representatives established a special committee under Representative Hamilton Fish to "investigate Communist propaganda in the United States and particularly in our educational institutions." Eight years later it established the famous Dies Committee with a mandate to investigate "the extent, character and objects of un-American propaganda activities in the United States," the "diffusion within the United States of subversive and un-American propaganda" of both domestic and foreign origin, and "all other questions in relation thereto that would aid Congress in any necessary remedial legislation."

These investigations were the forerunners of a great mass of governmental measures – investigations, executive orders, regulations, statutes, and court decisions–directed toward the defense of our free society from the dangers of sedition and subversion. Not since the Alien and Sedition Acts of 1798 had the Federal government moved in peacetime against sedition as such; never had it moved in such varied ways and on so great a scale. Different as they were, the formidable measures which resulted shared a common characteristic. Although they were justified, like the 1798 enactments, as essential to the defense of the country against *acts* of treason, espionage, sabotage, violent revolution, and the treacherous influencing of policy in the interests of a hostile foreign power, the method of defense was not to suppress such acts themselves but rather the faiths, political beliefs, and utterances from which the acts were believed to result.

The same principle underlies all the great group of measures here considered. Since, it is argued, dangerous consequences of a belief in Communism are difficult to foresee and avert, effective defense requires that the teaching and advocacy of Communism itself be suppressed. Since espionage is not easily detected and prevented, a successful defense against it requires the exposure of those who may hold or might come to hold pro-Communist loyalties, such persons being considered the most probable source of Soviet espionage agents. Since it is the Communist political faith which appears to be the root of the apprehended evils, the faith itself must be extirpated, not only by exposing but by heavily penalizing those who may be "guilty" of entertaining it. It is this common characteristic of attacking faith, belief, and utterance which makes all these properly anti-sedition measures. Since Hamilton Fish started out to investigate Communist "propaganda" with a view to legislating its suppression (a subject on which Congress is supposed to make "no law" and made none at the time) they have grown into a colossal system for the control of sedition, at almost every point at variance with the spirit if not the letter of the Constitution.

THE BUILDING OF THE DEFENSES

A brief summary of the process may better indicate its significance. From 1938 onward the Dies Committee devoted its main efforts to exposing Communists, or supposed Communists and Communist sympathizers, in the Federal government. The first echo of the old Alien Acts came later in the same year, when the McCormack Act decreed that anyone who served as an agent of a foreign principal must register with the Secretary of State. In 1939 the Hatch Act (originally adopted to debar Federal employees from partisan political activity) was amended to forbid government workers belonging to any organization "which advocates the overthrow of our constitutional form of government." In the same year a proviso was added to the Emergency Relief Act forbidding the payment of relief to any one advocating violent overthrow. It was the first of the riders which were subsequently added to every appropriation bill, forbidding the use of the funds to pay those advocating violent overthrow and making it a felony for such persons to accept such wages or salaries. Since the '40's it has thus in effect been unlawful for a Communist or pro-Communist to have a place on the Federal payroll.

Tensions already high were greatly increased with the outbreak of war in Europe in September 1939, as a result of a temporary alliance between the Soviet and the Nazi dictatorships. Our first explicit peacetime sedition act in nearly a century and a half came with the Smith Act of 1940. True to its prototypes, it was actually both an alien and a sedition act. It provided for the registration and fingerprinting of all aliens; it decreed the deportation of any alien who at any time after entering the country had advocated violent overthrow; finally, it made it a criminal offense to teach and advocate, or to conspire to teach and advocate, or to have membership in a party which taught or advocated, the violent overthrow of the government. These clauses, seemingly in direct violation of the Constitutional guarantees of free speech and assembly, were not to meet ultimate court test for another eight years—partly

because the Attorneys General of the time were reluctant to use them, mainly because, after June 1941, the Communists were aligned with the democracies, while after Pearl Harbor any Nazi seditions would have been only absurd. But the Smith Act represented a foundation stone in the great defenses against sedition which were to be erected with the reviving tensions of the cold war after 1945.

The requirements of military secrecy in wartime brought a considerable development of personnel security screening, not only of the military and of Federal government employees but of private employees in war plants and, in particular, the new and super-secret atomic energy industry. As early as 1942 the War Department instituted a strenuous, but generally voluntary, program for the "discharge of subversives from private plants of importance to Army procurement." By the end of the war the security officer, with his investigations into individual backgrounds, beliefs, and associations, was a familiar figure. His dossiers and fingerprint files were beginning to accumulate, but his efforts were not yet systematized on the grand scale later adopted. Other protections against subversion were developed as war measures. Few have since been willing to defend one of them, the mass evacuation from the West Coast of persons of Japanese ancestry; yet the principle behind it was later to be embedded in the Internal Security Act. The war was not yet over when the discovery of large numbers of classified papers (few, apparently, of much real security significance) in the office of the small magazine *Amerasia* awoke some interest in Communist espionage and in the seemingly subversive citizens who might supply its agents, but this was of no great popular concern at the time.

The onset of the cold war coincided, however, with two developments which were enormously to expand the popular demand for better defenses against sedition. One was the appearance of the staggering problem of the atomic bomb, the intense debates over a proper atomic policy, and the tremendous emphasis placed upon "keeping the secret from the Russians." The other was the revelation by Igor Gouzenko, the

defecting Soviet code clerk, of the existence of extensive Soviet espionage networks in Canada and the United States, largely staffed from natives recruited from the native Communist parties and study cells. With the conviction of the English nuclear physicist, Alan Nunn May, these nets were shown to have reached even to the periphery, at least, of the greatest and most jealously-guarded of all national secrets.

The defenses against sedition were rapidly strengthened. Other Congressional committees joined the House Un-American Activities Committee in its work of exposing Communists, pro-Communists, and suspected pro-Communists, not only in government service, but in the trades unions, the motion picture industry, the universities and schools, and in the press. The Atomic Energy Act of 1946, in making the most stringent provisions for secrecy, required the Atomic Energy Commission to establish a rigid screening of its own and its contractors' employees for "character, associations and loyalty." In 1947 President Truman promulgated the first formal loyalty program, requiring an investigation of the "loyalty" of all persons entering Federal civil employment and providing for the hearing of charges of disloyalty brought against any in the service. In the same year the Taft-Hartley Act required a non-Communist oath from officers of trades unions.

While the investigating committees had long been exposing suspected Communists in government, it was not until the summer of 1948 that the testimony of Elizabeth Bentley and Whittaker Chambers brought to the public the first tangible evidence that, at one time at any rate, there had existed Communist cells within the government which had assisted Soviet espionage or been in a position improperly to influence government policy. This helped to awaken powerful support for the Mundt-Nixon bill, introduced by the Un-American Activities Committee earlier in the year. The Mundt-Nixon bill (not itself enacted, but largely incorporated in the Internal Security Act of 1950) adopted a rather new approach. In 1940 the Voorhis Act had sought to compel subversive organizations to register, to disclose their membership, and reveal their finances and

activities. While the Communist Party was the principal target, the word "Communism" was not used, and the act was of no effect. The Mundt-Nixon bill now boldly defined "Communist action" and "Communist front" organizations, required them to register and make disclosure, and empowered the Attorney General to see that they did so. The Communists would thus expose themselves, and render themselves subject to the various disabilities that had been or might be imposed upon "subversives." Reliance on the principle of disclosure was believed preferable to the "outlawry" of Communism, as well as less repugnant to the Constitution. In effect, Communists would be isolated from the rest of the community, making it possible to reduce them to a status of second-class citizenship without, it seemed, imperilling the liberties of the great non-Communist majority. To many this seemed a valid solution for the problem of how to control those who were exploiting our freedoms in order to destroy them, without in the process risking the destruction of the freedoms themselves.

To the President it did not seem a valid solution, and he believed that the Congressmen's passionate concern with the Communist menace was motivated largely by their partisan desire to defeat him in the 1948 election. When the Un-American Activities Committee began to develop the case against Alger Hiss in the latter part of 1948, the President dismissed the matter as a partisan "red herring." But the popular pressures that had been generated forced the Administration into a competitive demonstration of its own ability to deal with Communism in its own way. It took up the Smith Act as its weapon, securing the indictment of the twelve principal leaders of the American Communist party for criminally conspiring to teach and advocate the violent overthrow of the government. The trial began in January 1949 and continued through the next ten months—an extraordinary proceeding, with its elaborate review of Communist literature and teaching, its revelation of some of the paid informers with whom the FBI had been infiltrating the Communist apparatus, its testimony as to the "Esopian" language and clandestine rituals of the Communists, and its dem-

onstration, by the excesses of defense counsel and the organized mobs in the streets, of the extent to which the Communists were capable of going in exploiting the liberties guaranteed to them by the Constitution to which they were avowedly opposed.

The jury finally determined that the teaching and advocacy of Communism was equivalent to the teaching and advocacy of violent overthrow and therefore a criminal sedition. Meanwhile the trials of Alger Hiss, on what amounted to a charge of Soviet espionage, were going on; while the witnesses before the committees were more voluble than ever. From the breaking of the Hiss case, according to one writer, "indignation grew with each month. Congressional committees, loyalty boards and the FBI began to track down present [a questionable adjective] and past members of Soviet apparats, most of them American citizens." Alger Hiss was convicted in January 1950; in February Senator Joseph R. McCarthy opened his celebrated campaign against subversion by announcing that there were "card-carrying Communists" in the State Department; in March there came the most sensational of all the espionage disclosures with the confession of Klaus Fuchs, the high-ranking nuclear physicist who had allegedly been a Communist in Germany. And at the end of June there came the onslaught on Korea.

The defenses against sedition were raised higher still. In August 1950 Public Law 733 granted the power of summary dismissal on national security grounds to the State Department, the military departments, and other sensitive agencies. The Magnuson Act required security clearance for all merchant seamen and many longshoremen. And the Internal Security (or McCarran) Act consolidated the provisions of the Mundt-Nixon bill with other proposed measures into one comprehensive measure for the control of, explicitly, Communist sedition. It opened with a finding of fact and necessity, declaring the existence of a "world Communist movement" directed and controlled by "the Communist dictatorship of a foreign country"; and declaring that the Communist organization in the United States was a part of this movement and as such presented "a clear and present danger to the security of the United States and to the

existence of free American institutions." It went on to define with all the precision possible what constituted "Communist action" and "Communist front" organizations; it established a Subversive Activities Control Board to determine what groups came within the definitions, and required such groups to register with the Attorney General and make full disclosure of their officers, members, and activities. It imposed extensive disabilities on members of Communist organizations, as members, debarring them from the receipt of passports, denying them the right to non-elective office or employment under the United States or in a "defense facility," requiring them to label all publications sent to two or more persons through the mails or over the air. The authors of the act (passed over Presidential veto) did all they could to ensure its constitutionality; the well-founded doubt on this score is yet to be resolved by the Supreme Court and the lengthy processes of appeal have left the act so far ineffective.

On the other hand, the Court in 1951 (the Korean War was still near its height) upheld the constitutionality of the Smith Act under the First Amendment. In so doing it accepted a certain modification of the doctrine of "clear and present danger." It was no longer the imminence of the peril of seditious speech which justified the suppression, but its probability. It was only too obvious that the danger of violent overthrow to be apprehended from the teachings of the tiny handful of remaining Communists was exceedingly remote, but the majority held that the evil would be so grave if it ever resulted, and the result was at least sufficiently probable in the light of Communist infiltrations elsewhere, as to authorize the ban. It was also in 1951 that the President was led to revise his loyalty order. It was no longer necessary to establish reasonable grounds to believe a man disloyal in order to exclude him from government service; it was enough to establish reasonable doubt that he was loyal.

With this, the major legal defenses against sedition and subversion were more or less complete. Subsequent expansions of the anti-sedition system were less matters of law or principle than of methods, administration, and popular attitudes. The savagery with which the McCarthy and other Congressional committees were to pursue Communists, pro-Communists, and those allegedly "soft" on Communism in government and elsewhere, and the patience with which they dug back into an often rather remote past to prove the existence and balefulness of Communist conspiracy, greatly heightened the impact of the anti-sedition defenses upon those affected by them. The trial of the Rosenbergs in the spring of 1951 on charges of atomic espionage, resulting in their conviction and subsequent execution, drew a sensational picture of appalling perils to be apprehended from Soviet espionage based on conspiratorial Communism. It fed the excesses of those who were exploiting "the Communist issue" for personal or partisan advantage. It put heavy pressures on loyalty boards and reviewing officials, leading them to an illogical and at times grotesque severity in their decisions. Enflamed popular opinion tended more and more to distort what was designed as a system for arriving at a rational estimate of an individual's loyalty and reliability into a system simply for ascertaining, in a fairly routine way, whether he was or ever had been in any way connected with Communism. Numerous state and local enactments were added to the Federal measures; teachers had to be screened for security, licenses to practice piano-tuning and other innocuous occupations were withheld on "security" grounds. The American Bar Association was vigorously to argue the question whether a lawyer, as an officer of the court, should be disbarred for Communist inclinations or associations; and various attempts at formal disbarment on these grounds were made, although so far they have been defeated in the courts.

In 1953 the Eisenhower Administration introduced important modifications in the Federal personnel security system and

other defenses against subversion, but these did not alter the structure in principle nor, at the beginning, markedly in practice. In the spring of 1954, when the televised Army-McCarthy hearings initiated the first shift in popular attitudes and reactions, the defenses against subversion and sedition stood at their greatest height. The nation had unquestionably accepted the conviction, to which the bi-partisan Commission on Government Security (the Wright Commission) still clung in mid-1957:

> *That, in the final analysis, with rare exceptions, the real danger to the nation from this source ["security risks"] lies with that small coterie of individuals who are now or may later be disloyal to the United States. A careful review of our record of infamy to date – the Hiss, Remington, Greenglass, Rosenberg, Gold, White and Silvermaster cases, and many others—makes it clear that their perfidy can be traced to a fundamental allegiance to another cause, principally communism, and a deep-seated disloyalty, or lack of loyalty to the United States.*

It had become unlawful to conspire to teach or advocate Communism, and scores of party officials had served jail sentences or were on trial for having committed this crime. No subversive alien could be admitted to the country, and any resident alien with subversive associations or beliefs was subject to deportation. None suspected of subversive belief could in practice secure passports for foreign travel. Officers of trades unions making use of the National Labor Relations Board facilities were required to swear that they were not Communists, under penalties for perjury (which were in fact adjudged against several) if it could be shown that they had sworn falsely to their beliefs.* (The measure was relatively ineffective. Fears of

*Throughout this discussion there has been no attempt to confine the terminology within its strict legal meaning. It is immaterial for present purposes that union officers are technically required to swear to their status rather than to their beliefs; that to be a Communist is not in law a crime; that a security hearing is not a trial at law, or that dismissal from one's job is not a legal penalty. The effort is to avoid such technical issues in order to discuss these problems in terms of the broad concepts of right and justice which seem applicable to them.

Communist-led unions were pretty well met, by other than governmental action, when in 1950 the CIO itself expelled such unions, setting up rival unions of its own in competition with the most important of them; but the Communist Control Act of 1954 still sought to plug this hole in the anti-Communist dykes by adding a definition of "Communist-infiltrated" organizations to those of "Communist-action" and "Communist-front" groups, and barring "infiltrated" labor unions from NLRB privileges.)

Some ten or fifteen million Americans in the armed services, in Federal civil employment, in defense plants, and in many forms of state and local employment were required to submit to security screening. For the vast majority this amounted to taking a kind of test oath, the Personnel Security Questionnaire or "PSQ," swearing, in effect, that they were not subversive in their beliefs and had no subversive associations. If they revealed such associations or beliefs they were dismissed, or refused initial employment or (if in the armed forces) confined to trivial and punitive duties. If they falsely concealed them they were liable to prosecution for perjury or at least dismissal for misrepresentation. In the case of a comparative few in sensitive positions it meant intensive, and at times embarrassing, investigation into all their past lives and associations; for all, it meant the establishment at the least of files and fingerprints, by which they could be followed throughout their lives and to which any "derogatory information" that might ever develop against them could be added. Merchant seamen and many port workers were under the special disability that in order to practice their trade they had to have security clearance from the Coast Guard, even though they were in wholly private employment, unconnected with classified defense contracts.

It was generally accepted that no Communist could be a school or university teacher; and teachers, with many other state or local officers, were widely required to take loyalty oaths in forms similar to those of the PSQ's. Anyone, from any walk of life, suspected of present or past association with or sympathy for Communism, might be haled before a Congressional investigating committee and subjected to hostile questioning about his

beliefs, utterances, and associations. If he confessed to a taint of Communism the usual result was immediate dismissal from his employment, whether public or private, unless, by "cooperating" with the committee, he demonstrated the fullness of his recantation. If he took refuge in the Fifth Amendment, he was safe from prosecution, but convicted himself in the public mind of still bearing the taint, and ordinarily the punishment—loss of his job—was the same. Nor does this exhaust the list of disabilities, in law or in public esteem, laid upon Communists, ex-Communists, persons suspected of a sympathy for Communism, by reason not of their acts but of their supposed beliefs.

FREEDOM AND SEDITION

Such, in brief, were the defenses against sedition and subversion which by 1954 had been erected in the United States. Were they compatible with the requirements of freedom and justice under contemporary world conditions? In attempting an answer one faces not one but two basic issues. The first is general and theoretical: Can a free society enforce such a proscription of a belief, as such, without peril to its freedom? Let it be assumed that the whole system for the suppression of Communists and Communism operates accurately, that all caught in its toils really are Communists at heart, loyal to the faith and to the domestic and international organizations which embody it, as, indeed, a great many unquestionably are. Is such a proscription of belief allowable? Thomas Jefferson, when he drafted the Virginia Statute of Religious Freedom, thought not:

> *To suffer the civil magistrate to intrude his powers into the field of opinion, and to restrain the possession or propagation of principles on supposition of their ill tendency, is a dangerous fallacy . . . Truth is great and will prevail if left to herself . . . errors ceasing to be dangerous when it is permitted freely to contradict them.*

Those who today take the contrary view usually do so on the ground that it is not error which they wish to combat but the conspiracies which it engenders, as Sidney Hook put it in a catchy title: "Heresy, Yes—Conspiracy, No." Yet virtually all heresies – from the time, if one likes, of the early Christian martyrs—assume some conspiratorial characteristics, and virtually all efforts to suppress heresy have been justified on the ground that it is the conspiracy, not the error, which is the object of the repression. Jesuit missionaries in the England of the Tudors and the Stuarts were hounded primarily as secret agents of a foreign power rather than on the ground that their teachings were erroneous. Sometimes the conspiracies are quite real—no one can deny that the Catholic plotters under Guy Fawkes introduced actual barrels of gunpowder into the cellar of the House of Commons and came near to destroying the Protestant King and Commons together. Sometimes they are fictions of overheated imagination, like Titus Oates' fantastic allegations, or like the conspiracies to commit murder and child sacrifice described in the celebrated anti-Semitic forgery, "The Protocols of Zion." Sometimes, as seems to have been the case with the heretical "deviations" so savagely suppressed by Stalin in the '30's, real elements of dangerous conspiracy are mingled with the febrile and fearsome inventions of the tyrants and their secret police. The Hook principle, "Conspiracy, No," since it has been invoked in nearly every heresy hunt in history, is of little use in answering the theoretical question.

The answer returned by the Supreme Court, in its various free speech decisions, turns upon the reality and urgency of the perils, whether of persuasion or of conspiracy, actually presented by the heretical or seditious belief. A free society may, indeed must, defend itself from genuine dangers arising from seditious teachings and disloyal beliefs. Whether the danger is that the seditious teaching will inflame enough minds to make possible a violent overthrow of our institutions by mob action, or whether it is that the disloyal faith will engender a dangerous infiltration of these institutions to distort their purposes and penetrate their secrets in the interests of a foreign

power, makes no difference. There is quite obviously not the slightest present danger of violent overthrow as a result of the educational efforts of the Communist party or its schools and missionaries, yet the Court found that the party's conspiratorial activities were at least so dangerous that Congress could not, despite the First Amendment, be denied power to legislate against them by prohibiting (in the Smith Act) the teaching and advocacy of the Communist belief.

The true theoretical argument revolves, then, around the reality of the peril—not the peril presented by specific Communist spies, saboteurs, or infiltrators, but the peril presented by the holding and teaching of the belief which presumably incites such persons to their acts. There is no question that this danger has been enormously exaggerated in the public mind by many forces, operating from many motives. The natural fears of the society as a whole engendered by a difficult and awesome international situation are by no means a complete explanation; these fears have received powerful reinforcement and exploitation from the pressures of personal ambition and partisan fury, from the tendency of the security officers and secret police to magnify their accomplishments and justify their function in society, from the reactions of those who see in Communism less a threat to the free society as a whole than to their own positions of power or profit, from the natural, if irrational, hatred which most men feel toward any heretical or non-conformist challenge. The dangers have been grossly exaggerated. Yet there is also little doubt that they are in some measure real. They are doubtless real enough to authorize some departure from the spirit of the First Amendment and the Jeffersonian principle that the civil authority may not "intrude his powers into the field of opinion." They are hardly real enough to authorize all the departures of the past few years. This has recently been increasingly recognized in court decisions and popular reactions. Yet the problem of just where and how to draw the dividing line remains; it is probably the most basic of all the issues which divide the devoted "anti-Communists" from the devoted "libertarians."

In an interview a couple of years ago the Attorney General of the United States adopted the extreme position that "it took only one Hiss, one Remington, one Coplon to be in a position to do incalculable harm," and in replying to a question disagreed with the proposition that "it is better that ten loyalty risks stay in the government than that one innocent man be dismissed." This seemed to him a "fanatical" attitude, which "of course would make it impossible to maintain an organized society." The nation's chief law-enforcing officer could not so violently have reversed the principle that it is better that the guilty should escape than that the innocent should suffer except on a very high estimate of the perils of sedition—an estimate for which there is no support. It has never been shown that the harm done by Hiss, Remington, and Coplon put together even approached the "incalculable"; the actual damage they did to the security of the nation seems at the most to have been of a very modest sort.

The episode well illustrates the unsatisfactory nature of the debate over the reality of the subversive peril. The "anti-Communists" emphasize the fact that Communists or crypto-Communists have been the chief actors in most (not all) of the actual espionage cases that have arisen since the war. They emphasize the Allis-Chalmers strike, during the period of the Stalinazi pact, one fairly clear case in which a Communist-dominated union leadership utilized a strike in a war industry for political reasons and in support of Soviet policy. They emphasize the *potential* threat of sabotage represented by Communists with access to war-vital industry. They emphasize the access to policy-making councils enjoyed by the known Communist cells in government between the '30's and the late '40's, and they strive to establish instances in which this access to policy-making was used to urge pro-Soviet policies.

Their opponents may grant that these Communist cells did use their positions to bring other Communists into office, but will point to the extremely tenuous nature of the proof that they succeeded in treasonably influencing policy. They point out that since the beginning of the Second War there has been

no known case of sabotage, and that there was no Communist sabotage even during the Korean War period. They may grant that Communist domination of union leadership has introduced a troublesome, irritating, and clandestine element into domestic labor relations, but will argue that it has represented no peril to the national security and has not even advanced the Communist ideology, since Communist leadership has rarely converted any large body of the union rank and file. And they point out that the instances of espionage which have come to light have been very few and, with perhaps the single exception of the Fuchs-Rosenberg atomic espionage, have done only the most minor damage, at the most, to the security of the state.

The theoretic issue over the suppression of sedition as such must turn primarily on the estimate of the dangers which sedition presents; and this estimate, depending so largely on passionate emotions, preconceptions, misunderstandings of the politico-military process, with a fair amount of outright mythology present on both sides of the debate, is not easily arrived at. A tentative conclusion is that, where the perils are real, the free society is warranted in proceeding against subversion as such; it is justified in isolating a dangerous sedition and adopting against it methods which it may not use against the non-seditious or loyal members of the free community. The subversives who, like the Communist writers who once stormed the Un-American Activities Committee, flaunting their constitutional rights as a means of concealing their own clandestine commitment to the destruction of those rights, need not as a matter of principle be granted all the immunities enjoyed by free men. But if this principle be accepted, it must at the same time be recognized as one peculiarly open to abuse; it cannot be applied in the suppression of any or every dissentient or "disloyal" political faith; it can safely be invoked only where the dangers to be apprehended from the sedition appear, under as calm, unbiased, and realistic an analysis as is possible, to be real, grave, and "present" dangers.

The second basic issue, or set of issues, to be considered is of a different kind. The foregoing has been assuming an ideal

anti-sedition system, operating perfectly within its own assumptions, identifying, controlling, and penalizing only those who really hold the seditious faith. But granting for the sake of argument that it is both necessary and legitimate to apply special disabilities and penalties to Communists, it cannot be legitimate to apply them to those who are not Communists at all. If the principle is allowable, justice clearly requires that the practice should accord with it. If pro-Communist believers are adjudged so treacherous, unreliable, and potentially dangerous as to warrant their exclusion, as a class, from full participation in the affairs and privileges of the community, this certainly does not warrant the similar exclusion of many who are in no way pro-Communist believers, as a result of suspicion, rumor, malice, or mistake. The second basic issue concerns the question of how far the anti-sedition system operates justly within its own premises.

It is important to distinguish the two issues, because they are usually inextricably confused in debate over such specific problems as the protections of the Fifth Amendment, the right of confrontation in security hearings, the right of the defense in criminal cases to examine the reports of FBI witnesses, and many similar issues of due process. In confronting such debates it is usually difficult to know (and the disputants usually do not seem to know themselves) whether the issue is over the rights of any citizen in defending himself from the charge of being a Communist or the right of a Communist not to be penalized or held blameworthy solely because of his Communism. The non-Communist position is: You may not invade my thoughts or require my testimony under oath in order to prove me guilty of Communism because with such methods too many mistakes are made. The Communist position is: You may not invade my thoughts or require my testimony in order to prove me guilty of Communism because Communism is no crime and you have no right to make it so in either law or common practice. These are quite different positions.

An attempt has been made to deal with the second in the preceding discussion of the proscription by a free society of

sedition as such; the conclusion was that the Communist's position cannot be sustained if the perils of the sedition are sufficiently grave. But this does not affect the validity of the first position. It is, of course, well recognized that any requirement of due process intended to protect an accused who is innocent may (and frequently does) operate to protect the guilty as well. In insisting that our defenses against subversive belief should not operate to entangle those who are innocent of subversion, we must inevitably ease to some extent the path of those who are guilty of it. But there is an important difference between protecting the individual wrongfully charged with what we consider to be a crime and protecting the individual rightly charged with what we do not believe to be criminal.

Our second basic issue, then, concerns the justice with which the anti-sedition system as a whole operates against the evils which it apprehends without invading the liberties of those not party to the evils. No war against disloyalty, sedition, or heresy can be carried on without the use of self-incrimination, condemnation by association, and tests for utterance or for received opinions and reading matter, since disloyalty or sedition are matters of the inner mind and emotions, and these are accessible to the investigator in no other way. If it is believed that the safety of the state requires that we ascertain whether a man is a heretic, or schismatic, or disloyal, or a Communist, these are the methods which must be employed. They are also methods which the experience of some two or three centuries of struggle had taught the liberal rationalists of the late Eighteenth Century to regard as abhorrent and incompatible with free popular government. Whether a government of free men ought to try and condemn for opinions of ill tendency was a question to which more than one answer might be returned; but there could be no doubt as to the cruel mistakes and miscarriages of justice which resulted whenever it sought to do so.

The origin of the privilege against self-incrimination is often ascribed to the desire to prevent physical torture. But even in the later Eighteenth Century people were not particu-

larly sensitive to torture. The objection to torture was not the agonies it inflicted but the unreliability of the evidence which it elicited. The development of the privilege in Anglo-Saxon law goes back to the struggles in Tudor times over the power of the ecclesiastical courts to try and punish for heresies and other errors; in exercising these powers they employed the "oath *ex-officio,*" requiring (like a modern "PSQ") that the suspect swear to his innocence, and then answer fully and truthfully all subsequent questions put to him. The result was not to elicit the truth, since the investigation was into the intangibles of belief, but to make it easy to entrap the subject into inconsistencies, apparent perjuries, and confessions of guilt as meaningless (although just as fatal to the defendant) as those with which the Russian treason trials of recent times have made us familiar.

When men are, in effect, tried for seditious belief (however the charge may be worded, or whatever the extra-judicial character of the tribunal or the punishments imposed), conviction can be obtained only by forcing them to incriminate or entrap themselves. A striking demonstration of the meaning of the ancient oath *ex-officio* (and of the reason for the privilege against self-incrimination which resulted from it) was provided by the Lattimore case in 1952, perhaps the one most extraordinary episode in the war upon subversion.

Lattimore was called before the McCarran Internal Security Subcommittee. He swore to his innocence at the outset—that he was not and never had been a Communist, a sympathizer, or "any other kind of promoter of Communist interests." He was then subjected to rigorous examination under oath for no less than twelve days running—an examination into his writings, his editorial work, into long-past associations and events of suspicious character. It could not be proved that he was or had been a Communist. But the committee and the Department of Justice believed that enough had been amassed to indict him for perjury, on the ground that he had sworn falsely in his initial oath that he had never been a "sympathizer or promoter of Communist interests." Minor discrepancies or slips in his

testimony were made the ground for six further counts in the indictment—not because the alleged perjuries were significant in themselves, but because, if they could be established as perjuries, they would indicate an evasiveness which would support the main charge: that Lattimore had lied in swearing that he was not a Communist sympathizer.

The indictment was struck down by the District Court as being hopelessly "nebulous and indefinite . . . To probe the mind in a situation like this would give rise to nothing more than sheer speculation on the part of the prober," an opinion sustained by an 8-1 vote of the Court of Appeals. The remarkable fact here is not the quashing of the indictment but the inability not only of the McCarran Committee but of the Department of Justice to understand the logic behind it. The Senators and the government attorneys had convinced themselves that Lattimore *was* a Communist sympathizer and promoter of Communist interests; they quite sincerely believed that he had lied in denying this—as an ancient Grand Inquisitor would sincerely believe that an accused must be lying in his denials of having harbored heretical belief – and they still thought that he ought to be punished for the perjury, the only means of punishing him for his wicked tendencies. Lattimore was actually re-indicted (a slightly different wording being adopted for essentially the same charge) and even after the second indictment was struck down, the District Judge telling the prosecution bluntly that if it stood it would "make a sham of the Sixth Amendment," the Justice Department persisted (unsuccessfully) in trying to put him in jail.

"When the propriety of obnoxious or unorthodox views about government," as Justice Black said in his partially concurrent, partially dissenting opinion in the California Smith Act cases, "is in reality made the crucial issue, as it must be in cases of this kind, prejudice makes conviction inevitable." It was the impossibility of proving—in any meaningful sense—a charge of heretic or seditious belief, and the virtual certainty that process of this kind must run riot in persecutions, false confessions, mistaken condemnations, executions on mere suspicion or mob

excitement, which led the authors of the Constitution to their effort to bar all such process from American practice. This is probably the deepest root of the First, Fifth, and Sixth Amendments, of the narrow definition of treason, and of other guarantees of the original Constitution and the Bill of Rights. It was essential to the liberties of the free America these men were trying to construct that its citizens be free in speech, assembly, and belief, and that men not be tried for their private beliefs or thoughts, nor condemned for heresies or seditions, whether they actually entertained such heresies or not. By 1954 we had, in the name of the national defense, built a vast system for doing just this; and it was producing, in affairs like the Lattimore case or the extravagances of Senator McCarthy or in hundreds of other episodes, the results in folly and injustice which were to be expected.

THE COURTS INTERVENE

Controversy naturally arose; and it tended generally to follow two lines. Those who argued that the pursuit of sedition was contrary to the spirit of the Constitution were answered with the argument that it conformed to the letter. In seeding a man out of Federal employment because of past Communist association, the government was not trying and punishing him for his beliefs; it was simply weighing him and finding him wanting for confidential employment—something which any employer must have the right to do. And to those who argued that the weighing system was both unjust and inaccurate, introducing into large areas of American life the injustices and destructions of morale which must flow from any arbitrary and capricious control over access to the means of livelihood, the answer was that the perils were so great that the injustices would have to be accepted. One Hiss, as the Attorney-General put it, could do such "incalculable" harm that it was better to penalize ten non-Hisses than to let one potential Hiss slip through.

As to the first of these two types of argument, it had to be

admitted that the requirements of defense, as indeed the requirements of many other modern institutions, might well necessitate a departure from a strict construction of the Constitution; and that here the letter was generally sufficiently regarded. The second type of argument was, however, to open unexpected avenues toward a resolution of the problem. What really were these menaces against which such extreme protections had to be erected? It was when the public began to get a little bored with the perils of Communism, and when (one may infer) Federal judges began to ask themselves a little more seriously what really were the "clear and present dangers" in response to which so many departures from established concepts of freedom and due process had been authorized, that the issues began to sink to manageable proportions.

The upholding of the Smith Act in the *Dennis* case in 1951 represents both the high point in the judicial validation of the war on sedition and the high point of judicial fears as to the dangerous nature of Communist conspiracy. The *Bailey* case in the same year (decided by a tie vote in the Supreme Court without opinion) upheld the loyalty-security screening procedures, essentially on the ground that the international peril must outweigh the normal claims of fairness and justice to the individual. But within four years the courts were beginning to take a closer view, both of the perils and of the invasions of individual rights which the perils were advanced to justify. The first striking manifestation of this tendency was to come with the decision of the Ninth Circuit Court of Appeals, in October, 1955, in *Parker vs. Lester*. The case involved certain West Coast seamen refused clearance by the Coast Guard as security risks, and thus debarred from the practice of their private trade, without adequate notice, adequate knowledge of the charges against them, or opportunity to confront hostile witnesses. "The whole question here," the court observed, "is whether the danger or possible danger to national security is of such character and magnitude that the ancient and generally accepted rights of notice and hearing envisioned by the Fifth Amendment may be denied to these seamen citizens."

The court recognized that the national safety might require the security screening of merchant seamen, but it insisted that the screening could be carried out under regulations that protected the individual's rights in respect to notice and an opportunity to be heard. "Such a system might make more work for the investigating officers and pose more difficulties," but if this involved any added peril to the national security it would be too slight to outweigh the rights of the individual. "The question is: Is this system of secret informers, whisperers and talebearers of such vital importance to the public welfare that it must be preserved at the cost of denying to the citizen even a modicum of the protection traditionally associated with due process?" The court's answer was an emphatic negative.

Other court decisions, though seldom going so directly to the constitutional issue, began to look in the same direction. A series of manifestly unjust, even grotesque, security determinations coming to public notice resulted in a considerable improvement of personnel screening procedures and the regulations governing them. The State Department's power to deny passports without hearing was curbed. The defenses against sedition were made to work less unjustly in practice; but such measures tended to strengthen, rather than weaken, the basic assumption that sedition, as such, was a peril against which defenses must be maintained. The more accurately the system operated to identify and disqualify only those who were really seditionists—that is to say, Communists—the more firmly did the necessity and desirability of suppressing sedition become embedded in the popular mind and in official practice. The examination into belief, self-incrimination, punishment for associations became more acceptable as the system was modified to ensure that these sanctions would be applied only against Communist believers. The many who were outraged when Midshipman Landy was denied a reserve commission because he had continued to associate with his mother, who had once been a Communist, would only have applauded if there had been some real showing that his associations indicated a pro-Communist bias on his part. If the practice was being improved, the theory

of the defenses against sedition remained unimpaired.

It was only when majorities on the Supreme Court (supported by increasingly large segments of public opinion) began to ask what, actually, were the perils of sedition as such, that the defenses against sedition began to be restrained more nearly within the spirit of the Bill of Rights. In *Cole v. Young* (June 1956) the court held, in effect, that government employees could not be dismissed as security risks unless they were in a position to endanger the national security. The decision was technical—on the ground that the statute on which the Eisenhower Executive Order setting up the Federal personnel security system was based did not authorize the extension of the system to all Federal employees—but the underlying reasoning was both obvious and persuasive. The subject in this case had been a Federal meat inspector, who could not, except in the wildest flight of fancy, have imperilled the national security any more than almost any one of his 160 million fellow-citizens. The idea that dismissing this man from his Federal employment was any real contribution to the safety of the state was so absurd that it collapsed of its own weight. The professional anti-seditionists in Congress argued that the court, in confining security dismissals to sensitive positions only, was imperilling the national security; but nothing has yet come of their legislative proposals to restore full statutory authority to the Eisenhower system. The decision, according to Representative Francis E. Walter, chairman of the Un-American Activities Committee, had the effect of opening the entire government "to the infiltration of our mortal enemies." But in the year which has since elapsed no one has shown that it has had the slightest effect upon the security of the state.

The court was to continue with a series of striking decisions, all directed toward a reduction of the defenses to accord more appropriately with the dangers against which they had been erected. In the *Nelson* case (April 1956) it had already struck down the numerous state sedition statutes on the ground that the field had been pre-empted by Federal legislation. Thirty-five state attorneys-general declared that it was "dan-

gerous to public safety" to "leave the states impotent to regulate acts of sedition or subversion occurring within state borders," but no evidences of the danger have as yet appeared. In *Slochower* (April 1956) it had held that New York could not constitutionally discharge a school teacher solely because he had used his constitutional privilege to plead the Fifth Amendment. In the *Schware* and *Konigsberg* cases (May 1957) it denied a state's power to exclude a man from admission to the bar on the ground of Communist association. In *Witkovitch* it held that an alien under order of deportation as a Communist, but remaining in the United States under supervision of the Attorney General because his own country would not receive him, was not compelled to answer questions about his Communist activities. The majority of the court turned a deaf ear to the government's argument that this would "jeopardize internal security."

In June 1957 the Supreme Court handed down a series of remarkable decisions, all tending to restrict the war against sedition within narrower limits. The *Sweezy* case involved a New Hampshire university professor convicted of contempt for refusing to answer questions by the state attorney general about his teaching, his political opinions and associations. Chief Justice Warren's opinion, setting aside the conviction, was an eloquent reassertion of the rights of academic freedom as against the demands of anti-Communist investigators: "We believe that there unquestionably was an invasion of petitioner's liberties in the areas of academic freedom and political expression—areas in which government should be extremely reticent to tread."

This decision was followed by *Watkins,* in which the Court set aside the contempt conviction of a man who, while freely disclosing his own past Communist associations to the Un-American Activities Committee, had refused to name past associates whom he believed to be no longer Communists. The decision was again on narrowly technical grounds. Under the statute, for contempt to arise the question which the witness refuses to answer must be "pertinent" to the purposes of the investigation. The Court held that the vagueness of the Un-

American Activities Committee's mandate and its failure clearly to explain its purpose made it impossible for Watkins to determine whether the questions were pertinent and consequently to know whether, in refusing to answer them, he was committing a contempt or not. The Chief Justice's opinion did not in terms deny the committee's right to use the investigatory power for the purposes of exposing Communists or to demand that witnesses inform upon long-past associates; but it was filled with eloquent dicta on the powers of investigation into a witness's "beliefs, expressions and associations" which suggested that the Court would tend to draw closely the limits upon this type of Congressional enquiry.

On the same day the Court ordered the acquittal of five defendants and a new trial for nine others convicted in California under the Smith Act for conspiracy to teach and advocate the violent overthrow of the government. While sustaining its 1951 decision, in the *Dennis* case, as to the constitutionality of the statute, it construed the statute itself in a way which came as close to reversing *Dennis* as was possible without actually doing so. The Court rejected the assumption, universal since *Dennis,* that the teaching and advocacy of Communism was tantamount to teaching violent overthrow and had therefore been made criminal under the act. The opinion (by Justice Harlan) held that the mere teaching of Communism, or the teaching of violent overthrow itself, "as an abstract doctrine" was not debarred. "The statute was aimed at the advocacy and teaching of concrete action for the forcible overthrow of the Government, and not of principles divorced from action." The Court could find no evidence against the five whom it acquitted other than that they had been active in the Communist party; this was insufficient in itself to convict them of "advocacy or teaching in the sense of a call to forcible action at some future time." Against the others, remanded for a new trial, there was more evidence that they may have taught "illegal action," while it was possible that in a new trial the government, warned of the necessity of establishing this crucial element in the crime, might produce further evidence against them.

The Court admitted the "subtlety" of its distinction, but, subtle though the point was, it notably restored a large area of the First Amendment protections to free speech and belief. And it did so basically upon a reappraisal of the dangers to be apprehended from seditious teaching. Prior to *Dennis* seditious teaching could be suppressed only when its dangers were "present" as well as "clear." By 1951 the perils seemed so great that the state could be protected against seditious teaching threatening only future evils, provided they were grave enough and there was some probability that they might one day eventuate. By 1957 the Court considered the dangers from sedition taught as an "abstract doctrine" to be negligible; the most which was required by the needs of the common defense was protection against the teaching and advocacy of criminal action at some future time.

A similar reappraisal plainly lay under one more notable decision, in the *Jencks* case. Jencks was convicted of falsely swearing to a Taft-Hartley non-Communist oath, largely on the evidence of two FBI informers as to his Communist party activities. Relying on an accepted rule of criminal law, the defense asked to see the written reports originally submitted by these informers, as a means of testing the credibility of their oral testimony in court. In deference to the unvarying claim of the FBI that its reports must remain inviolate in the interests of national security, the documents were refused. The Supreme Court held that this constituted a reversible infringement of the rights of the defendant, and remanded him for a new trial. By putting its informers on the stand, the FBI obligated itself to disclose those of their written reports which were relevant to their testimony. The Court recognized the government's right to keep documents secret where "the protection of vital national interests may militate against public disclosure," but in a criminal case it could not invoke this privilege at the cost of the rights of the defendant. This was because, in a criminal case, the government "which prosecutes an accused also has the duty to see that justice is done," and it would be "unconscionable" to allow it first to put a man on trial and then use its evidentiary

privilege to deny him "anything which might be material to his defense." Quoting an opinion of Learned Hand's, the Court declared that "the Government must choose; either it must leave the transactions in the obscurity from which a trial will draw them, or it must expose them fully." While the government could suppress the documents if it felt that national security demanded, it could do so only "at the price of letting the defendant go free."

The point at issue clearly had wider implications. The FBI had long taken the position that the absolute inviolability of its files and complete secrecy as to its investigatory methods and its informer system were vital requirements of the common defense. Had the Court felt (as did Justice Clark in his dissenting opinion) that the perils against which it was claimed that this secrecy was necessary to protect us were grave ones, it would probably have hesitated in requiring the FBI to make even this degree of disclosure of its files. If it had believed that letting those accused under these circumstances "go free" represented a greater danger to the safety of the state and the freedoms of its people than would permitting the FBI to depart in this respect from the ordinary rules of due process in criminal law, it would doubtless have followed Justice Clark's reasoning. As it was, the decision amounted to a finding that the FBI's appeals to the vital requirements of national security in order to protect the secrecy of its files and its informer system were at best somewhat exaggerated.

The opinion actually made no great breach in the FBI's system of secret files and informers. The only files it would open would be those in cases in which most of the reasons for secrecy had disappeared when the informers had been put openly on the stand. The only prosecutions it would estop would be those in which the FBI, although willing to produce the informers, was unwilling to produce their relevant reports; and while these might be the cases most necessary to convict men (under one guise or another) of seditious belief, it was unlikely that they would involve crimes really dangerous to the national security. Perhaps the point was minor. But just as the Smith Act decision

restored the First Amendment protections over a considerable area, *Jencks* restored a small, but nevertheless significant, area of the Fifth and Sixth Amendment protections of due process.

This whole group of decisions has come under violent—though, not it would seem, very widespread—attack from Congressmen, security officers, lawyers, attorneys general, and others especially interested for one reason or another in building the defense against sedition and subversion as such. Attorney General Brownell declared that *Jencks* had created a "grave emergency in law enforcement," and the Administration rushed a bill into Congress to correct the situation. Loyd Wright, chairman of the Commission on Government Security, demanded "immediate legislation . . . to negative the grave consequences that will flow from this confusing decision." James Burnham demanded, in *The National Review*, that Congress investigate the Supreme Court, for its usurpations of power and for its "legal sabotage of security measures." Rep. Walter has announced an omnibus security bill to repair the breaches made by the court. But nowhere in all this was there any very persuasive rebuttal of the Court's reduced estimate of the perils from sedition and subversion; the impression remained that Mr. Burnham's phrase was accurate—what the critics were objecting to was the "sabotage," not of the national security, but of the "measures" which had been adopted in its name.

THE PRAGMATIC ISSUE

Here the really basic issue seems to be whether the courts, in placing some curbs upon the measures, have materially weakened any defenses really demanded by the requirements of the national security. To their critics they have been destroying the protections painstakingly erected against Communist subversion, flinging open the gates to all the perils apprehended from it. It is not really responsive to reply that they have, nevertheless, restored in the process important parts of the old ramparts raised a century and a half ago against the dangers and injus-

tices inherent in any war on sedition and subversion. The basic problem is, precisely, how far these old ramparts may properly and justly be maintained in the face of modern conditions. It is a problem which can only be resolved by a calm, pragmatic analysis of the actual dangers (of both kinds) and of the new appraisals which the courts, to say nothing of larger and larger sections of public opinion, are putting on them.

The trouble is not so much that wrong answers are returned to these pragmatic issues; rather it is that they are not debated in rational terms and therefore are never answered at all.

As an example, one might cite the discussion of the port security program—involving the security screening of seamen. The Special Committee of the New York City Bar Association (the Bonsal Committee) put a low estimate on the real dangers against which this program was capable of protecting the state, and recommended its abolition. The Commission on Government Security (Wright Commission) on the other hand strongly recommended the retention of the program as "necessary to protect United States shipping, ports, harbor installations and the Panama Canal from destruction and crippling damage by saboteurs and subversives." In reaching this conclusion it did not dispute, or indeed, even notice the Bonsal Committee's very different estimate, while its own estimate of the danger was certainly no contribution to the clear and rational discussion of this question.

The very phrase it used—"crippling damage by saboteurs *and* subversives," later changed into "destruction from sabotage *or* subversive acts"—indicates a confusion of mind. What are the dangers from "subversives" and "subversive acts" which do not involve sabotage? The supporting statement that the dangers which led to the creation of the port security program "continue to confront the nation, as there is substantial Communist control of certain maritime unions" throws little light on what these dangers of "subversion" other than sabotage really are; though it may perhaps reflect the mixture of motives behind the passage of the Magnuson Act, which instituted the program.

Until the debate on this basic issue of the real nature and magnitude of the perils apprehended from subversion and sedition as such can be recast into more meaningful terms it will be impossible to come to any conclusion as to what are the true requirements of the common defense in this respect. It will be impossible to know to what extent, if any, the Eighteenth Century prohibitions on wars against sedition must be modified to meet the necessities of modern conditions. The courts, by holding in effect that they need not be modified to anything like the extent to which we have gone, have arrived at what is after all a rather rough rule of thumb decision. It would seem incumbent upon those who challenge it as imperilling the national security to give some better demonstration than they yet have done as to just how and why and in what degree it imperils real security. It is equally incumbent upon those who believe that these court decisions have not gone far enough in the restoration of ancient liberties to give some demonstration that the defense will not be imperilled by further reducing the safeguards against sedition.

SECRECY AND SECURITY

Those defensive measures which are directed primarily against subversion, rather than against the acts which it is supposed to incite, are in a sense negative in character. Interlaced with them are a series of more positive protections, raising for the free society issues of a superficially similar yet rather different kind. These include the elaborate measures now taken to preserve government secrets and to prevent sabotage, the legal penalties for unauthorized disclosure, and the police and intelligence systems used to detect and prevent actual espionage and treason, as well as to collect information concerning potential enemies.

ESPIONAGE AND SECRECY

The foundation of the whole internal security structure is provided by the system for the "classification" of government and defense documents, weapons, machines, and so on. The need for some measure of governmental secrecy in the interests of defense and security has, of course, long been recognized. It was President Washington who established the right of the Federal Executive to withhold even from the Senate public papers the disclosure of which would not be in the national interest. The necessity for military secrecy in wartime has always been accepted, though in the past the United States was notoriously careless in such matters. Toward the end of the Nineteenth Century the increasing complexity of military technology, and the competitive war planning of the European general staffs, began to put an increasing premium on military secrecy and espionage even in time of peace. One of the items of information which Captain Dreyfus was wrongfully accused of transmitting to the Germans was technological, referring to the design of a new artillery recoil mechanism; another concerned the war plan—Plan XIII—then being developed by the French general staff. Led by the efficient Prussians, all the great powers began to develop elaborate secret intelligence, espionage, and counter-espionage networks. At the same time the development of revolutionary terrorist conspiracies in the autocratic empires made the secret political police operative a familiar figure. By the turn of the century, secrecy, espionage, and counter-espionage were becoming an increasingly necessary and normal part of the peacetime relations of the military powers.

The First World War greatly enhanced the American consciousness of military secrecy and its counterpart, espionage; but with the end of that "war to end war" the interest flagged. In the earlier interwar years, little attention was paid to the protection of information on weapons design, troop strengths, and so on. The armed services maintained intelligence and counter-intelligence branches and engaged in at least some

"covert" operations; but intelligence was normally staffed from the least rather than the most promising of the officer material. Within the government as a whole secrecy, for defense or other reasons, was at a minimum.

With the rising tensions of the mid-30's, however, interest in secrecy and secret operations dramatically revived. In 1936 President Roosevelt ordered the FBI to undertake a secret investigation of Communist and Fascist activities within the country, so as to provide him with a "broad intelligence picture." Secrecy for the government's own operations, especially in the military field, was greatly intensified. It is true that as late as December 1941 the *Chicago Tribune* could see nothing improper in publishing the highly secret strategic plans of the Army and Navy—a disclosure which would today ruin the greatest of newspapers. The fact that its motive was primarily political—the *Tribune* hoped to alter the Roosevelt Administration's interventionist policies, to which it was bitterly opposed—makes this an interesting illustration of the relationship between military secrecy and free, popular government. But with the attack on Pearl Harbor such publications became impossible.

The requirements for secrecy of many kinds during the Second World War were real and urgent. Voluntary censorship was established to enforce an increasingly regularized and extended system of classification or secrecy; the public was made secrecy conscious and overconscious by intensive campaigns of education and propaganda. The notion was driven home that the most useful military intelligence work is accomplished, not by cloak and dagger methods, but by the patient assembly of bits and pieces of information of seemingly the most innocuous character. The good citizen was taught to guard his tongue in everything, great or small, lest he contribute unwittingly to the deaths of American men in battle. The FBI extended its intelligence operations widely through Latin America, as well as through the United States. Great numbers of competent men were trained in the military and diplomatic intelligence services and in the OSS. Secrecy and secret operations became, it seemed, a major key to national survival.

The effects of this experience would in any event have carried over into the cold war period which ensued. But they were vastly exaggerated by the enormous popular interest in "the" secret of the atomic bomb. In the Atomic Energy Act of 1946 Congress not only decreed the first formalized loyalty-security personnel program; at the same time it decreed that *all* data concerning atomic energy and fissionable materials must be kept secret, except as the AEC might determine that they could be published "without adversely affecting the common defense and security." Under the shadow of our own creation, we thus entered the non-war period under almost an obsession with secrecy, in which misconceptions as to the nature and significance of the atomic secrets, jumbled with the experiences of the "shooting war" and hazy notions derived largely from the spy-thrillers of the pre-1914 period, were carried over into an unprecedented world situation to which many of these ideas were inapplicable.

THE CLASSIFICATION SYSTEM

The result is the vast and spreading structure of governmental secrecy, regularized and formalized in the classification system. In its present form (established by the Eisenhower Executive Order 10501 of November 1953) this gives unrestricted authority to seven agencies – the Departments of State, Defense, Treasury, Justice, and Commerce, the AEC, and the CIA – to classify as "confidential," "secret," or "top secret" information the unauthorized disclosure of which "could be prejudicial" or worse "to the defense interests of the nation." In seventeen other agencies classification stamps may be affixed by the head of the agency alone; twenty-eight other agencies (ranging from the Battle Monuments Commission to the Veterans Education Appeal Board) are forbidden to classify on grounds of national defense or security, though they retain the powers normal to any public or private organization for safeguarding their files and controlling the release of information.

Information once classified, for whatever reason and whether of great or only trivial import, is protected by stringent penal statutes. For a government official to make unauthorized disclosure of classified material, or for a private individual to make such disclosure with intent to injure the United States or further the interests of a foreign power, may entail heavy fines and imprisonment. The classified secrets are perhaps even better protected by the wide popular notion—shared by administrators, courts, and juries—that they are all of equal value to the security of the state and that *any* breach of the classification system is in itself a serious threat to the national safety.

The Executive Order makes some attempt to define and restrict the categories of material which may be protected by these powerful sanctions. Thus, it authorizes the "secret" classification "only for defense information or material the unauthorized disclosure of which could result in serious damage to the Nation, such as by jeopardizing the international relations of the United States, endangering the effectiveness of a program or policy of vital importance to the national defense, or compromising important military or defense plans, scientific or technological developments important to national defense, or information revealing important intelligence operations." The intent seems to be to confine this formalized structure of secrecy to three general categories of information: (1) on international negotiations and reports and on internal policy discussions and decisions; (2) on war plans, weapons design and performance, scientific and technical discoveries of direct military importance; (3) on intelligence, espionage, and counter-espionage operations. The categories are, however, far too loosely defined to be applicable in any given situation. "Endangering the effectiveness of a program or policy of importance to the national defense" seems almost meaningless, for example, since almost any governmental program may be thought to be of some relevance to the national defense, while the disclosure of almost any sort of information about it may be considered to "endanger its effectiveness." There are, moreover, wholly legitimate reasons for governmental secrecy which seem not to fall within

even these broad definitions, but which nevertheless tend to expand the classification system—examples include secrecy for Treasury operations, to prevent individuals from improperly benefiting through advance information, or secrecy in personnel matters to avoid unjust injury to the individual.

The several agencies have, of course, endeavored to establish their own more precise criteria for the classification of information; but it still appears to be almost impossible, where there are so many authorized reasons for secrecy, to erect rational and meaningful standards. As a governmental spokesman recently said, in specific cases "judgment" becomes "the decisive factor," and judgments in the face of such conflicts of values as confront every classifying officer are bound to differ widely. With thousands if not tens of thousands of individual officers endowed with the authority to classify, with the official and popular obsession with secrecy almost for its own sake, with every pressure in favor of classification when in doubt and with virtually no pressure in favor of declassification or refusal to classify, it is inevitable that governmental secrecy should spread far beyond the bounds of the reasonable and necessary. Nearly everyone who has examined the subject has agreed with the Defense Department's own Committee on Classified Information (under Charles A. Coolidge) that there is a tremendous over-classification of documents. But in spite of elaborate regulations for restraint and declassification no one seems yet to have discovered an adequate means for controlling the process.

Secrecy breeds secrecy. An important example is the way in which Congressional committees have, because they find themselves dealing with classified matter, expanded their use of executive sessions and thus concealed their own operations from the scrutiny of their constituents. Secrecy for certain technological developments, because of their immediate military importance, invites secrecy for related developments, of less direct significance, and so on in widening circles. Where authorized reasons for secrecy are so numerous, it becomes easy to use secrecy for mere administrative convenience, for public relations, and so on. One would hesitate to criticize such admin-

istrative suppressions in themselves; it is only when they are supported by the tremendous legal and popular sanctions surrounding "the national security" that they become questionable.

When almost any bit of information about a country can conceivably be of some use to a potential enemy, it becomes difficult to discriminate between secrets which can be kept, secrets which cannot be kept, and secrets which are not worth keeping. In the *Sperry Gyroscope* cases, the company insisted that the whole of its plant, and not merely those areas in which classified work was going on, should be classified. It was seriously argued that a truck driver coming in simply to pick up packaged shipments might, if he were a Soviet agent, convey valuable information merely by noting the bulk, numbers, and addresses of the shipments. It is just possible that in time of war information of this kind might to some slight extent ease the work of a hostile intelligence service; it is incredible that in time of peace any Soviet intelligence agency would waste much time or effort in suborning truck drivers to copy addresses on Sperry shipments, and certain that if they did so the military value of the information would be negligible. Presumably, the company's real reason for wanting the whole plant classified was to simplify the administrative and managerial tasks imposed by the complications of the security system itself, if not, as some believed, to enable it to bar from its plants employees whom it regarded for other than security reasons as "undesirable." The whole issue was irrelevant to the real security of the nation, but was solemnly debated as though it were.

THE SECURITY POLICE

The classification system entails other consequences. The scope of the classification determines the scope of the personnel security screening system since (in the industrial security system wholly and to a large extent in the others) access to classified material determines who must be screened. The wider the reach of classification the more individuals must be screened, the

more numerous grow the personal files and dossiers, and – it might be added – the farther removed does the whole system become from its supposed job of protecting secrets of real significance to the security of the state.

The greater the mass and variety of classified material, the more elaborate must be the counter-espionage and counter-intelligence systems set up to protect it. And because counter-intelligence must by its very nature be largely secret, this breeds still more secrecy. In the name of the national security, the secret police and intelligence agencies claim a complete secrecy not just for some but for all their operations; they thus pass quite beyond the normal controls of publicity and debate which free societies are accustomed to apply to their major institutions. It was the imagined imperatives of national security which led to Captain Dreyfus' being tried and condemned in secret for crimes he did not commit. It is assumed that American intelligence agencies could never be guilty of so gross a transgression of justice and due process. But in the *Jencks* case (discussed in the preceding section) the Supreme Court felt constrained to issue what amounted to a warning.

In *Jencks* the Court held, in effect, that if the government (or the FBI) felt it necessary and desirable to place a man on trial, then it must accord him all his rights as a defendant. It was for the government to choose between the loss to security resulting from leaving an accused untried and the loss resulting from giving him a fair and open trial. The appeal to the "interests of national security" could not override even to this degree the Constitutional requirements of due process.

The reasoning was persuasive; but it did not seem so to the FBI and its more ardent Congressional supporters. Only the obsessive overvaluation of secrecy, espionage, and counter-espionage in the protection of the modern state could explain the immediate campaign that arose against the decision. A bill was introduced (finally enacted in modified form) to override the Court. J. Edgar Hoover intimated that dozens of cases against spies and subversives would have to be cancelled as a result of the decision. Fortuitously, a case developed at this

time against Rudolf Abel, allegedly the head of a Soviet spy ring. It was put about that the Supreme Court ruling would render a prosecution impossible. This hardly seemed logical at the time, since it was reported that the chief witness would be a defecting Russian agent whose prior reports could hardly have had much security value; and the government in fact went forward with the prosecution apparently unembarrassed by *Jencks*.

THE COSTS OF SECRECY

The present great system of governmental secrecy and its concomitants of intelligence and counter-espionage have had adverse effects upon both the individual and the political freedoms of Americans which are obvious, though also, unfortunately, non-measurable. It has had some effect in hampering free scientific enquiry. This limits the individual freedom of the scientist to pursue his goal of ascertaining truth; it restricts the political liberties of the rest of us to enjoy, in our own defense, the fruits of an alert and powerful scientific advance. It clogs to some extent our technological progress. It reduces the individual liberty of the armaments manufacturer to advertise his wares, and secure acceptance of his products; it adds to his managerial difficulties and his costs. It is probable that for some scientific-technical defense projects, as much as one-third or more of the money costs may be absorbed by the direct and indirect requirements of security. If, as is generally the case, the money costs are passed back to the taxpayer, then they reduce his individual liberties by that extent, while they diminish his political liberties—his interest in defense—by the extent to which they hold up technological development of improved weapons systems.

Secrecy has personal and social consequences which are not negligible. The classified research contract divides academic communities, reduces their freedom of thought and communication, introduces the great class distinction between the

"cleared" and the "uncleared." It erects barriers within the most intimate of all social organisms, the family, by dividing husband from wife. Probably few who have not engaged in top secret work can appreciate the personal and social and educational consequences of a situation in which a husband cannot even mention to his wife or children the matters which engage his whole working time and energy.

Secrecy affects the political liberties of all. It closes off, not only the operations of the secret agencies, but the work of the most important organs of public policy formation from the scrutiny of the public for whom they profess to act. The classification system was recently defended by a government spokesman on the ground that after all it made little difference, since most of its secrets, while hidden from the public, were disclosed to the public's representatives in executive sessions of the Congressional committees. The representatives could adequately guard whatever public interest there might be in the information. This, of course, quite overlooks the important public interest in checking upon the representatives; it is another example of the tendency of modern big government to revert to authoritarian concepts which, while acceptable in the early days of parliamentary and representative institutions, when legislative sessions were normally secret, seem hardly consonant with the free society of today.

Secrecy is the foundation of the current system of government by "leaks." It is the unlovely parent of the calculated leak no less than of the calculated suppression. A good example may be found in the figures on Soviet airplane production. American intelligence has, presumably, fairly accurate statistics. There are valid reasons for not releasing these statistics as official statements. They may be wrong, in which case Soviet planners would be given a valuable insight into the basis for our plans; they may be precisely right, in which case the Soviet Union would be warned that chinks existed in its own armor of secrecy. But there is no particular reason for not letting the figures be known, so long as they do not carry authentication as the official estimates of the United States Government. Thus, partial and frag-

mentary intelligence statistics are readily "leaked" in support of one side or another of inter-service or inter-governmental policy disputes. The public, the supposedly final arbiter in great policy issues, is compelled to debate them on partial facts, the authenticity of which it cannot know. The result is conflict, not of policy but of propaganda, which would be impossible except for the original classification of all the relevant facts.

Secrecy is the parent of the secret police and intelligence operations. These affect our political liberties by the extent to which they make policy decisions dependent on secret intelligence material fed to the policy-makers. This, it may be said, is a subject about which little is known. All secret intelligence systems apparently endeavor in some degree to use their secret information as a weapon to influence policies; on the proven principle that "knowledge is power" those who possess (or imagine that they possess) superior knowledge are almost compulsively driven to employ it to enhance their own power and importance. On the other hand, the policy-makers are normally resistant to these drives. Whether in Hitler's Chancellery or the recesses of the American National Security Council, the policy makers don't read the intelligence reports, or don't believe them if they do read them, or don't agree with the policy conclusions which may be concealed within the "factual" estimates. The real significance of this aspect of "intelligence" in a free society has, so far as the writer is aware, barely been touched on by contemporary studies of government.

The promotion of the secret police and intelligence agencies to their present high estate within our community is bound to infringe the individual liberties of the citizen to some extent. The *Jencks* (and also the earlier *Coplon*) case may be cited in support, since here the courts in effect reproved the FBI for violating individual rights of defendants. Because the FBI and the military intelligence agencies have apparently removed themselves beyond any possibility of public examination or analysis it is not easy to speak with confidence on this subject. Many believe that J. Edgar Hoover occupies a position of power and influence in the community inappropriate, in a free society,

to the head of a secret police agency. Many others believe that his efforts to protect us from imminent dangers of sedition and espionage are so significant to the survival of the state that they should not even be questioned. The FBI and intelligence agencies do raise issues of importance to the free society. They are not issues easily dealt with.

These are some of the costs of secrecy in terms of individual and political liberty. Unfortunately, as has been said, they are not measurable; and if they were, the values would prove incommensurate with the gains to liberty which secrecy may bring with it. A different approach seems to be required. Perhaps it can be found through a better analysis, not of the costs of secrecy and espionage, but of their practical function and utility in the lives of modern states.

THE FUNCTIONS OF INTELLIGENCE

There can be no doubt that the true role of secrecy, espionage, counter-espionage, and intelligence in contemporary international relations is widely misunderstood and grossly overvalued in contemporary attitudes. The old picture of the spy—despicable if he is working for the other side, heroic if, like Nathan Hale or an FBI informer, he is one of ours—whose machinations control the outcome of decisive battles or send thousands of soldiers to needless death, still dominates a complex of contemporary problems to which it has little relevance. The spy is probably the least significant of all figures involved in the great modern apparatus of intelligence, counter-intelligence, and secrecy. Historically, he never had half the importance attributed to him in myth and legend; today, when the real problem is not the detection of espionage but the sound formulation of strategic and national policies, he can have very little.

It seems impossible that a judge who had any real understanding of the actual operation of intelligence and espionage in the contemporary world could have sentenced the Rosenbergs to death on the ground that their criminal activities imperilled

the lives of millions. (The British, who, since they received Fuchs' confession, presumably know more than anyone else about the importance of his espionage, gave him only fourteen years.) "Intelligence," as it is gathered or guarded by all modern nations, is of two kinds—"overt" or "covert." Nine-tenths of all intelligence is of the overt kind; it represents the careful accumulation, comparison, and analysis of non-secret information culled from all kinds of sources. Into it may go the unguarded remarks of a foreign diplomat, data from the foreign technical press, the daily files of American news agencies and foreign correspondents, non-secret data of many kinds. During the Second World War American intelligence found that a useful source of information on the configuration of invasion beaches and their defenses could be derived from collecting tourists' vacation snapshots. In most intelligence agencies the published histories, reference books, statistical almanacs, and encyclopaedias are consulted far more often than the fragmentary reports of secret agents.

"Covert" intelligence is that which is secretly acquired, through secret agents—"spy rings"—established in the hostile country or, much more important today, through the secret interception of the other country's communications and the breaking of its codes. Most of the major wartime triumphs of covert intelligence were accomplished by this latter means, or by aerial photography. In active war, covert intelligence assumes a relatively greater importance than the overt kind; it is still remarkable how few and unimportant are the successes attributed in the literature to covert espionage by individual operatives.

Intelligence is often categorized in a different way — as "military," "strategic," or "counter-intelligence." Military intelligence in peacetime is concerned with penetrating another power's war plans, weapons design, numbers and locations of his troops, and with the identification of his vital strategic targets. Strategic intelligence is more broadly concerned with his national capabilities and intentions; it concentrates on political and economic information concerning him, the personalities

of his leaders, the opportunities for propaganda offensives. This division is not sharp. Military intelligence agencies must consider political and economic factors as well as those of a more strictly military kind; strategic intelligence agencies cannot, of course, overlook the other power's military capabilities. Both overt and covert methods are used by both types of intelligence, though perhaps in varying proportions. Counter-intelligence, the third of these categories, is almost wholly covert; it concentrates on penetrating the other power's intelligence systems, unmasking its agents, interrupting their activities or (rather more frequently, it would seem) utilizing them as sources through which to feed misleading information back to their principals.

Most works on these obscure subjects, and most public information which comes to light, suggest that counter-intelligence consumes a disproportionate amount of the time and energies of all intelligence systems. The double agent is so familiar a figure that one is led to wonder a little what the whole activity may add up to. One derives the impression that all the intelligence agencies are engaged in a kind of game, in which the detection and execution of the other side's agents is a much more important object than the interruption of the information they may be transmitting, most of which is of little practical consequence anyway.

Boris Morros (whom the Department of Justice produced for an interview at the height of the excitement over the *Jencks* decision) declared that he had been serving as a double agent for some twelve years. He said that "many of the agents working [in this country] for Russia are important people financially, and often held in high esteem." But except for Martha Dodd Stern and her husband, no such people have been named or indicted. Morros intimated that he had been feeding information to the Sobles and Albam, who have pleaded guilty to espionage, over a long period. Apparently, the FBI felt that it was a greater contribution to the national security to prolong this arrangement than to arrest and convict the spies. The inference is that the content of espionage is a relatively trivial factor

in security operations. The great goal has become security in the abstract; the specific dangers against which we must be made secure are of no great consequence.

It is a conclusion borne out by nearly everything available on peacetime secrecy and espionage. Considering the whole mass of peacetime intelligence and counter-intelligence operations—overt and covert, military and strategic, that which the Russians collect on us and which we collect on the Russians—one cannot feel that it is of great importance in the present relations between the two powers. Strategic intelligence is likely to be more confusing than helpful, to both sides. Certainly, the great Soviet intelligence networks, largely concerned with strategic or political rather than with specifically military information, seem to have given the occupants of the Kremlin a most imperfect view of the real intentions, capabilities, and governing policies of the Western powers. Our own elaborate intelligence summaries, devised in CIA, often go unheeded by the policy-makers for whom they are produced.

In the field of military intelligence there are some things which it is highly desirable that we know about the Russians, and some things which it is equally desirable that we conceal from them. We do need to know about their weapons designs, the numbers of their forces, and as much as we can about their war plans, if any. Without at least some fairly good data on these subjects it becomes impossible to formulate a rational American policy. However, the fact that the Russians, in order to formulate rational policies, need to know the same kinds of things about us does not mean that we must necessarily keep them all secret. Many have made the argument that a military policy founded, like our own today, wholly upon "deterrence" requires for its success that the potential enemy should have a clear knowledge of our power to deter him. There have been arguments, in Congress and without, over the wisdom of keeping secret the size and power of our atomic arsenal. As Louis Ridenour, former Chief Scientist for the Air Force, has succinctly put it: "Information on present military capability must reach the potential enemy to give the military capability any peace-

time value." Since our whole present national policy is directed not toward the waging of war but the preservation of peace, we must, it would seem, reconsider the problems of secrecy, espionage, and counter-espionage from the point of view of planning for peace. Disclosure as well as suppression has values. Even by the strictest tests of military power, secrecy has disadvantages as well as advantages, and some of the latter may in sober fact be utterly insignificant by comparison with the former.

POSSIBLE LINES OF SOLUTION

The problems of freedom and liberty in this complex field are not readily resolved; but it would seem that solution would have to be looked for along certain avenues. One rough but very practical solution has been advanced. It would be simply to require that every classification stamp carry a time-limit. Today, once a paper is classified it automatically remains classified for eternity, unless it undergoes a complicated and always difficult process of de-classification. Under this proposal, the paper would automatically cease to be classified at the expiry of the time-limit, unless a similarly complicated and difficult process determined that the stamp should remain. The value of the suggestion is apparent; unfortunately, so is the likelihood that bureaucratic routine would soon overwhelm it and that to continue the classification would become as automatic a process as the original classification is now.

Effective solutions would seem to lie along the lines of, first, a genuine re-examination of the uses and effects of both secrecy and intelligence in the relations of modern peoples. It should be made with a clear understanding that, as has been suggested, the true problem here is not one of catching and punishing spies; it is a problem in the proper formulation and protection of over-all national policy. From such a re-examination it might be possible to proceed to a second step, a much more precise definition of the categories of information for which protection is really essential to the national security,

and a separation of all other forms of secrecy from the imperatives of security and the penalties imposed in its name. The present categories of "confidential," "secret," and "top secret" fail in two ways. They make no real distinction between the material involved—some, with experience in these matters, have said that they could see no effective difference in the security importance of the "confidential" and "top secret" information they have received; the designation seems largely a matter of administrative convenience, since more cylinder locks, guards, and similar precautions must be used with "top secret" than with "confidential," and these protections can make business impossibly time-consuming. The categories likewise fail in leaving to the administrator no good method of controlling information which for administrative or other reasons ought to be kept confidential, but concerning which the national security significance is minimal or non-existent.

The entire secrecy system needs clearer definition as to aims, purposes, and uses; it needs greater flexibility in practice. It should be purged, if possible, of extreme concepts of an impossible total security. The fact that almost any piece of information about American technical advances might be of some assistance to Soviet war industry does not warrant efforts (such as that set up, but now happily abandoned, in the Department of Commerce) to keep all kinds of non-classified technical information from falling into the hands of the Russians. The fact that it is conceivable that a truck-driver might be a Soviet agent, that he might as a truck driver acquire some information about the shipments from a defense plant, and that this information might just possibly assist the Russians in following our war preparations, is in itself no argument for screening all defense plant truck drivers to ensure that none had any Communist associations in his background. It is perhaps true that in time of active war bits of apparently innocuous information picked up by a secret agent can lead to lamentable results—though it is remarkable how few are the reported cases of this kind, even in wartime, when, as has been said, most of the significant intelligence triumphs were obtained

through penetrating the enemy's electronic communications or through photographic analysis. In peacetime, after one has traced a bit of either overt or covert intelligence back through the hostile power's intelligence nets, back through his services of evaluation and distribution and through the minds of his policy makers, it is extremely difficult to say what if any value, military or political, the intelligence was to him and what was the justification of the efforts of secrecy and counter-espionage intended to keep it from him.

A sense of proportion is badly needed as to what we endeavor to protect from either covert or overt penetration. A sense of proportion is likewise needed as to how we protect it. The government should have recognized rights to control and keep confidential many types of official information, but it should also have recognized means of doing so without invoking the whole ponderous machinery of classification and the penalties attached to it. Its secret intelligence and police agencies should not be left totally beyond any form of public scrutiny or accountability; admitting that we must have intelligence and secret police agencies and that much of their work must be kept secret if it is to be effective, they should not be allowed the extreme, and on the face of it unwarranted, claim that any breach whatever in the secrecy of their operations constitutes a grave peril to the security of the state.

Secrecy, espionage, and counter-espionage are factors grossly overvalued in their actual effect on the relations of modern states, on the formulation of policy, and on the strength of the common defense. In times of non-war, especially, they constitute little more than nuisances, which no doubt have to be put up with in some degree, but could be greatly reduced without in any way adversely affecting the destiny of the American people. With a calmer view of the whole subject they can be reduced, and, as *Jencks* indicates, their many impacts on individual liberties and civil rights can also be reduced to acceptable levels.

Dear Ed:

I am enclosing a copy of an editorial I have written for The Saturday Review to be published in the November 30th issue.

In it I have tried to put the case for not relying solely on the heads of states and the professional diplomats for seeing to it that all possible avenues of greater unity among the genuine democracies of the world are explored and the logical ones recommended.

It seems to me like a peculiarly good time to publicly air such thoughts, with the heads of states meeting as they are in December. I am hopeful, of course, that you will feel like raising your even more powerful voice in behalf of the same cause--the urgency of which seems to me to be becoming more apparent each day.

Cordially yours,

Elmo

A Declaration of Interdependence

EDITOR'S NOTE: *Ever since the end of World War II, this page has been concerned with the need for a universal design for world peace. In the following editorial, Elmo Roper,* SR *editor-at-large, advocates a design for the Free World.*

ONCE again we have heard a bold Proclamation from High Places of the critical need of the countries of the free world for each other. After last month's talks between President Eisenhower and British Prime Minister Macmillan, a "declaration of common purpose" was issued that included these brave words:

". . . The concept of national self-sufficiency is now out of date. The countries of the free world are interdependent, and only in genuine partnership, by combining their resources and sharing tasks in many fields, can progress and safety be found. For our part, we have agreed that our two countries will henceforth act in accordance with this principle."

It is a noble principle. In fact, the concept of interdependence, properly applied, may yet be able to save us and the world we know from destruction and chaos. The concept of national self-sufficiency, which has been out of date for some time now, could diffuse the power of the non-Communist world so that it might buckle under a bold Communist blow.

Over and over our leaders have urged the necessity for "close cooperation" among the free nations. Over and over our "interdependence" has been emphasized. The fault is not in the sentiment but in the lack of action to back it up. Too often in the past "close cooperation" has amounted to no more than "keeping the others informed." This is not just because of the unwillingness of policymakers to share their functions with their opposite numbers in other countries. The reason lies far deeper. It lies in the way our governmental process is set up. We simply do not now have the mechanisms for genuine collective policy, so we are forced to resort to improvisation, to emergency meetings and agreements which lack enduring force.

The big question, then, is not whether we are "for" or "against" interdependence of the free nations any more than it is whether we are for or against survival. True, some arguments for national self-sufficiency are still heard, but they are proposed with less and less conviction. Like it or not, we are deeply involved with the rest of the world, and few see much hope of returning to a charmed isolation.

The central question is how we are to go about implementing this interdependence which everyone in high places knows confronts us. We must find now ways to establish close, lasting ties between the people of our country and the people of the other free nations. Treaties, alliances, pacts—all the old ways—have clearly shown their inadequacy, most dramatically a year ago when common policymaking between us and our main allies failed, information channels froze, and the result was the Suez fiasco—for which we probably will still have to pay.

I suggest that the best people to find these new ways are not the professional diplomats, whose training is in the niceties of power relations, who are responsible to their governments and to policies and forms already established. If a new solution is to be found, it is most likely to be discovered by free and unfettered minds, operating without restrictions or commitments to established positions and policies. I suggest that the best approach to this problem is to call a citizens' convention, where the best minds in our country, with the aid of political, sociological, economic, and financial experts can meet with the best minds of those democracies with whom we will inevitably share a common fate and together work out what seems to be the best way of securing close and continuing cooperation among the democracies. This group should include all shades of representative opinion on this subject and be strictly bipartisan—and strictly "top drawer." They should be as close as we can find to the Jeffersons, Madisons, and Hamiltons of an earlier critical period in our history.

For some time we have been attempting to work together in the military sphere and the results of our efforts have been less than spectacular. With all our vast wealth and know-how, the West has been caught short by decidedly spectacular Russian advances that have brought new wonder and anxiety to our contemplation of outer and intermediate space. The Eisenhower-Macmillan statement emphasized that military security must today be collective, that "It is not within the capacity of each nation acting alone to make itself fully secure."

BUT the statement did not stop at the military sphere. It went on to say that "our collective security efforts must be supported and reinforced by cooperative economic action," and expressed gratification at the developing of a European free-trade area. Military coordination alone cannot bring our potential strength to its full capacity. In so many areas, wealth and efficiency are cut down by artificial and unnecessary barriers.

Many of these barriers can probably be eliminated, or at least lowered. Such a conference would have many problems to consider. A common currency, for example, among all the Atlantic countries, would greatly speed the flow of trade. But is this something we can have now or must we work toward it gradually? Loosening or eliminating immigration regulations would let labor flow where it is needed as well as bringing the countries of the West spiritually and culturally closer. But what would be

(*Continued on page* 37)

CAST PROOF

Interdependence

Continued from page 20

the drawbacks in making this change? What about tariffs? Could a free-trade area be made to cover the entire Atlantic basin? Or, again, is that something that must be done gradually—or in other ways?

A citizens' convention would be ideally suited to tackle such problems. Together its delegates—the best minds available in the Free World—could work out a practical plan for pushing toward real unity among the free countries of the West—indeed, the free countries of the world.

THERE is no use speculating on what recommendations would come out of such a conference. They might be very simple—or quite wideranging. They might stop with the devising of a new political mechanism to insure a common foreign policy—or they might go much further. No one can predict what a group of the best brains in the Free World would come up with—and certainly no one can, in advance, discount the possibility of workable answers. Surely the ability of man to devise new and better forms under which to govern himself did not end in 1789! Surely the faith of Jefferson and Lincoln and Wilson in *the people* and in their ability to solve their problems was not misplaced.

The time has come for something more than solemn and high-sounding pronouncements from the heads of state. By all means let them meet in Paris to to see what they can do. By all means let the NATO parliamentarians meet to see what they can do. By all means let the diplomats continue to see what they can do. But in addition let's put the finest representatives of the public of the free world together to see what they can come up with.

Time after time, in public-opinion surveys, overwhelming majorities of the American people have shown that they have turned their backs on isolation, that they welcome active cooperation with the other democracies of the world. They cannot be expected to write the formula for that cooperation. Such a convention as I propose would search for that formula.

The news that the United States of America was willing to sit down with representatives of other free people and discuss, with no diplomatic inhibitions, any and all ways to form a stronger union of the free world would circle the world with an even greater impact than that of the Russians' truly great achievement, the Sputniks.

—ELMO ROPER.

CLASSIFIED

CLASSIFIED ADVERTISEMENTS are accepted for things wanted or unwanted; personal services; literary or publishing offers, unclassified elsewhere; miscellaneous items appealing to special intelligent clientele; jobs wanted; houses or camps for rent; tutoring; traveling companions; ideas for sale; opinions (limited to 50 lines). All advertisements must be consonant with the character of Saturday Review. Rates per insertion: 45¢ per word; 10-word minimum. Count 2 extra words for Box and Numbers. Rates for several insertions—52 times 37¢ per word; 26 times 39¢ per word; 13 times 41¢ per word; 6 times 43¢ per word. Full payment must be received seventeen days before publication. We forward all mail received in answer to box numbers and submit postage bills periodically. Mail to be called for at this office will be held 30 days only. Address: Personals Department, Saturday Review, 25 West 45 Street, New York 36, N. Y.

485 Madison Avenue
New York, New York

Dear Ed:

I thought you might be interested in the results of a survey question we asked recently of a nation-wide cross section on the subject of the recently passed civil rights bill.

The answers contained in the enclosed release were obtained while the bill was still in debate in the Congress. It was interesting that among the public at large, outright opposition to Federal civil rights legislation has shrunk from 49 per cent to 26 per cent in the last decade.

Also:

One third of the population thought that the bill should have mentioned integration of the schools.

The call for stronger Federal legislation was stronger in the Far West than in any other part of the country.

Half of the Southern whites expressing opinion on the subject favor some type of Federal legislation.

If any of the enclosed findings interest you, I would be happy to have you use them with credit to the source, Elmo Roper and Associates.

Yours sincerely,

Elmo

P.S. Lunch?

THE PUBLIC PULSE
By Elmo Roper and Associates
(for release on and after September 22, 1957)

CIVIL RIGHTS LAW BACKED BY LARGE MAJORITY

Equal access to the ballot box is, for most Americans, a right that merits strong Federal guarantees. Two-thirds of a national cross section recently interviewed thought that Congress was right in passing the first civil rights bill in more than 80 years, and three-quarters of the proponents of Federal legislation thought that Congress should have gone even further than it did in eliminating racial bars to equality. These are the answers our interviewers received:

> One of the biggest controversies in Congress this year was over legislation to guarantee Negroes the right to vote. Several different plans were put forward. Which of these statements comes closest to expressing what you think Congress should have done?
>
> Pass strong civil rights legislation that assured equal rights for all in voting and going to unsegregated schools. 33%
>
> Pass civil rights legislation that assured equal rights for all in voting only and that would let judges decide all cases of violations of the law. . . 15
>
> Pass civil rights legislation that assured equal rights for all in voting only and that would have jury trials decide criminal violations of the law. . . 17
>
> Pass no Federal civil rights legislation and leave the matter to the states to decide. 26
>
> Don't know. 9

The days of complacency over the state of civil rights appear to be over. Nine years ago, when President Harry Truman stuck his neck out by recommending Federal legislation to assure Negro voting rights, a survey showed that while 43 per cent of the nation agreed with him, 49 per cent thought the matter should be left to the states to decide. This year the opponents of Federal action have shrunk to a minority of 26 per cent.

While youth and higher education tend to make people somewhat more enthusiastic about Federal voting guarantees, these are not crucial factors. Nor is membership in one political party or the other, both of which are split in an almost

identical way over the issue. This particular form of equality is above all a racial and a regional issue. Sixty-eight per cent of the Negroes we talked to wanted a strong, double-barreled bill, while the corresponding figure for whites was 30 per cent. Regional differences were almost as dramatic:

	East	Mid-west	Far West	South
	%	%	%	%
For stronger Federal legislation	61	48	67	32
For bill as passed	15	19	15	18
Against Federal legislation	16	26	10	39
Don't know	8	7	8	11

The civil rights battle is often talked of as a conflict between the values of the conservative South and the liberal Northeast. There is truth in this, yet these figures point out once again, as recent surveys have done, that the freshest forces of liberalism are coming from the Western, rather than the Eastern, seaboard.

Even the South is breaking away from its old habits of thought on this subject. The fact that half of the white Southerners interviewed opposed Federal legislation is less surprising than that the other half supported it. And among the supporters, half wished that Congress had passed a stronger law. The times are changing, and no group, no class, nor any region of our country is immune.

This year's bill did not mention the integration of schools. One third of the people think it should have. If the transition to equal and unseparate schooling continues to be marked with bursts of violence like those of the past few weeks, the clamor for Federal machinery to secure this right may well get more, rather than less, insistent.

Roper, Elmo

August 24, 1957

Dear Elmo:

I should be back in the ill-fitting harness by September 2nd.

If you are about and would like to lunch one day, just pick the day.

As ever yours,

MEMO TO: Members of the Society of Profound Thinkers DATE: September 5, 1956

FROM: Elmo Roper

[redacted]

Word has been received that we have a quorum for our dinner meeting for Tuesday, September 18th, here in New York, probably at 7 o'clock at a place yet to be determined.

I am hoping that we can do better than a quorum--a reasonably full membership. So if some of you Profound Thinkers who gave me tentative "yeses" or nebulous "noes" will reconsider, we might have one of our best evenings yet.

So that we'll know exactly how to plan, please give me your positive, final, irrevocable, affirmative answer promptly.

Roper, Elmo

August 8, 1956

Dear Elmo:

I am not sure about the 18th. The reason for the uncertainty is that I may have to be aboard the FORRESTAL shooting film for SEE IT NOW. I am now waiting word from the navy as to exact dates and will make you a signal as soon as I know anything definite.

As ever yours,

Mr. Elmo Roper

Dear Ed:

Mr. Robert T. Stevens, who has several claims to fame, greatest among which is the fact that he is a member of the Society of Profound Thinkers, vows that he wants to be host to our imposing group on the evening of Tuesday, September 18th, here in the city of New York--if a quorum can be found for that evening.

Bob Sherwood had planned to be host at the next meeting, which was to have been this spring and at which you were to be welcomed to full membership in our group. I do hope you can make it.

Cordially yours,

Elmo

Dear Ed:

As you can well imagine, I have read your script for November 5th with interest, and as you doubtless suspected, I find myself both shocked and disappointed at the paragraph which begins at the bottom of page 4.

I am not going to comment at length on your obvious delight in thinking that it is impossible to gain any clues as to the motives of mankind. At a time when it seems to me of vital importance to throw whatever light can be thrown on what are the forces that make mankind tick, it would seem to me any searcher for the truth would welcome any effort that had any validity. However, if you get any happiness out of thinking that mankind and his behavior arenot only a mystery at the present moment but, thank God, will always remain equally a mystery, I think you may be permitted that little form of mysticism without any substantial loss to progress.

Nor do I want to dwell on the relationship between the editorializing you have done in that paragraph as contrasted with your very splendid promise at the beginning of the campaign to report facts and not editorialize.

Rather, I should like to comment on what I think is a very bad case of reporting the facts. You state, in parenthetical form, "They (meaning the polls) were as wrong as they were four years ago." By whatever standards you choose to set up, this is not true. In 1948 we used our figures on which to base a flat prediction; in 1952 we made no prediction at all. Our final figures, given out over another network on the Sunday before election, were Eisenhower 49 per cent, Stevenson 37 per cent, and the "undecided" 14 per cent. In line with the implied promise made to the Social Science Research group which investigated

the 1948 polls--and with my own previously published convictions--we offered no speculation whatever as to how the undecided vote would go. However, it shouldn't have required very much of an analytical genius to figure out that Stevenson had to take all of the undecided vote in order to have 51 per cent and that if Eisenhower got any substantial percentage of them, it would be an Eisenhower landslide. In short, the figures themselves were accurate enough for any who wanted to use them as a basis for prediction.

Also I'd like to comment on the implications inherent in your statement that we regard ourselves as set up for the sole purpose of "predicting the unpredictable." I have been contending for some time that if public opinion polls were used in election years for the purpose of flat prediction and if they continued to be as successful as they were in 1936, 1940, and 1944, they might do a considerable amount of harm, including the fact that they might sometime find themselves with the measuring rod influencing the thing they were trying to measure. In my opinion, this happened in 1948, when the polls helped lull Thomas Dewey's advisers into a feeling of false security. There was obviously no danger of the polls' being accepted in an oracular sense in 1952, but at the same time, I announced flatly on the air and in my column in February of 1952 that we would offer no flat predictions at all but rather would try to find out which issues were influencing which groups, while at the same time publishing <u>all</u> the evidence we had so that any who cared to predict could do so. (I felt it was necessary to publish total figures so anyone could judge for himself the validity of the group--or breakdown--figures.) On this I think we did a very creditable job, and since those scripts are available and since such people as Sam Stouffer of Harvard, Lazarsfeld of Columbia, Clyde Hart of Chicago, to say nothing about such people as Frank Stanton and Frank Folsom and Bob Sherwood and others, also feel that we did a creditable job on the one thing we announced in February we intended to do, I'm not going to take the trouble here to try to document it.

I suspect I disagree with practically every thought in that paragraph, but for purposes of this letter let me content myself by saying that your statement that the polls--and by inference, therefore, our poll--were as wrong as they were in 1948 is demonstrably false and that your assumption that our purpose was to predict the unpredictable shows that--although you now elect yourself to judge it--you never once paid any attention to the many times since 1944 I have said that this was not their function--including an entire broadcast and an entire column on that subject one year ago next month.

In conclusion, I think it is ironic that you should choose to quote Carl Sandburg in what is to me the offending paragraph, since he once took the trouble to come to my house in Redding to tell me that he thought the work we were doing was one of the two or three most important jobs being done in the field of trying to understand the common man--a subject close to his heart. He repeated that statement this month.

Cordially yours,

Elmo

Roper, Elmo

October 4, 1950

Dear Elmo:

This is a belated answer to your epistle of April 5.

The troup of newspaper editors--sterling, stentorian, satchel-mouthed individuals all--was, in fact, organized and prepared to tour the country in order, particularly, that the less civilized and sophisticated residents of the eastern seaboard might have an opportunity to bask in the sunshine of their wit and wisdom.

The project was finally abandoned because during the last briefing session the name of Elmo Roper arose and the controversy over that individual became so acrimonius the team was dissolved. Some were in favor of including him; others maintained that his posture could only be described in the way that the G.I. described the little South Korean.

This limited survey of opinion persuaded me that most editors regard Roper as either responsible or repulsive. My efforts to convince them that you were, in fact, a deep thinker (andhere I avoid the use of alliteration) were unavailing. The result is that the eastern seaboard must wallow along in its own confusion, the path of destruction being illumined only once each week for fifteen minutes--and that late at night.

As ever yours,

Mr. Elmo Roper
30 Rockefeller Plaza
New York, New York

Dear Ed:

Rumor has it that you are collecting a troupe of newspaper editors for an across-the-country tour, which will include radio, television, and personal appearances before Rotary Clubs, Leagues of Women Voters, etc.

As another skilled connoisseur of newspaper editors, I want to bring to your attention the qualifications of my old friend, Mr. Twinkwell Schoonerbottom, editor of the Oskaloosa (Iowa) Blatant Bladder. Mr. Schoonerbottom was born in Oskaloosa, Iowa, on August 10, 1902, and has been as far north in this country as Des Moines and as far east as Keokuk. His travels even have something of an international flavor because in January of 1921 he played basketball way down in Chillicothe, Missouri. (I forget what the score was now.)

Twinkwell attended the School of Taxidermy at Ames, Iowa, but later found it more fun and more profitable to tan the hides of local politicians via the editorial pages of his paper. As one who was there at the time, I can tell you that there isn't a word of truth in the rumor that Mr. Schoonerbottom's taxidermy professor compalined that he never could tell which was stuffed--the animal or Mr. Schoonerbottom. You need have no fears about Twinkwell's radio voice, since he was an easy winner in the Union County, Iowa, hog-calling contest in 1924.

Mr. Schoonerbottom's better known editorials are: "Spring Comes to Oskaloosa," "Oskaloosa--Upward and Onward," "Why Oskaloosa Doesn't Need a $200,000 High School"--and, of course, others too numerous to mention, none of which won the Pulitzer Prize.

As you can see, I have a very prejudiced view toward Mr. Schoonerbottom, since he and I are old friends. I'm sure, however, that you can look beneath this bias and recognize in Twinkwell the kind of rare genius that would blend in perfectly with the troupe now being organized.

Cordially yours,

Elmo Roper

HOW CAN A BETTER UNDERSTANDING OF OUR ECONOMIC SYSTEM BE FOSTERED

A Paper Given By F. W. Abrams at
the Meeting of the C.E.D.
Washington, D.C., May 19th, 1950

Many of us, when we talk about a better public understanding of our economic system, really mean a better public attitude toward business. We feel that a better understanding cannot fail to mean a better attitude. We know that we ourselves have reacted that way, as our knowledge of business and business leaders has grown.

To understand fully our economic system would require a good many years of graduate work as well as experience in the practical field. I, for one, would certainly not like to say that it is all as simple as ABC to me. I know some very distinguished economists and I must say they don't all see eye-to-eye. It is my impression that the well-educated, thoughtful, experienced economists in the government do not always agree with the equally able economists in business and industry, or the experts of the labor movement, or the economists in our colleges and universities.

There are some elementary propositions that are important and that are generally accepted. For example, as a people, we can have more only by producing more. There must be a greater production to divide if we are going to have higher living standards. The total of production available for distribution is a result of how much capital we have, and of how effectively we use it -- and it takes profits to build that capital. Finally, it is well to recall that those who receive more than they produce, do so only at the expense of those who produce

more than they receive. These facts we believe to be basic. The C.E.D. is feeling its way, and is developing effective methods to teach these basic principles. And frankly, except for some of these fundamental propositions, I think it would be a very difficult thing to explain economics to the public successfully.

Even this simpler task, essential as it is, will not be successful if we businessmen are not trusted by ordinary folks. Without trust, our economics will not be believed, no matter how right it may be. With trust, our economics may be believed even by people who do not fully understand it. It is simply not enough to ring the old school bell and ask everyone in for a course of lectures in economics.

I want to inquire here today how we might achieve a better understanding and trust between the public and business of the motivations and aspirations of each. If we can understand these better, I think everyone will understand our economic system better. And, it is worth observing, the more we in management know about people, the better managers we will be, and people will get a feeling and sense that we are sincerely concerned with their problems.

Basically, most men want simple things. They want the esteem of their fellow men. They want a reasonable degree of assured comfort for themselves and those dependent upon them. They want freedom to develop culturally and to express themselves spiritually. They want the opportunity to improve themselves by dint of their own efforts, in part, because they are driven by the hope of personal fortune; but also, because of the satisfactions that go with personal achievement. They want to feel they are playing a part in building a finer country and life for themselves and their neighbors. I believe they would like to feel they are doing this <u>together</u> with their business leaders. These, it seems to me, are the fundamental wants of the great majority of men.

Likewise, let us put it down as the hard core of reality, that regardless of the physical environment and social structure at any particular time, mankind is constantly reaching out for something better -- materially, culturally, and spiritually. As businessmen, we can all be profoundly thankful for that compelling drive within men. It is the essence of the dynamic development of American business, in which we can all take justifiable satisfaction.

Down through time, by trial and error, men have come to know that their basic desires can be realized through certain homely virtues. Industry and thrift, together with a sense of self-reliance, have characterized the solid citizens of every generation. Integrity and moral honesty are virtues that have dominated the lives of respected men in every age. But if we are to be at peace with ourselves and our fellow men, there is another great virtue that must not be overlooked, and that virtue is faith in each other.

We hear a lot about the American way of life, and the essential dignity of man. Faith in our fellow men is the only basis on which each and every one of us can live that democratic principle. Suspicion of our fellow men generally -- or any section of our fellow men -- regardless of race, economic group, or religion, is incompatible with the dignity and aspirations of men in a free society.

Today, the complexity of our national life has amplified the basic wants of men, and changed the form of their expression. We are now preoccupied with such things as adequate medical protection, educational opportunities, stability of employment and income, and adequate pensions to begin when our productive lives may have been spent. These are the contemporary manifestations of the fundamental wants of man in his continuing search for better living. At the same time, the complexity of life today seems to have made us less aware of the simple but time-tested virtues that have always been the means of realizing the aspirations of men.

The geographical pioneering of this country's development is pretty much accomplished. Population has increased and shifted to the point where congestion occurs in many locations. The problems incident to increased population are accentuated by more rapid transportation and improved means of communication. People have been brought into closer association. Their opportunities for personal differences have multiplied.

It has become more important for us to learn how to live in harmony in a new kind of world. People now are more concerned with each other, and much less with the mastery of their physical environment. The importance of faith in our fellow men, and understanding among men, is thereby made the greater. Yet suspicion and acrimony exist amongst people, and seem to be growing stronger. In words that have been attributed to Dean McIntosh of Barnard, "while man has brought his physical universe under control, he cannot manage the simple relations between himself and his fellows."

There are some that feel that the New Deal recognized these diverging forces in contemporary life -- brought their outlines into focus, and made political capital out of them. Unfortunately, the New Deal solved few of the problems. But it did hasten the need of facing up to the implications of our basic position, which otherwise might have taken half a century. It seems to me that the great need of our time -- and this is true particularly of the business community -- is to recognize the situation as we now find it, and to proceed with patience and wisdom to make our contribution to meet it.

Well, then, what can be done about it? In my opinion, there is one thing that can be done, and that is to spend a lot more of our thought and our energies working to achieve a redistribution of faith, and less in what has come to be a somewhat sterile discussion of a redistribution of wealth.

Management must apply to its relationships with the rest of the community the same type of searching analysis that it would make of its more

usual business problems. It must do this in terms of what it knows, and can learn about, the basic wants and needs of men. After all, when you stop to think about it, it is absurd that business and the public, of which business is a part, should be regarded as being in conflict; or again, that management should be opposed to labor's basic interest and labor to management's.

All this may sound pretty idealistic to you. It is. But it also can be very practical. Trust among people can be recaptured only if we succeed in breaking through the separatism that has grown up among groups. We must aim to tear down the psychological walls that have been built around group interests. We must realize that in these matters, the whole is greater than the sum of its parts. Business management must make its own contribution to a restoration of understanding and faith among men.

To be certain that we make our full contribution to the welfare of all, we businessmen must recognize the possibility that we may have become possessed of some of those suspicions and fears that are so clear to us when we see them in others. We too may have lost some of our faith in our fellow men. What can we of good faith in the business community do about minimizing suspicions among the dominant groups of the country, including ourselves? We can make a brave start by examining the area about which we should know the most -- ourselves.

Management can make sure that any action it takes or sponsors in its own behalf is clearly justified, in the light of principle. At all costs, it should avoid building bear traps for business. Conscientious care and restraint must guide us in anything that touches us personally, such as our own compensation. We must curb our occasional enthusiasms for special government protection, or other forms of assistance. We must be sure we do not support the imposition of measures within the economy that are beneficial only to the interests that we may personally represent -- measures that may fail to serve the interests, or may even be contrary to the interests of everyone else.

But self discipline and restraint by business management, essential though it is, is not enough if we are to succeed in reestablishing genuine public acceptance of our economic leadership. We must reestablish the common touch with our fellow men. We must reappear in the role of warm-hearted human beings -- which is what we are.

It always amazes me when I consider how many of the leaders of business and industry today have come from very humble circumstances. Most of the people I know in high positions were not only born barefooted but many of them stayed that way for some time.

But it is true -- and I think we can see it everywhere -- that as success comes and men rise to positions of responsibility they start going to the same clubs, talking to each other, playing golf in the same foursomes, making speeches to each other (as we are doing here) and generally building up a wall around themselves. Perhaps our business leadership needs to go back to school to re-learn the art of knowing all the people. Don't tell me there are many exceptions. I know there are. But there is plenty of truth in the picture too.

There is a growing notion in a big enterprise that the team is what counts and not the individual playing a lone game. But in addition the simple fact, as I see it, is that men give their confidence to men. People turn to people. We trust men and women whose character we have come to recognize and respect. There is no good substitute for people. "These are men I trust," we say. "So long as they are there I am sure the institution is honest, decent, fair-minded and progressive." And since institutions reflect the character of their leadership it seems to me important that people should get to know that leadership.

It always seems rather sad to me that we of the industrial and business world deceive ourselves that we can "make friends and influence people" through such things as paid newspaper advertising, pamphlets and billboards.

Some of that may help under certain conditions. But when it becomes the main channel of our effort, I think it is almost an insult to the intelligence of the average reader. We live our relatively sheltered and exclusive lives, away from the home folks, and expect that a paid notice in the paper will hold their loyalty and admiration for us and what we represent. "Free enterprise, it's wonderful" we say, and then we congratulate each other on what a swell "ad" we have written.

What I am trying to say is that I don't think that business has a chance to do the kind of job it honestly wants to do, and the kind of job for which it is trained and equipped -- it does not have a chance to make its full contribution to the welfare of all, unless businessmen get out and sell themselves personally to the other major groups that make up the people of good faith in America. Part of that selling is the exercise of conscientious care and restraint in our businesses, and part is the simple matter of re-meeting the folks. I am sure that too few people really know those responsible in business organizations. We have gone too far down the road of setting up what might be called a business aristocracy, simply by mingling and talking only with ourselves.

It is easy to be suspicious of the aims and purposes of people you do not know. The foundation of good human relationships must be faith, and it's hard to have faith in a strange name on a piece of paper. We frequently feel hurt that our motives are questioned and our sincerity doubted. But all the advertising space we can buy, exhorting others to believe in us as businessmen, will go unheeded, and all our speeches and statements will fall on deaf ears until folks believe that we understand and are concerned with their problems.

Anyone who knows the business leaders of this country knows that they are patriotic, high-principled men dedicated to the responsibilities of their work. But too few people know them. The very consecration that they give to the problems of their business, has served to absorb their time and thereby isolate them from people generally.

This situation must be changed. The public attitude toward business has become the primary problem of business itself. No longer can the industrial manager believe that he has met the full responsibilities of his position in the efficient operation of his business. A new competitive threat has appeared -- that of governmental encroachment under the guise of social consciousness. It is my firm conviction that business managers can meet this, but they must take to the field to do it.

The faith of the people can be regained by our showing faith in them through the cultivation of their friendship. We have something real to offer in the competition for the future social way of life in this country. But we have to get out and show the folks that we who are responsible for the conduct of business, are warm-hearted human beings like themselves.

Then and only then will they turn to business for economic leadership.

Roper, Elmo

July 6, 1950

Dear Elmo:

This time I have "had it". I go off the air the end of this week and go to Korea the end of next week. I'm sorry to miss the proposed dinner. When I return I shall send you a Roper questionnaire as to how salubrious was the evening and the percentage of drinkers as distinguished from thinkers.

As ever yours,

Mr. Elmo Roper

Dear Ed:

You remember I wrote you on June 13th about a little dinner party I proposed where the guest of honor was to be our mayor, Bill O'Dwyer. You duly replied, as did the others, but a combination of the fact that half the guests I wanted couldn't come on one of the two dates and the other half couldn't come on the other, plus the fact that my own schedule got in a jam made me call the thing off--or rather postpone it.

I'm now setting it up again, so here's another questionnaire:

1. Would the evening of July 12th be convenient for you? Yes____ No_____

2. Would the evening of July 18th be convenient for you? Yes____ No_____

If you'll let me know promptly, I'll set it up definitely for one of those dates and let you know which one is "majority choice."

Cordially yours,

Elmo

Dear Ed:

This letter is simply intended to confirm our dinner engagement for Wednesday evening, January 25th, at 7 p.m. in a private dining room at the Century Club.

I haven't positive assurance from two of the invitees yet, but the ones who have accepted, besides you and me, are Brien McMahon, Frank Folsom, Winthrop Rockefeller, Albert Lasker, and Ernest Angell.

Cordially yours,

Elmo

Dear Elmo:

Many thanks for your thoughtfulness in sending me "The Rock Cried Out". I haven't yet had the time to read it, but if God is good I'll be off this schedule in two weeks and will then be able to get to it.

As ever yours,

ELMO ROPER

Dear Ed:

I have just finished reading in unbound proof form Ed Stanley's new novel THE ROCK CRIED OUT. — on shelf

It is beautifully written and puts some of the half forgotten figures of history and half remembered incidents into such clear perspective that I thought you might like to read it too, and I'm asking him to send you a copy.

Cordially yours,

Elmo

Dear Elmo:

Many thanks for sending me "There's Freedom for the Brave", which arrived here while I was in Washington. I'm hoping to get a chance to read it soon.

As ever yours,

ELMO ROPER

30 ROCKEFELLER PLAZA · NEW YORK 20, N. Y.

January 11, 1949

Dear Ed:

I am having mailed to you today a copy of Paul McGuire's new book, THERE'S FREEDOM FOR THE BRAVE, which Morrow will publish on February 24th. I am sending it because I think you will find it highly provocative. The acceptance of what he suggests may very well be a necessary "first step" toward world order.

I do not agree with all Mr. McGuire has said, and I am sure you won't. For example, I can't see the sharp distinction between what he calls "The State" and what he calls "The Economy." I do, however, think his point that even in the Western democracies some people tend toward nationalism to the point where they imbue the "state" with God-like qualities is good.

You may find one or two chapters, such as the one where he traces developments in France, a little boring; but if you do, I think you will find some of the other chapters equally as exciting.

Yours sincerely,

Elmo

January 14, 1949

Dear Mr. Hobson:

Thank you for sending Mr. Murrow a copy of "There's Freedom for the Brave".

It has been received here during his absence but will be called to his attention as soon as he returns to the office.

Sincerely yours,

Dorothy McDonough
Secretary to Mr. Murrow

.M MORROW & COMPANY, INC., *Publishers* 425 *Fourth Avenue, New York* 16, N. Y.

January 10, 1948

Dear Mr. Murrow:

At the request of Elmo Roper, we are sending you a copy of Paul McGuire's THERE'S FREEDOM FOR THE BRAVE: An Approach to World Order, which will be published on February 24th.

If you feel as I do that the ideas and doctrine in THERE'S FREEDOM FOR THE BRAVE are vitally needed today in America - and in the whole world - you may very well write me and ask what you can do to help get this book into the hands of people who ought to read it. Whatever you write me about the McGuire book will not be used publicly without your permission, but I would be less than honest if I did not admit that I hope you will feel that you will want to send me comment which could be used in publicity and promotion. THERE'S FREEDOM FOR THE BRAVE is not impulse merchandise and it will not attract a large audience unless it enjoys from the outset the positive support of the people who lead thought in this country.

Yours sincerely,

Thayer Hobson
